                         memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_or(integral-type,
                        memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_or(integral-type,
                        memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_xor(integral-type,
                         memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_xor(integral-type,
                         memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_max(integral-type,
                         memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_max(integral-type,
                         memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_min(integral-type,
                         memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_min(integral-type,
                         memory_order = memory_order::seq_cst) noexcept;

```

```

    integral-type operator++(int) volatile noexcept;
    integral-type operator++(int) noexcept;
    integral-type operator--(int) volatile noexcept;
    integral-type operator--(int) noexcept;
    integral-type operator++() volatile noexcept;
    integral-type operator++() noexcept;
    integral-type operator--() volatile noexcept;
    integral-type operator--() noexcept;
    integral-type operator+=(integral-type) volatile noexcept;
    integral-type operator+=(integral-type) noexcept;
    integral-type operator-=(integral-type) volatile noexcept;
    integral-type operator-=(integral-type) noexcept;
    integral-type operator&=(integral-type) volatile noexcept;
    integral-type operator&=(integral-type) noexcept;
    integral-type operator|=(integral-type) volatile noexcept;
    integral-type operator|=(integral-type) noexcept;
    integral-type operator^=(integral-type) volatile noexcept;
    integral-type operator^=(integral-type) noexcept;

    void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
    void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    void notify_one() noexcept;
    void notify_all() volatile noexcept;
    void notify_all() noexcept;
};
}

```

- 2 The atomic integral specializations are standard-layout structs. They each have a trivial destructor.
- 3 Descriptions are provided below only for members that differ from the primary template.
- 4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 150](#).

**Table 150** — Atomic arithmetic computations [tab:atomic.types.int.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	and	&	bitwise and
sub	-	subtraction	or		bitwise inclusive or
max		maximum	xor	^	bitwise exclusive or
min		minimum			

```

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

```

- 5 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.
- 6 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2](#)).
- 7 *Returns:* Atomically, the value pointed to by `this` immediately before the effects.
- 8 *Remarks:* Except for `fetch_max` and `fetch_min`, for signed integer types the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.
- [Note 2: There are no undefined results arising from the computation. — end note]
- 9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms ([26.8.9](#)), respectively, with the object value and the first parameter as the arguments.

```

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

```

- 10 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

11 *Effects:* Equivalent to: return `fetch_key(operand) op operand`;

#### 32.5.8.4 Specializations for floating-point types [atomics.types.float]

- <sup>1</sup> There are specializations of the atomic class template for all cv-unqualified floating-point types. For each such type *floating-point-type*, the specialization `atomic<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
    template<> struct atomic<floating-point-type> {
        using value_type = floating-point-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(floating-point-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
        floating-point-type operator=(floating-point-type) volatile noexcept;
        floating-point-type operator=(floating-point-type) noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
        operator floating-point-type() volatile noexcept;
        operator floating-point-type() noexcept;

        floating-point-type exchange(floating-point-type,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type exchange(floating-point-type,
                                    memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                     memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                     memory_order, memory_order) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                     memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                     memory_order = memory_order::seq_cst) noexcept;

        floating-point-type fetch_add(floating-point-type,
                                     memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type fetch_add(floating-point-type,
                                     memory_order = memory_order::seq_cst) noexcept;
        floating-point-type fetch_sub(floating-point-type,
                                     memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type fetch_sub(floating-point-type,
                                     memory_order = memory_order::seq_cst) noexcept;

        floating-point-type operator+=(floating-point-type) volatile noexcept;
        floating-point-type operator+=(floating-point-type) noexcept;
        floating-point-type operator-=(floating-point-type) volatile noexcept;
    };
}
```

```

floating-point-type operator==(floating-point-type) noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};
}

```

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in [Table 150](#).

```

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

```

5 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

6 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2](#)).

7 *Returns:* Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks:* If the result is not a representable value for its type ([7.1](#)) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([29.3](#)) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

```

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

```

9 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

10 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

11 *Remarks:* If the result is not a representable value for its type ([7.1](#)) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([29.3](#)) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

### 32.5.8.5 Partial specialization for pointers

[`atomics.types.pointer`]

```

namespace std {
template<class T> struct atomic<T*> {
    using value_type = T*;
    using difference_type = ptrdiff_t;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const volatile noexcept;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(T*) noexcept;
    atomic(const atomic&) = delete;
    atomic& operator=(const atomic&) = delete;
    atomic& operator=(const atomic&) volatile = delete;

    void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
    void store(T*, memory_order = memory_order::seq_cst) noexcept;
    T* operator=(T*) volatile noexcept;
    T* operator=(T*) noexcept;
};

```

```

T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
T* load(memory_order = memory_order::seq_cst) const noexcept;
operator T*() const volatile noexcept;
operator T*() const noexcept;

T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T*&, T*,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T*&, T*,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T*&, T*,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T*&, T*,
    memory_order = memory_order::seq_cst) noexcept;

T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_max(T*, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_max(T*, memory_order = memory_order::seq_cst) noexcept;
T* fetch_min(T*, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_min(T*, memory_order = memory_order::seq_cst) noexcept;

T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};
}

```

- <sup>1</sup> There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
- <sup>2</sup> Descriptions are provided below only for members that differ from the primary template.
- <sup>3</sup> The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in [Table 151](#).

```

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;

```

- <sup>4</sup> *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.
- <sup>5</sup> *Mandates:* `T` is a complete object type.

[*Note 1:* Pointer arithmetic on `void*` or function pointers is ill-formed. — *end note*]

Table 151 — Atomic pointer computations [tab:atomic.types.pointer.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction
max		maximum	min		minimum

6 *Effects:* Atomically replaces the value pointed to by **this** with the result of the computation applied to the value pointed to by **this** and the given **operand**. Memory is affected according to the value of **order**. These operations are atomic read-modify-write operations (6.9.2).

7 *Returns:* Atomically, the value pointed to by **this** immediately before the effects.

8 *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

9 For **fetch\_max** and **fetch\_min**, the maximum and minimum computation is performed as if by **max** and **min** algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

[*Note 2:* If the pointers point to different complete objects (or subobjects thereof), the < operator does not establish a strict weak ordering (Table 29, 7.6.9). — end note]

T\* operator op=(ptrdiff\_t operand) volatile noexcept;

T\* operator op=(ptrdiff\_t operand) noexcept;

10 *Constraints:* For the volatile overload of this function, **is\_always\_lock\_free** is true.

11 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

### 32.5.8.6 Member operators common to integers and pointers to objects[atomic.types.memop]

value\_type operator++(int) volatile noexcept;

value\_type operator++(int) noexcept;

1 *Constraints:* For the volatile overload of this function, **is\_always\_lock\_free** is true.

2 *Effects:* Equivalent to: `return fetch_add(1);`

value\_type operator--(int) volatile noexcept;

value\_type operator--(int) noexcept;

3 *Constraints:* For the volatile overload of this function, **is\_always\_lock\_free** is true.

4 *Effects:* Equivalent to: `return fetch_sub(1);`

value\_type operator++() volatile noexcept;

value\_type operator++() noexcept;

5 *Constraints:* For the volatile overload of this function, **is\_always\_lock\_free** is true.

6 *Effects:* Equivalent to: `return fetch_add(1) + 1;`

value\_type operator--() volatile noexcept;

value\_type operator--() noexcept;

7 *Constraints:* For the volatile overload of this function, **is\_always\_lock\_free** is true.

8 *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

### 32.5.8.7 Partial specializations for smart pointers [util.smartptr.atomic]

#### 32.5.8.7.1 General [util.smartptr.atomic.general]

1 The library provides partial specializations of the atomic template for shared-ownership smart pointers (20.3.2).

[*Note 1:* The partial specializations are declared in header <memory> (20.2.2). — end note]

The behavior of all operations is as specified in 32.5.8, unless specified otherwise. The template parameter T of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 32.5.8.7, and all associated **use\_count** increments, are guaranteed to be performed atomically. Associated **use\_count** decrements are sequenced after the atomic operation, but

are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[*Note 2:* If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed.

— *end note*]

<sup>3</sup> [*Example 1:*

```
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

public:
    shared_ptr<node> find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;

        return p;
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
        while (!head.compare_exchange_weak(p->next, p)) {}
    }
};
```

— *end example*]

### 32.5.8.7.2 Partial specialization for `shared_ptr`

[`util.smartptr.atomic.shared`]

```
namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(nullptr_t) noexcept : atomic() { }
        atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator shared_ptr<T>() const noexcept;
        void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(shared_ptr<T> desired) noexcept;
        void operator=(nullptr_t) noexcept;

        shared_ptr<T> exchange(shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                   memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                     memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                   memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                     memory_order order = memory_order::seq_cst) noexcept;
    };
};
```

```

    void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() noexcept;
    void notify_all() noexcept;

private:
    shared_ptr<T> p;           // exposition only
};
}

constexpr atomic() noexcept;
1     Effects: Initializes p{ }.

atomic(shared_ptr<T> desired) noexcept;
2     Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).
    [Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by
    communicating the address of the just-constructed object A to another thread via memory_order::relaxed
    operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This
    results in undefined behavior. — end note]

void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
3     Preconditions: order is memory_order::relaxed, memory_order::release, or memory_order::seq_cst.
4     Effects: Atomically replaces the value pointed to by this with the value of desired as if by
    p.swap(desired). Memory is affected according to the value of order.

void operator=(shared_ptr<T> desired) noexcept;
5     Effects: Equivalent to store(desired).

void operator=(nullptr_t) noexcept;
6     Effects: Equivalent to store(nullptr).

shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
7     Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::acquire, or memory_order::seq_cst.
8     Effects: Memory is affected according to the value of order.
9     Returns: Atomically returns p.

operator shared_ptr<T>() const noexcept;
10    Effects: Equivalent to: return load();

shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
11    Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according
    to the value of order. This is an atomic read-modify-write operation (6.9.2.2).
12    Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order success, memory_order failure) noexcept;
13    Preconditions: failure is memory_order::relaxed, memory_order::consume, memory_order::acquire, or memory_order::seq_cst.
14    Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics
    corresponding to the value of success, otherwise assigns p to expected and has synchronization
    semantics corresponding to the value of failure.
15    Returns: true if p was equivalent to expected, false otherwise.
16    Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and either share
    ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

```

17 If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                          memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

19 *Effects:* Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

20 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

21 *Effects:* Repeatedly performs the following steps, in order:

(21.1) — Evaluates `load(order)` and compares it to `old`.

(21.2) — If the two are not equivalent, returns.

(21.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

22 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```
void notify_one() noexcept;
```

23 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

24 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
void notify_all() noexcept;
```

25 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

26 *Remarks:* This function is an atomic notifying operation (32.5.6).

### 32.5.8.7.3 Partial specialization for `weak_ptr` [util.smartptr.atomic.weak]

```
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;
    };
}
```

```

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
operator weak_ptr<T>() const noexcept;
void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
void operator=(weak_ptr<T> desired) noexcept;

weak_ptr<T> exchange(weak_ptr<T> desired,
                    memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                          memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                          memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
void notify_one() noexcept;
void notify_all() noexcept;

```

```

private:
    weak_ptr<T> p;           // exposition only
};
}

```

```
constexpr atomic() noexcept;
```

1     *Effects:* Initializes p{ }.

```
atomic(weak_ptr<T> desired) noexcept;
```

2     *Effects:* Initializes the object with the value **desired**. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — *end note*]

```
void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3     *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

4     *Effects:* Atomically replaces the value pointed to by **this** with the value of **desired** as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```
void operator=(weak_ptr<T> desired) noexcept;
```

5     *Effects:* Equivalent to `store(desired)`.

```
weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6     *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

7     *Effects:* Memory is affected according to the value of `order`.

8     *Returns:* Atomically returns p.

```
operator weak_ptr<T>() const noexcept;
```

9     *Effects:* Equivalent to: `return load();`

```
weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10    *Effects:* Atomically replaces p with **desired** as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.9.2.2).

11    *Returns:* Atomically returns the value of p immediately before the effects.

```

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order success, memory_order failure) noexcept;

```

12 *Preconditions:* failure is memory\_order::relaxed, memory\_order::consume, memory\_order::acquire, or memory\_order::seq\_cst.

13 *Effects:* If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

14 *Returns:* true if p was equivalent to expected, false otherwise.

15 *Remarks:* Two weak\_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

16 If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use\_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

```

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;

```

17 *Effects:* Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where fail\_order is the same as order except that a value of memory\_order::acq\_rel shall be replaced by the value memory\_order::acquire and a value of memory\_order::release shall be replaced by the value memory\_order::relaxed.

```

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;

```

18 *Effects:* Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where fail\_order is the same as order except that a value of memory\_order::acq\_rel shall be replaced by the value memory\_order::acquire and a value of memory\_order::release shall be replaced by the value memory\_order::relaxed.

```

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

```

19 *Preconditions:* order is memory\_order::relaxed, memory\_order::consume, memory\_order::acquire, or memory\_order::seq\_cst.

20 *Effects:* Repeatedly performs the following steps, in order:

(20.1) — Evaluates load(order) and compares it to old.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two weak\_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```

void notify_one() noexcept;

```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (32.5.6).

```

void notify_all() noexcept;

```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (32.5.6).

### 32.5.9 Non-member functions

[atomics.nonmembers]

- 1 A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_`  
`explicit` invokes the member function `f`, with the value of the first parameter as the object expression and  
the values of the remaining parameters (if any) as the arguments of the member function call, in order. An  
argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member  
function call. If no such member function exists, the program is ill-formed.
- 2 [Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for  
example in a shared header file. — end note]

### 32.5.10 Flag type and operations

[atomics.flag]

```
namespace std {
    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) volatile = delete;

        bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
        bool test(memory_order = memory_order::seq_cst) const noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
        void clear(memory_order = memory_order::seq_cst) volatile noexcept;
        void clear(memory_order = memory_order::seq_cst) noexcept;

        void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
        void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
        void notify_one() volatile noexcept;
        void notify_one() noexcept;
        void notify_all() volatile noexcept;
        void notify_all() noexcept;
    };
}
```

- 1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- 2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.
- 3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```
constexpr atomic_flag::atomic_flag() noexcept;
```

- 4 *Effects:* Initializes `*this` to the clear state.

```
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;
```

- 5 For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

- 6 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::ac-`  
`quire`, or `memory_order::seq_cst`.

- 7 *Effects:* Memory is affected according to the value of `order`.

- 8 *Returns:* Atomically returns the value pointed to by `object` or `this`.

```
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
```

```
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;
```

9 *Effects:* Atomically sets the value pointed to by `object` or by `this` to true. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

10 *Returns:* Atomically, the value of the object immediately before the effects.

```
void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;
```

11 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

12 *Effects:* Atomically sets the value pointed to by `object` or by `this` to false. Memory is affected according to the value of `order`.

```
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const noexcept;
```

13 For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.

14 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

15 *Effects:* Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.

(15.2) — If the result of that evaluation is true, returns.

(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 *Remarks:* This function is an atomic waiting operation (32.5.6).

```
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;
```

17 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

18 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;
```

19 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

20 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
#define ATOMIC_FLAG_INIT see below
```

21 *Remarks:* The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

### 32.5.11 Fences

[atomics.fences]

- <sup>1</sup> This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.
- <sup>2</sup> A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- <sup>3</sup> A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- <sup>4</sup> An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

<sup>5</sup> *Effects*: Depending on the value of `order`, this operation:

- (5.1) — has no effects, if `order == memory_order::relaxed`;
- (5.2) — is an acquire fence, if `order == memory_order::acquire` or `order == memory_order::consume`;
- (5.3) — is a release fence, if `order == memory_order::release`;
- (5.4) — is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;
- (5.5) — is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.

```
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

<sup>6</sup> *Effects*: Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

<sup>7</sup> [*Note 1*: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — *end note*]

### 32.5.12 C compatibility

[stdatomic.h.syn]

The header `<stdatomic.h>` provides the following definitions:

```
template<class T>
    using std-atomic = std::atomic<T>;           // exposition only

#define _Atomic(T) std-atomic<T>

#define ATOMIC_BOOL_LOCK_FREE see below
#define ATOMIC_CHAR_LOCK_FREE see below
#define ATOMIC_CHAR16_T_LOCK_FREE see below

```

- <sup>1</sup> Each *using-declaration* for some name *A* in the synopsis above makes available the same entity as `std::A` declared in `<atomic>` (32.5.2). Each macro listed above other than `_Atomic(T)` is defined as in `<atomic>`. It is unspecified whether `<stdatomic.h>` makes available any declarations in namespace `std`.
- <sup>2</sup> Each of the *using-declarations* for `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` listed above is defined if and only if the implementation defines the corresponding *typedef-name* in 32.5.2.
- <sup>3</sup> Neither the `_Atomic` macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than `<stdatomic.h>`.
- <sup>4</sup> *Recommended practice*: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an `_Atomic(T)` from C code and an `atomic<T>` from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

## 32.6 Mutual exclusion

[thread.mutex]

### 32.6.1 General

[thread.mutex.general]

- <sup>1</sup> Subclause 32.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

### 32.6.2 Header `<mutex>` synopsis

[mutex.syn]

```

namespace std {
    // 32.6.4.2.2, class mutex
    class mutex;
    // 32.6.4.2.3, class recursive_mutex
    class recursive_mutex;
    // 32.6.4.3.2, class timed_mutex
    class timed_mutex;
    // 32.6.4.3.3, class recursive_timed_mutex
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t adopt_lock { };

    // 32.6.5, locks
    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

```

```

template<class Mutex>
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

// 32.6.6, generic locking algorithms
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

struct once_flag;

template<class Callable, class... Args>
    void call_once(once_flag& flag, Callable&& func, Args&&... args);
}

```

### 32.6.3 Header <shared\_mutex> synopsis

[shared.mutex.syn]

```

namespace std {
// 32.6.4.4.2, class shared_mutex
class shared_mutex;
// 32.6.4.5.2, class shared_timed_mutex
class shared_timed_mutex;
// 32.6.5.5, class template shared_lock
template<class Mutex> class shared_lock;
template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

```

### 32.6.4 Mutex requirements

[thread.mutex.requirements]

#### 32.6.4.1 General

[thread.mutex.requirements.general]

- <sup>1</sup> A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (32.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

#### 32.6.4.2 Mutex types

[thread.mutex.requirements.mutex]

##### 32.6.4.2.1 General

[thread.mutex.requirements.mutex.general]

- <sup>1</sup> The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 32.6.4.2. In this description, `m` denotes an object of a mutex type.

[Note 1: The mutex types meet the *Cpp17Lockable* requirements (32.2.5.3). — end note]

- <sup>2</sup> The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.

- <sup>3</sup> The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

- (3.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (3.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

- <sup>4</sup> The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appears to occur in a single total order.

[Note 2: This can be viewed as the modification order (6.9.2) of the mutex. — end note]

[Note 3: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — end note]

- <sup>5</sup> The expression `m.lock()` is well-formed and has the following semantics:

- <sup>6</sup> *Preconditions:* If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

- <sup>7</sup> *Effects:* Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

8 *Synchronization*: Prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

9 *Postconditions*: The calling thread owns the mutex.

10 *Return type*: `void`.

11 *Throws*: `system_error` when an exception is required (32.2.2).

12 *Error conditions*:

(12.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(12.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

13 The expression `m.try_lock()` is well-formed and has the following semantics:

14 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

15 *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[*Note 4*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — *end note*]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

16 *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

[*Note 5*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

17 *Return type*: `bool`.

18 *Returns*: `true` if ownership was obtained, otherwise `false`.

19 *Throws*: Nothing.

20 The expression `m.unlock()` is well-formed and has the following semantics:

21 *Preconditions*: The calling thread owns the mutex.

22 *Effects*: Releases the calling thread's ownership of the mutex.

23 *Return type*: `void`.

24 *Synchronization*: This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

25 *Throws*: Nothing.

#### 32.6.4.2.2 Class `mutex`

[`thread.mutex.class`]

```
namespace std {
    class mutex {
    public:
        constexpr mutex() noexcept;
        ~mutex();

        mutex(const mutex&) = delete;
        mutex& operator=(const mutex&) = delete;

        void lock();
        bool try_lock();
        void unlock();

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                           // see 32.2.3
    };
}
```

- <sup>1</sup> The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`.
- <sup>2</sup> [Note 1: After a thread A has called `unlock()`, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Conforming implementations handle such scenarios correctly, as long as thread A does not access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]
- <sup>3</sup> The class `mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).
- <sup>4</sup> [Note 2: A program can deadlock if the thread that owns a `mutex` object calls `lock()` on that object. If the implementation can detect the deadlock, a `resource_deadlock_would_occur` error condition might be observed. — end note]
- <sup>5</sup> The behavior of a program is undefined if it destroys a `mutex` object owned by any thread or a thread terminates while owning a `mutex` object.

### 32.6.4.2.3 Class `recursive_mutex`

[thread.mutex.recursive]

```
namespace std {
    class recursive_mutex {
    public:
        recursive_mutex();
        ~recursive_mutex();

        recursive_mutex(const recursive_mutex&) = delete;
        recursive_mutex& operator=(const recursive_mutex&) = delete;

        void lock();
        bool try_lock() noexcept;
        void unlock();

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                           // see 32.2.3
    };
}
```

- <sup>1</sup> The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.
- <sup>2</sup> The class `recursive_mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).
- <sup>3</sup> A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.
- <sup>4</sup> The behavior of a program is undefined if
  - (4.1) — it destroys a `recursive_mutex` object owned by any thread or
  - (4.2) — a thread terminates while owning a `recursive_mutex` object.

### 32.6.4.3 Timed mutex types

[thread.timedmutex.requirements]

#### 32.6.4.3.1 General

[thread.timedmutex.requirements.general]

- <sup>1</sup> The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (30.5), and `abs_time` denotes an object of an instantiation of `time_point` (30.6).

[Note 1: The timed mutex types meet the *Cpp17TimedLockable* requirements (32.2.5.4). — end note]

2 The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

3 *Preconditions:* If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

4 *Effects:* The function attempts to obtain ownership of the mutex within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[*Note 2:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

5 *Synchronization:* If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

6 *Return type:* `bool`.

7 *Returns:* `true` if ownership was obtained, otherwise `false`.

8 *Throws:* Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions:* If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

11 *Effects:* The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[*Note 3:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

12 *Synchronization:* If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

13 *Return type:* `bool`.

14 *Returns:* `true` if ownership was obtained, otherwise `false`.

15 *Throws:* Timeout-related exceptions (32.2.4).

#### 32.6.4.3.2 Class `timed_mutex`

[`thread.timedmutex.class`]

```
namespace std {
    class timed_mutex {
    public:
        timed_mutex();
        ~timed_mutex();

        timed_mutex(const timed_mutex&) = delete;
        timed_mutex& operator=(const timed_mutex&) = delete;

        void lock(); // blocking
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        using native_handle_type = implementation-defined; // see 32.2.3
        native_handle_type native_handle(); // see 32.2.3
    };
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has

released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

- 2 The class `timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).
- 3 The behavior of a program is undefined if
  - (3.1) — it destroys a `timed_mutex` object owned by any thread,
  - (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
  - (3.3) — a thread terminates while owning a `timed_mutex` object.

### 32.6.4.3.3 Class `recursive_timed_mutex`

[thread.timedmutex.recursive]

```
namespace std {
  class recursive_timed_mutex {
  public:
    recursive_timed_mutex();
    ~recursive_timed_mutex();

    recursive_timed_mutex(const recursive_timed_mutex&) = delete;
    recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

    void lock(); // blocking
    bool try_lock() noexcept;
    template<class Rep, class Period>
      bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    using native_handle_type = implementation-defined; // see 32.2.3
    native_handle_type native_handle(); // see 32.2.3
  };
}
```

- 1 The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- 2 The class `recursive_timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).
- 3 A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.
- 4 The behavior of a program is undefined if
  - (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
  - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

### 32.6.4.4 Shared mutex types

[thread.sharedmutex.requirements]

#### 32.6.4.4.1 General

[thread.sharedmutex.requirements.general]

- 1 The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (32.6.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

[Note 1: The shared mutex types meet the *Cpp17SharedLockable* requirements (32.2.5.5). — end note]

2 In addition to the exclusive lock ownership mode specified in 32.6.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

3 The expression `m.lock_shared()` is well-formed and has the following semantics:

4 *Preconditions:* The calling thread has no ownership of the mutex.

5 *Effects:* Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

6 *Synchronization:* Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

7 *Postconditions:* The calling thread has a shared lock on the mutex.

8 *Return type:* `void`.

9 *Throws:* `system_error` when an exception is required (32.2.2).

10 *Error conditions:*

(10.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(10.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

11 The expression `m.unlock_shared()` is well-formed and has the following semantics:

12 *Preconditions:* The calling thread holds a shared lock on the mutex.

13 *Effects:* Releases a shared lock on the mutex held by the calling thread.

14 *Return type:* `void`.

15 *Synchronization:* This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.

16 *Throws:* Nothing.

17 The expression `m.try_lock_shared()` is well-formed and has the following semantics:

18 *Preconditions:* The calling thread has no ownership of the mutex.

19 *Effects:* Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

20 *Synchronization:* If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

21 *Return type:* `bool`.

22 *Returns:* `true` if the shared lock was acquired, otherwise `false`.

23 *Throws:* Nothing.

#### 32.6.4.4.2 Class `shared_mutex`

[`thread.sharedmutex.class`]

```
namespace std {
    class shared_mutex {
    public:
        shared_mutex();
        ~shared_mutex();

        shared_mutex(const shared_mutex&) = delete;
        shared_mutex& operator=(const shared_mutex&) = delete;

        // exclusive ownership
        void lock();
        bool try_lock();
        // blocking
```

```

void unlock();

// shared ownership
void lock_shared();           // blocking
bool try_lock_shared();
void unlock_shared();

using native_handle_type = implementation-defined;           // see 32.2.3
native_handle_type native_handle();                           // see 32.2.3
};
}

```

1 The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_mutex` meets all of the shared mutex requirements (32.6.4.4). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

- (3.1) — it destroys a `shared_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.

4 `shared_mutex` may be a synonym for `shared_timed_mutex`.

### 32.6.4.5 Shared timed mutex types [thread.sharedtimedmutex.requirements]

#### 32.6.4.5.1 General [thread.sharedtimedmutex.requirements.general]

1 The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (32.6.4.3), shared mutex types (32.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of `duration` (30.5), and `abs_time` denotes an object of an instantiation of `time_point` (30.6).

[Note 1: The shared timed mutex types meet the *Cpp17SharedTimedLockable* requirements (32.2.5.6). — end note]

2 The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

3 *Preconditions:* The calling thread has no ownership of the mutex.

4 *Effects:* Attempts to obtain shared lock ownership for the calling thread within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

5 *Synchronization:* If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

6 *Return type:* `bool`.

7 *Returns:* `true` if the shared lock was acquired, otherwise `false`.

8 *Throws:* Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions:* The calling thread has no ownership of the mutex.

11 *Effects:* The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[Note 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

12 *Synchronization:* If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

13 *Return type:* `bool`.

14 *Returns:* `true` if the shared lock was acquired, otherwise `false`.

15 *Throws:* Timeout-related exceptions (32.2.4).

### 32.6.4.5.2 Class `shared_timed_mutex` [`thread.sharedtimedmutex.class`]

```
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();

        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // exclusive ownership
        void lock(); // blocking
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // shared ownership
        void lock_shared(); // blocking
        bool try_lock_shared();
        template<class Rep, class Period>
            bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock_shared();
    };
}
```

1 The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_timed_mutex` meets all of the shared timed mutex requirements (32.6.4.5). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

- (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

## 32.6.5 Locks [`thread.lock`]

### 32.6.5.1 General [`thread.lock.general`]

1 A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[*Note 1:* Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — *end note*]

2 Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```

namespace std {
    struct defer_lock_t { };           // do not acquire ownership of the mutex
    struct try_to_lock_t { };         // try to acquire ownership of the mutex
                                        // without blocking
    struct adopt_lock_t { };          // assume the calling thread has already
                                        // obtained mutex ownership and manage it

    inline constexpr defer_lock_t  defer_lock { };
    inline constexpr try_to_lock_t  try_to_lock { };
    inline constexpr adopt_lock_t   adopt_lock { };
}

```

### 32.6.5.2 Class template lock\_guard

[thread.lock.guard]

```

namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;

    private:
        mutex_type& pm;           // exposition only
    };
}

```

- <sup>1</sup> An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

```
explicit lock_guard(mutex_type& m);
```

- <sup>2</sup> *Effects:* Initializes `pm` with `m`. Calls `m.lock()`.

```
lock_guard(mutex_type& m, adopt_lock_t);
```

- <sup>3</sup> *Preconditions:* The calling thread holds a non-shared lock on `m`.

- <sup>4</sup> *Effects:* Initializes `pm` with `m`.

- <sup>5</sup> *Throws:* Nothing.

```
~lock_guard();
```

- <sup>6</sup> *Effects:* Equivalent to: `pm.unlock()`

### 32.6.5.3 Class template scoped\_lock

[thread.lock.scoped]

```

namespace std {
    template<class... MutexTypes>
    class scoped_lock {
    public:
        using mutex_type = see below; // Only if sizeof...(MutexTypes) == 1 is true

        explicit scoped_lock(MutexTypes&... m);
        explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
        ~scoped_lock();

        scoped_lock(const scoped_lock&) = delete;
        scoped_lock& operator=(const scoped_lock&) = delete;
    };
}

```

```
private:
    tuple<MutexTypes&...> pm;    // exposition only
};
}
```

<sup>1</sup> An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

- (1.1) — If `sizeof... (MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the *Cpp17BasicLockable* requirements (32.2.5.2). The member *typedef-name* `mutex_type` denotes the same type as `Mutex`.
- (1.2) — Otherwise, all types in the template parameter pack `MutexTypes` shall meet the *Cpp17Lockable* requirements (32.2.5.3) and there is no member `mutex_type`.

```
explicit scoped_lock(MutexTypes&... m);
```

<sup>2</sup> *Effects*: Initializes `pm` with `tie(m...)`. Then if `sizeof... (MutexTypes)` is 0, no effects. Otherwise if `sizeof... (MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

```
explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
```

<sup>3</sup> *Preconditions*: The calling thread holds a non-shared lock on each element of `m`.

<sup>4</sup> *Effects*: Initializes `pm` with `tie(m...)`.

<sup>5</sup> *Throws*: Nothing.

```
~scoped_lock();
```

<sup>6</sup> *Effects*: For all `i` in `[0, sizeof... (MutexTypes))`, `get<i>(pm).unlock()`.

### 32.6.5.4 Class template `unique_lock`

[thread.lock.unique]

#### 32.6.5.4.1 General

[thread.lock.unique.general]

```
namespace std {
    template<class Mutex>
    class unique_lock {
    public:
        using mutex_type = Mutex;

        // 32.6.5.4.2, construct/copy/destroy
        unique_lock() noexcept;
        explicit unique_lock(mutex_type& m);
        unique_lock(mutex_type& m, defer_lock_t) noexcept;
        unique_lock(mutex_type& m, try_to_lock_t);
        unique_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
            unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
            unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~unique_lock();

        unique_lock(const unique_lock&) = delete;
        unique_lock& operator=(const unique_lock&) = delete;

        unique_lock(unique_lock&& u) noexcept;
        unique_lock& operator=(unique_lock&& u);

        // 32.6.5.4.3, locking
        void lock();
        bool try_lock();

        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    };
};
```

```

template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

void unlock();

// 32.6.5.4.4, modifiers
void swap(unique_lock& u) noexcept;
mutex_type* release() noexcept;

// 32.6.5.4.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
    mutex_type* pm;           // exposition only
    bool owns;               // exposition only
};
}

```

- 1 An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).
- 2 [Note 1: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (32.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements. — end note]

#### 32.6.5.4.2 Constructors, destructor, and assignment

[thread.lock.unique.cons]

```

unique_lock() noexcept;
1     Postconditions: pm == nullptr and owns == false.

explicit unique_lock(mutex_type& m);
2     Effects: Calls m.lock().
3     Postconditions: pm == addressof(m) and owns == true.

unique_lock(mutex_type& m, defer_lock_t) noexcept;
4     Postconditions: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);
5     Preconditions: The supplied Mutex type meets the Cpp17Lockable requirements (32.2.5.3).
6     Effects: Calls m.try_lock().
7     Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);
8     Preconditions: The calling thread holds a non-shared lock on m.
9     Postconditions: pm == addressof(m) and owns == true.
10    Throws: Nothing.

template<class Clock, class Duration>
    unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
11    Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).
12    Effects: Calls m.try_lock_until(abs_time).

```

13 *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

```
template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

14 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

15 *Effects:* Calls `m.try_lock_for(rel_time)`.

16 *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

```
unique_lock(unique_lock&& u) noexcept;
```

17 *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

```
unique_lock& operator=(unique_lock&& u);
```

18 *Effects:* If `owns` calls `pm->unlock()`.

19 *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

20 [Note 1: With a recursive mutex it is possible for both `*this` and `u` to own the same mutex before the assignment. In this case, `*this` will own the mutex after the assignment and `u` will not. — end note]

21 *Throws:* Nothing.

```
~unique_lock();
```

22 *Effects:* If `owns` calls `pm->unlock()`.

#### 32.6.5.4.3 Locking

[thread.lock.unique.locking]

```
void lock();
```

1 *Effects:* As if by `pm->lock()`.

2 *Postconditions:* `owns == true`.

3 *Throws:* Any exception thrown by `pm->lock()`. `system_error` when an exception is required (32.2.2).

4 *Error conditions:*

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
bool try_lock();
```

5 *Preconditions:* The supplied Mutex meets the *Cpp17Lockable* requirements (32.2.5.3).

6 *Effects:* As if by `pm->try_lock()`.

7 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock()`.

8 *Returns:* The value returned by `pm->try_lock()`.

9 *Throws:* Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required (32.2.2).

10 *Error conditions:*

(10.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(10.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

11 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

12 *Effects:* As if by `pm->try_lock_until(abs_time)`.

13 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_until(abs_time)`.

14 *Returns:* The value returned by `pm->try_lock_until(abs_time)`.

15 *Throws:* Any exception thrown by `pm->try_lock_until(abstime)`. `system_error` when an exception is required (32.2.2).

16 *Error conditions:*

(16.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(16.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
template<class Rep, class Period>
  bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

17 *Preconditions:* The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

18 *Effects:* As if by `pm->try_lock_for(rel_time)`.

19 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_for(rel_time)`.

20 *Returns:* The value returned by `pm->try_lock_for(rel_time)`.

21 *Throws:* Any exception thrown by `pm->try_lock_for(rel_time)`. `system_error` when an exception is required (32.2.2).

22 *Error conditions:*

(22.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(22.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
void unlock();
```

23 *Effects:* As if by `pm->unlock()`.

24 *Postconditions:* `owns == false`.

25 *Throws:* `system_error` when an exception is required (32.2.2).

26 *Error conditions:*

(26.1) — `operation_not_permitted` — if on entry `owns` is false.

#### 32.6.5.4.4 Modifiers

[thread.lock.unique.mod]

```
void swap(unique_lock& u) noexcept;
```

1 *Effects:* Swaps the data members of `*this` and `u`.

```
mutex_type* release() noexcept;
```

2 *Postconditions:* `pm == 0` and `owns == false`.

3 *Returns:* The previous value of `pm`.

```
template<class Mutex>
```

```
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by `x.swap(y)`.

#### 32.6.5.4.5 Observers

[thread.lock.unique.obs]

```
bool owns_lock() const noexcept;
```

1 *Returns:* `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns:* `owns`.

```
mutex_type *mutex() const noexcept;
```

3 *Returns:* `pm`.

#### 32.6.5.5 Class template `shared_lock`

[thread.lock.shared]

##### 32.6.5.5.1 General

[thread.lock.shared.general]

```
namespace std {
  template<class Mutex>
  class shared_lock {
```

```

public:
    using mutex_type = Mutex;

    // 32.6.5.5.2, construct/copy/destroy
    shared_lock() noexcept;
    explicit shared_lock(mutex_type& m);           // blocking
    shared_lock(mutex_type& m, defer_lock_t) noexcept;
    shared_lock(mutex_type& m, try_to_lock_t);
    shared_lock(mutex_type& m, adopt_lock_t);
    template<class Clock, class Duration>
        shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
    ~shared_lock();

    shared_lock(const shared_lock&) = delete;
    shared_lock& operator=(const shared_lock&) = delete;

    shared_lock(shared_lock&& u) noexcept;
    shared_lock& operator=(shared_lock&& u) noexcept;

    // 32.6.5.5.3, locking
    void lock();                               // blocking
    bool try_lock();
    template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    // 32.6.5.5.4, modifiers
    void swap(shared_lock& u) noexcept;
    mutex_type* release() noexcept;

    // 32.6.5.5.5, observers
    bool owns_lock() const noexcept;
    explicit operator bool () const noexcept;
    mutex_type* mutex() const noexcept;

private:
    mutex_type* pm;                             // exposition only
    bool owns;                                  // exposition only
};
}

```

- <sup>1</sup> An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the *Cpp17SharedLockable* requirements (32.2.5.5).
- <sup>2</sup> [Note 1: `shared_lock<Mutex>` meets the *Cpp17Lockable* requirements (32.2.5.3). If `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6), `shared_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements (32.2.5.4). — end note]

### 32.6.5.5.2 Constructors, destructor, and assignment

[thread.lock.shared.cons]

```
shared_lock() noexcept;
```

- <sup>1</sup> *Postconditions:* `pm == nullptr` and `owns == false`.

```
explicit shared_lock(mutex_type& m);
```

- <sup>2</sup> *Effects:* Calls `m.lock_shared()`.

- <sup>3</sup> *Postconditions:* `pm == addressof(m)` and `owns == true`.

```

shared_lock(mutex_type& m, defer_lock_t) noexcept;
4   Postconditions: pm == addressof(m) and owns == false.

shared_lock(mutex_type& m, try_to_lock_t);
5   Effects: Calls m.try_lock_shared().
6   Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
    m.try_lock_shared().

shared_lock(mutex_type& m, adopt_lock_t);
7   Preconditions: The calling thread holds a shared lock on m.
8   Postconditions: pm == addressof(m) and owns == true.

template<class Clock, class Duration>
    shared_lock(mutex_type& m,
                const chrono::time_point<Clock, Duration>& abs_time);
9   Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (32.2.5.6).
10  Effects: Calls m.try_lock_shared_until(abs_time).
11  Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
    m.try_lock_shared_until(abs_time).

template<class Rep, class Period>
    shared_lock(mutex_type& m,
                const chrono::duration<Rep, Period>& rel_time);
12  Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (32.2.5.6).
13  Effects: Calls m.try_lock_shared_for(rel_time).
14  Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
    m.try_lock_shared_for(rel_time).

~shared_lock();
15  Effects: If owns calls pm->unlock_shared().

shared_lock(shared_lock&& sl) noexcept;
16  Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
    this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock&& sl) noexcept;
17  Effects: If owns calls pm->unlock_shared().
18  Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
    this assignment), sl.pm == nullptr and sl.owns == false.

```

### 32.6.5.5.3 Locking

[thread.lock.shared.locking]

```

void lock();
1   Effects: As if by pm->lock_shared().
2   Postconditions: owns == true.
3   Throws: Any exception thrown by pm->lock_shared(). system_error when an exception is required
    (32.2.2).
4   Error conditions:
(4.1) — operation_not_permitted — if pm is nullptr.
(4.2) — resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();
5   Effects: As if by pm->try_lock_shared().
6   Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared().

```

7 *Returns:* The value returned by the call to `pm->try_lock_shared()`.

8 *Throws:* Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required (32.2.2).

9 *Error conditions:*

(9.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(9.2) — `resource_deadlock_would_occur` — if `on entry owns` is `true`.

```
template<class Clock, class Duration>
  bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

10 *Preconditions:* Mutex meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

11 *Effects:* As if by `pm->try_lock_shared_until(abs_time)`.

12 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.

13 *Returns:* The value returned by the call to `pm->try_lock_shared_until(abs_time)`.

14 *Throws:* Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required (32.2.2).

15 *Error conditions:*

(15.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(15.2) — `resource_deadlock_would_occur` — if `on entry owns` is `true`.

```
template<class Rep, class Period>
  bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

16 *Preconditions:* Mutex meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

17 *Effects:* As if by `pm->try_lock_shared_for(rel_time)`.

18 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.

19 *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.

20 *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (32.2.2).

21 *Error conditions:*

(21.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(21.2) — `resource_deadlock_would_occur` — if `on entry owns` is `true`.

```
void unlock();
```

22 *Effects:* As if by `pm->unlock_shared()`.

23 *Postconditions:* `owns == false`.

24 *Throws:* `system_error` when an exception is required (32.2.2).

25 *Error conditions:*

(25.1) — `operation_not_permitted` — if `on entry owns` is `false`.

#### 32.6.5.5.4 Modifiers

[thread.lock.shared.mod]

```
void swap(shared_lock& sl) noexcept;
```

1 *Effects:* Swaps the data members of `*this` and `sl`.

```
mutex_type* release() noexcept;
```

2 *Postconditions:* `pm == nullptr` and `owns == false`.

3 *Returns:* The previous value of `pm`.

```
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by `x.swap(y)`.

### 32.6.5.5.5 Observers

[thread.lock.shared.obs]

```
bool owns_lock() const noexcept;
```

1 *Returns:* `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns:* `owns`.

```
mutex_type* mutex() const noexcept;
```

3 *Returns:* `pm`.

## 32.6.6 Generic locking algorithms

[thread.lock.algorithm]

```
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

1 *Preconditions:* Each template parameter type meets the *Cpp17Lockable* requirements.

[Note 1: The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

2 *Effects:* Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.

3 *Returns:* `-1` if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.

```
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4 *Preconditions:* Each template parameter type meets the *Cpp17Lockable* requirements.

[Note 2: The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

5 *Effects:* All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[Note 3: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note*]

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

## 32.6.7 Call once

[thread.once]

### 32.6.7.1 Struct `once_flag`

[thread.once.onceflag]

```
namespace std {
    struct once_flag {
        constexpr once_flag() noexcept;

        once_flag(const once_flag&) = delete;
        once_flag& operator=(const once_flag&) = delete;
    };
}
```

1 The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

```
constexpr once_flag() noexcept;
```

2 *Synchronization:* The construction of a `once_flag` object is not synchronized.

3 *Postconditions:* The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

32.6.7.2 Function `call_once`

[thread.once.callonce]

```
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1 *Mandates:* `is_invocable_v<Callable, Args...>` is true.

2 *Effects:* An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution evaluates `INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...) (22.10.4)`. If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[*Note 1:* Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note*]

3 *Synchronization:* For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

4 *Throws:* `system_error` when an exception is required (32.2.2), or any exception thrown by `func`.

5 [*Example 1:*

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
    void verifier();
public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
};
```

— *end example*]

## 32.7 Condition variables

[thread.condition]

## 32.7.1 General

[thread.condition.general]

1 Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.

2 Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

3 The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:

1. the release of the mutex and entry into the waiting state;
  2. the unblocking of the wait; and
  3. the reacquisition of the lock.
- 4 The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.
- 5 Condition variable construction and destruction need not be synchronized.

### 32.7.2 Header `<condition_variable>` synopsis [condition.variable.syn]

```
namespace std {
    // 32.7.4, class condition_variable
    class condition_variable;
    // 32.7.5, class condition_variable_any
    class condition_variable_any;

    // 32.7.3, non-member functions
    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}
```

### 32.7.3 Non-member functions [thread.condition.nonmember]

```
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

- 1 *Preconditions:* `lk` is locked by the calling thread and either
- (1.1) — no other thread is waiting on `cond`, or
- (1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- 2 *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:
- ```
    lk.unlock();
    cond.notify_all();
```
- 3 *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.
- 4 [Note 1: The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. — *end note*]
- 5 [Note 2: It is the user’s responsibility to ensure that waiting threads do not incorrectly assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. — *end note*]

### 32.7.4 Class `condition_variable` [thread.condition.condvar]

```
namespace std {
    class condition_variable {
    public:
        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
        void wait(unique_lock<mutex>& lock);
        template<class Predicate>
            void wait(unique_lock<mutex>& lock, Predicate pred);
    };
}
```

```

template<class Clock, class Duration>
    cv_status wait_until(unique_lock<mutex>& lock,
                        const chrono::time_point<Clock, Duration>& abs_time);
template<class Clock, class Duration, class Predicate>
    bool wait_until(unique_lock<mutex>& lock,
                   const chrono::time_point<Clock, Duration>& abs_time,
                   Predicate pred);
template<class Rep, class Period>
    cv_status wait_for(unique_lock<mutex>& lock,
                      const chrono::duration<Rep, Period>& rel_time);
template<class Rep, class Period, class Predicate>
    bool wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time,
                  Predicate pred);

using native_handle_type = implementation-defined;           // see 32.2.3
native_handle_type native_handle();                          // see 32.2.3
};
}

```

1 The class `condition_variable` is a standard-layout class (11.2).

```
condition_variable();
```

2 *Throws:* `system_error` when an exception is required (32.2.2).

3 *Error conditions:*

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

```
~condition_variable();
```

4 *Preconditions:* There is no thread blocked on `*this`.

[*Note 1:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

```
void wait(unique_lock<mutex>& lock);
```

7 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either

(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8 *Effects:*

(8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

10 *Throws:* Nothing.

11 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 2:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);
```

12 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either  
(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

14 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

15 *Throws:* Any exception thrown by `pred`.

16 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 3:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
                    const chrono::time_point<Clock, Duration>& abs_time);
```

17 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either  
(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18 *Effects:*

(18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.

(18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

20 *Returns:* `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

21 *Throws:* Timeout-related exceptions (32.2.4).

22 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 4:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time);
```

23 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either  
(23.1) — no other thread is waiting on this `condition_variable` object or

(23.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

24 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

25 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

26 *Returns:* `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

27 *Throws:* Timeout-related exceptions (32.2.4).

28 *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[*Note 5:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
               const chrono::time_point<Clock, Duration>& abs_time,
               Predicate pred);
```

29 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either  
 (29.1) — no other thread is waiting on this `condition_variable` object or

(29.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently  
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

30 *Effects:* Equivalent to:

```
while (!pred())
  if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
return true;
```

31 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

32 [Note 6: The returned value indicates whether the predicate evaluated to **true** regardless of whether the timeout  
 was triggered. — end note]

33 *Throws:* Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

34 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
             const chrono::duration<Rep, Period>& rel_time,
             Predicate pred);
```

35 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either  
 (35.1) — no other thread is waiting on this `condition_variable` object or

(35.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently  
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

36 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

37 [Note 8: There is no blocking if `pred()` is initially **true**, even if the timeout has already expired. — end note]

38 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

39 [Note 9: The returned value indicates whether the predicate evaluates to **true** regardless of whether the timeout  
 was triggered. — end note]

40 *Throws:* Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

41 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 10: This can happen if the re-locking of the mutex throws an exception. — end note]

## 32.7.5 Class `condition_variable_any` [thread.condition.condvarany]

### 32.7.5.1 General [thread.condition.condvarany.general]

<sup>1</sup> In 32.7.5, template arguments for template parameters named `Lock` shall meet the *Cpp17BasicLockable*  
 requirements (32.2.5.2).

[Note 1: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex  
 types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, any necessary  
 synchronization is assumed to be in place with respect to the predicate associated with the `condition_variable_any`  
 instance. — end note]

```
namespace std {
class condition_variable_any {
public:
  condition_variable_any();
  ~condition_variable_any();
```

```

condition_variable_any(const condition_variable_any&) = delete;
condition_variable_any& operator=(const condition_variable_any&) = delete;

void notify_one() noexcept;
void notify_all() noexcept;

// 32.7.5.2, noninterruptible waits
template<class Lock>
    void wait(Lock& lock);
template<class Lock, class Predicate>
    void wait(Lock& lock, Predicate pred);

template<class Lock, class Clock, class Duration>
    cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
template<class Lock, class Clock, class Duration, class Predicate>
    bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                    Predicate pred);
template<class Lock, class Rep, class Period>
    cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
template<class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

// 32.7.5.3, interruptible waits
template<class Lock, class Predicate>
    bool wait(Lock& lock, stop_token stoken, Predicate pred);
template<class Lock, class Clock, class Duration, class Predicate>
    bool wait_until(Lock& lock, stop_token stoken,
                    const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
template<class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, stop_token stoken,
                  const chrono::duration<Rep, Period>& rel_time, Predicate pred);
};
}

```

```
condition_variable_any();
```

2 *Throws:* `bad_alloc` or `system_error` when an exception is required (32.2.2).

3 *Error conditions:*

- (3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

```
~condition_variable_any();
```

4 *Preconditions:* There is no thread blocked on `*this`.

[*Note 2:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

### 32.7.5.2 Noninterruptible waits

[`thread.condvarany.wait`]

```
template<class Lock>
    void wait(Lock& lock);
```

1 *Effects:*

- (1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2 *Postconditions:* `lock` is locked by the calling thread.

3 *Throws:* Nothing.

4 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 1:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

5 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

```
template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

6 *Effects:*

- (6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.
- (6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7 *Postconditions:* `lock` is locked by the calling thread.

8 *Returns:* `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

9 *Throws:* Timeout-related exceptions (32.2.4).

10 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 2:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

11 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

12 *Postconditions:* `lock` is locked by the calling thread.

13 *Returns:* `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

14 *Throws:* Timeout-related exceptions (32.2.4).

15 *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[*Note 3:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

16 *Effects:* Equivalent to:

```
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
return true;
```

17 [*Note 4:* There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — *end note*]

18 [*Note 5:* The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note*]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

19 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

### 32.7.5.3 Interruptible waits

[thread.condvarany.intwait]

1 The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

2 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    wait(lock);
}
return pred();
```

3 [Note 1: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request. — end note]

4 *Postconditions:* `lock` is locked by the calling thread.

5 *Throws:* Any exception thrown by `pred`.

6 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
               const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

7 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
}
return pred();
```

8 [Note 3: There is no blocking if `pred()` is initially `true`, `stoken.stop_requested()` was already `true` or the timeout has already expired. — end note]

9 [Note 4: The returned value indicates whether the predicate evaluated to `true` regardless of whether the timeout was triggered or a stop request was made. — end note]

10 *Postconditions:* `lock` is locked by the calling thread.

11 *Throws:* Timeout-related exceptions (32.2.4), or any exception thrown by `pred`.

12 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
             const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

13 *Effects:* Equivalent to:

```
return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
                 std::move(pred));
```

## 32.8 Semaphore

[thread.sema]

### 32.8.1 General

[thread.sema.general]

- 1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.
- 2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

### 32.8.2 Header <semaphore> synopsis

[semaphore.syn]

```
namespace std {
    // 32.8.3, class template counting_semaphore
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}
```

### 32.8.3 Class template counting\_semaphore

[thread.sema.cnt]

```
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore {
        public:
            static constexpr ptrdiff_t max() noexcept;

            constexpr explicit counting_semaphore(ptrdiff_t desired);
            ~counting_semaphore();

            counting_semaphore(const counting_semaphore&) = delete;
            counting_semaphore& operator=(const counting_semaphore&) = delete;

            void release(ptrdiff_t update = 1);
            void acquire();
            bool try_acquire() noexcept;
            template<class Rep, class Period>
                bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

        private:
            ptrdiff_t counter;           // exposition only
        };
}
```

- 1 Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.
- 2 `least_max_value` shall be non-negative; otherwise the program is ill-formed.
- 3 Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

- 4 *Returns:* The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

- 5 *Preconditions:* `desired >= 0` is true, and `desired <= max()` is true.

- 6 *Effects:* Initializes counter with `desired`.

- 7 *Throws:* Nothing.

```
void release(ptrdiff_t update = 1);
```

8 *Preconditions:* `update >= 0` is true, and `update <= max() - counter` is true.

9 *Effects:* Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

10 *Synchronization:* Strongly happens before invocations of `try_acquire` that observe the result of the effects.

11 *Throws:* `system_error` when an exception is required (32.2.2).

12 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_acquire() noexcept;
```

13 *Effects:* Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[*Note 1:* This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — *end note*]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

14 *Returns:* `true` if `counter` was decremented, otherwise `false`.

```
void acquire();
```

15 *Effects:* Repeatedly performs the following steps, in order:

(15.1) — Evaluates `try_acquire()`. If the result is `true`, returns.

(15.2) — Blocks on `*this` until `counter` is greater than zero.

16 *Throws:* `system_error` when an exception is required (32.2.2).

17 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
template<class Rep, class Period>
```

```
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
```

```
template<class Clock, class Duration>
```

```
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

18 *Effects:* Repeatedly performs the following steps, in order:

(18.1) — Evaluates `try_acquire()`. If the result is `true`, returns `true`.

(18.2) — Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (32.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

19 *Throws:* Timeout-related exceptions (32.2.4), or `system_error` when a non-timeout-related exception is required (32.2.2).

20 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

## 32.9 Coordination types

[thread.coord]

### 32.9.1 General

[thread.coord.general]

1 Subclause 32.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

### 32.9.2 Latches

[thread.latch]

#### 32.9.2.1 General

[thread.latch.general]

1 A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

**32.9.2.2 Header <latch> synopsis**

[latch.syn]

```
namespace std {
    class latch;
}
```

**32.9.2.3 Class latch**

[thread.latch.class]

```
namespace std {
    class latch {
    public:
        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit latch(ptrdiff_t expected);
        ~latch();

        latch(const latch&) = delete;
        latch& operator=(const latch&) = delete;

        void count_down(ptrdiff_t update = 1);
        bool try_wait() const noexcept;
        void wait() const;
        void arrive_and_wait(ptrdiff_t update = 1);

    private:
        ptrdiff_t counter; // exposition only
    };
}
```

1 A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

2 Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

3 *Returns:* The maximum value of `counter` that the implementation supports.

```
constexpr explicit latch(ptrdiff_t expected);
```

4 *Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

5 *Effects:* Initializes `counter` with `expected`.

6 *Throws:* Nothing.

```
void count_down(ptrdiff_t update = 1);
```

7 *Preconditions:* `update >= 0` is true, and `update <= counter` is true.

8 *Effects:* Atomically decrements `counter` by `update`. If `counter` is equal to zero, unblocks all threads blocked on `*this`.

9 *Synchronization:* Strongly happens before the returns from all calls that are unblocked.

10 *Throws:* `system_error` when an exception is required (32.2.2).

11 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_wait() const noexcept;
```

12 *Returns:* With very low probability `false`. Otherwise `counter == 0`.

```
void wait() const;
```

13 *Effects:* If `counter` equals zero, returns immediately. Otherwise, blocks on `*this` until a call to `count_down` that decrements `counter` to zero.

14 *Throws:* `system_error` when an exception is required (32.2.2).

15 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait(ptrdiff_t update = 1);
```

16 *Effects:* Equivalent to:

```
count_down(update);
wait();
```

### 32.9.3 Barriers

[thread.barrier]

#### 32.9.3.1 General

[thread.barrier.general]

- <sup>1</sup> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[*Note 1:* A barrier is useful for managing repeated tasks that are handled by multiple threads. — *end note*]

#### 32.9.3.2 Header <barrier> synopsis

[barrier.syn]

```
namespace std {
    template<class CompletionFunction = see below>
        class barrier;
}
```

#### 32.9.3.3 Class template barrier

[thread.barrier.class]

```
namespace std {
    template<class CompletionFunction = see below>
        class barrier {
        public:
            using arrival_token = see below;

            static constexpr ptrdiff_t max() noexcept;

            constexpr explicit barrier(ptrdiff_t expected,
                                       CompletionFunction f = CompletionFunction());
            ~barrier();

            barrier(const barrier&) = delete;
            barrier& operator=(const barrier&) = delete;

            arrival_token arrive(ptrdiff_t update = 1);
            void wait(arrival_token&& arrival) const;

            void arrive_and_wait();
            void arrive_and_drop();

        private:
            CompletionFunction completion;    // exposition only
        };
}
```

- <sup>1</sup> Each *barrier phase* consists of the following steps:

- (1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- (1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to `arrive`, `arrive_and_drop`, or `wait`, except that it is implementation-defined whether the step executes if no thread calls `wait`.
- (1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

- <sup>2</sup> Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.

- <sup>3</sup> The *phase completion step* that is executed at the end of each phase has the following effects:

- (3.1) — Invokes the completion function, equivalent to `completion()`.
- (3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

- 4 Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.
- 5 `CompletionFunction` shall meet the *Cpp17MoveConstructible* (Table 31) and *Cpp17Destructible* (Table 35) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.
- 6 The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements (Table 30) and `completion()` has no effects.
- 7 `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* (Table 31), *Cpp17MoveAssignable* (Table 33), and *Cpp17Destructible* (Table 35) requirements.

```
static constexpr ptrdiff_t max() noexcept;
```

- 8 *Returns:* The maximum expected count that the implementation supports.

```
constexpr explicit barrier(ptrdiff_t expected,
                          CompletionFunction f = CompletionFunction());
```

- 9 *Preconditions:* `expected >= 0` is `true` and `expected <= max()` is `true`.

- 10 *Effects:* Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[Note 1: If `expected` is 0 this object can only be destroyed. — end note]

- 11 *Throws:* Any exception thrown by `CompletionFunction`'s move constructor.

```
arrival_token arrive(ptrdiff_t update = 1);
```

- 12 *Preconditions:* `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

- 13 *Effects:* Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

- 14 *Synchronization:* The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

- 15 *Returns:* The constructed `arrival_token` object.

- 16 *Throws:* `system_error` when an exception is required (32.2.2).

- 17 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

- 18 [Note 2: This call can cause the completion step for the current phase to start. — end note]

```
void wait(arrival_token&& arrival) const;
```

- 19 *Preconditions:* `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

- 20 *Effects:* Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.

[Note 3: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

- 21 *Throws:* `system_error` when an exception is required (32.2.2).

- 22 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait();
```

- 23 *Effects:* Equivalent to: `wait(arrive())`.

```
void arrive_and_drop();
```

- 24 *Preconditions:* The expected count for the current barrier phase is greater than zero.

25 *Effects:* Decrements the initial expected count for all subsequent phases by one. Then decrements the  
expected count for the current phase by one.

26 *Synchronization:* The call to `arrive_and_drop` strongly happens before the start of the phase completion  
step for the current phase.

27 *Throws:* `system_error` when an exception is required (32.2.2).

28 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

29 [Note 4: This call can cause the completion step for the current phase to start. — *end note*]

## 32.10 Futures

[futures]

### 32.10.1 Overview

[futures.overview]

1 32.10 describes components that a C++ program can use to retrieve in one thread the result (value or  
exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded  
programs as well. — *end note*]

### 32.10.2 Header `<future>` synopsis

[future.syn]

```
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };

    // 32.10.3, error handling
    template<> struct is_error_code_enum<future_errc> : public true_type { };
    error_code make_error_code(future_errc e) noexcept;
    error_condition make_error_condition(future_errc e) noexcept;

    const error_category& future_category() noexcept;

    // 32.10.4, class future_error
    class future_error;

    // 32.10.6, class template promise
    template<class R> class promise;
    template<class R> class promise<R&&>;
    template<> class promise<void>;

    template<class R>
        void swap(promise<R>& x, promise<R>& y) noexcept;

    template<class R, class Alloc>
        struct uses_allocator<promise<R>, Alloc>;

    // 32.10.7, class template future
    template<class R> class future;
    template<class R> class future<R&&>;

```

```

template<> class future<void>;

// 32.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&&>;
template<> class shared_future<void>;

// 32.10.10, class template packaged_task
template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>;

template<class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 32.10.9, function template async
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(F&& f, Args&&... args);
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(launch_policy, F&& f, Args&&... args);
}

```

- <sup>1</sup> The enum type `launch` is a bitmask type (16.3.3.3) with elements `launch::async` and `launch::deferred`.

[Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. — end note]

- <sup>2</sup> The enum values of `future_errc` are distinct and not zero.

### 32.10.3 Error handling

[futures.errors]

```
const error_category& future_category() noexcept;
```

- <sup>1</sup> *Returns:* A reference to an object of a type derived from class `error_category`.

- <sup>2</sup> The object’s `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object’s `name` virtual function returns a pointer to the string “future”.

```
error_code make_error_code(future_errc e) noexcept;
```

- <sup>3</sup> *Returns:* `error_code(static_cast<int>(e), future_category())`.

```
error_condition make_error_condition(future_errc e) noexcept;
```

- <sup>4</sup> *Returns:* `error_condition(static_cast<int>(e), future_category())`.

### 32.10.4 Class `future_error`

[futures.future.error]

```

namespace std {
    class future_error : public logic_error {
    public:
        explicit future_error(future_errc e);

        const error_code& code() const noexcept;
        const char* what() const noexcept;

    private:
        error_code ec_; // exposition only
    };
}

```

```
explicit future_error(future_errc e);
```

- <sup>1</sup> *Effects:* Initializes `ec_` with `make_error_code(e)`.

```
const error_code& code() const noexcept;
```

2 *Returns:* `ec_`.

```
const char* what() const noexcept;
```

3 *Returns:* An NTBS incorporating `code().message()`.

### 32.10.5 Shared state

[**futures.state**]

1 Many of the classes introduced in subclause 32.10 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception.

[*Note 1:* Futures, promises, and tasks defined in this Clause reference such shared state. — *end note*]

2 [*Note 2:* The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. — *end note*]

3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (32.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[*Example 1:* Promises and tasks are examples of asynchronous providers. — *end example*]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

- (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
- (5.2) — the return object or provider gives up its reference to its shared state; and
- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

6 When an asynchronous provider is said to make its shared state ready, it means:

- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

7 When an asynchronous provider is said to abandon its shared state, it means:

- (7.1) — first, if that state is not ready, the provider
  - (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then
  - (7.1.2) — makes its shared state ready;
- (7.2) — second, the provider releases its shared state.

8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.

10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.

11 Access to the result of the same shared state may conflict (6.9.2).

[*Note 3*: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (32.10.8) must either use read-only operations or provide additional synchronization. — *end note*]

### 32.10.6 Class template promise

[`futures.promise`]

```
namespace std {
    template<class R>
    class promise {
    public:
        promise();
        template<class Allocator>
            promise(allocator_arg_t, const Allocator& a);
        promise(promise&& rhs) noexcept;
        promise(const promise&) = delete;
        ~promise();

        // assignment
        promise& operator=(promise&& rhs) noexcept;
        promise& operator=(const promise&) = delete;
        void swap(promise& other) noexcept;

        // retrieving the result
        future<R> get_future();

        // setting the result
        void set_value(see below);
        void set_exception(exception_ptr p);

        // setting the result with deferred notification
        void set_value_at_thread_exit(see below);
        void set_exception_at_thread_exit(exception_ptr p);
    };

    template<class R, class Alloc>
        struct uses_allocator<promise<R>, Alloc>;
}
```

- 1 For the primary template, R shall be an object type that meets the *Cpp17Destructible* requirements.
- 2 The implementation provides the template `promise` and two specializations, `promise<R&&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.
- 3 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>
        : true_type { };

```

- 4 *Preconditions*: `Alloc` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

```
promise();
template<class Allocator>
    promise(allocator_arg_t, const Allocator& a);

```

- 5 *Effects*: Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;

```

- 6 *Effects*: Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

- 7 *Postconditions*: `rhs` has no shared state.

```

~promise();
8     Effects: Abandons any shared state (32.10.5).

promise& operator=(promise&& rhs) noexcept;
9     Effects: Abandons any shared state (32.10.5) and then as if promise(std::move(rhs)).swap(*this).
10    Returns: *this.

void swap(promise& other) noexcept;
11    Effects: Exchanges the shared state of *this and other.
12    Postconditions: *this has the shared state (if any) that other had prior to the call to swap. other
    has the shared state (if any) that *this had prior to the call to swap.

future<R> get_future();
13    Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to set_value,
    set_exception, set_value_at_thread_exit, or set_exception_at_thread_exit.
    [Note 1: Such calls need not synchronize with each other. — end note]
14    Returns: A future<R> object with the same shared state as *this.
15    Throws: future_error if *this has no shared state or if get_future has already been called on a
    promise with the same shared state as *this.
16    Error conditions:
(16.1) — future_already_retrieved if get_future has already been called on a promise with the same
    shared state as *this.
(16.2) — no_state if *this has no shared state.

void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&&>::set_value(R& r);
void promise<void>::set_value();
17    Effects: Atomically stores the value r in the shared state and makes that state ready (32.10.5).
18    Throws:
(18.1) — future_error if its shared state already has a stored value or exception, or
(18.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(18.3) — for the second version, any exception thrown by the constructor selected to move an object of R.
19    Error conditions:
(19.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(19.2) — no_state if *this has no shared state.

void set_exception(exception_ptr p);
20    Preconditions: p is not null.
21    Effects: Atomically stores the exception pointer p in the shared state and makes that state ready
    (32.10.5).
22    Throws: future_error if its shared state already has a stored value or exception.
23    Error conditions:
(23.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(23.2) — no_state if *this has no shared state.

void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&&>::set_value_at_thread_exit(R& r);

```

```
void promise<void>::set_value_at_thread_exit();
```

24 *Effects:* Stores the value `r` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

25 *Throws:*

(25.1) — `future_error` if its shared state already has a stored value or exception, or

(25.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

(25.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

26 *Error conditions:*

(26.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(26.2) — `no_state` if `*this` has no shared state.

```
void set_exception_at_thread_exit(exception_ptr p);
```

27 *Preconditions:* `p` is not null.

28 *Effects:* Stores the exception pointer `p` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

29 *Throws:* `future_error` if an error condition occurs.

30 *Error conditions:*

(30.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(30.2) — `no_state` if `*this` has no shared state.

```
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
```

31 *Effects:* As if by `x.swap(y)`.

### 32.10.7 Class template `future`

[`futures.unique.future`]

1 The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (32.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

2 [Note 1: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — end note]

3 The effect of calling any member function other than the destructor, the move assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

[Note 2: It is valid to move from a future object for which `valid() == false`. — end note]

*Recommended practice:* Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class future {
    public:
        future() noexcept;
        future(future&&) noexcept;
        future(const future&) = delete;
        ~future();
        future& operator=(const future&) = delete;
        future& operator=(future&&) noexcept;
        shared_future<R> share() noexcept;
```

```

// retrieving the value
see below get();

// functions to check state
bool valid() const noexcept;

void wait() const;
template<class Rep, class Period>
    future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
template<class Clock, class Duration>
    future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
};
}

```

4 For the primary template, R shall be an object type that meets the *Cpp17Destructible* requirements.

5 The implementation provides the template `future` and two specializations, `future<R&&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
future() noexcept;
```

6 *Effects:* The object does not refer to a shared state.

7 *Postconditions:* `valid() == false`.

```
future(future&& rhs) noexcept;
```

8 *Effects:* Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

9 *Postconditions:*

(9.1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

(9.2) — `rhs.valid() == false`.

```
~future();
```

10 *Effects:*

(10.1) — Releases any shared state (32.10.5);

(10.2) — destroys `*this`.

```
future& operator=(future&& rhs) noexcept;
```

11 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

(11.1) — Releases any shared state (32.10.5).

(11.2) — move assigns the contents of `rhs` to `*this`.

12 *Postconditions:*

(12.1) — `valid()` returns the same value as `rhs.valid()` prior to the assignment.

(12.2) — If `addressof(rhs) == this` is false, `rhs.valid() == false`.

```
shared_future<R> share() noexcept;
```

13 *Postconditions:* `valid() == false`.

14 *Returns:* `shared_future<R>(std::move(*this))`.

```
R future::get();
```

```
R& future<R&&>::get();
```

```
void future<void>::get();
```

15 [Note 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`. — end note]

16 *Effects:*

(16.1) — `wait()`s until the shared state is ready, then retrieves the value stored in the shared state;

(16.2) — releases any shared state (32.10.5).

17 *Postconditions:* `valid() == false`.

18 *Returns:*

(18.1) — `future::get()` returns the value `v` stored in the object's shared state as `std::move(v)`.

(18.2) — `future<R&>::get()` returns the reference stored as value in the object's shared state.

(18.3) — `future<void>::get()` returns nothing.

19 *Throws:* The stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

20 *Returns:* `true` only if `*this` refers to a shared state.

```
void wait() const;
```

21 *Effects:* Blocks until the shared state is ready.

```
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

22 *Effects:* None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by `rel_time` has expired.

23 *Returns:*

(23.1) — `future_status::deferred` if the shared state contains a deferred function.

(23.2) — `future_status::ready` if the shared state is ready.

(23.3) — `future_status::timeout` if the function is returning because the relative timeout (32.2.4) specified by `rel_time` has expired.

24 *Throws:* timeout-related exceptions (32.2.4).

```
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

25 *Effects:* None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by `abs_time` has expired.

26 *Returns:*

(26.1) — `future_status::deferred` if the shared state contains a deferred function.

(26.2) — `future_status::ready` if the shared state is ready.

(26.3) — `future_status::timeout` if the function is returning because the absolute timeout (32.2.4) specified by `abs_time` has expired.

27 *Throws:* timeout-related exceptions (32.2.4).

### 32.10.8 Class template `shared_future` [`futures.shared.future`]

1 The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (32.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

2 [*Note 1:* Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — *end note*]

3 The effect of calling any member function other than the destructor, the move assignment operator, the copy assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.

[*Note 2:* It is valid to copy or move from a `shared_future` object for which `valid()` is `false`. — *end note*]

*Recommended practice:* Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class shared_future {
```

```

public:
    shared_future() noexcept;
    shared_future(const shared_future& rhs) noexcept;
    shared_future(future<R>&&) noexcept;
    shared_future(shared_future&& rhs) noexcept;
    ~shared_future();
    shared_future& operator=(const shared_future& rhs) noexcept;
    shared_future& operator=(shared_future&& rhs) noexcept;

    // retrieving the value
    see below get() const;

    // functions to check state
    bool valid() const noexcept;

    void wait() const;
    template<class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>&& rel_time) const;
    template<class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>&& abs_time) const;
};
}

```

4 For the primary template, R shall be an object type that meets the *Cpp17Destructible* requirements.

5 The implementation provides the template `shared_future` and two specializations, `shared_future<R&&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
```

6 *Effects:* The object does not refer to a shared state.

7 *Postconditions:* `valid() == false`.

```
shared_future(const shared_future& rhs) noexcept;
```

8 *Effects:* The object refers to the same shared state as `rhs` (if any).

9 *Postconditions:* `valid()` returns the same value as `rhs.valid()`.

```
shared_future(future<R>&& rhs) noexcept;
```

```
shared_future(shared_future&& rhs) noexcept;
```

10 *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

11 *Postconditions:*

(11.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(11.2) — `rhs.valid() == false`.

```
~shared_future();
```

12 *Effects:*

(12.1) — Releases any shared state (32.10.5);

(12.2) — destroys `*this`.

```
shared_future& operator=(shared_future&& rhs) noexcept;
```

13 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

(13.1) — Releases any shared state (32.10.5);

(13.2) — move assigns the contents of `rhs` to `*this`.

14 *Postconditions:*

(14.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the assignment.

(14.2) — If `addressof(rhs) == this` is false, `rhs.valid() == false`.

```

shared_future& operator=(const shared_future& rhs) noexcept;
15     Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
(15.1)     — Releases any shared state (32.10.5);
(15.2)     — assigns the contents of rhs to *this.
           [Note 3: As a result, *this refers to the same shared state as rhs (if any). — end note]
16     Postconditions: valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;
17     [Note 4: As described above, the template and its two required specializations differ only in the return type
and return value of the member function get. — end note]
18     [Note 5: Access to a value object stored in the shared state is unsynchronized, so operations on R might
introduce a data race (6.9.2). — end note]
19     Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.
20     Returns:
(20.1)     — shared_future::get() returns a const reference to the value stored in the object's shared state.
           [Note 6: Access through that reference after the shared state has been destroyed produces undefined
behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the
shared_future object that returned the reference. — end note]
(20.2)     — shared_future<R&>::get() returns the reference stored as value in the object's shared state.
(20.3)     — shared_future<void>::get() returns nothing.
21     Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;
22     Returns: true only if *this refers to a shared state.

void wait() const;
23     Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
    future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
24     Effects: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the
shared state is ready or until the relative timeout (32.2.4) specified by rel_time has expired.
25     Returns:
(25.1)     — future_status::deferred if the shared state contains a deferred function.
(25.2)     — future_status::ready if the shared state is ready.
(25.3)     — future_status::timeout if the function is returning because the relative timeout (32.2.4) specified
by rel_time has expired.
26     Throws: timeout-related exceptions (32.2.4).

template<class Clock, class Duration>
    future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
27     Effects: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the
shared state is ready or until the absolute timeout (32.2.4) specified by abs_time has expired.
28     Returns:
(28.1)     — future_status::deferred if the shared state contains a deferred function.
(28.2)     — future_status::ready if the shared state is ready.
(28.3)     — future_status::timeout if the function is returning because the absolute timeout (32.2.4)
specified by abs_time has expired.
29     Throws: timeout-related exceptions (32.2.4).

```

32.10.9 Function template `async`

[futures.async]

- <sup>1</sup> The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template<class F, class... Args>
  future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
  async(F&& f, Args&&... args);
template<class F, class... Args>
  future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
  async(launch policy, F&& f, Args&&... args);
```

- <sup>2</sup> *Mandates:* The following are all true:

- (2.1) — `is_constructible_v<decay_t<F>, F>`,
- (2.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (2.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

- <sup>3</sup> *Effects:* The first function behaves the same as a call to the second function with a `policy` argument of `launch::async` | `launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- (3.1) — If `launch::async` is set in `policy`, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 32.4.3.3) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.
- (3.2) — If `launch::deferred` is set in `policy`, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (32.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

*Recommended practice:* If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- (3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

- <sup>4</sup> *Synchronization:* The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

[*Note 1:* These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens. — *end note*]

If the implementation chooses the `launch::async` policy,

- (4.1) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (32.4.3.6);
- (4.2) — the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

5 *Returns:* An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[*Note 2:* If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — *end note*]

6 *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

7 *Error conditions:*

(7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

8 [*Example 1:*

```
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async( [= ] { return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();    // #1
}
```

[*Note 3:* Line #1 might not result in concurrency because the `async` call uses the default policy, which might use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*]

— *end example*]

### 32.10.10 Class template `packaged_task`

[`futures.task`]

#### 32.10.10.1 General

[`futures.task.general`]

1 The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

2 When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
    template<class> class packaged_task;    // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)> {
    public:
        // construction and destruction
        packaged_task() noexcept;
        template<class F>
            explicit packaged_task(F&& f);
        ~packaged_task();

        // no copy
        packaged_task(const packaged_task&) = delete;
        packaged_task& operator=(const packaged_task&) = delete;

        // move support
        packaged_task(packaged_task&& rhs) noexcept;
        packaged_task& operator=(packaged_task&& rhs) noexcept;
        void swap(packaged_task& other) noexcept;

        bool valid() const noexcept;

        // result retrieval
        future<R> get_future();

        // execution
        void operator()(ArgTypes... );
        void make_ready_at_thread_exit(ArgTypes... );
    };
}
```

```

    void reset();
};

template<class R, class... ArgTypes>
    packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>;

template<class F> packaged_task(F) -> packaged_task<see below>;
}

```

### 32.10.10.2 Member functions

[futures.task.members]

```
packaged_task() noexcept;
```

1 *Effects:* The object has no shared state and no stored task.

```
template<class F>
    explicit packaged_task(F&& f);
```

2 *Constraints:* `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

3 *Mandates:* `is_invocable_r_v<R, F&, ArgTypes...>` is true.

4 *Preconditions:* Invoking a copy of `f` behaves the same as invoking `f`.

5 *Effects:* Constructs a new `packaged_task` object with a shared state and initializes the object's stored task with `std::forward<F>(f)`.

6 *Throws:* Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures cannot be allocated.

```
template<class F> packaged_task(F) -> packaged_task<see below>;
```

7 *Constraints:* `&F::operator()` is well-formed when treated as an unevaluated operand (7.2.3) and either

(7.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G:*)(A...) cv &opt noexceptopt` or of the form `R(*) (G, A...) noexceptopt` for a type `G`, or

(7.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*) (A...) noexceptopt`.

8 *Remarks:* The deduced type is `packaged_task<R(A...)>`.

```
packaged_task(packaged_task&& rhs) noexcept;
```

9 *Effects:* Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

10 *Postconditions:* `rhs` has no shared state.

```
packaged_task& operator=(packaged_task&& rhs) noexcept;
```

11 *Effects:*

(11.1) — Releases any shared state (32.10.5);

(11.2) — calls `packaged_task(std::move(rhs)).swap(*this)`.

```
~packaged_task();
```

12 *Effects:* Abandons any shared state (32.10.5).

```
void swap(packaged_task& other) noexcept;
```

13 *Effects:* Exchanges the shared states and stored tasks of `*this` and `other`.

14 *Postconditions:* `*this` has the same shared state and stored task (if any) as `other` prior to the call to `swap`. `other` has the same shared state and stored task (if any) as `*this` prior to the call to `swap`.

```
bool valid() const noexcept;
```

15 *Returns:* true only if `*this` has a shared state.

```
future<R> get_future();
```

16 *Synchronization:* Calls to this function do not introduce data races (6.9.2) with calls to `operator()` or `make_ready_at_thread_exit`.

[*Note 1:* Such calls need not synchronize with each other. — *end note*]

17 *Returns:* A `future` object that shares the same shared state as `*this`.

18 *Throws:* A `future_error` object if an error occurs.

19 *Error conditions:*

(19.1) — `future_already_retrieved` if `get_future` has already been called on a `packaged_task` object with the same shared state as `*this`.

(19.2) — `no_state` if `*this` has no shared state.

```
void operator()(ArgTypes... args);
```

20 *Effects:* As if by `INVOKE<R>(f, t1, t2, ..., tN)` (22.10.4), where `f` is the stored task of `*this` and `t1, t2, ..., tN` are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. The shared state of `*this` is made ready, and any threads blocked in a function waiting for the shared state of `*this` to become ready are unblocked.

21 *Throws:* A `future_error` exception object if there is no shared state or the stored task has already been invoked.

22 *Error conditions:*

(22.1) — `promise_already_satisfied` if the stored task has already been invoked.

(22.2) — `no_state` if `*this` has no shared state.

```
void make_ready_at_thread_exit(ArgTypes... args);
```

23 *Effects:* As if by `INVOKE<R>(f, t1, t2, ..., tN)` (22.10.4), where `f` is the stored task and `t1, t2, ..., tN` are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (32.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

24 *Throws:* `future_error` if an error condition occurs.

25 *Error conditions:*

(25.1) — `promise_already_satisfied` if the stored task has already been invoked.

(25.2) — `no_state` if `*this` has no shared state.

```
void reset();
```

26 *Effects:* As if `*this = packaged_task(std::move(f))`, where `f` is the task stored in `*this`.

[*Note 2:* This constructs a new shared state for `*this`. The old state is abandoned (32.10.5). — *end note*]

27 *Throws:*

(27.1) — `bad_alloc` if memory for the new shared state cannot be allocated.

(27.2) — Any exception thrown by the move constructor of the task stored in the shared state.

(27.3) — `future_error` with an error condition of `no_state` if `*this` has no shared state.

### 32.10.10.3 Globals

[`futures.task.nonmembers`]

```
template<class R, class... ArgTypes>
```

```
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

1 *Effects:* As if by `x.swap(y)`.

## 32.11 Safe reclamation [saferecl]

### 32.11.1 General [saferecl.general]

- <sup>1</sup> Subclause 32.11 contains safe-reclamation techniques, which are most frequently used to straightforwardly resolve access-deletion races.

### 32.11.2 Read-copy update (RCU) [saferecl.rcu]

#### 32.11.2.1 General [saferecl.rcu.general]

- <sup>1</sup> RCU is a synchronization mechanism that can be used for linked data structures that are frequently read, but seldom updated. RCU does not provide mutual exclusion, but instead allows the user to schedule specified actions such as deletion at some later time.
- <sup>2</sup> A class type *T* is *rcu-protectable* if it has exactly one base class of type `rcu_obj_base<T, D>` for some *D*, and that base is public and non-virtual, and it has no base classes of type `rcu_obj_base<X, Y>` for any other combination *X*, *Y*. An object is *rcu-protectable* if it is of *rcu-protectable* type.
- <sup>3</sup> An invocation of `unlock U` on an `rcu_domain dom` corresponds to an invocation of `lock L` on `dom` if *L* is sequenced before *U* and either
- (3.1) — no other invocation of `lock` on `dom` is sequenced after *L* and before *U*, or
- (3.2) — every invocation of `unlock U2` on `dom` such that *L* is sequenced before *U2* and *U2* is sequenced before *U* corresponds to an invocation of `lock L2` on `dom` such that *L* is sequenced before *L2* and *L2* is sequenced before *U2*.

[Note 1: This pairs nested locks and unlocks on a given domain in each thread. — end note]

- <sup>4</sup> A *region of RCU protection* on a domain `dom` starts with a `lock L` on `dom` and ends with its corresponding `unlock U`.
- <sup>5</sup> Given a region of RCU protection *R* on a domain `dom` and given an evaluation *E* that scheduled another evaluation *F* in `dom`, if *E* does not strongly happen before the start of *R*, the end of *R* strongly happens before evaluating *F*.
- <sup>6</sup> The evaluation of a scheduled evaluation is potentially concurrent with any other scheduled evaluation. Each scheduled evaluation is evaluated at most once.

#### 32.11.2.2 Header <rcu> synopsis [rcu.syn]

```
namespace std {
    // 32.11.2.3, class template rcu_obj_base
    template<class T, class D = default_delete<T>> class rcu_obj_base;

    // 32.11.2.4, class rcu_domain
    class rcu_domain;

    // 32.11.2.4.3, non-member functions
    rcu_domain& rcu_default_domain() noexcept;
    void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
    void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
    template<class T, class D = default_delete<T>>
        void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
}
```

#### 32.11.2.3 Class template `rcu_obj_base` [saferecl.rcu.base]

- <sup>1</sup> Objects of type *T* to be protected by RCU inherit from a specialization `rcu_obj_base<T, D>` for some *D*.

```
namespace std {
    template<class T, class D = default_delete<T>>
    class rcu_obj_base {
    public:
        void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
    protected:
        rcu_obj_base() = default;
        rcu_obj_base(const rcu_obj_base&) = default;
        rcu_obj_base(rcu_obj_base&&) = default;
        rcu_obj_base& operator=(const rcu_obj_base&) = default;
    };
}
```

```

    rcu_obj_base& operator=(rcu_obj_base&&) = default;
    ~rcu_obj_base() = default;
private:
    D deleter;           // exposition only
};
}

```

- 2 The behavior of a program that adds specializations for `rcu_obj_base` is undefined.
- 3 `T` may be an incomplete type. It shall be complete before any member of the resulting specialization of `rcu_obj_base` is referenced.
- 4 `D` shall be a function object type (22.10) for which, given a value `d` of type `D` and a value `ptr` of type `T*`, the expression `d(ptr)` is valid.
- 5 `D` shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.
- 6 If `D` is trivially copyable, all specializations of `rcu_obj_base<T, D>` are trivially copyable.

```
void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
```

- 7 *Mandates:* `T` is an rcu-protectable type.
- 8 *Preconditions:* `*this` is a base class subobject of an object `x` of type `T`. The member function `rcu_obj_base<T, D>::retire` was not invoked on `x` before. The assignment to *deleter* does not exit via an exception.
- 9 *Effects:* Evaluates `deleter = std::move(d)` and schedules the evaluation of the expression `deleter(addressof(x))` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.
- [Note 1: If such evaluations acquire resources held across any invocation of `retire` on `dom`, deadlock can occur. — end note]

### 32.11.2.4 Class `rcu_domain`

[saferecl.rcu.domain]

#### 32.11.2.4.1 General

[saferecl.rcu.domain.general]

```

namespace std {
    class rcu_domain {
    public:
        rcu_domain(const rcu_domain&) = delete;
        rcu_domain& operator=(const rcu_domain&) = delete;

        void lock() noexcept;
        bool try_lock() noexcept;
        void unlock() noexcept;
    };
}

```

- 1 This class meets the requirements of *Cpp17Lockable* (32.2.5.3) and provides regions of RCU protection.

[Example 1:

```
std::scoped_lock<rcu_domain> rlock(rcu_default_domain());
```

— end example]

- 2 The functions `lock` and `unlock` establish (possibly nested) regions of RCU protection.

#### 32.11.2.4.2 Member functions

[saferecl.rcu.domain.members]

```
void lock() noexcept;
```

- 1 *Effects:* Opens a region of RCU protection.
- 2 *Remarks:* Calls to `lock` do not introduce a data race (6.9.2.2) involving `*this`.

```
bool try_lock() noexcept;
```

- 3 *Effects:* Equivalent to `lock()`.

- 4 *Returns:* `true`.

```
void unlock() noexcept;
```

5 *Preconditions:* A call to `lock` that opened an unclosed region of RCU protection is sequenced before the call to `unlock`.

6 *Effects:* Closes the unclosed region of RCU protection that was most recently opened. May invoke scheduled evaluations in `*this`.

7 [Note 1: If such evaluations acquire resources held across any invocation of `unlock` on `*this`, deadlock can occur. — end note]

8 *Remarks:* Calls to `unlock` do not introduce a data race involving `*this`.

[Note 2: Evaluation of scheduled evaluations can still cause a data race. — end note]

### 32.11.2.4.3 Non-member functions [saferecl.rcu.domain.func]

```
rcu_domain& rcu_default_domain() noexcept;
```

1 *Returns:* A reference to a static-duration object of type `rcu_domain`. A reference to the same object is returned every time this function is called.

```
void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
```

2 *Effects:* If the call to `rcu_synchronize` does not strongly happen before the lock opening an RCU protection region `R` on `dom`, blocks until the `unlock` closing `R` happens.

3 *Synchronization:* The `unlock` closing `R` strongly happens before the return from `rcu_synchronize`.

```
void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
```

4 *Effects:* May evaluate any scheduled evaluations in `dom`. For any evaluation that happens before the call to `rcu_barrier` and that schedules an evaluation `E` in `dom`, blocks until `E` has been evaluated.

5 *Synchronization:* The evaluation of any such `E` strongly happens before the return from `rcu_barrier`.

[Note 1: A call to `rcu_barrier` does not imply a call to `rcu_synchronize` and vice versa. — end note]

```
template<class T, class D = default_delete<T>>
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
```

6 *Mandates:* `is_move_constructible_v<D>` is true and the expression `d(p)` is well-formed.

7 *Preconditions:* `D` meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements.

8 *Effects:* May allocate memory. It is unspecified whether the memory allocation is performed by invoking operator `new`. Initializes an object `d1` of type `D` from `std::move(d)`. Schedules the evaluation of `d1(p)` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.

[Note 2: If `rcu_retire` exits via an exception, no evaluation is scheduled. — end note]

9 *Throws:* `bad_alloc` or any exception thrown by the initialization of `d1`.

10 [Note 3: If scheduled evaluations acquire resources held across any invocation of `rcu_retire` on `dom`, deadlock can occur. — end note]

### 32.11.3 Hazard pointers [saferecl.hp]

#### 32.11.3.1 General [saferecl.hp.general]

1 A hazard pointer is a single-writer multi-reader pointer that can be owned by at most one thread at any time. Only the owner of the hazard pointer can set its value, while any number of threads may read its value. The owner thread sets the value of a hazard pointer to point to an object in order to indicate to concurrent threads—which may delete such an object—that the object is not yet safe to delete.

2 A class type `T` is *hazard-protectable* if it has exactly one base class of type `hazard_pointer_obj_base<T, D>` for some `D`, that base is public and non-virtual, and it has no base classes of type `hazard_pointer_obj_base<T2, D2>` for any other combination `T2, D2`. An object is *hazard-protectable* if it is of hazard-protectable type.

3 The time span between creation and destruction of a hazard pointer `h` is partitioned into a series of *protection epochs*; in each protection epoch, `h` either is *associated with* a hazard-protectable object, or is *unassociated*. Upon creation, a hazard pointer is unassociated. Changing the association (possibly to the same object) initiates a new protection epoch and ends the preceding one.

4 An object `x` of hazard-protectable type `T` is *retired* with a deleter of type `D` when the member function `hazard_pointer_obj_base<T, D>::retire` is invoked on `x`. Any given object `x` shall be retired at most once.

5 A retired object `x` is *reclaimed* by invoking its deleter with a pointer to `x`; the behavior is undefined if that invocation exits via an exception.

6 A hazard-protectable object `x` is *possibly-reclaimable* with respect to an evaluation `A` if

(6.1) — `x` is not reclaimed; and

(6.2) — `x` is retired in an evaluation `R` and `A` does not happen before `R`; and

(6.3) — for all hazard pointers `h` and for every protection epoch `E` of `h` during which `h` is associated with `x`:

(6.3.1) — if the beginning of `E` happens before `R`, the end of `E` strongly happens before `A`; and

(6.3.2) — if `E` began by an evaluation of `try_protect` with argument `src`, label its atomic load operation `L`. If there exists an atomic modification `B` on `src` such that `L` observes a modification that is modification-ordered before `B`, and `B` happens before `x` is retired, the end of `E` strongly happens before `A`.

[*Note 1:* In typical use, a store to `src` sequenced before retiring `x` will be such an atomic operation `B`. — *end note*]

[*Note 2:* The latter two conditions convey the informal notion that a protection epoch that began before retiring `x`, as implied either by the happens-before relation or the coherence order of some source, delays the reclamation of `x`. — *end note*]

7 The number of possibly-reclaimable objects has an unspecified bound.

[*Note 3:* The bound can be a function of the number of hazard pointers, the number of threads that retire objects, and the number of threads that use hazard pointers. — *end note*]

[*Example 1:* The following example shows how hazard pointers allow updates to be carried out in the presence of concurrent readers. The object of type `hazard_pointer` in `print_name` protects the object `*ptr` from being reclaimed by `ptr->retire` until the end of the protection epoch.

```
struct Name : public hazard_pointer_obj_base<Name> { /* details */ };
atomic<Name*> name;
// called often and in parallel!
void print_name() {
    hazard_pointer h = make_hazard_pointer();
    Name* ptr = h.protect(name);           // Protection epoch starts
    // ... safe to access *ptr
}   // Protection epoch ends.

// called rarely, but possibly concurrently with print_name
void update_name(Name* new_name) {
    Name* ptr = name.exchange(new_name);
    ptr->retire();
}
```

— *end example*]

### 32.11.3.2 Header <hazard\_pointer> synopsis

[`hazard.pointer.syn`]

```
namespace std {
    // 32.11.3.3, class template hazard_pointer_obj_base
    template<class T, class D = default_delete<T>> class hazard_pointer_obj_base;

    // 32.11.3.4, class hazard_pointer
    class hazard_pointer;

    // 32.11.3.4.4, non-member functions
    hazard_pointer make_hazard_pointer();
    void swap(hazard_pointer&, hazard_pointer&) noexcept;
}
```

32.11.3.3 Class template `hazard_pointer_obj_base`

[saferecl.hp.base]

```

namespace std {
    template<class T, class D = default_delete<T>>
    class hazard_pointer_obj_base {
    public:
        void retire(D d = D()) noexcept;
    protected:
        hazard_pointer_obj_base() = default;
        hazard_pointer_obj_base(const hazard_pointer_obj_base&) = default;
        hazard_pointer_obj_base(hazard_pointer_obj_base&&) = default;
        hazard_pointer_obj_base& operator=(const hazard_pointer_obj_base&) = default;
        hazard_pointer_obj_base& operator=(hazard_pointer_obj_base&&) = default;
        ~hazard_pointer_obj_base() = default;
    private:
        D deleter;    // exposition only
    };
}

```

- 1 D shall be a function object type (22.10.4) for which, given a value `d` of type `D` and a value `ptr` of type `T*`, the expression `d(ptr)` is valid.
- 2 The behavior of a program that adds specializations for `hazard_pointer_obj_base` is undefined.
- 3 D shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.
- 4 T may be an incomplete type. It shall be complete before any member of the resulting specialization of `hazard_pointer_obj_base` is referenced.

```
void retire(D d = D()) noexcept;
```

- 5 *Mandates:* T is a hazard-protectable type.
- 6 *Preconditions:* `*this` is a base class subobject of an object `x` of type `T`. `x` is not retired. Move-assigning `d` to `deleter` does not exit via an exception.
- 7 *Effects:* Move-assigns `d` to `deleter`, thereby setting it as the deleter of `x`, then retires `x`. May reclaim possibly-reclaimable objects.

32.11.3.4 Class `hazard_pointer`

[saferecl.hp.holder]

## 32.11.3.4.1 General

[saferecl.hp.holder.general]

```

namespace std {
    class hazard_pointer {
    public:
        hazard_pointer() noexcept;
        hazard_pointer(hazard_pointer&&) noexcept;
        hazard_pointer& operator=(hazard_pointer&&) noexcept;
        ~hazard_pointer();

        bool empty() const noexcept;
        template<class T> T* protect(const atomic<T*>& src) noexcept;
        template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
        template<class T> void reset_protection(const T* ptr) noexcept;
        void reset_protection(nullptr_t = nullptr) noexcept;
        void swap(hazard_pointer&) noexcept;
    };
}

```

- 1 An object of type `hazard_pointer` is either empty or *owns* a hazard pointer. Each hazard pointer is owned by exactly one object of type `hazard_pointer`.

[Note 1: An empty `hazard_pointer` object is different from a `hazard_pointer` object that owns an unassociated hazard pointer. An empty `hazard_pointer` object does not own any hazard pointers. — end note]

## 32.11.3.4.2 Constructors, destructor, and assignment

[saferecl.hp.holder.ctor]

```
hazard_pointer() noexcept;
```

- 1 *Postconditions:* `*this` is empty.

```
hazard_pointer(hazard_pointer&& other) noexcept;
```

2 *Postconditions:* If *other* is empty, *\*this* is empty. Otherwise, *\*this* owns the hazard pointer originally owned by *other*; *other* is empty.

```
~hazard_pointer();
```

3 *Effects:* If *\*this* is not empty, destroys the hazard pointer owned by *\*this*, thereby ending its current protection epoch.

```
hazard_pointer& operator=(hazard_pointer&& other) noexcept;
```

4 *Effects:* If *this == &other* is true, no effect. Otherwise, if *\*this* is not empty, destroys the hazard pointer owned by *\*this*, thereby ending its current protection epoch.

5 *Postconditions:* If *other* was empty, *\*this* is empty. Otherwise, *\*this* owns the hazard pointer originally owned by *other*. If *this != &other* is true, *other* is empty.

6 *Returns:* *\*this*.

### 32.11.3.4.3 Member functions

[saferecl.hp.holder.mem]

```
bool empty() const noexcept;
```

1 *Returns:* true if and only if *\*this* is empty.

```
template<class T> T* protect(const atomic<T*& src) noexcept;
```

2 *Effects:* Equivalent to:

```
    T* ptr = src.load(memory_order::relaxed);
    while (!try_protect(ptr, src)) {}
    return ptr;
```

```
template<class T> bool try_protect(T*& ptr, const atomic<T*& src) noexcept;
```

3 *Mandates:* T is a hazard-protectable type.

4 *Preconditions:* *\*this* is not empty.

5 *Effects:* Performs the following steps in order:

- (5.1) — Initializes a variable *old* of type T\* with the value of *ptr*.
- (5.2) — Evaluates `reset_protection(old)`.
- (5.3) — Assigns the value of `src.load(memory_order::acquire)` to *ptr*.
- (5.4) — If `old == ptr` is false, evaluates `reset_protection()`.

6 *Returns:* `old == ptr`.

```
template<class T> void reset_protection(const T* ptr) noexcept;
```

7 *Mandates:* T is a hazard-protectable type.

8 *Preconditions:* *\*this* is not empty.

9 *Effects:* If *ptr* is a null pointer value, invokes `reset_protection()`. Otherwise, associates the hazard pointer owned by *\*this* with *\*ptr*, thereby ending the current protection epoch.

10 *Complexity:* Constant.

```
void reset_protection(nullptr_t = nullptr) noexcept;
```

11 *Preconditions:* *\*this* is not empty.

12 *Postconditions:* The hazard pointer owned by *\*this* is unassociated.

13 *Complexity:* Constant.

```
void swap(hazard_pointer& other) noexcept;
```

14 *Effects:* Swaps the hazard pointer ownership of this object with that of *other*.

[Note 1: The owned hazard pointers, if any, remain unchanged during the swap and continue to be associated with the respective objects that they were protecting before the swap, if any. No protection epochs are ended or initiated. — end note]

15        *Complexity:* Constant.

#### 32.11.3.4.4 Non-member functions

[saferecl.hp.holder.nonmem]

```
hazard_pointer make_hazard_pointer();
```

1        *Effects:* Constructs a hazard pointer.

2        *Returns:* A `hazard_pointer` object that owns the newly-constructed hazard pointer.

3        *Throws:* May throw `bad_alloc` if memory for the hazard pointer could not be allocated.

```
void swap(hazard_pointer& a, hazard_pointer& b) noexcept;
```

4        *Effects:* Equivalent to `a.swap(b)`.

## 33 Execution control library [exec]

### 33.1 General [exec.general]

- <sup>1</sup> This Clause describes components supporting execution of function objects (22.10).
- <sup>2</sup> The following subclauses describe the requirements, concepts, and components for execution control primitives as summarized in Table 152.

**Table 152** — Execution control library summary [tab:exec.summary]

| Subclause                             | Header      |
|---------------------------------------|-------------|
| <a href="#">33.6</a> Schedulers       | <execution> |
| <a href="#">33.7</a> Receivers        |             |
| <a href="#">33.8</a> Operation states |             |
| <a href="#">33.9</a> Senders          |             |

- <sup>3</sup> Table 153 shows the types of customization point objects (16.3.3.3.5) used in the execution control library.

**Table 153** — Types of customization point objects in the execution control library [tab:exec.pos]

| Customization point object type | Purpose                                                                                    | Examples                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| core                            | provide core execution functionality, and connection between core components               | e.g., <code>connect</code> , <code>start</code>                                                                                                                                                                                                                                                                                                                                                                 |
| completion functions            | called by senders to announce the completion of the work (success, error, or cancellation) | <code>set_value</code> , <code>set_error</code> , <code>set_stopped</code>                                                                                                                                                                                                                                                                                                                                      |
| senders                         | allow the specialization of the provided sender algorithms                                 | <ul style="list-style-type: none"> <li>— sender factories (e.g., <code>schedule</code>, <code>just</code>, <code>read_env</code>)</li> <li>— sender adaptors (e.g., <code>continues_on</code>, <code>then</code>, <code>let_value</code>)</li> <li>— sender consumers (e.g., <code>sync_wait</code>)</li> </ul>                                                                                                 |
| queries                         | allow querying different properties of objects                                             | <ul style="list-style-type: none"> <li>— general queries (e.g., <code>get_allocator</code>, <code>get_stop_token</code>)</li> <li>— environment queries (e.g., <code>get_scheduler</code>, <code>get_delegation_scheduler</code>)</li> <li>— scheduler queries (e.g., <code>get_forward_progress_guarantee</code>)</li> <li>— sender attribute queries (e.g., <code>get_completion_scheduler</code>)</li> </ul> |

- <sup>4</sup> This clause makes use of the following exposition-only entities.
- <sup>5</sup> For a subexpression `expr`, let `MANDATE-NOT_THROW(expr)` be expression-equivalent to `expr`.  
*Mandates:* `noexcept(expr)` is true.

```

6 namespace std {
  template<class T>
    concept movable-value = // exposition only
      move_constructible<decay_t<T>> &&
      constructible_from<decay_t<T>, T> &&
      (!is_array_v<remove_reference_t<T>>);
}

```

7 For function types F1 and F2 denoting R1(Args1...) and R2(Args2...), respectively, *MATCHING-SIG*(F1, F2) is true if and only if *same\_as*<R1(Args1&&...), R2(Args2&&...)> is true.

8 For a subexpression *err*, let *Err* be *decltype*((*err*)) and let *AS-EXCEPT-PTR*(*err*) be:

(8.1) — *err* if *decay\_t*<*Err*> denotes the type *exception\_ptr*.

*Mandates:* *err* != *exception\_ptr*() is true.

(8.2) — Otherwise, *make\_exception\_ptr*(*system\_error*(*err*)) if *decay\_t*<*Err*> denotes the type *error\_code*.

(8.3) — Otherwise, *make\_exception\_ptr*(*err*).

### 33.2 Queries and queryables

[*exec.queryable*]

#### 33.2.1 General

[*exec.queryable.general*]

1 A *queryable object* is a read-only collection of key/value pair where each key is a customization point object known as a *query object*. A *query* is an invocation of a query object with a queryable object as its first argument and a (possibly empty) set of additional arguments. A query imposes syntactic and semantic requirements on its invocations.

2 Let *q* be a query object, let *args* be a (possibly empty) pack of subexpressions, let *env* be a subexpression that refers to a queryable object *o* of type *O*, and let *cenv* be a subexpression referring to *o* such that *decltype*((*cenv*)) is *const O&*. The expression *q*(*env*, *args*...) is equal to (18.2) the expression *q*(*cenv*, *args*...).

3 The type of a query expression cannot be *void*.

4 The expression *q*(*env*, *args*...) is equality-preserving (18.2) and does not modify the query object or the arguments.

5 If the expression *env*.*query*(*q*, *args*...) is well-formed, then it is expression-equivalent to *q*(*env*, *args*...).

6 Unless otherwise specified, the result of a query is valid as long as the queryable object is valid.

#### 33.2.2 queryable concept

[*exec.queryable.concept*]

```

namespace std {
  template<class T>
    concept queryable = destructible<T>; // exposition only
}

```

1 The exposition-only *queryable* concept specifies the constraints on the types of queryable objects.

2 Let *env* be an object of type *Env*. The type *Env* models queryable if for each callable object *q* and a pack of subexpressions *args*, if *requires* { *q*(*env*, *args*...) } is true then *q*(*env*, *args*...) meets any semantic requirements imposed by *q*.

### 33.3 Asynchronous operations

[*exec.async.ops*]

1 An *execution resource* is a program entity that manages a (possibly dynamic) set of execution agents (32.2.5.1), which it uses to execute parallel work on behalf of callers.

[*Example 1:* The currently active thread, a system-provided thread pool, and uses of an API associated with an external hardware accelerator are all examples of execution resources. — *end example*]

Execution resources execute asynchronous operations. An execution resource is either valid or invalid.

2 An *asynchronous operation* is a distinct unit of program execution that

(2.1) — is explicitly created;

(2.2) — can be explicitly started once at most;

- (2.3) — once started, eventually completes exactly once with a (possibly empty) set of result datums and in exactly one of three *dispositions*: success, failure, or cancellation;
- (2.3.1) — A successful completion, also known as a *value completion*, can have an arbitrary number of result datums.
- (2.3.2) — A failure completion, also known as an *error completion*, has a single result datum.
- (2.3.3) — A cancellation completion, also known as a *stopped completion*, has no result datum.

An asynchronous operation's *async result* is its disposition and its (possibly empty) set of result datums.

- (2.4) — can complete on a different execution resource than the execution resource on which it started; and
- (2.5) — can create and start other asynchronous operations called *child operations*. A child operation is an asynchronous operation that is created by the parent operation and, if started, completes before the parent operation completes. A *parent operation* is the asynchronous operation that created a particular child operation.

[*Note 1*: An asynchronous operation can execute synchronously; that is, it can complete during the execution of its start operation on the thread of execution that started it. — *end note*]

- 3 An asynchronous operation has associated state known as its *operation state*.
- 4 An asynchronous operation has an associated environment. An *environment* is a queryable object (33.2) representing the execution-time properties of the operation's caller. The caller of an asynchronous operation is its parent operation or the function that created it. An asynchronous operation's operation state owns the operation's environment.
- 5 An asynchronous operation has an associated receiver. A *receiver* is an aggregation of three handlers for the three asynchronous completion dispositions:
  - (5.1) — a value completion handler for a value completion,
  - (5.2) — an error completion handler for an error completion, and
  - (5.3) — a stopped completion handler for a stopped completion.

A receiver has an associated environment. An asynchronous operation's operation state owns the operation's receiver. The environment of an asynchronous operation is equal to its receiver's environment.

- 6 For each completion disposition, there is a *completion function*. A completion function is a customization point object (16.3.3.3.5) that accepts an asynchronous operation's receiver as the first argument and the result datums of the asynchronous operation as additional arguments. The value completion function invokes the receiver's value completion handler with the value result datums; likewise for the error completion function and the stopped completion function. A completion function has an associated type known as its *completion tag* that is the unqualified type of the completion function. A valid invocation of a completion function is called a *completion operation*.
- 7 The *lifetime of an asynchronous operation*, also known as the operation's *async lifetime*, begins when its start operation begins executing and ends when its completion operation begins executing. If the lifetime of an asynchronous operation's associated operation state ends before the lifetime of the asynchronous operation, the behavior is undefined. After an asynchronous operation executes a completion operation, its associated operation state is invalid. Accessing any part of an invalid operation state is undefined behavior.
- 8 An asynchronous operation shall not execute a completion operation before its start operation has begun executing. After its start operation has begun executing, exactly one completion operation shall execute. The lifetime of an asynchronous operation's operation state can end during the execution of the completion operation.
- 9 A *sender* is a factory for one or more asynchronous operations. *Connecting* a sender and a receiver creates an asynchronous operation. The asynchronous operation's associated receiver is equal to the receiver used to create it, and its associated environment is equal to the environment associated with the receiver used to create it. The lifetime of an asynchronous operation's associated operation state does not depend on the lifetimes of either the sender or the receiver from which it was created. A sender is started when it is connected to a receiver and the resulting asynchronous operation is started. A sender's *async result* is the *async result* of the asynchronous operation created by connecting it to a receiver. A sender sends its results by way of the asynchronous operation(s) it produces, and a receiver receives those results. A sender is either valid or invalid; it becomes invalid when its parent sender (see below) becomes invalid.

- 10 A *scheduler* is an abstraction of an execution resource with a uniform, generic interface for scheduling work onto that resource. It is a factory for senders whose asynchronous operations execute value completion operations on an execution agent belonging to the scheduler's associated execution resource. A *schedule-expression* obtains such a sender from a scheduler. A *schedule sender* is the result of a schedule expression. On success, an asynchronous operation produced by a schedule sender executes a value completion operation with an empty set of result datums. Multiple schedulers can refer to the same execution resource. A scheduler can be valid or invalid. A scheduler becomes invalid when the execution resource to which it refers becomes invalid, as do any schedule senders obtained from the scheduler, and any operation states obtained from those senders.
- 11 An asynchronous operation has one or more associated completion schedulers for each of its possible dispositions. A *completion scheduler* is a scheduler whose associated execution resource is used to execute a completion operation for an asynchronous operation. A value completion scheduler is a scheduler on which an asynchronous operation's value completion operation can execute. Likewise for error completion schedulers and stopped completion schedulers.
- 12 A sender has an associated queryable object (33.2) known as its *attributes* that describes various characteristics of the sender and of the asynchronous operation(s) it produces. For each disposition, there is a query object for reading the associated completion scheduler from a sender's attributes; i.e., a value completion scheduler query object for reading a sender's value completion scheduler, etc. If a completion scheduler query is well-formed, the returned completion scheduler is unique for that disposition for any asynchronous operation the sender creates. A schedule sender is required to have a value completion scheduler attribute whose value is equal to the scheduler that produced the schedule sender.
- 13 A *completion signature* is a function type that describes a completion operation. An asynchronous operation has a finite set of possible completion signatures corresponding to the completion operations that the asynchronous operation potentially evaluates (6.3). For a completion function `set`, receiver `rcvr`, and pack of arguments `args`, let `c` be the completion operation `set(rcvr, args...)`, and let `F` be the function type `decltype(auto)(set)(decltype(args)...)...`. A completion signature `Sig` is associated with `c` if and only if `MATCHING-SIG(Sig, F)` is `true` (33.1). Together, a sender type and an environment type `Env` determine the set of completion signatures of an asynchronous operation that results from connecting the sender with a receiver that has an environment of type `Env`. The type of the receiver does not affect an asynchronous operation's completion signatures, only the type of the receiver's environment.
- 14 A sender algorithm is a function that takes and/or returns a sender. There are three categories of sender algorithms:
- (14.1) — A *sender factory* is a function that takes non-senders as arguments and that returns a sender.
  - (14.2) — A *sender adaptor* is a function that constructs and returns a parent sender from a set of one or more child senders and a (possibly empty) set of additional arguments. An asynchronous operation created by a parent sender is a parent operation to the child operations created by the child senders.
  - (14.3) — A *sender consumer* is a function that takes one or more senders and a (possibly empty) set of additional arguments, and whose return type is not the type of a sender.

### 33.4 Header <execution> synopsis

[execution.syn]

```

template<class Sigs>
    concept valid_completion_signatures = see below; // exposition only

// 33.10.2
template<
    valid_completion_signatures InputSignatures,
    valid_completion_signatures AdditionalSignatures = completion_signatures<>,
    template<class...> class SetValue = see below,
    template<class> class SetError = see below,
    valid_completion_signatures SetStopped = completion_signatures<set_stopped_t()>>
using transform_completion_signatures = completion_signatures<see below>;

template<
    sender Sndr,
    class Env = empty_env,
    valid_completion_signatures AdditionalSignatures = completion_signatures<>,

```

```

template<class...> class SetValue = see below,
template<class> class SetError = see below,
valid-completion-signatures SetStopped = completion_signatures<set_stopped_t()>>
    requires sender_in<Sndr, Env>
using transform_completion_signatures_of =
    transform_completion_signatures<
        completion_signatures_of_t<Sndr, Env>,
        AdditionalSignatures, SetValue, SetError, SetStopped>;

// 33.11.1, run_loop
class run_loop;
}

namespace std::this_thread {
// 33.9.13, consumers
struct sync_wait_t { unspecified };
struct sync_wait_with_variant_t { unspecified };

inline constexpr sync_wait_t sync_wait{};
inline constexpr sync_wait_with_variant_t sync_wait_with_variant{};
}

namespace std::execution {
// 33.12.1
struct as_awaitable_t { unspecified };
inline constexpr as_awaitable_t as_awaitable{};

// 33.12.2
template<class-type Promise>
    struct with_awaitable_senders;
}

```

<sup>1</sup> The exposition-only type *variant-or-empty*<Ts...> is defined as follows:

- (1.1) — If `sizeof...(Ts)` is greater than zero, *variant-or-empty*<Ts...> denotes `variant<Us...>` where `Us...` is the pack `decay_t<Ts>...` with duplicate types removed.
- (1.2) — Otherwise, *variant-or-empty*<Ts...> denotes the exposition-only class type:

```

namespace std::execution {
    struct empty-variant { // exposition only
        empty-variant() = delete;
    };
}

```

<sup>2</sup> For types `Sndr` and `Env`, *single-sender-value-type*<`Sndr`, `Env`> is an alias for:

- (2.1) — `value_types_of_t<Sndr, Env, decay_t, type_identity_t>` if that type is well-formed,
- (2.2) — Otherwise, `void` if `value_types_of_t<Sndr, Env, tuple, variant>` is `variant<tuple<>>` or `variant<>`,
- (2.3) — Otherwise, `value_types_of_t<Sndr, Env, decayed-tuple, type_identity_t>` if that type is well-formed,
- (2.4) — Otherwise, *single-sender-value-type*<`Sndr`, `Env`> is ill-formed.

<sup>3</sup> The exposition-only concept *single-sender* is defined as follows:

```

namespace std::execution {
    template<class Sndr, class Env>
        concept single-sender = sender_in<Sndr, Env> &&
            requires {
                typename single-sender-value-type<Sndr, Env>;
            };
}

```

### 33.5 Queries [exec.queries]

#### 33.5.1 forwarding\_query [exec.fwd.env]

- 1 forwarding\_query asks a query object whether it should be forwarded through queryable adaptors.
- 2 The name forwarding\_query denotes a query object. For some query object q of type Q, forwarding\_query(q) is expression-equivalent to:
  - (2.1) — *MANDATE-NOT\_THROW*(q.query(forwarding\_query)) if that expression is well-formed.  
*Mandates:* The expression above has type bool and is a core constant expression if q is a core constant expression.
  - (2.2) — Otherwise, true if derived\_from<Q, forwarding\_query\_t> is true.
  - (2.3) — Otherwise, false.

#### 33.5.2 get\_allocator [exec.get.allocator]

- 1 get\_allocator asks a queryable object for its associated allocator.
- 2 The name get\_allocator denotes a query object. For a subexpression env, get\_allocator(env) is expression-equivalent to *MANDATE-NOT\_THROW*(as\_const(env).query(get\_allocator)).  
*Mandates:* If the expression above is well-formed, its type satisfies *simple\_allocator* (16.4.4.6.1).
- 3 forwarding\_query(get\_allocator) is a core constant expression and has value true.

#### 33.5.3 get\_stop\_token [exec.get.stop.token]

- 1 get\_stop\_token asks a queryable object for an associated stop token.
- 2 The name get\_stop\_token denotes a query object. For a subexpression env, get\_stop\_token(env) is expression-equivalent to:
  - (2.1) — *MANDATE-NOT\_THROW*(as\_const(env).query(get\_stop\_token)) if that expression is well-formed.  
*Mandates:* The type of the expression above satisfies *stoppable\_token*.
  - (2.2) — Otherwise, never\_stop\_token{}
- 3 forwarding\_query(get\_stop\_token) is a core constant expression and has value true.

#### 33.5.4 execution::get\_env [exec.get.env]

- 1 execution::get\_env is a customization point object. For a subexpression o, execution::get\_env(o) is expression-equivalent to:
  - (1.1) — *MANDATE-NOT\_THROW*(as\_const(o).get\_env()) if that expression is well-formed.  
*Mandates:* The type of the expression above satisfies *queryable* (33.2).
  - (1.2) — Otherwise, empty\_env{}
- 2 The value of get\_env(o) shall be valid while o is valid.
- 3 [*Note 1:* When passed a sender object, get\_env returns the sender's associated attributes. When passed a receiver, get\_env returns the receiver's associated execution environment. — *end note*]

#### 33.5.5 execution::get\_domain [exec.get.domain]

- 1 get\_domain asks a queryable object for its associated execution domain tag.
- 2 The name get\_domain denotes a query object. For a subexpression env, get\_domain(env) is expression-equivalent to *MANDATE-NOT\_THROW*(as\_const(env).query(get\_domain)).
- 3 forwarding\_query(execution::get\_domain) is a core constant expression and has value true.

#### 33.5.6 execution::get\_scheduler [exec.get.scheduler]

- 1 get\_scheduler asks a queryable object for its associated scheduler.
- 2 The name get\_scheduler denotes a query object. For a subexpression env, get\_scheduler(env) is expression-equivalent to *MANDATE-NOT\_THROW*(as\_const(env).query(get\_scheduler)).  
*Mandates:* If the expression above is well-formed, its type satisfies *scheduler*.
- 3 forwarding\_query(execution::get\_scheduler) is a core constant expression and has value true.

**33.5.7 execution::get\_delegation\_scheduler** [exec.get.delegation.scheduler]

- <sup>1</sup> `get_delegation_scheduler` asks a queryable object for a scheduler that can be used to delegate work to for the purpose of forward progress delegation (6.9.2.3).
- <sup>2</sup> The name `get_delegation_scheduler` denotes a query object. For a subexpression `env`, `get_delegation_scheduler(env)` is expression-equivalent to `MANDATE-NOT_THROW(as_const(env).query(get_delegation_scheduler))`.

*Mandates:* If the expression above is well-formed, its type satisfies `scheduler`.

- <sup>3</sup> `forwarding_query(execution::get_delegation_scheduler)` is a core constant expression and has value `true`.

**33.5.8 execution::get\_forward\_progress\_guarantee** [exec.get.fwd.progress]

```
namespace std::execution {
    enum class forward_progress_guarantee {
        concurrent,
        parallel,
        weakly_parallel
    };
}
```

- <sup>1</sup> `get_forward_progress_guarantee` asks a scheduler about the forward progress guarantee of execution agents created by that scheduler's associated execution resource (6.9.2.3).
- <sup>2</sup> The name `get_forward_progress_guarantee` denotes a query object. For a subexpression `sch`, let `Sch` be `decltype((sch))`. If `Sch` does not satisfy `scheduler`, `get_forward_progress_guarantee` is ill-formed. Otherwise, `get_forward_progress_guarantee(sch)` is expression-equivalent to:
- (2.1) — `MANDATE-NOT_THROW(as_const(sch).query(get_forward_progress_guarantee))`, if that expression is well-formed.
- Mandates:* The type of the expression above is `forward_progress_guarantee`.
- (2.2) — Otherwise, `forward_progress_guarantee::weakly_parallel`.
- <sup>3</sup> If `get_forward_progress_guarantee(sch)` for some scheduler `sch` returns `forward_progress_guarantee::concurrent`, all execution agents created by that scheduler's associated execution resource shall provide the concurrent forward progress guarantee. If it returns `forward_progress_guarantee::parallel`, all such execution agents shall provide at least the parallel forward progress guarantee.

**33.5.9 execution::get\_completion\_scheduler** [exec.get.compl.sched]

- <sup>1</sup> `get_completion_scheduler<completion-tag>` obtains the completion scheduler associated with a completion tag from a sender's attributes.
- <sup>2</sup> The name `get_completion_scheduler` denotes a query object template. For a subexpression `q`, the expression `get_completion_scheduler<completion-tag>(q)` is ill-formed if `completion-tag` is not one of `set_value_t`, `set_error_t`, or `set_stopped_t`. Otherwise, `get_completion_scheduler<completion-tag>(q)` is expression-equivalent to

```
MANDATE-NOT_THROW(as_const(q).query(get_completion_scheduler<completion-tag>))
```

*Mandates:* If the expression above is well-formed, its type satisfies `scheduler`.

- <sup>3</sup> Let `completion-fn` be a completion function (33.3); let `completion-tag` be the associated completion tag of `completion-fn`; let `args` be a pack of subexpressions; and let `sndr` be a subexpression such that `sender<decltype((sndr))>` is `true` and `get_completion_scheduler<completion-tag>(get_env(sndr))` is well-formed and denotes a scheduler `sch`. If an asynchronous operation created by connecting `sndr` with a receiver `rcvr` causes the evaluation of `completion-fn(rcvr, args...)`, the behavior is undefined unless the evaluation happens on an execution agent that belongs to `sch`'s associated execution resource.
- <sup>4</sup> The expression `forwarding_query(get_completion_scheduler<completion-tag>)` is a core constant expression and has value `true`.

**33.6 Schedulers** [exec.sched]

- <sup>1</sup> The `scheduler` concept defines the requirements of a scheduler type (33.3). `schedule` is a customization point object that accepts a scheduler. A valid invocation of `schedule` is a schedule-expression.

```

namespace std::execution {
    template<class Sch>
    concept scheduler =
        derived_from<typename remove_cvref_t<Sch>::scheduler_concept, scheduler_t> &&
        queryable<Sch> &&
        requires(Sch&& sch) {
            { schedule(std::forward<Sch>(sch)) } -> sender;
            { auto(get_completion_scheduler<set_value_t>(
                get_env(schedule(std::forward<Sch>(sch)))) ) }
                -> same_as<remove_cvref_t<Sch>>;
        } &&
        equality_comparable<remove_cvref_t<Sch>> &&
        copy_constructible<remove_cvref_t<Sch>>;
}

```

- 2 Let `Sch` be the type of a scheduler and let `Env` be the type of an execution environment for which `sender_in<schedule_result_t<Sch>, Env>` is satisfied. Then `sender-in-of<schedule_result_t<Sch>, Env>` shall be modeled.
- 3 None of a scheduler's copy constructor, destructor, equality comparison, or `swap` member functions shall exit via an exception. None of these member functions, nor a scheduler type's `schedule` function, shall introduce data races as a result of potentially concurrent (6.9.2.2) invocations of those functions from different threads.
- 4 For any two values `sch1` and `sch2` of some scheduler type `Sch`, `sch1 == sch2` shall return `true` only if both `sch1` and `sch2` share the same associated execution resource.
- 5 For a given scheduler expression `sch`, the expression `get_completion_scheduler<set_value_t>(get_env(schedule(sch)))` shall compare equal to `sch`.
- 6 For a given scheduler expression `sch`, if the expression `get_domain(sch)` is well-formed, then the expression `get_domain(get_env(schedule(sch)))` is also well-formed and has the same type.
- 7 A scheduler type's destructor shall not block pending completion of any receivers connected to the sender objects returned from `schedule`.

[Note 1: The ability to wait for completion of submitted function objects can be provided by the associated execution resource of the scheduler. — end note]

## 33.7 Receivers

[exec.recv]

### 33.7.1 Receiver concepts

[exec.recv.concepts]

- 1 A receiver represents the continuation of an asynchronous operation. The `receiver` concept defines the requirements for a receiver type (33.3). The `receiver_of` concept defines the requirements for a receiver type that is usable as the first argument of a set of completion operations corresponding to a set of completion signatures. The `get_env` customization point object is used to access a receiver's associated environment.

```

namespace std::execution {
    template<class Rcvr>
    concept receiver =
        derived_from<typename remove_cvref_t<Rcvr>::receiver_concept, receiver_t> &&
        requires(const remove_cvref_t<Rcvr>& rcvr) {
            { get_env(rcvr) } -> queryable;
        } &&
        move_constructible<remove_cvref_t<Rcvr>> && // rvalues are movable, and
        constructible_from<remove_cvref_t<Rcvr>, Rcvr>; // lvalues are copyable

    template<class Signature, class Rcvr>
    concept valid_completion_for =
        requires (Signature* sig) {
            []<class Tag, class... Args>(Tag*)(Args...)
                requires callable<Tag, remove_cvref_t<Rcvr>, Args...>
            {}(sig);
        };
}

```

```

template<class Rcvr, class Completions>
concept has-completions =
    requires (Completions* completions) {
        []<valid-completion-for<Rcvr>...Sigs>(completion_signatures<Sigs...>*)
        {}(completions);
    };

template<class Rcvr, class Completions>
concept receiver_of =
    receiver<Rcvr> && has-completions<Rcvr, Completions>;
}

```

<sup>2</sup> Class types that are marked `final` do not model the `receiver` concept.

<sup>3</sup> Let `rcvr` be a receiver and let `op_state` be an operation state associated with an asynchronous operation created by connecting `rcvr` with a sender. Let `token` be a stop token equal to `get_stop_token(get_env(rcvr))`. `token` shall remain valid for the duration of the asynchronous operation's lifetime (33.3).

[*Note 1*: This means that, unless it knows about further guarantees provided by the type of `rcvr`, the implementation of `op_state` cannot use `token` after it executes a completion operation. This also implies that any stop callbacks registered on `token` must be destroyed before the invocation of the completion operation. — *end note*]

### 33.7.2 `execution::set_value` [exec.set.value]

<sup>1</sup> `set_value` is a value completion function (33.3). Its associated completion tag is `set_value_t`. The expression `set_value(rcvr, vs...)` for a subexpression `rcvr` and pack of subexpressions `vs` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NO_THROW(rcvr.set_value(vs...))`.

### 33.7.3 `execution::set_error` [exec.set.error]

<sup>1</sup> `set_error` is an error completion function (33.3). Its associated completion tag is `set_error_t`. The expression `set_error(rcvr, err)` for some subexpressions `rcvr` and `err` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NO_THROW(rcvr.set_error(err))`.

### 33.7.4 `execution::set_stopped` [exec.set.stopped]

<sup>1</sup> `set_stopped` is a stopped completion function (33.3). Its associated completion tag is `set_stopped_t`. The expression `set_stopped(rcvr)` for a subexpression `rcvr` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NO_THROW(rcvr.set_stopped())`.

## 33.8 Operation states [exec.opstate]

### 33.8.1 General [exec.opstate.general]

<sup>1</sup> The `operation_state` concept defines the requirements of an operation state type (33.3).

```

namespace std::execution {
    template<class O>
        concept operation_state =
            derived_from<typename O::operation_state_concept, operation_state_t> &&
            is_object_v<O> &&
            requires (O& o) {
                { start(o) } noexcept;
            };
}

```

<sup>2</sup> If an `operation_state` object is destroyed during the lifetime of its asynchronous operation (33.3), the behavior is undefined.

[*Note 1*: The `operation_state` concept does not impose requirements on any operations other than destruction and `start`, including copy and move operations. Invoking any such operation on an object whose type models `operation_state` can lead to undefined behavior. — *end note*]

<sup>3</sup> The program is ill-formed if it performs a copy or move construction or assignment operation on an operation state object created by connecting a library-provided sender.

### 33.8.2 `execution::start` [exec.opstate.start]

- 1 The name `start` denotes a customization point object that starts (33.3) the asynchronous operation associated with the operation state object. For a subexpression `op`, the expression `start(op)` is ill-formed if `op` is an rvalue. Otherwise, it is expression-equivalent to `MANDATE-NO_THROW(op.start())`.
- 2 If `op.start()` does not start (33.3) the asynchronous operation associated with the operation state `op`, the behavior of calling `start(op)` is undefined.

## 33.9 Senders [exec.snd]

### 33.9.1 General [exec.snd.general]

- 1 Subclauses 33.9.11 and 33.9.12 define customizable algorithms that return senders. Each algorithm has a default implementation. Let `sndr` be the result of an invocation of such an algorithm or an object equal to the result (18.2), and let `Sndr` be `decltype((sndr))`. Let `rcvr` be a receiver of type `Rcvr` with associated environment `env` of type `Env` such that `sender_to<Sndr, Rcvr>` is true. For the default implementation of the algorithm that produced `sndr`, connecting `sndr` to `rcvr` and starting the resulting operation state (33.3) necessarily results in the potential evaluation (6.3) of a set of completion operations whose first argument is a subexpression equal to `rcvr`. Let `Sigs` be a pack of completion signatures corresponding to this set of completion operations. Then the type of the expression `get_completion_signatures(sndr, env)` is a specialization of the class template `completion_signatures` (33.10.1), the set of whose template arguments is `Sigs`. If a user-provided implementation of the algorithm that produced `sndr` is selected instead of the default, any completion signature that is in the set of types denoted by `completion_signatures_of_t<Sndr, Env>` and that is not part of `Sigs` shall correspond to error or stopped completion operations, unless otherwise specified.

### 33.9.2 Exposition-only entities [exec.snd.expos]

- 1 Subclause 33.9 makes use of the following exposition-only entities.
- 2 For a queryable object `env`, `FWD-ENV(env)` is an expression whose type satisfies *queryable* such that for a query object `q` and a pack of subexpressions `as`, the expression `FWD-ENV(env).query(q, as...)` is ill-formed if `forwarding_query(q)` is false; otherwise, it is expression-equivalent to `env.query(q, as...)`.
- 3 For a query object `q` and a subexpression `v`, `MAKE-ENV(q, v)` is an expression `env` whose type satisfies *queryable* such that the result of `env.query(q)` has a value equal to `v` (18.2). Unless otherwise stated, the object to which `env.query(q)` refers remains valid while `env` remains valid.
- 4 For two queryable objects `env1` and `env2`, a query object `q`, and a pack of subexpressions `as`, `JOIN-ENV(env1, env2)` is an expression `env3` whose type satisfies *queryable* such that `env3.query(q, as...)` is expression-equivalent to:
  - (4.1) — `env1.query(q, as...)` if that expression is well-formed,
  - (4.2) — otherwise, `env2.query(q, as...)` if that expression is well-formed,
  - (4.3) — otherwise, `env3.query(q, as...)` is ill-formed.
- 5 The results of `FWD-ENV`, `MAKE-ENV`, and `JOIN-ENV` can be context-dependent; i.e., they can evaluate to expressions with different types and value categories in different contexts for the same arguments.
- 6 For a scheduler `sch`, `SCHED-ATTRS(sch)` is an expression `o1` whose type satisfies *queryable* such that `o1.query(get_completion_scheduler<Tag>)` is an expression with the same type and value as `sch` where `Tag` is one of `set_value_t` or `set_stopped_t`, and such that `o1.query(get_domain)` is expression-equivalent to `sch.query(get_domain)`. `SCHED-ENV(sch)` is an expression `o2` whose type satisfies *queryable* such that `o2.query(get_scheduler)` is a prvalue with the same type and value as `sch`, and such that `o2.query(get_domain)` is expression-equivalent to `sch.query(get_domain)`.
- 7 For two subexpressions `rcvr` and `expr`, `SET-VALUE(rcvr, expr)` is expression-equivalent to `(expr, set_value(std::move(rcvr)))` if the type of `expr` is void; otherwise, `set_value(std::move(rcvr), expr)`. `TRY-EVAL(rcvr, expr)` is equivalent to:

```
try {
    expr;
} catch(...) {
    set_error(std::move(rcvr), current_exception());
}
```

if `expr` is potentially-throwing; otherwise, `expr`. *TRY-SET-VALUE*(`rcvr`, `expr`) is

*TRY-EVAL*(`rcvr`, *SET-VALUE*(`rcvr`, `expr`))

except that `rcvr` is evaluated only once.

```
template<class Default = default_domain, class Snдр>
constexpr auto completion-domain(const Snдр& snдр) noexcept;
```

8 *COMPL-DOMAIN*(`T`) is the type of the expression `get_domain(get_completion_scheduler<T>(get_env(snдр)))`.

9 *Effects*: If all of the types *COMPL-DOMAIN*(`set_value_t`), *COMPL-DOMAIN*(`set_error_t`), and *COMPL-DOMAIN*(`set_stopped_t`) are ill-formed, `completion-domain<Default>(snдр)` is a default-constructed prvalue of type `Default`. Otherwise, if they all share a common type (21.3.8.7) (ignoring those types that are ill-formed), then `completion-domain<Default>(snдр)` is a default-constructed prvalue of that type. Otherwise, `completion-domain<Default>(snдр)` is ill-formed.

```
template<class Tag, class Env, class Default>
constexpr decltype(auto) query-with-default(
    Tag, const Env& env, Default&& value) noexcept(see below);
```

10 Let `e` be the expression `Tag()(env)` if that expression is well-formed; otherwise, it is `static_cast<Default>(std::forward<Default>(value))`.

11 *Returns*: `e`.

12 *Remarks*: The expression in the `noexcept` clause is `noexcept(e)`.

```
template<class Snдр>
constexpr auto get-domain-early(const Snдр& snдр) noexcept;
```

13 *Effects*: Equivalent to:

```
return Domain();
```

where `Domain` is the decayed type of the first of the following expressions that is well-formed:

(13.1) — `get_domain(get_env(snдр))`

(13.2) — `completion-domain(snдр)`

(13.3) — `default_domain()`

```
template<class Snдр, class Env>
constexpr auto get-domain-late(const Snдр& snдр, const Env& env) noexcept;
```

14 *Effects*: Equivalent to:

(14.1) — If `sender-for<Snдр, continues_on_t>` is true, then

```
return Domain();
```

where `Domain` is the type of the following expression:

```
[] {
    auto [_, sch, _] = snдр;
    return query-or-default(get_domain, sch, default_domain());
}();
```

[*Note 1*: The `continues_on` algorithm works in tandem with `schedule_from` (33.9.12.5) to give scheduler authors a way to customize both how to transition onto (`continues_on`) and off of (`schedule_from`) a given execution context. Thus, `continues_on` ignores the domain of the predecessor and uses the domain of the destination scheduler to select a customization, a property that is unique to `continues_on`. That is why it is given special treatment here. — *end note*]

(14.2) — Otherwise,

```
return Domain();
```

where `Domain` is the first of the following expressions that is well-formed and whose type is not `void`:

(14.2.1) — `get_domain(get_env(snдр))`

(14.2.2) — `completion-domain<void>(snдр)`

- (14.2.3) — `get_domain(env)`  
 (14.2.4) — `get_domain(get_scheduler(env))`  
 (14.2.5) — `default_domain()`

```

15  template<callable Fun>
    requires is_nothrow_move_constructible_v<Fun>
    struct emplace-from {
        Fun fun; // exposition only
        using type = call-result-t<Fun>;

        constexpr operator type() && noexcept(nothrow-callable<Fun>) {
            return std::move(fun)();
        }

        constexpr type operator()() && noexcept(nothrow-callable<Fun>) {
            return std::move(fun)();
        }
    };

```

[*Note 2: `emplace-from` is used to emplace non-movable types into tuple, optional, variant, and similar types. — end note*]

```

16  struct on-stop-request {
        inplace_stop_source& stop-src; // exposition only
        void operator()() noexcept { stop-src.request_stop(); }
    };

17  template<class T0, class T1, ..., class Tn>
    struct product-type { // exposition only
        T0 t0; // exposition only
        T1 t1; // exposition only
        ...
        Tn tn; // exposition only

        template<size_t I, class Self>
        constexpr decltype(auto) get(this Self&& self) noexcept; // exposition only

        template<class Self, class Fn>
        constexpr decltype(auto) apply(this Self&& self, Fn&& fn) // exposition only
            noexcept(see below);
    };

```

- 18 [Note 3: *product-type* is presented here in pseudo-code form for the sake of exposition. It can be approximated in standard C++ with a tuple-like implementation that takes care to keep the type an aggregate that can be used as the initializer of a structured binding declaration. — end note]

[Note 4: An expression of type *product-type* is usable as the initializer of a structured binding declaration (9.6). — end note]

```

template<size_t I, class Self>
constexpr decltype(auto) get(this Self&& self) noexcept;

19  Effects: Equivalent to:
        auto& [...ts] = self;
        return std::forward_like<Self>(ts...[I]);

    template<class Self, class Fn>
    constexpr decltype(auto) apply(this Self&& self, Fn&& fn) noexcept(see below);

20  Constraints: The expression in the return statement below is well-formed.

21  Effects: Equivalent to:
        auto& [...ts] = self;
        return std::forward<Fn>(fn)(std::forward_like<Self>(ts)...);

22  Remarks: The expression in the noexcept clause is true if the return statement above is not potentially
        throwing; otherwise, false.

```

```
template<class Tag, class Data = see below, class... Child>
constexpr auto make-sender(Tag tag, Data&& data, Child&&... child);
```

23 *Mandates:* The following expressions are true:

(23.1) — semiregular<Tag>

(23.2) — movable-value<Data>

(23.3) — (sender<Child> &&...)

24 *Returns:* A prvalue of type *basic-sender*<Tag, decay\_t<Data>, decay\_t<Child>...> that has been direct-list-initialized with the forwarded arguments, where *basic-sender* is the following exposition-only class template except as noted below.

```
namespace std::execution {
template<class Tag>
concept completion-tag = // exposition only
    same_as<Tag, set_value_t> || same_as<Tag, set_error_t> || same_as<Tag, set_stopped_t>;

template<template<class...> class T, class... Args>
concept valid-specialization = // exposition only
    requires { typename T<Args...>; };

struct default-impls { // exposition only
    static constexpr auto get-attrs = see below; // exposition only
    static constexpr auto get-env = see below; // exposition only
    static constexpr auto get-state = see below; // exposition only
    static constexpr auto start = see below; // exposition only
    static constexpr auto complete = see below; // exposition only
};

template<class Tag>
struct impls-for : default-impls {}; // exposition only

template<class Sndr, class Rcvr> // exposition only
using state-type = decay_t<call-result-t<
    decltype(impls-for<tag_of_t<Sndr>>::get-state), Sndr, Rcvr&&>>;

template<class Index, class Sndr, class Rcvr> // exposition only

};

constexpr auto connect-all = see below; // exposition only

template<class Sndr, class Rcvr>
using connect-all-result = call-result-t< // exposition only
    decltype(connect-all), basic-state<Sndr, Rcvr>*, Sndr, indices-for<Sndr>>;

template<class Sndr, class Rcvr>
requires valid-specialization<state-type, Sndr, Rcvr> &&
    valid-specialization<connect-all-result, Sndr, Rcvr>
struct basic-operation : basic-state<Sndr, Rcvr> { // exposition only
    using operation_state_concept = operation_state_t;
    using tag-t = tag_of_t<Sndr>; // exposition only

    connect-all-result<Sndr, Rcvr> inner-ops; // exposition only

    basic-operation(Sndr&& sndr, Rcvr&& rcvr) noexcept(see below) // exposition only
    : basic-state<Sndr, Rcvr>(std::forward<Sndr>(sndr), std::move(rcvr)),
      inner-ops(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))
    {}

    void start() & noexcept {
        auto& [...ops] = inner-ops;
        impls-for<tag-t>::start(this->state, this->rcvr, ops...);
    }
};

template<class Sndr, class Env>
using completion-signatures-for = see below; // exposition only

template<class Tag, class Data, class... Child>
struct basic-sender : product-type<Tag, Data, Child...> { // exposition only
    using sender_concept = sender_t;
    using indices-for = index_sequence_for<Child...>; // exposition only

    decltype(auto) get_env() const noexcept {
        auto& [..., data, ...child] = *this;
        return impls-for<Tag>::get-attrs(data, child...);
    }
}

```

```

template<decays-to<basic-sender> Self, receiver Rcvr>
auto connect(this Self&& self, Rcvr rcvr) noexcept(see below)
-> basic-operation<Self, Rcvr> {
    return {std::forward<Self>(self), std::move(rcvr)};
}

template<decays-to<basic-sender> Self, class Env>
auto get_completion_signatures(this Self&& self, Env&& env) noexcept
-> completion-signatures-for<Self, Env> {
    return {};
}
};
}

```

25 The default template argument for the Data template parameter denotes an unspecified empty trivially copyable class type that models *semiregular*.

26 It is unspecified whether a specialization of *basic-sender* is an aggregate.

27 An expression of type *basic-sender* is usable as the initializer of a structured binding declaration (9.6).

28 The expression in the *noexcept* clause of the constructor of *basic-state* is:

```

is_nothrow_move_constructible_v<Rcvr> &&
nothrow_callable<decltype(impls-for<tag_of_t<Sndr>>::get-state), Sndr, Rcvr&&

```

29 The object *connect-all* is initialized with a callable object equivalent to the following lambda:

```

[]<class Sndr, class Rcvr, size_t... Is>(
    basic-state<Sndr, Rcvr>* op, Sndr&& sndr, index_sequence<Is...>) noexcept(see below)
-> decltype(auto) {
    auto& [_ , data, ...child] = sndr;
    return product-type{connect(
        std::forward_like<Sndr>(child),
        basic-receiver<Sndr, Rcvr, integral_constant<size_t, Is>>{op})...};
}

```

30 *Constraints:* The expression in the *return* statement is well-formed.

31 *Remarks:* The expression in the *noexcept* clause is true if the *return* statement is not potentially throwing; otherwise, false.

32 The expression in the *noexcept* clause of the constructor of *basic-operation* is:

```

is_nothrow_constructible_v<basic-state<Self, Rcvr>, Self, Rcvr> &&
noexcept(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))

```

33 The expression in the *noexcept* clause of the *connect* member function of *basic-sender* is:

```

is_nothrow_constructible_v<basic-operation<Self, Rcvr>, Self, Rcvr>

```

34 The member *default-impls::get-attrs* is initialized with a callable object equivalent to the following lambda:

```

[](const auto&, const auto&... child) noexcept -> decltype(auto) {
    if constexpr (sizeof...(child) == 1)
        return (FWD-ENV(get_env(child)), ...);
    else
        return empty_env();
}

```

35 The member *default-impls::get-env* is initialized with a callable object equivalent to the following lambda:

```

[(auto, auto&, const auto& rcvr) noexcept -> decltype(auto) {
    return FWD-ENV(get_env(rcvr));
}

```

36 The member *default-impls::get-state* is initialized with a callable object equivalent to the following lambda:

```

[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept -> decltype(auto) {
    auto& [_ , data, ...child] = sndr;
}

```

```

    return std::forward_like<Sndr>(data);
}

```

37 The member `default-impls::start` is initialized with a callable object equivalent to the following lambda:

```

[](auto&, auto&, auto&... ops) noexcept -> void {
    (execution::start(ops), ...);
}

```

38 The member `default-impls::complete` is initialized with a callable object equivalent to the following lambda:

```

[]<class Index, class Rcvr, class Tag, class... Args>(
    Index, auto& state, Rcvr& rcvr, Tag, Args&&... args) noexcept
    -> void requires callable<Tag, Rcvr, Args...> {
    static_assert(Index::value == 0);
    Tag()(std::move(rcvr), std::forward<Args>(args)...);
}

```

39 For a subexpression `sndr` let `Sndr` be `decltype((sndr))`. Let `rcvr` be a receiver with an associated environment of type `Env` such that `sender_in<Sndr, Env>` is true. `completion-signatures-for<Sndr, Env>` denotes a specialization of `completion_signatures`, the set of whose template arguments correspond to the set of completion operations that are potentially evaluated as a result of starting (33.3) the operation state that results from connecting `sndr` and `rcvr`. When `sender_in<Sndr, Env>` is false, the type denoted by `completion-signatures-for<Sndr, Env>`, if any, is not a specialization of `completion_signatures`.

*Recommended practice:* When `sender_in<Sndr, Env>` is false, implementations are encouraged to use the type denoted by `completion-signatures-for<Sndr, Env>` to communicate to users why.

```

template<sender Sndr, queryable Env>
constexpr auto write-env(Sndr&& sndr, Env&& env); // exposition only

```

40 `write-env` is an exposition-only sender adaptor that, when connected with a receiver `rcvr`, connects the adapted sender with a receiver whose execution environment is the result of joining the `queryable` argument `env` to the result of `get_env(rcvr)`.

41 Let `write-env-t` be an exposition-only empty class type.

42 *Returns:*

```

make-sender(write-env-t(), std::forward<Env>(env), std::forward<Sndr>(sndr))

```

43 *Remarks:* The exposition-only class template `impls-for` (33.9.1) is specialized for `write-env-t` as follows:

```

template<>
struct impls-for<write-env-t> : default-impls {
    static constexpr auto get-env =
        [](auto& state, const auto& rcvr) noexcept {
            return JOIN-ENV(state, get_env(rcvr));
        };
};

```

### 33.9.3 Sender concepts

[exec.snd.concepts]

1 The `sender` concept defines the requirements for a sender type (33.3). The `sender_in` concept defines the requirements for a sender type that can create asynchronous operations given an associated environment type. The `sender_to` concept defines the requirements for a sender type that can connect with a specific receiver type. The `get_env` customization point object is used to access a sender's associated attributes. The `connect` customization point object is used to connect (33.3) a sender and a receiver to produce an operation state.

```

namespace std::execution {
    template<class Sigs>
        concept valid-completion-signatures = see below; // exposition only

    template<class Sndr>
        concept is-sender = // exposition only
            derived_from<typename Sndr::sender_concept, sender_t>;
}

```

```

template<class Sndr>
concept enable_sender = // exposition only
    is_sender<Sndr> ||
    is_awaitable<Sndr, env_promise<empty_env>>; // 33.9.4

template<class Sndr>
concept sender =
    bool(enable_sender<remove_cvref_t<Sndr>>) &&
    requires (const remove_cvref_t<Sndr>& sndr) {
        { get_env(sndr) } -> queryable;
    } &&
    move_constructible<remove_cvref_t<Sndr>> &&
    constructible_from<remove_cvref_t<Sndr>, Sndr>;

template<class Sndr, class Env = empty_env>
concept sender_in =
    sender<Sndr> &&
    queryable<Env> &&
    requires (Sndr&& sndr, Env&& env) {
        { get_completion_signatures(std::forward<Sndr>(sndr), std::forward<Env>(env)) }
        -> valid_completion_signatures;
    };

template<class Sndr, class Rcvr>
concept sender_to =
    sender_in<Sndr, env_of_t<Rcvr>> &&
    receiver_of<Rcvr, completion_signatures_of_t<Sndr, env_of_t<Rcvr>>> &&
    requires (Sndr&& sndr, Rcvr&& rcvr) {
        connect(std::forward<Sndr>(sndr), std::forward<Rcvr>(rcvr));
    };
}

```

- <sup>2</sup> Given a subexpression `sndr`, let `Sndr` be `decltype((sndr))` and let `rcvr` be a receiver with an associated environment whose type is `Env`. A completion operation is a *permissible completion* for `Sndr` and `Env` if its completion signature appears in the argument list of the specialization of `completion_signatures` denoted by `completion_signatures_of_t<Sndr, Env>`. `Sndr` and `Env` model `sender_in<Sndr, Env>` if all the completion operations that are potentially evaluated by connecting `sndr` to `rcvr` and starting the resulting operation state are permissible completions for `Sndr` and `Env`.
- <sup>3</sup> A type models the exposition-only concept *valid-completion-signatures* if it denotes a specialization of the `completion_signatures` class template.
- <sup>4</sup> The exposition-only concepts *sender-of* and *sender-in-of* define the requirements for a sender type that completes with a given unique set of value result types.

```

namespace std::execution {
    template<class... As>
        using value_signature = set_value_t(As...); // exposition only

    template<class Sndr, class Env, class... Values>
        concept sender_in_of =
            sender_in<Sndr, Env> &&
            MATCHING-SIG( // see 33.1
                set_value_t(Values...),
                value_types_of_t<Sndr, Env, value_signature, type_identity_t>);

    template<class Sndr, class... Values>
        concept sender_of = sender_in_of<Sndr, empty_env, Values...>;
}

```

- <sup>5</sup> Let `sndr` be an expression such that `decltype((sndr))` is `Sndr`. The type `tag_of_t<Sndr>` is as follows:
- (5.1) — If the declaration
- ```

auto&& [tag, data, ...children] = sndr;

```
- would be well-formed, `tag_of_t<Sndr>` is an alias for `decltype(auto(tag))`.

(5.2) — Otherwise, `tag_of_t<Sndr>` is ill-formed.

6 Let *sender-for* be an exposition-only concept defined as follows:

```
namespace std::execution {
    template<class Sndr, class Tag>
    concept sender-for =
        sender<Sndr> &&
        same_as<tag_of_t<Sndr>, Tag>;
}
```

7 For a type T, *SET-VALUE-SIG*(T) denotes the type `set_value_t()` if T is *cv void*; otherwise, it denotes the type `set_value_t(T)`.

8 Library-provided sender types

(8.1) — always expose an overload of a member `connect` that accepts an rvalue sender and

(8.2) — only expose an overload of a member `connect` that accepts an lvalue sender if they model `copy_constructible`.

### 33.9.4 Awaitable helpers

[`exec.awaitable`]

1 The sender concepts recognize awaitables as senders. For [Clause 33](#), an *awaitable* is an expression that would be well-formed as the operand of a `co_await` expression within a given context.

2 For a subexpression *c*, let *GET-AWAITER*(*c*, *p*) be expression-equivalent to the series of transformations and conversions applied to *c* as the operand of an *await-expression* in a coroutine, resulting in lvalue *e* as described by [7.6.2.4](#), where *p* is an lvalue referring to the coroutine's promise, which has type `Promise`.

[*Note 1*: This includes the invocation of the promise type's `await_transform` member if any, the invocation of the operator `co_await` picked by overload resolution if any, and any necessary implicit conversions and materializations. — *end note*]

3 Let *is-awaitable* be the following exposition-only concept:

```
namespace std {
    template<class T>
    concept await-suspend-result = see below; // exposition only

    template<class A, class Promise>
    concept is-awaiter = // exposition only
        requires (A& a, coroutine_handle<Promise> h) {
            a.await_ready() ? 1 : 0;
            { a.await_suspend(h) } -> await-suspend-result;
            a.await_resume();
        };

    template<class C, class Promise>
    concept is-awaitable = // exposition only
        requires (C (*fc)() noexcept, Promise& p) {
            { GET-AWAITER(fc(), p) } -> is-awaiter<Promise>;
        };
}
```

*await-suspend-result*<T> is true if and only if one of the following is true:

(3.1) — T is void, or

(3.2) — T is bool, or

(3.3) — T is a specialization of `coroutine_handle`.

4 For a subexpression *c* such that `decltype((c))` is type C, and an lvalue *p* of type `Promise`, *await-result-type*<C, `Promise`> denotes the type `decltype(GET-AWAITER(c, p).await_resume())`.

5 Let *with-await-transform* be the exposition-only class template:

```
namespace std::execution {
    template<class T, class Promise>
    concept has-as-awaitable = // exposition only
        requires (T&& t, Promise& p) {
            { std::forward<T>(t).as_awaitable(p) } -> is-awaitable<Promise&>;
        };
}
```

```

};

template<class Derived>
struct with-await-transform { // exposition only
    template<class T>
        T&& await_transform(T&& value) noexcept {
            return std::forward<T>(value);
        }

    template<has-as-awaitable<Derived> T>
        decltype(auto) await_transform(T&& value)
            noexcept(noexcept(std::forward<T>(value).as_awaitable(declval<Derived>()))) {
            return std::forward<T>(value).as_awaitable(static_cast<Derived&&>(*this));
        }
};
}

```

<sup>6</sup> Let *env-promise* be the exposition-only class template:

```

namespace std::execution {
    template<class Env>
    struct env-promise : with-await-transform<env-promise<Env>> { // exposition only
        unspecified get_return_object() noexcept;
        unspecified initial_suspend() noexcept;
        unspecified final_suspend() noexcept;
        void unhandled_exception() noexcept;
        void return_void() noexcept;
        coroutine_handle<> unhandled_stopped() noexcept;

        const Env& get_env() const noexcept;
    };
}

```

[Note 2: of *env-promise* are used only for the purpose of type computation; its members need not be defined. — end note]

### 33.9.5 execution::default\_domain

[exec.domain.default]

```

1 namespace std::execution {
    struct default_domain {
        template<sender Sndr, queryable... Env>
            requires (sizeof...(Env) <= 1)
            static constexpr sender decltype(auto) transform_sender(Sndr&& sndr, const Env&... env)
                noexcept(see below);

        template<sender Sndr, queryable Env>
            static constexpr queryable decltype(auto) transform_env(Sndr&& sndr, Env&& env) noexcept;

        template<class Tag, sender Sndr, class... Args>
            static constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
                noexcept(see below);
    };
}

template<sender Sndr, queryable... Env>
    requires (sizeof...(Env) <= 1)
constexpr sender decltype(auto) transform_sender(Sndr&& sndr, const Env&... env)
    noexcept(see below);

```

<sup>2</sup> Let *e* be the expression

```
tag_of_t<Sndr>().transform_sender(std::forward<Sndr>(sndr), env...)
```

if that expression is well-formed; otherwise, `std::forward<Sndr>(sndr)`.

<sup>3</sup> Returns: *e*.

Remarks: The exception specification is equivalent to `noexcept(e)`.

```
template<sender Sndr, queryable Env>
constexpr queryable decltype(auto) transform_env(Sndr&& sndr, Env&& env) noexcept;
4   Let e be the expression
      tag_of_t<Sndr>().transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
      if that expression is well-formed; otherwise, static_cast<Env>(std::forward<Env>(env)).
5   Mandates: noexcept(e) is true.
6   Returns: e.
```

```
template<class Tag, sender Sndr, class... Args>
constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
noexcept(see below);
```

```
7   Let e be the expression
      Tag().apply_sender(std::forward<Sndr>(sndr), std::forward<Args>(args)...)
8   Constraints: e is a well-formed expression.
9   Returns: e.
10  Remarks: The exception specification is equivalent to noexcept(e).
```

### 33.9.6 execution::transform\_sender [exec.snd.transform]

```
namespace std::execution {
  template<class Domain, sender Sndr, queryable... Env>
    requires (sizeof...(Env) <= 1)
    constexpr sender decltype(auto) transform_sender(Domain dom, Sndr&& sndr, const Env&... env)
      noexcept(see below);
}
```

```
1   Let transformed-sndr be the expression
      dom.transform_sender(std::forward<Sndr>(sndr), env...)
      if that expression is well-formed; otherwise,
      default_domain().transform_sender(std::forward<Sndr>(sndr), env...)
      Let final-sndr be the expression transformed-sndr if transformed-sndr and sndr have the same
      type ignoring cv-qualifiers; otherwise, it is the expression transform_sender(dom, transformed-sndr,
      env...).
2   Returns: final-sndr.
3   Remarks: The exception specification is equivalent to noexcept(final-sndr).
```

### 33.9.7 execution::transform\_env [exec.snd.transform.env]

```
namespace std::execution {
  template<class Domain, sender Sndr, queryable Env>
    constexpr queryable decltype(auto) transform_env(Domain dom, Sndr&& sndr, Env&& env) noexcept;
}
```

```
1   Let e be the expression
      dom.transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
      if that expression is well-formed; otherwise,
      default_domain().transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
2   Mandates: noexcept(e) is true.
3   Returns: e.
```

**33.9.8 execution::apply\_sender****[exec.snd.apply]**

```
namespace std::execution {
    template<class Domain, class Tag, sender Sndr, class... Args>
        constexpr decltype(auto) apply_sender(Domain dom, Tag, Sndr&& sndr, Args&&... args)
            noexcept(see below);
}
```

- 1 Let  $e$  be the expression  
     `dom.apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)...`  
 if that expression is well-formed; otherwise,  
     `default_domain().apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)...`
- 2 *Constraints:* The expression  $e$  is well-formed.
- 3 *Returns:*  $e$ .
- 4 *Remarks:* The exception specification is equivalent to `noexcept( $e$ )`.

**33.9.9 execution::get\_completion\_signatures****[exec.getcompsigs]**

- 1 `get_completion_signatures` is a customization point object. Let `sndr` be an expression such that `decltype((sndr))` is `Sndr`, and let `env` be an expression such that `decltype((env))` is `Env`. Let `new_sndr` be the expression `transform_sender(decltype(get_domain_late(sndr, env)), sndr, env)`, and let `NewSndr` be `decltype((new_sndr))`. Then `get_completion_signatures(sndr, env)` is expression-equivalent to `(void(sndr), void(env), CS())` except that `void(sndr)` and `void(env)` are indeterminately sequenced, where `CS` is:

- (1.1) — `decltype(new_sndr.get_completion_signatures(env))` if that type is well-formed,  
 (1.2) — `remove_cvref_t<NewSndr>::completion_signatures` if that type is well-formed,  
 (1.3) — Otherwise, if `is_awaitable<NewSndr, env-promise<Env>>` is true, then:

```
completion_signatures<
    SET-VALUE-SIG(await-result-type<NewSndr, env-promise<Env>>), // (33.9.3)
    set_error_t(exception_ptr),
    set_stopped_t()>
```

- (1.4) — Otherwise, `CS` is ill-formed.

- 2 Let `rcvr` be an rvalue whose type `Rcvr` models receiver, and let `Sndr` be the type of a sender such that `sender_in<Sndr, env_of_t<Rcvr>>` is true. Let `Sigs...` be the template arguments of the `completion_signatures` specialization named by `completion_signatures_of_t<Sndr, env_of_t<Rcvr>>`. Let `CS0` be a completion function. If sender `Sndr` or its operation state cause the expression `CS0(rcvr, args...)` to be potentially evaluated (6.3) then there shall be a signature `Sig` in `Sigs...` such that

```
MATCHING-SIG(decayed-typeof<CS0>(decltype(args)...), Sig)
```

is true (33.1).

**33.9.10 execution::connect****[exec.connect]**

- 1 `connect` connects (33.3) a sender with a receiver.
- 2 The name `connect` denotes a customization point object. For subexpressions `sndr` and `rcvr`, let `Sndr` be `decltype((sndr))` and `Rcvr` be `decltype((rcvr))`, let `new_sndr` be the expression

```
transform_sender(decltype(get_domain_late(sndr, get_env(rcvr))) {}, sndr, get_env(rcvr))
```

and let `DS` and `DR` be `decay_t<decltype((new_sndr))>` and `decay_t<Rcvr>`, respectively.

- 3 Let `connect-awaitable-promise` be the following exposition-only class:

```
namespace std::execution {
    struct connect-awaitable-promise : with-await-transform<connect-awaitable-promise> {

        connect-awaitable-promise(DS&, DR& rcvr) noexcept : rcvr(rcvr) {}

        suspend_always initial_suspend() noexcept { return {}; }
        [[noreturn]] suspend_always final_suspend() noexcept { terminate(); }
        [[noreturn]] void unhandled_exception() noexcept { terminate(); }
    };
}
```

```

[[noreturn]] void return_void() noexcept { terminate(); }

coroutine_handle<> unhandled_stopped() noexcept {
    set_stopped(std::move(rcvr));
    return noop_coroutine();
}

operation-state-task get_return_object() noexcept {
    return operation-state-task{
        coroutine_handle<connect-awaitable-promise>::from_promise(*this)};
}

env_of_t<DR> get_env() const noexcept {
    return execution::get_env(rcvr);
}

private:
    DR& rcvr; // exposition only
};
}

```

- 4 Let *operation-state-task* be the following exposition-only class:

```

namespace std::execution {
    struct operation-state-task {
        using operation_state_concept = operation_state_t;
        using promise_type = connect-awaitable-promise;

        explicit operation-state-task(coroutine_handle<> h) noexcept : coro(h) {}
        operation-state-task(operation-state-task&& o) noexcept
            : coro(exchange(o.coro, {})) {}
        ~operation-state-task() { if (coro) coro.destroy(); }

        void start() & noexcept {
            coro.resume();
        }

    private:
        coroutine_handle<> coro; // exposition only
    };
}

```

- 5 Let *V* name the type *await-result-type*<DS, *connect-awaitable-promise*>, let *Sigs* name the type

```

completion_signatures<
    SET-VALUE-SIG(V), // see (33.9.3)
    set_error_t(exception_ptr),
    set_stopped_t()>

```

and let *connect-awaitable* be an exposition-only coroutine defined as follows:

```

namespace std::execution {
    template<class Fun, class... Ts>
    auto suspend-complete(Fun fun, Ts&&... as) noexcept { // exposition only
        auto fn = [&, fun]() noexcept { fun(std::forward<Ts>(as)...); };

        struct awaiter {
            decltype(fn) fn; // exposition only

            static constexpr bool await_ready() noexcept { return false; }
            void await_suspend(coroutine_handle<>) noexcept { fn(); }
            [[noreturn]] void await_resume() noexcept { unreachable(); }
        };
        return awaiter{fn};
    }
}

```

```

operation-state-task connect-awaitable(DS sndr, DR rcvr) requires receiver_of<DR, Sigs> {
    exception_ptr ep;
    try {
        if constexpr (same_as<V, void>) {
            co_await std::move(sndr);
            co_await suspend-complete(set_value, std::move(rcvr));
        } else {
            co_await suspend-complete(set_value, std::move(rcvr), co_await std::move(sndr));
        }
    } catch(...) {
        ep = current_exception();
    }
    co_await suspend-complete(set_error, std::move(rcvr), std::move(ep));
}
}

```

<sup>6</sup> The expression `connect(sndr, rcvr)` is expression-equivalent to:

(6.1) — `new_sndr.connect(rcvr)` if that expression is well-formed.

*Mandates:* The type of the expression above satisfies `operation_state`.

(6.2) — Otherwise, `connect-awaitable(new_sndr, rcvr)`.

*Mandates:* `sender<Sndr> && receiver<Rcvr>` is true.

### 33.9.11 Sender factories

[exec.factories]

#### 33.9.11.1 `execution::schedule`

[exec.schedule]

<sup>1</sup> `schedule` obtains a schedule sender (33.3) from a scheduler.

<sup>2</sup> The name `schedule` denotes a customization point object. For a subexpression `sch`, the expression `schedule(sch)` is expression-equivalent to `sch.schedule()`.

<sup>3</sup> *Mandates:* The type of `sch.schedule()` satisfies `sender`.

<sup>4</sup> If the expression

```
get_completion_scheduler<set_value_t>(get_env(sch.schedule())) == sch
```

is ill-formed or evaluates to `false`, the behavior of calling `schedule(sch)` is undefined.

#### 33.9.11.2 `execution::just`, `execution::just_error`, `execution::just_stopped`

[exec.just]

<sup>1</sup> `just`, `just_error`, and `just_stopped` are sender factories whose asynchronous operations complete synchronously in their start operation with a value completion operation, an error completion operation, or a stopped completion operation, respectively.

<sup>2</sup> The names `just`, `just_error`, and `just_stopped` denote customization point objects. Let *just-cpo* be one of `just`, `just_error`, or `just_stopped`. For a pack of subexpressions `ts`, let `Ts` be the pack of types `decltype(ts)`. The expression `just-cpo(ts...)` is ill-formed if

(2.1) — `(movable-value<Ts> &&...)` is false, or

(2.2) — `just-cpo` is `just_error` and `sizeof...(ts) == 1` is false, or

(2.3) — `just-cpo` is `just_stopped` and `sizeof...(ts) == 0` is false.

Otherwise, it is expression-equivalent to `make-sender(just-cpo, product-type{ts...})`.

For `just`, `just_error`, and `just_stopped`, let *set-cpo* be `set_value`, `set_error`, and `set_stopped`, respectively. The exposition-only class template *impls-for* (33.9.1) is specialized for *just-cpo* as follows:

```

namespace std::execution {
    template<>
    struct impls-for<decayed-typeof<just-cpo>> : default-impls {
        static constexpr auto start =
            [] (auto& state, auto& rcvr) noexcept -> void {
                auto& [...ts] = state;
                set-cpo(std::move(rcvr), std::move(ts)...);
            };
    };
}

```

**33.9.11.3 execution::read\_env**

[exec.read.env]

- 1 `read_env` is a sender factory for a sender whose asynchronous operation completes synchronously in its start operation with a value completion result equal to a value read from the receiver's associated environment.
- 2 `read_env` is a customization point object. For some query object `q`, the expression `read_env(q)` is expression-equivalent to `make_sender(read_env, q)`.
- 3 The exposition-only class template *impls-for* (33.9.1) is specialized for `read_env` as follows:

```
namespace std::execution {
    template<>
    struct impls_for<decayed_typeof<read_env>> : default_impls {
        static constexpr auto start =
            [](auto query, auto& rcvr) noexcept -> void {
                TRY-SET-VALUE(rcvr, query(get_env(rcvr)));
            };
    };
}
```

**33.9.12 Sender adaptors**

[exec.adapt]

**33.9.12.1 General**

[exec.adapt.general]

- 1 Subclause 33.9.12 specifies a set of sender adaptors.
- 2 The bitwise inclusive OR operator is overloaded for the purpose of creating sender chains. The adaptors also support function call syntax with equivalent semantics.
- 3 Unless otherwise specified:
  - (3.1) — A sender adaptor is prohibited from causing observable effects, apart from moving and copying its arguments, before the returned sender is connected with a receiver using `connect`, and `start` is called on the resulting operation state.
  - (3.2) — A parent sender (33.3) with a single child sender `sndr` has an associated attribute object equal to `FWD-ENV(get_env(sndr))` (33.5.1).
  - (3.3) — A parent sender with more than one child sender has an associated attributes object equal to `empty_env{}`.
  - (3.4) — When a parent sender is connected to a receiver `rcvr`, any receiver used to connect a child sender has an associated environment equal to `FWD-ENV(get_env(rcvr))`.
  - (3.5) — These requirements apply to any function that is selected by the implementation of the sender adaptor.
- 4 If a sender returned from a sender adaptor specified in 33.9.12 is specified to include `set_error_t(Err)` among its set of completion signatures where `decay_t<Err>` denotes the type `exception_ptr`, but the implementation does not potentially evaluate an error completion operation with an `exception_ptr` argument, the implementation is allowed to omit the `exception_ptr` error completion signature from the set.

**33.9.12.2 Closure objects**

[exec.adapt.obj]

- 1 A *pipeable sender adaptor closure object* is a function object that accepts one or more `sender` arguments and returns a `sender`. For a pipeable sender adaptor closure object `c` and an expression `sndr` such that `decltype((sndr))` models `sender`, the following expressions are equivalent and yield a `sender`:

```
c(sndr)
sndr | c
```

Given an additional pipeable sender adaptor closure object `d`, the expression `c | d` produces another pipeable sender adaptor closure object `e`:

`e` is a perfect forwarding call wrapper (22.10.4) with the following properties:

- (1.1) — Its target object is an object `d2` of type `decltype(auto(d))` direct-non-list-initialized with `d`.
- (1.2) — It has one bound argument entity, an object `c2` of type `decltype(auto(c))` direct-non-list-initialized with `c`.
- (1.3) — Its call pattern is `d2(c2(arg))`, where `arg` is the argument used in a function call expression of `e`.

The expression `c | d` is well-formed if and only if the initializations of the state entities (22.10.3) of `e` are all well-formed.

- 2 An object `t` of type `T` is a pipeable sender adaptor closure object if `T` models `derived_from<sender_adaptor_closure<T>>`, `T` has no other base classes of type `sender_adaptor_closure<U>` for any other type `U`, and `T` does not satisfy `sender`.
- 3 The template parameter `D` for `sender_adaptor_closure` can be an incomplete type. Before any expression of type `cv D` appears as an operand to the `|` operator, `D` shall be complete and model `derived_from<sender_adaptor_closure<D>>`. The behavior of an expression involving an object of type `cv D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined `operator|` function.
- 4 A *pipeable sender adaptor object* is a customization point object that accepts a `sender` as its first argument and returns a `sender`. If a pipeable sender adaptor object accepts only one argument, then it is a pipeable sender adaptor closure object.
- 5 If a pipeable sender adaptor object `adaptor` accepts more than one argument, then let `sndr` be an expression such that `decltype((sndr))` models `sender`, let `args...` be arguments such that `adaptor(sndr, args...)` is a well-formed expression as specified below, and let `BoundArgs` be a pack that denotes `decltype(auto(args))...`. The expression `adaptor(args...)` produces a pipeable sender adaptor closure object `f` that is a perfect forwarding call wrapper with the following properties:
  - (5.1) — Its target object is a copy of `adaptor`.
  - (5.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward, respectively.`
  - (5.3) — Its call pattern is `adaptor(rcvr, bound_args...)`, where `rcvr` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initializations of the bound argument entities of the result, as specified above, are all well-formed.

### 33.9.12.3 execution::starts\_on

[exec.starts.on]

- 1 `starts_on` adapts an input sender into a sender that will start on an execution agent belonging to a particular scheduler's associated execution resource.
- 2 The name `starts_on` denotes a customization point object. For subexpressions `sch` and `sndr`, if `decltype((sch))` does not satisfy `scheduler`, or `decltype((sndr))` does not satisfy `sender`, `starts_on(sch, sndr)` is ill-formed.
- 3 Otherwise, the expression `starts_on(sch, sndr)` is expression-equivalent to:
 

```
transform_sender(
    query-or-default(get_domain, sch, default_domain()),
    make_sender(starts_on, sch, sndr))
```

 except that `sch` is evaluated only once.
- 4 Let `out_sndr` and `env` be subexpressions such that `OutSndr` is `decltype((out_sndr))`. If `sender_for<OutSndr, starts_on_t>` is false, then the expressions `starts_on.transform_env(out_sndr, env)` and `starts_on.transform_sender(out_sndr, env)` are ill-formed; otherwise
  - (4.1) — `starts_on.transform_env(out_sndr, env)` is equivalent to:
 

```
auto&& [_, sch, _] = out_sndr;
return JOIN-ENV(SCHED-ENV(sch), FWD-ENV(env));
```
  - (4.2) — `starts_on.transform_sender(out_sndr, env)` is equivalent to:
 

```
auto&& [_, sch, sndr] = out_sndr;
return let_value(
    schedule(sch),
    [sndr = std::forward_like<OutSndr>(sndr)]() mutable
    noexcept(is_nothrow_move_constructible_v<decay_t<OutSndr>>) {
    return std::move(sndr);
});
```
- 5 Let `out_sndr` be a subexpression denoting a sender returned from `starts_on(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling

`start(op)` shall start `sndr` on an execution agent of the associated execution resource of `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

### 33.9.12.4 `execution::continues_on` [exec.continues.on]

- 1 `continues_on` adapts a sender into one that completes on the specified scheduler.
- 2 The name `continues_on` denotes a pipeable sender adaptor object. For subexpressions `sch` and `sndr`, if `decltype((sch))` does not satisfy `scheduler`, or `decltype((sndr))` does not satisfy `sender`, `continues_on(sndr, sch)` is ill-formed.
- 3 Otherwise, the expression `continues_on(sndr, sch)` is expression-equivalent to:
 

```
transform_sender(get-domain-early(sndr), make-sender(continues_on, sch, sndr))
```

 except that `sndr` is evaluated only once.
- 4 The exposition-only class template `impls-for` is specialized for `continues_on_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<continues_on_t> : default-impls {
    static constexpr auto get-attrs =
      [] (const auto& data, const auto& child) noexcept -> decltype(auto) {
        return JOIN-ENV(SCHED-ATTRS(data), FWD-ENV(get_env(child)));
      };
  };
}
```

- 5 Let `sndr` and `env` be subexpressions such that `Sndr` is `decltype((sndr))`. If `sender-for<Sndr, continues_on_t>` is false, then the expression `continues_on.transform_sender(sndr, env)` is ill-formed; otherwise, it is equal to:

```
auto [_, data, child] = sndr;
return schedule_from(std::move(data), std::move(child));
```

[Note 1: This causes the `continues_on(sndr, sch)` sender to become `schedule_from(sch, sndr)` when it is connected with a receiver whose execution domain does not customize `continues_on`. — end note]

- 6 Let `out_sndr` be a subexpression denoting a sender returned from `continues_on(sndr, sch)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on the current execution agent and execute completion operations on `out_rcvr` on an execution agent of the execution resource associated with `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

### 33.9.12.5 `execution::schedule_from` [exec.schedule.from]

- 1 `schedule_from` schedules work dependent on the completion of a sender onto a scheduler's associated execution resource.

[Note 1: `schedule_from` is not meant to be used in user code; it is used in the implementation of `continues_on`. — end note]

- 2 The name `schedule_from` denotes a customization point object. For some subexpressions `sch` and `sndr`, let `Sch` be `decltype((sch))` and `Sndr` be `decltype((sndr))`. If `Sch` does not satisfy `scheduler`, or `Sndr` does not satisfy `sender`, `schedule_from(sch, sndr)` is ill-formed.

- 3 Otherwise, the expression `schedule_from(sch, sndr)` is expression-equivalent to:

```
transform_sender(
  query-or-default(get_domain, sch, default_domain()),
  make-sender(schedule_from, sch, sndr))
```

except that `sch` is evaluated only once.

- 4 The exposition-only class template `impls-for` (33.9.1) is specialized for `schedule_from_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<schedule_from_t> : default-impls {
    static constexpr auto get-attrs = see below;
  };
}
```

```

    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
};
}

```

- 5 The member `impls-for<schedule_from_t>::get-attrs` is initialized with a callable object equivalent to the following lambda:

```

[] (const auto& data, const auto& child) noexcept -> decltype(auto) {
    return JOIN-ENV(SCHED-ATTRS(data), FWD-ENV(get_env(child)));
}

```

- 6 The member `impls-for<schedule_from_t>::get-state` is initialized with a callable object equivalent to the following lambda:

```

[] <class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(see below)
    requires sender_in<child-type<Sndr>, env_of_t<Rcvr>> {

    auto& [_ , sch, child] = sndr;

    using sched_t = decltype(auto(sch));
    using variant_t = see below;
    using receiver_t = see below;
    using operation_t = connect_result_t<schedule_result_t<sched_t>, receiver_t>;
    constexpr bool nothrow = noexcept(connect(schedule(sch), receiver_t{nullptr}));

    struct state-type {
        Rcvr& rcvr; // exposition only
        variant_t async-result; // exposition only
        operation_t op-state; // exposition only

        explicit state-type(sched_t sch, Rcvr& rcvr) noexcept(nothrow)
            : rcvr(rcvr), op-state(connect(schedule(sch), receiver_t{this})) {}
    };

    return state-type{sch, rcvr};
}

```

- 7 Objects of the local class `state-type` can be used to initialize a structured binding.

- 8 Let `Sigs` be a pack of the arguments to the `completion_signatures` specialization named by `completion_signatures_of_t<child-type<Sndr>, env_of_t<Rcvr>>`. Let `as-tuple` be an alias template that transforms a completion signature `Tag(Args...)` into the tuple specialization `decayed-tuple<Tag, Args...>`. Then `variant_t` denotes the type `variant<monostate, as-tuple<Sigs>...>`, except with duplicate types removed.

- 9 `receiver_t` is an alias for the following exposition-only class:

```

namespace std::execution {
    struct receiver-type {
        using receiver_concept = receiver_t;
        state-type* state; // exposition only

        void set_value() && noexcept {
            visit(
                [this]<class Tuple>(Tuple& result) noexcept -> void {
                    if constexpr (!same_as<monostate, Tuple>) {
                        auto& [tag, ...args] = result;
                        tag(std::move(state->rcvr), std::move(args)...);
                    }
                },
                state->async-result);
        }

        template<class Error>
        void set_error(Error&& err) && noexcept {
            execution::set_error(std::move(state->rcvr), std::forward<Error>(err));
        }
    };
}

```

```

void set_stopped() && noexcept {
    execution::set_stopped(std::move(state->rcvr));
}

decltype(auto) get_env() const noexcept {
    return FWD-ENV(execution::get_env(state->rcvr));
}
};
}

```

<sup>10</sup> The expression in the `noexcept` clause of the lambda is `true` if the construction of the returned *state-type* object is not potentially throwing; otherwise, `false`.

<sup>11</sup> The member *impls-for*<schedule\_from\_t>::*complete* is initialized with a callable object equivalent to the following lambda:

```

[]<class Tag, class... Args>(auto, auto& state, auto& rcvr, Tag, Args&&... args) noexcept
-> void {
    using result_t = decayed-tuple<Tag, Args...>;
    constexpr bool nothrow = is_nothrow_constructible_v<result_t, Tag, Args...>;

    TRY-EVAL(rcvr, [&]() noexcept(nothrow) {
        state.async-result.template emplace<result_t>(Tag(), std::forward<Args>(args)...);
    }());

    if (state.async-result.valueless_by_exception())
        return;
    if (state.async-result.index() == 0)
        return;

    start(state.op-state);
};

```

<sup>12</sup> Let `out_sndr` be a subexpression denoting a sender returned from `schedule_from(sch, sndr)` or one equal to `sch`, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is `true`. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on the current execution agent and execute completion operations on `out_rcvr` on an execution agent of the execution resource associated with `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

### 33.9.12.6 execution::on

[exec.on]

<sup>1</sup> The `on` sender adaptor has two forms:

- (1.1) — `on(sch, sndr)`, which starts a sender `sndr` on an execution agent belonging to a scheduler `sch`'s associated execution resource and that, upon `sndr`'s completion, transfers execution back to the execution resource on which the `on` sender was started.
- (1.2) — `on(sndr, sch, closure)`, which upon completion of a sender `sndr`, transfers execution to an execution agent belonging to a scheduler `sch`'s associated execution resource, then executes a sender adaptor closure `closure` with the async results of the sender, and that then transfers execution back to the execution resource on which `sndr` completed.

<sup>2</sup> The name `on` denotes a pipeable sender adaptor object. For subexpressions `sch` and `sndr`, `on(sch, sndr)` is ill-formed if any of the following is true:

- (2.1) — `decltype((sch))` does not satisfy `scheduler`, or
- (2.2) — `decltype((sndr))` does not satisfy `sender` and `sndr` is not a pipeable sender adaptor closure object (33.9.12.2), or
- (2.3) — `decltype((sndr))` satisfies `sender` and `sndr` is also a pipeable sender adaptor closure object.

<sup>3</sup> Otherwise, if `decltype((sndr))` satisfies `sender`, the expression `on(sch, sndr)` is expression-equivalent to:

```

transform_sender(
    query-or-default(get_domain, sch, default_domain()),
    make_sender(on, sch, sndr))

```

except that `sch` is evaluated only once.

4 For subexpressions `sndr`, `sch`, and `closure`, if

- (4.1) — `decltype((sch))` does not satisfy `scheduler`, or
- (4.2) — `decltype((sndr))` does not satisfy `sender`, or
- (4.3) — `closure` is not a pipeable sender adaptor closure object (33.9.12.2),

the expression `on(sndr, sch, closure)` is ill-formed; otherwise, it is expression-equivalent to:

```
transform_sender(
    get-domain-early(sndr),
    make_sender(on, product-type{sch, closure}, sndr))
```

except that `sndr` is evaluated only once.

5 Let `out_sndr` and `env` be subexpressions, let `OutSndr` be `decltype((out_sndr))`, and let `Env` be `decltype((env))`. If `sender-for<OutSndr, on_t>` is `false`, then the expressions `on.transform_env(out_sndr, env)` and `on.transform_sender(out_sndr, env)` are ill-formed.

6 Otherwise: Let `not-a-scheduler` be an unspecified empty class type, and let `not-a-sender` be the exposition-only type:

```
struct not-a-sender {
    using sender_concept = sender_t;

    auto get_completion_signatures(auto&&) const {
        return see below;
    }
};
```

where the member function `get_completion_signatures` returns an object of a type that is not a specialization of the `completion_signatures` class template.

7 The expression `on.transform_env(out_sndr, env)` has effects equivalent to:

```
auto&& [_, data, _] = out_sndr;
if constexpr (scheduler<decltype(data)>) {
    return JOIN-ENV(SCHED-ENV(std::forward_like<OutSndr>(data)), FWD-ENV(std::forward<Env>(env)));
} else {
    return std::forward<Env>(env);
}
```

8 The expression `on.transform_sender(out_sndr, env)` has effects equivalent to:

```
auto&& [_, data, child] = out_sndr;
if constexpr (scheduler<decltype(data)>) {
    auto orig_sch =
        query-with-default(get_scheduler, env, not-a-scheduler());

    if constexpr (same_as<decltype(orig_sch), not-a-scheduler>) {
        return not-a-sender{};
    } else {
        return continues_on(
            starts_on(std::forward_like<OutSndr>(data), std::forward_like<OutSndr>(child)),
            std::move(orig_sch));
    }
} else {
    auto& [sch, closure] = data;
    auto orig_sch = query-with-default(
        get_completion_scheduler<set_value_t>,
        get_env(child),
        query-with-default(get_scheduler, env, not-a-scheduler()));

    if constexpr (same_as<decltype(orig_sch), not-a-scheduler>) {
        return not-a-sender{};
    } else {
```

```

return write-env(
  continues_on(
    std::forward_like<OutSndr>(closure)(
      continues_on(
        write-env(std::forward_like<OutSndr>(child), SCHED-ENV(orig_sch)),
        sch)),
      orig_sch),
    SCHED-ENV(sch));
}
}

```

- 9 *Recommended practice:* Implementations should use the return type of `not-a-sender::get_completion_signatures` to inform users that their usage of `on` is incorrect because there is no available scheduler onto which to restore execution.
- 10 Let `out_sndr` be a subexpression denoting a sender returned from `on(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall
- (10.1) — remember the current scheduler, `get_scheduler(get_env(rcvr))`;
  - (10.2) — start `sndr` on an execution agent belonging to `sch`'s associated execution resource;
  - (10.3) — upon `sndr`'s completion, transfer execution back to the execution resource associated with the scheduler remembered in step 1; and
  - (10.4) — forward `sndr`'s async result to `out_rcvr`.

If any scheduling operation fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

- 11 Let `out_sndr` be a subexpression denoting a sender returned from `on(sndr, sch, closure)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall
- (11.1) — remember the current scheduler, which is the first of the following expressions that is well-formed:
    - (11.1.1) — `get_completion_scheduler<set_value_t>(get_env(sndr))`
    - (11.1.2) — `get_scheduler(get_env(rcvr))`;
  - (11.2) — start `sndr` on the current execution agent;
  - (11.3) — upon `sndr`'s completion, transfer execution to an agent owned by `sch`'s associated execution resource;
  - (11.4) — forward `sndr`'s async result as if by connecting and starting a sender `closure(S)`, where `S` is a sender that completes synchronously with `sndr`'s async result; and
  - (11.5) — upon completion of the operation started in the previous step, transfer execution back to the execution resource associated with the scheduler remembered in step 1 and forward the operation's async result to `out_rcvr`.

If any scheduling operation fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

### 33.9.12.7 `execution::then`, `execution::upon_error`, `execution::upon_stopped` [exec.then]

- 1 `then` attaches an invocable as a continuation for an input sender's value completion operation. `upon_error` and `upon_stopped` do the same for the error and stopped completion operations, respectively, sending the result of the invocable as a value completion.
- 2 The names `then`, `upon_error`, and `upon_stopped` denote pipeable sender adaptor objects. Let the expression `then-cpo` be one of `then`, `upon_error`, or `upon_stopped`. For subexpressions `sndr` and `f`, if `decltype((sndr))` does not satisfy `sender`, or `decltype((f))` does not satisfy `movable-value`, `then-cpo(sndr, f)` is ill-formed.
- 3 Otherwise, the expression `then-cpo(sndr, f)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(then-cpo, f, sndr))
```

except that `sndr` is evaluated only once.

- <sup>4</sup> For `then`, `upon_error`, and `upon_stopped`, let `set-cpo` be `set_value`, `set_error`, and `set_stopped`, respectively. The exposition-only class template `impls-for` (33.9.1) is specialized for `then-cpo` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<decayed-typeof<then-cpo>> : default-impls {
    static constexpr auto complete =
      [<class Tag, class... Args>
       (auto, auto& fn, auto& rcvr, Tag, Args&&... args) noexcept -> void {
         if constexpr (same_as<Tag, decayed-typeof<set-cpo>>) {
           TRY-SET-VALUE(rcvr,
                        invoke(std::move(fn), std::forward<Args>(args)...));
         } else {
           Tag()(std::move(rcvr), std::forward<Args>(args)...);
         }
       }
      ];
  };
}
```

- <sup>5</sup> The expression `then-cpo(sndr, f)` has undefined behavior unless it returns a `senderout_sndr` that

- (5.1) — invokes `f` or a copy of such with the value, error, or stopped result datums of `sndr` for `then`, `upon_error`, and `upon_stopped`, respectively, using the result value of `f` as `out_sndr`'s value completion, and
- (5.2) — forwards all other completion operations unchanged.

### 33.9.12.8 `execution::let_value`, `execution::let_error`, `execution::let_stopped` [exec.let]

- <sup>1</sup> `let_value`, `let_error`, and `let_stopped` transform a sender's value, error, and stopped completions, respectively, into a new child asynchronous operation by passing the sender's result datums to a user-specified callable, which returns a new sender that is connected and started.

- <sup>2</sup> For `let_value`, `let_error`, and `let_stopped`, let `set-cpo` be `set_value`, `set_error`, and `set_stopped`, respectively. Let the expression `let-cpo` be one of `let_value`, `let_error`, or `let_stopped`. For a subexpression `sndr`, let `let-env(sndr)` be expression-equivalent to the first well-formed expression below:

- (2.1) — `SCHED-ENV(get_completion_scheduler<decayed-typeof<set-cpo>>(get_env(sndr)))`
- (2.2) — `MAKE-ENV(get_domain, get_domain(get_env(sndr)))`
- (2.3) — `(void(sndr), empty_env{})`

- <sup>3</sup> The names `let_value`, `let_error`, and `let_stopped` denote pipeable sender adaptor objects. For subexpressions `sndr` and `f`, let `F` be the decayed type of `f`. If `decltype((sndr))` does not satisfy `sender` or if `decltype((f))` does not satisfy `movable-value`, the expression `let-cpo(sndr, f)` is ill-formed. If `F` does not satisfy `invocable`, the expression `let_stopped(sndr, f)` is ill-formed.

- <sup>4</sup> Otherwise, the expression `let-cpo(sndr, f)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make_sender(let-cpo, f, sndr))
```

except that `sndr` is evaluated only once.

- <sup>5</sup> The exposition-only class template `impls-for` (33.9.1) is specialized for `let-cpo` as follows:

```
namespace std::execution {
  template<class State, class Rcvr, class... Args>
  void let-bind(State& state, Rcvr& rcvr, Args&&... args); // exposition only

  template<>
  struct impls-for<decayed-typeof<let-cpo>> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
  };
}
```

- <sup>6</sup> Let `receiver2` denote the following exposition-only class template:

```

namespace std::execution {
    template<class Rcvr, class Env>
    struct receiver2 {
        using receiver_concept = receiver_t;

        template<class... Args>
        void set_value(Args&&... args) && noexcept {
            execution::set_value(std::move(rcvr), std::forward<Args>(args)...);
        }

        template<class Error>
        void set_error(Error&& err) && noexcept {
            execution::set_error(std::move(rcvr), std::forward<Error>(err));
        }

        void set_stopped() && noexcept {
            execution::set_stopped(std::move(rcvr));
        }

        decltype(auto) get_env() const noexcept {
            return JOIN-ENV(env, FWD-ENV(execution::get_env(rcvr)));
        }

        Rcvr& rcvr;           // exposition only
        Env env;             // exposition only
    };
}

```

- 7 *impls-for<decayed-typeof<let-cpo>>::get-state* is initialized with a callable object equivalent to the following:

```

[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) requires see below {
    auto& [_ , fn, child] = sndr;
    using fn_t = decay_t<decltype(fn)>;
    using env_t = decltype(let-env(child));
    using args_variant_t = see below;
    using ops2_variant_t = see below;

    struct state-type {
        fn_t fn;           // exposition only
        env_t env;        // exposition only
        args_variant_t args; // exposition only
        ops2_variant_t ops2; // exposition only
    };
    return state-type{std::forward_like<Sndr>(fn), let-env(child), {}, {}};
}

```

- 8 Let Sigs be a pack of the arguments to the `completion_signatures` specialization named by `completion_signatures_of_t<child-type<Sndr>, env_of_t<Rcvr>>`. Let LetSigs be a pack of those types in Sigs with a return type of `decayed-typeof<set-cpo>`. Let *as-tuple* be an alias template such that *as-tuple*<Tag(Args...)> denotes the type *decayed-tuple*<Args...>. Then `args_variant_t` denotes the type `variant<monostate, as-tuple<LetSigs>...>` except with duplicate types removed.
- 9 Given a type Tag and a pack Args, let *as-sndr2* be an alias template such that *as-sndr2*<Tag(Args...)> denotes the type *call-result-t*<Fn, decay\_t<Args>&...>. Then `ops2_variant_t` denotes the type `variant<monostate, connect_result_t<as-sndr2<LetSigs>, receiver2<Rcvr, Env>>...>` except with duplicate types removed.
- 10 The *requires-clause* constraining the above lambda is satisfied if and only if the types `args_variant_t` and `ops2_variant_t` are well-formed.
- 11 The exposition-only function template *let-bind* has effects equivalent to:
- ```

using args_t = decayed-tuple<Args...>;

```

```

auto mkop2 = [&] {
    return connect(
        apply(std::move(state.fn),
            state.args.template emplace<args_t>(std::forward<Args>(args)...)),
        receiver2{rcvr, std::move(state.env)});
};
start(state.ops2.template emplace<decltype(mkop2())>(emplace-from{mkop2}));

```

- 12 *impls-for*<*decayed-typeof*<*let-cpo*>>::*complete* is initialized with a callable object equivalent to the following:

```

[]<class Tag, class... Args>
(auto, auto& state, auto& rcvr, Tag, Args&&... args) noexcept -> void {
    if constexpr (same_as<Tag, decayed-typeof<set-cpo>>) {
        TRY-EVAL(rcvr, let-bind(state, rcvr, std::forward<Args>(args)...));
    } else {
        Tag()(std::move(rcvr), std::forward<Args>(args)...);
    }
}

```

- 13 Let *sndr* and *env* be subexpressions, and let *Sndr* be *decltype*((*sndr*)). If *sender-for*<*Sndr*, *decayed-typeof*<*let-cpo*>> is false, then the expression *let-cpo*.*transform\_env*(*sndr*, *env*) is ill-formed. Otherwise, it is equal to *JOIN-ENV*(*let-env*(*sndr*), *FWD-ENV*(*env*)).

- 14 Let the subexpression *out\_sndr* denote the result of the invocation *let-cpo*(*sndr*, *f*) or an object equal to such, and let the subexpression *rcvr* denote a receiver such that the expression *connect*(*out\_sndr*, *rcvr*) is well-formed. The expression *connect*(*out\_sndr*, *rcvr*) has undefined behavior unless it creates an asynchronous operation (33.3) that, when started:

- (14.1) — invokes *f* when *set-cpo* is called with *sndr*'s result datums,
- (14.2) — makes its completion dependent on the completion of a sender returned by *f*, and
- (14.3) — propagates the other completion operations sent by *sndr*.

### 33.9.12.9 execution::bulk

[exec.bulk]

- 1 *bulk* runs a task repeatedly for every index in an index space.

The name *bulk* denotes a pipeable sender adaptor object. For subexpressions *sndr*, *shape*, and *f*, let *Shape* be *decltype*(*auto*(*shape*)). If

- (1.1) — *decltype*((*sndr*)) does not satisfy *sender*, or
- (1.2) — *Shape* does not satisfy *integral*, or
- (1.3) — *decltype*((*f*)) does not satisfy *movable-value*,

*bulk*(*sndr*, *shape*, *f*) is ill-formed.

- 2 Otherwise, the expression *bulk*(*sndr*, *shape*, *f*) is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(bulk, product-type{shape, f}, sndr))
```

except that *sndr* is evaluated only once.

- 3 The exposition-only class template *impls-for* (33.9.1) is specialized for *bulk\_t* as follows:

```

namespace std::execution {
    template<>
    struct impls-for<bulk_t> : default-impls {
        static constexpr auto complete = see below;
    };
}

```

- 4 The member *impls-for*<*bulk\_t*>::*complete* is initialized with a callable object equivalent to the following lambda:

```

[]<class Index, class State, class Rcvr, class Tag, class... Args>
(Index, State& state, Rcvr& rcvr, Tag, Args&&... args) noexcept -> void requires see below {
    if constexpr (same_as<Tag, set_value_t>) {
        auto& [shape, f] = state;
        constexpr bool nothrow = noexcept(f(auto(shape), args...));
    }
}

```

```

    TRY-EVAL(rcvr, [&]() noexcept(nothrow) {
        for (decltype(auto(shape)) i = 0; i < shape; ++i) {
            f(auto(i), args...);
        }
        Tag()(std::move(rcvr), std::forward<Args>(args)...);
    }());
} else {
    Tag()(std::move(rcvr), std::forward<Args>(args)...);
}
}

```

- <sup>5</sup> The expression in the *requires-clause* of the lambda above is `true` if and only if `Tag` denotes a type other than `set_value_t` or if the expression `f(auto(shape), args...)` is well-formed.
- <sup>6</sup> Let the subexpression `out_sndr` denote the result of the invocation `bulk(sndr, shape, f)` or an object equal to such, and let the subexpression `rcvr` denote a receiver such that the expression `connect(out_sndr, rcvr)` is well-formed. The expression `connect(out_sndr, rcvr)` has undefined behavior unless it creates an asynchronous operation (33.3) that, when started,
- (6.1) — on a value completion operation, invokes `f(i, args...)` for every `i` of type `Shape` from 0 to `shape`, where `args` is a pack of lvalue subexpressions referring to the value completion result datums of the input sender, and
- (6.2) — propagates all completion operations sent by `sndr`.

### 33.9.12.10 `execution::split`

[exec.split]

- <sup>1</sup> `split` adapts an arbitrary sender into a sender that can be connected multiple times.
- <sup>2</sup> Let *split-env* be the type of an environment such that, given an instance `env`, the expression `get_stop_token(env)` is well-formed and has type `inplace_stop_token`.
- <sup>3</sup> The name `split` denotes a pipeable sender adaptor object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `sender_in<Sndr, split-env>` is false, `split(sndr)` is ill-formed.
- <sup>4</sup> Otherwise, the expression `split(sndr)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(split, {}, sndr))
```

except that `sndr` is evaluated only once.

[Note 1: The default implementation of `transform_sender` will have the effect of connecting the sender to a receiver. It will return a sender with a different tag type. — end note]

- <sup>5</sup> Let *local-state* denote the following exposition-only class template:

```

namespace std::execution {
    struct local-state-base { // exposition only
        virtual ~local-state-base() = default;
        virtual void notify() noexcept = 0; // exposition only
    };

    template<class Sndr, class Rcvr>
    struct local-state : local-state-base { // exposition only
        using on-stop-callback = // exposition only
            stop_callback_for_t<stop_token_of_t<env_of_t<Rcvr>>, on-stop-request>;

        local-state(Sndr&& sndr, Rcvr& rcvr) noexcept;
        ~local-state();

        void notify() noexcept override;

    private:
        optional<on-stop-callback> on_stop; // exposition only
        shared-state<Sndr>* sh_state; // exposition only
        Rcvr* rcvr; // exposition only
    };
}

```

```
local-state(Sndr&& sndr, Rcvr& rcvr) noexcept;
```

6 *Effects:* Equivalent to:

```
auto& [_, data, _] = sndr;
this->sh_state = data.sh_state.get();
this->sh_state->inc-ref();
this->rcvr = addressof(rcvr);
```

```
~local-state();
```

7 *Effects:* Equivalent to:

```
sh_state->dec-ref();
```

```
void notify() noexcept override;
```

8 *Effects:* Equivalent to:

```
on_stop.reset();
visit(
    [this](const auto& tupl) noexcept -> void {
        apply(
            [this](auto tag, const auto&... args) noexcept -> void {
                tag(std::move(*rcvr), args...);
            },
            tupl);
    },
    sh_state->result);
```

9 Let *split-receiver* denote the following exposition-only class template:

```
namespace std::execution {
    template<class Sndr>
    struct split_receiver { // exposition only
        using receiver_concept = receiver_t;

        template<class Tag, class... Args>
        void complete(Tag, Args&&... args) noexcept { // exposition only
            using tuple_t = decayed_tuple<Tag, Args...>;
            try {
                sh_state->result.template emplace<tuple_t>(Tag(), std::forward<Args>(args)...);
            } catch (...) {
                using tuple_t = tuple<set_error_t, exception_ptr>;
                sh_state->result.template emplace<tuple_t>(set_error, current_exception());
            }
            sh_state->notify();
        }

        template<class... Args>
        void set_value(Args&&... args) && noexcept {
            complete(execution::set_value, std::forward<Args>(args)...);
        }

        template<class Error>
        void set_error(Error&& err) && noexcept {
            complete(execution::set_error, std::forward<Error>(err));
        }

        void set_stopped() && noexcept {
            complete(execution::set_stopped);
        }

        struct env { // exposition only
            shared_state<Sndr>* sh_state; // exposition only

            inplace_stop_token query(get_stop_token_t) const noexcept {
                return sh_state->stop_src.get_token();
            }
        }
    }
}
```

```

};

env get_env() const noexcept {
    return env{sh_state};
}

shared-state<Sndr>* sh_state; // exposition only
};
}

```

10 Let *shared-state* denote the following exposition-only class template:

```

namespace std::execution {
    template<class Sndr>
    struct shared-state {
        using variant-type = see below; // exposition only
        using state-list-type = see below; // exposition only

        explicit shared-state(Sndr&& sndr);

        void start-op() noexcept; // exposition only
        void notify() noexcept; // exposition only
        void inc-ref() noexcept; // exposition only
        void dec-ref() noexcept; // exposition only

        inplace_stop_source stop_src{}; // exposition only
        variant-type result{}; // exposition only
        state-list-type waiting_states; // exposition only
        atomic<bool> completed{false}; // exposition only
        atomic<size_t> ref_count{1}; // exposition only
        connect_result_t<Sndr, split-receiver<Sndr>> op_state; // exposition only
    };
}

```

11 Let *Sigs* be a pack of the arguments to the *completion\_signatures* specialization named by *completion\_signatures\_of\_t<Sndr>*. For type *Tag* and pack *Args*, let *as-tuple* be an alias template such that *as-tuple<Tag(Args...)>* denotes the type *decayed-tuple<Tag, Args...>*. Then *variant-type* denotes the type

```
variant<tuple<set_stopped_t>, tuple<set_error_t, exception_ptr>, as-tuple<Sigs>...>
```

but with duplicate types removed.

12 Let *state-list-type* be a type that stores a list of pointers to *local-state-base* objects and that permits atomic insertion.

```
explicit shared-state(Sndr&& sndr);
```

13 *Effects*: Initializes *op\_state* with the result of `connect(std::forward<Sndr>(sndr), split-receiver{this})`.

14 *Postconditions*: *waiting\_states* is empty, and *completed* is false.

```
void start-op() noexcept;
```

15 *Effects*: Evaluates *inc-ref()*. If `stop_src.stop_requested()` is true, evaluates *notify()*; otherwise, evaluates `start(op_state)`.

```
void notify() noexcept;
```

16 *Effects*: Atomically does the following:

(16.1) — Sets *completed* to true, and

(16.2) — Exchanges *waiting\_states* with an empty list, storing the old value in a local *prior\_states*.

Then, for each pointer *p* in *prior\_states*, evaluates `p->notify()`. Finally, evaluates *dec-ref()*.

```
void inc-ref() noexcept;
```

17 *Effects*: Increments *ref\_count*.

```
void dec-ref() noexcept;
```

- 18 *Effects:* Decrements *ref\_count*. If the new value of *ref\_count* is 0, calls `delete` this.
- 19 *Synchronization:* If an evaluation of `dec-ref()` does not decrement the *ref\_count* to 0 then synchronizes with the evaluation of `dec-ref()` that decrements *ref\_count* to 0.
- 20 Let *split-impl-tag* be an empty exposition-only class type. Given an expression *sndr*, the expression `split.transform_sender(sndr)` is equivalent to:

```
auto&& [tag, _, child] = sndr;
auto* sh_state = new shared-state{std::forward_like<decltype((sndr))>(child)};
return make_sender(split-impl-tag(), shared-wrapper{sh_state, tag});
```

where *shared-wrapper* is an exposition-only class that manages the reference count of the *shared-state* object pointed to by *sh\_state*. *shared-wrapper* models `copyable` with move operations nulling out the moved-from object, copy operations incrementing the reference count by calling `sh_state->inc-ref()`, and assignment operations performing a copy-and-swap operation. The destructor has no effect if *sh\_state* is null; otherwise, it decrements the reference count by evaluating `sh_state->dec-ref()`.

- 21 The exposition-only class template *impls-for* (33.9.1) is specialized for *split-impl-tag* as follows:

```
namespace std::execution {
  template<>
  struct impls-for<split-impl-tag> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto start = see below;
  };
}
```

- 22 The member `impls-for<split-impl-tag>::get-state` is initialized with a callable object equivalent to the following lambda expression:

```
[]<class Sndr>(Sndr&& sndr, auto& rcvr) noexcept {
  return local-state{std::forward<Sndr>(sndr), rcvr};
}
```

- 23 The member `impls-for<split-impl-tag>::start` is initialized with a callable object that has a function call operator equivalent to the following:

```
template<class Sndr, class Rcvr>
void operator()(local-state<Sndr, Rcvr&& state, Rcvr& rcvr) const noexcept;
```

*Effects:* If `state.sh_state->completed` is true, evaluates `state.notify()` and returns. Otherwise, does the following in order:

- (23.1) — Evaluates

```
state.on_stop.emplace(
  get_stop_token(get_env(rcvr)),
  on-stop-request{state.sh_state->stop_src});
```

- (23.2) — Then atomically does the following:

- (23.2.1) — Reads the value *c* of `state.sh_state->completed`, and

- (23.2.2) — Inserts `addressof(state)` into `state.sh_state->waiting_states` if *c* is false.

- (23.3) — If *c* is true, calls `state.notify()` and returns.

- (23.4) — Otherwise, if `addressof(state)` is the first item added to `state.sh_state->waiting_states`, evaluates `state.sh_state->start-op()`.

### 33.9.12.11 execution::when\_all

[exec.when.all]

- 1 `when_all` and `when_all_with_variant` both adapt multiple input senders into a sender that completes when all input senders have completed. `when_all` only accepts senders with a single value completion signature and on success concatenates all the input senders' value result datums into its own value completion operation. `when_all_with_variant(sndrs...)` is semantically equivalent to `when_all(into_variant(sndrs)...)`, where *sndrs* is a pack of subexpressions whose types model *sender*.

- 2 The names `when_all` and `when_all_with_variant` denote customization point objects. Let *sndrs* be a pack of subexpressions, let *Sndrs* be a pack of the types `decltype((sndrs))...`, and let *CD* be the type

`common_type_t<decltype(get-domain-early(sndrs))...>`. The expressions `when_all(sndrs...)` and `when_all_with_variant(sndrs...)` are ill-formed if any of the following is true:

- (2.1) — `sizeof...(sndrs)` is 0, or
- (2.2) — `(sender<Sndrs> && ...)` is false, or
- (2.3) — CD is ill-formed.

<sup>3</sup> The expression `when_all(sndrs...)` is expression-equivalent to:

```
transform_sender(CD(), make-sender(when_all, {}, sndrs...))
```

<sup>4</sup> The exposition-only class template `impls-for` (33.9.1) is specialized for `when_all_t` as follows:

```
namespace std::execution {
    template<>
    struct impls-for<when_all_t> : default-impls {
        static constexpr auto get-attrs = see below;
        static constexpr auto get-env = see below;
        static constexpr auto get-state = see below;
        static constexpr auto start = see below;
        static constexpr auto complete = see below;
    };
}
```

<sup>5</sup> The member `impls-for<when_all_t>::get-attrs` is initialized with a callable object equivalent to the following lambda expression:

```
[](auto&&, auto&&... child) noexcept {
    if constexpr (same_as<CD, default_domain>) {
        return empty_env();
    } else {
        return MAKE-ENV(get_domain, CD());
    }
}
```

<sup>6</sup> The member `impls-for<when_all_t>::get-env` is initialized with a callable object equivalent to the following lambda expression:

```
[]<class State, class Rcvr>(auto&&, State& state, const Receiver& rcvr) noexcept {
    return JOIN-ENV(
        MAKE-ENV(get_stop_token, state.stop_src.get_token()), get_env(rcvr));
}
```

<sup>7</sup> The member `impls-for<when_all_t>::get-state` is initialized with a callable object equivalent to the following lambda expression:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(e) -> decltype(e) {
    return e;
}
```

where `e` is the expression

```
std::forward<Sndr>(sndr).apply(make-state<Rcvr>())
```

and where `make-state` is the following exposition-only class template:

```
template<class Sndr, class Env>
concept max-1-sender-in = sender_in<Sndr, Env> && // exposition only
    (tuple_size_v<value_types_of_t<Sndr, Env, tuple>> <= 1);

enum class disposition { started, error, stopped }; // exposition only

template<class Rcvr>
struct make-state {
    template<max-1-sender-in<env_of_t<Rcvr>>... Sndrs>
    auto operator()(auto, auto, Sndrs&&... sndrs) const {
        using values_tuple = see below;
        using errors_variant = see below;
        using stop_callback = stop_callback_for_t<stop_token_of_t<env_of_t<Rcvr>>, on-stop-request>;
```

```

struct state-type {
    void arrive(Rcvr& rcvr) noexcept { // exposition only
        if (0 == --count) {
            complete(rcvr);
        }
    }

    void complete(Rcvr& rcvr) noexcept; // exposition only

    atomic<size_t> count{sizeof...(sndrs)}; // exposition only
    inplace_stop_source stop_src{}; // exposition only
    atomic<disposition> disp{disposition::started}; // exposition only
    errors_variant errors{}; // exposition only
    values_tuple values{}; // exposition only
    optional<stop_callback> on_stop{nullptr}; // exposition only
};

return state-type{};
}
};

```

<sup>8</sup> Let *copy-fail* be `exception_ptr` if decay-copying any of the child senders' result datums can potentially throw; otherwise, *none-such*, where *none-such* is an unspecified empty class type.

<sup>9</sup> The alias `values_tuple` denotes the type

```
tuple<value_types_of_t<Sndrs, env_of_t<Rcvr>, decayed_tuple, optional>...>
```

if that type is well-formed; otherwise, `tuple<>`.

<sup>10</sup> The alias `errors_variant` denotes the type `variant<none-such, copy-fail, Es...>` with duplicate types removed, where `Es` is the pack of the decayed types of all the child senders' possible error result datums.

<sup>11</sup> The member `void state-type::complete(Rcvr& rcvr) noexcept` behaves as follows:

(11.1) — If `disp` is equal to `disposition::started`, evaluates:

```

auto tie = [<class... T>(tuple<T...& t) noexcept { return tuple<T...>(t); }];
auto set = [&(auto&... t) noexcept { set_value(std::move(rcvr), std::move(t)...); }];

on_stop.reset();
apply(
    [&(auto&... opts) noexcept {
        apply(set, tuple_cat(tie(*opts)...));
    }],
    values);

```

(11.2) — Otherwise, if `disp` is equal to `disposition::error`, evaluates:

```

on_stop.reset();
visit(
    [&<class Error>(Error& error) noexcept {
        if constexpr (!same_as<Error, none-such>) {
            set_error(std::move(rcvr), std::move(error));
        }
    }],
    errors);

```

(11.3) — Otherwise, evaluates:

```

on_stop.reset();
set_stopped(std::move(rcvr));

```

<sup>12</sup> The member `impls-for<when_all_t>::start` is initialized with a callable object equivalent to the following lambda expression:

```

 [<class State, class Rcvr, class... Ops>(
     State& state, Rcvr& rcvr, Ops&... ops) noexcept -> void {
     state.on_stop.emplace(
         get_stop_token(get_env(rcvr)),
         on-stop-request{state.stop_src});
 }

```

```

    if (state.stop_src.stop_requested()) {
        state.on_stop.reset();
        set_stopped(std::move(rcvr));
    } else {
        (start(ops), ...);
    }
}

```

- 13 The member *impls-for<when\_all\_t>::complete* is initialized with a callable object equivalent to the following lambda expression:

```

[]<class Index, class State, class Rcvr, class Set, class... Args>(
    this auto& complete, Index, State& state, Rcvr& rcvr, Set, Args&&... args) noexcept -> void {
    if constexpr (same_as<Set, set_error_t>) {
        if (disposition::error != state.disp.exchange(disposition::error)) {
            state.stop_src.request_stop();
            TRY-EMPLACE-ERROR (state.errors, std::forward<Args>(args)...);
        }
    } else if constexpr (same_as<Set, set_stopped_t>) {
        auto expected = disposition::started;
        if (state.disp.compare_exchange_strong(expected, disposition::stopped)) {
            state.stop_src.request_stop();
        }
    } else if constexpr (!same_as<decltype(State::values), tuple<>>) {
        if (state.disp == disposition::started) {
            auto& opt = get<Index::value>(state.values);
            TRY-EMPLACE-VALUE (complete, opt, std::forward<Args>(args)...);
        }
    }
    state.arrive (rcvr);
}

```

where *TRY-EMPLACE-ERROR* (*v*, *e*), for subexpressions *v* and *e*, is equivalent to:

```

try {
    v.template emplace<decltype(auto(e))>(e);
} catch (...) {
    v.template emplace<exception_ptr>(current_exception());
}

```

if the expression *decltype(auto(e))(e)* is potentially throwing; otherwise, *v.template emplace<decltype(auto(e))>(e)*; and where *TRY-EMPLACE-VALUE* (*c*, *o*, *as...*), for subexpressions *c*, *o*, and pack of subexpressions *as*, is equivalent to:

```

try {
    o.emplace(as...);
} catch (...) {
    c(Index(), state, rcvr, set_error, current_exception());
    return;
}

```

if the expression *decayed-tuple<decltype(as)...>{as...}* is potentially throwing; otherwise, *o.emplace(as...)*.

- 14 The expression *when\_all\_with\_variant*(*sndrs...*) is expression-equivalent to:

```

transform_sender(CD(), make_sender(when_all_with_variant, {}, sndrs...));

```

- 15 Given subexpressions *sndr* and *env*, if *sender-for<decltype((sndr))*, *when\_all\_with\_variant\_t* is *false*, then the expression *when\_all\_with\_variant.transform\_sender(sndr, env)* is ill-formed; otherwise, it is equivalent to:

```

auto&& [_ , _ , ...child] = sndr;
return when_all(into_variant(std::forward_like<decltype((sndr))>(child))...);

```

[Note 1: This causes the *when\_all\_with\_variant*(*sndrs...*) sender to become *when\_all(into\_variant(sndrs)...*) when it is connected with a receiver whose execution domain does not customize *when\_all\_with\_variant*. — end note]

**33.9.12.12 execution::into\_variant** [exec.into.variant]

- 1 `into_variant` adapts a sender with multiple value completion signatures into a sender with just one value completion signature consisting of a variant of tuples.
- 2 The name `into_variant` denotes a pipeable sender adaptor object. For a subexpression `snдр`, let `Sndr` be `decltype((snдр))`. If `Sndr` does not satisfy `sender`, `into_variant(snдр)` is ill-formed.
- 3 Otherwise, the expression `into_variant(snдр)` is expression-equivalent to:

```
transform_sender(get-domain-early(snдр), make-sender(into_variant, {}, snдр))
```

except that `snдр` is only evaluated once.

- 4 The exposition-only class template `impls-for` (33.9.1) is specialized for `into_variant` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<into_variant_t> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
  };
}
```

- 5 The member `impls-for<into_variant_t>::get-state` is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& snдр, Rcvr& rcvr) noexcept
-> type_identity<value_types_of_t<child-type<Sndr>, env_of_t<Rcvr>>> {
  return {};
}
```

- 6 The member `impls-for<into_variant_t>::complete` is initialized with a callable object equivalent to the following lambda:

```
[]<class State, class Rcvr, class Tag, class... Args>(
  auto, State, Rcvr& rcvr, Tag, Args&&... args) noexcept -> void {
  if constexpr (same_as<Tag, set_value_t>) {
    using variant_type = typename State::type;
    TRY-SET-VALUE(rcvr, variant_type(decayed-tuple<Args...>{std::forward<Args>(args)...}));
  } else {
    Tag()(std::move(rcvr), std::forward<Args>(args)...);
  }
}
```

**33.9.12.13 execution::stopped\_as\_optional** [exec.stopped.opt]

- 1 `stopped_as_optional` maps a sender's stopped completion operation into a value completion operation as a disengaged optional. The sender's value completion operation is also converted into an optional. The result is a sender that never completes with stopped, reporting cancellation by completing with a disengaged optional.
- 2 The name `stopped_as_optional` denotes a pipeable sender adaptor object. For a subexpression `snдр`, let `Sndr` be `decltype((snдр))`. The expression `stopped_as_optional(snдр)` is expression-equivalent to:

```
transform_sender(get-domain-early(snдр), make-sender(stopped_as_optional, {}, snдр))
```

except that `snдр` is only evaluated once.

- 3 Let `snдр` and `env` be subexpressions such that `Sndr` is `decltype((snдр))` and `Env` is `decltype((env))`. If `sender-for<Sndr, stopped_as_optional_t>` is false, or if the type `single-sender-value-type<Sndr, Env>` is ill-formed or void, then the expression `stopped_as_optional.transform_sender(snдр, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, _, child] = snдр;
using V = single-sender-value-type<Sndr, Env>;
return let_stopped(
  then(std::forward_like<Sndr>(child),
    []<class... Ts>(Ts&&... ts) noexcept(is_nothrow_constructible_v<V, Ts...>) {
      return optional<V>(in_place, std::forward<Ts>(ts)...);
    }
  ),
  []() noexcept { return just(optional<V>()); });
```

**33.9.12.14** `execution::stopped_as_error` [exec.stopped.err]

- <sup>1</sup> `stopped_as_error` maps an input sender's stopped completion operation into an error completion operation as a custom error type. The result is a sender that never completes with stopped, reporting cancellation by completing with an error.
- <sup>2</sup> The name `stopped_as_error` denotes a pipeable sender adaptor object. For some subexpressions `snldr` and `err`, let `Sndr` be `decltype((snldr))` and let `Err` be `decltype((err))`. If the type `Sndr` does not satisfy `sender` or if the type `Err` does not satisfy `movable-value`, `stopped_as_error(snldr, err)` is ill-formed. Otherwise, the expression `stopped_as_error(snldr, err)` is expression-equivalent to:

```
transform_sender(get-domain-early(snldr), make-sender(stopped_as_error, err, snldr))
```

except that `snldr` is only evaluated once.

- <sup>3</sup> Let `snldr` and `env` be subexpressions such that `Sndr` is `decltype((snldr))` and `Env` is `decltype((env))`. If `sender-for<Sndr, stopped_as_error_t>` is false, then the expression `stopped_as_error.transform_sender(snldr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, err, child] = snldr;
using E = decltype(auto(err));
return let_stopped(
    std::forward_like<Sndr>(child),
    [err = std::forward_like<Sndr>(err)]() mutable noexcept(is_nothrow_move_constructible_v<E>) {
        return just_error(std::move(err));
    });
```

**33.9.13** `Sender consumers` [exec.consumers]**33.9.13.1** `this_thread::sync_wait` [exec.sync.wait]

- <sup>1</sup> `this_thread::sync_wait` and `this_thread::sync_wait_with_variant` are used to block the current thread of execution until the specified sender completes and to return its async result. `sync_wait` mandates that the input sender has exactly one value completion signature.
- <sup>2</sup> Let `sync-wait-env` be the following exposition-only class type:

```
namespace std::this_thread {
    struct sync-wait-env {
        execution::run_loop* loop; // exposition only

        auto query(execution::get_scheduler_t) const noexcept {
            return loop->get_scheduler();
        }

        auto query(execution::get_delegation_scheduler_t) const noexcept {
            return loop->get_scheduler();
        }
    };
}
```

- <sup>3</sup> Let `sync-wait-result-type` and `sync-wait-with-variant-result-type` be exposition-only alias templates defined as follows:

```
namespace std::this_thread {
    template<execution::sender_in<sync-wait-env> Sndr>
    using sync-wait-result-type =
        optional<execution::value_types_of_t<Sndr, sync-wait-env, decayed-tuple,
            type_identity_t>>;

    template<execution::sender_in<sync-wait-env> Sndr>
    using sync-wait-with-variant-result-type =
        optional<execution::value_types_of_t<Sndr, sync-wait-env>>;
}
```

- <sup>4</sup> The name `this_thread::sync_wait` denotes a customization point object. For a subexpression `snldr`, let `Sndr` be `decltype((snldr))`. If `sender_in<Sndr, sync-wait-env>` is false, the expression `this_thread::sync_wait(snldr)` is ill-formed. Otherwise, it is expression-equivalent to the following, except that `snldr` is evaluated only once:

```
apply_sender(get-domain-early(snldr), sync_wait, snldr)
```

*Mandates:*

- (4.1) — The type *sync-wait-result-type*<Sndr> is well-formed.
- (4.2) — *same\_as*<decltype(*e*), *sync-wait-result-type*<Sndr>> is true, where *e* is the *apply\_sender* expression above.

5 Let *sync-wait-state* and *sync-wait-receiver* be the following exposition-only class templates:

```
namespace std::this_thread {
    template<class Sndr>
    struct sync-wait-state { // exposition only
        execution::run_loop loop; // exposition only
        exception_ptr error; // exposition only
        sync-wait-result-type<Sndr> result; // exposition only
    };

    template<class Sndr>
    struct sync-wait-receiver { // exposition only
        using receiver_concept = execution::receiver_t; // exposition only
        sync-wait-state<Sndr>* state; // exposition only

        template<class... Args>
        void set_value(Args&&... args) && noexcept;

        template<class Error>
        void set_error(Error&& err) && noexcept;

        void set_stopped() && noexcept;

        sync-wait-env get_env() const noexcept { return {&state->loop}; }
    };
}
```

```
template<class... Args>
void set_value(Args&&... args) && noexcept;
```

6 *Effects:* Equivalent to:

```
try {
    state->result.emplace(std::forward<Args>(args)...);
} catch (...) {
    state->error = current_exception();
}
state->loop.finish();
```

```
template<class Error>
void set_error(Error&& err) && noexcept;
```

7 *Effects:* Equivalent to:

```
state->error = AS-EXCEPT-PTR(std::forward<Error>(err)); // see 33.1
state->loop.finish();
```

```
void set_stopped() && noexcept;
```

8 *Effects:* Equivalent to *state->loop.finish()*.

9 For a subexpression *sndr*, let *Sndr* be *decltype*((*sndr*)). If *sender\_to*<*Sndr*, *sync-wait-receiver*<*Sndr*>> is false, the expression *sync\_wait.apply\_sender*(*sndr*) is ill-formed; otherwise, it is equivalent to:

```
sync-wait-state<Sndr> state;
auto op = connect(sndr, sync-wait-receiver<Sndr>{&state});
start(op);

state.loop.run();
if (state.error) {
    rethrow_exception(std::move(state.error));
}
```

```
return std::move(state.result);
```

<sup>10</sup> The behavior of `this_thread::sync_wait(sndr)` is undefined unless:

- (10.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.9.2.3) until the specified sender completes.

[*Note 1*: The default implementation of `sync_wait` achieves forward progress guarantee delegation by providing a `run_loop` scheduler via the `get_delegation_scheduler` query on the `sync-wait-receiver`'s environment. The `run_loop` is driven by the current thread of execution. — *end note*]

- (10.2) — It returns the specified sender's async results as follows:

- (10.2.1) — For a value completion, the result datums are returned in a `tuple` in an engaged `optional` object.  
 (10.2.2) — For an error completion, an exception is thrown.  
 (10.2.3) — For a stopped completion, a disengaged `optional` object is returned.

### 33.9.13.2 `this_thread::sync_wait_with_variant` [exec.sync.wait.var]

<sup>1</sup> The name `this_thread::sync_wait_with_variant` denotes a customization point object. For a subexpression `sndr`, let `Sndr` be `decltype(into_variant(sndr))`. If `sender_in<Sndr, sync-wait-env>` is `false`, `this_thread::sync_wait_with_variant(sndr)` is ill-formed. Otherwise, it is expression-equivalent to the following, except `sndr` is evaluated only once:

```
apply_sender(get-domain-early(sndr), sync_wait_with_variant, sndr)
```

*Mandates:*

- (1.1) — The type `sync-wait-with-variant-result-type<Sndr>` is well-formed.  
 (1.2) — `same_as<decltype(e), sync-wait-with-variant-result-type<Sndr>>` is `true`, where `e` is the `apply_sender` expression above.

<sup>2</sup> If `callable<sync_wait_t, Sndr>` is `false`, the expression `sync_wait_with_variant.apply_sender(sndr)` is ill-formed. Otherwise, it is equivalent to:

```
using result_type = sync-wait-with-variant-result-type<Sndr>;
if (auto opt_value = sync_wait(into_variant(sndr))) {
    return result_type(std::move(get<0>(*opt_value)));
}
return result_type(nullopt);
```

<sup>3</sup> The behavior of `this_thread::sync_wait_with_variant(sndr)` is undefined unless:

- (3.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.9.2.3) until the specified sender completes.

[*Note 1*: The default implementation of `sync_wait_with_variant` achieves forward progress guarantee delegation by relying on the forward progress guarantee delegation provided by `sync_wait`. — *end note*]

- (3.2) — It returns the specified sender's async results as follows:

- (3.2.1) — For a value completion, the result datums are returned in an engaged `optional` object that contains a `variant` of `tuples`.  
 (3.2.2) — For an error completion, an exception is thrown.  
 (3.2.3) — For a stopped completion, a disengaged `optional` object is returned.

## 33.10 Sender/receiver utilities [exec.util]

### 33.10.1 `execution::completion_signatures` [exec.util.cmpsig]

<sup>1</sup> `completion_signatures` is a type that encodes a set of completion signatures (33.3).

<sup>2</sup> [*Example 1*:

```
struct my_sender {
    using sender_concept = sender_t;
    using completion_signatures =
        execution::completion_signatures<
            set_value_t(),
            set_value_t(int, float),
            set_error_t(exception_ptr),
            set_error_t(error_code),
```

```

    set_stopped_t(>);
};

```

Declares `my_sender` to be a sender that can complete by calling one of the following for a receiver expression `rcvr`:

- (2.1) — `set_value(rcvr)`
  - (2.2) — `set_value(rcvr, int{...}, float{...})`
  - (2.3) — `set_error(rcvr, exception_ptr{...})`
  - (2.4) — `set_error(rcvr, error_code{...})`
  - (2.5) — `set_stopped(rcvr)`
- *end example*]

3 This subclause makes use of the following exposition-only entities:

```

template<class Fn>
concept completion-signature = see below;

```

4 A type `Fn` satisfies *completion-signature* if and only if it is a function type with one of the following forms:

- (4.1) — `set_value_t(Vs...)`, where `Vs` is a pack of object or reference types.
- (4.2) — `set_error_t(Err)`, where `Err` is an object or reference type.
- (4.3) — `set_stopped_t()`

```

5 template<bool>
  struct indirect-meta-apply {
    template<template<class...> class T, class... As>
      using meta-apply = T<As...>; // exposition only
  };

```

```

template<class...>
  concept always-true = true; // exposition only

```

```

template<class Tag,
  valid-completion-signatures Completions,
  template<class...> class Tuple,
  template<class...> class Variant>
  using gather-signatures = see below;

```

6 Let `Fns` be a pack of the arguments of the `completion_signatures` specialization named by `Completions`, let `TagFns` be a pack of the function types in `Fns` whose return types are `Tag`, and let `Tsn` be a pack of the function argument types in the *n*-th type in `TagFns`. Then, given two variadic templates `Tuple` and `Variant`, the type `gather-signatures<Tag, Completions, Tuple, Variant>` names the type

```

META-APPLY(Variant, META-APPLY(Tuple, Ts0...),
  META-APPLY(Tuple, Ts1...),
  ...,
  META-APPLY(Tuple, Tsm-1...))

```

where *m* is the size of the pack `TagFns` and `META-APPLY(T, As...)` is equivalent to:

```

typename indirect-meta-apply<always-true<As...>>::template meta-apply<T, As...>

```

7 [Note 1: The purpose of `META-APPLY` is to make it valid to use non-variadic templates as `Variant` and `Tuple` arguments to `gather-signatures`. — *end note*]

```

8 namespace std::execution {
  template<completion-signature... Fns>
    struct completion_signatures {};

  template<class Sndr,
    class Env = empty_env,
    template<class...> class Tuple = decayed-tuple,
    template<class...> class Variant = variant-or-empty>
    requires sender_in<Sndr, Env>
    using value_types_of_t =
      gather-signatures<set_value_t, completion_signatures_of_t<Sndr, Env>, Tuple, Variant>;

```

```

template<class Sndr,
        class Env = empty_env,
        template<class...> class Variant = variant-or-empty>
requires sender_in<Sndr, Env>
using error_types_of_t =
    gather-signatures<set_error_t, completion_signatures_of_t<Sndr, Env>,
                    type_identity_t, Variant>;

template<class Sndr, class Env = empty_env>
requires sender_in<Sndr, Env>
constexpr bool sends_stopped =
    !same_as<type-list<>,
    gather-signatures<set_stopped_t, completion_signatures_of_t<Sndr, Env>,
                    type-list, type-list>>;
}

```

### 33.10.2 `execution::transform_completion_signatures` [exec.util.cmplsig.trans]

- <sup>1</sup> `transform_completion_signatures` is an alias template used to transform one set of completion signatures into another. It takes a set of completion signatures and several other template arguments that apply modifications to each completion signature in the set to generate a new specialization of `completion_signatures`.
- <sup>2</sup> [Example 1: Given a sender `Sndr` and an environment `Env`, adapt the completion signatures of `Sndr` by lvalue-ref qualifying the values, adding an additional `exception_ptr` error completion if it is not already there, and leaving the other completion signatures alone.

```

template<class... Args>
using my_set_value_t =
    completion_signatures<
        set_value_t(add_lvalue_reference_t<Args>...)>;

using my_completion_signatures =
    transform_completion_signatures<
        completion_signatures_of_t<Sndr, Env>,
        completion_signatures<set_error_t(exception_ptr)>,
        my_set_value_t>;

```

— end example]

- <sup>3</sup> This subclause makes use of the following exposition-only entities:

```

template<class... As>
using default-set-value =
    completion_signatures<set_value_t(As...)>;

template<class Err>
using default-set-error =
    completion_signatures<set_error_t(Err)>;

```

- <sup>4</sup> namespace `std::execution` {
- ```

    template<valid-completion-signatures InputSignatures,
            valid-completion-signatures AdditionalSignatures = completion_signatures<>,
            template<class...> class SetValue = default-set-value,
            template<class> class SetError = default-set-error,
            valid-completion-signatures SetStopped = completion_signatures<set_stopped_t()>>
    using transform_completion_signatures = completion_signatures<see below>;
}

```

- <sup>5</sup> `SetValue` shall name an alias template such that for any pack of types `As`, the type `SetValue<As...>` is either ill-formed or else `valid-completion-signatures<SetValue<As...>>` is satisfied. `SetError` shall name an alias template such that for any type `Err`, `SetError<Err>` is either ill-formed or else `valid-completion-signatures<SetError<Err>>` is satisfied.
- <sup>6</sup> Let `Vs` be a pack of the types in the `type-list` named by `gather-signatures<set_value_t, InputSignatures, SetValue, type-list>`.

<sup>7</sup> Let *Es* be a pack of the types in the *type-list* named by *gather-signatures*<set\_error\_t, InputSignatures, type\_identity\_t, error-list>, where *error-list* is an alias template such that *error-list*<Ts...> is *type-list*<SetError<Ts>...>.

<sup>8</sup> Let *Ss* name the type completion\_signatures<> if *gather-signatures*<set\_stopped\_t, InputSignatures, type-list, type-list> is an alias for the type *type-list*<>; otherwise, SetStopped.

<sup>9</sup> If any of the above types are ill-formed, then

```
transform_completion_signatures<InputSignatures, AdditionalSignatures,
                               SetValue, SetError, SetStopped>
```

is ill-formed. Otherwise,

```
transform_completion_signatures<InputSignatures, AdditionalSignatures,
                               SetValue, SetError, SetStopped>
```

is the type completion\_signatures<Sigs...> where Sigs... is the unique set of types in all the template arguments of all the completion\_signatures specializations in the set AdditionalSignatures, Vs..., Es..., Ss.

### 33.11 Execution contexts

[exec.ctx]

#### 33.11.1 execution::run\_loop

[exec.run.loop]

##### 33.11.1.1 General

[exec.run.loop.general]

<sup>1</sup> A *run\_loop* is an execution resource on which work can be scheduled. It maintains a thread-safe first-in-first-out queue of work. Its *run* member function removes elements from the queue and executes them in a loop on the thread of execution that calls *run*.

<sup>2</sup> A *run\_loop* instance has an associated *count* that corresponds to the number of work items that are in its queue. Additionally, a *run\_loop* instance has an associated state that can be one of *starting*, *running*, or *finishing*.

<sup>3</sup> Concurrent invocations of the member functions of *run\_loop* other than *run* and its destructor do not introduce data races. The member functions *pop-front*, *push-back*, and *finish* execute atomically.

<sup>4</sup> *Recommended practice*: Implementations should use an intrusive queue of operation states to hold the work units to make scheduling allocation-free.

```
namespace std::execution {
  class run_loop {
    // 33.11.1.2, associated types
    class run-loop-scheduler; // exposition only
    class run-loop-sender; // exposition only
    struct run-loop-opstate-base { // exposition only
      virtual void execute() = 0; // exposition only
      run_loop* loop; // exposition only
      run-loop-opstate-base* next; // exposition only
    };
    template<class Rcvr>
      using run-loop-opstate = unspecified; // exposition only

    // 33.11.1.4, member functions
    run-loop-opstate-base* pop-front(); // exposition only
    void push-back(run-loop-opstate-base*); // exposition only

  public:
    // 33.11.1.3, constructor and destructor
    run_loop() noexcept;
    run_loop(run_loop&&) = delete;
    ~run_loop();

    // 33.11.1.4, member functions
    run-loop-scheduler get_scheduler();
    void run();
    void finish();
  };
}
```

## 33.11.1.2 Associated types

[exec.run.loop.types]

```
class run-loop-scheduler;
```

1 *run-loop-scheduler* is an unspecified type that models *scheduler*.

2 Instances of *run-loop-scheduler* remain valid until the end of the lifetime of the *run\_loop* instance from which they were obtained.

3 Two instances of *run-loop-scheduler* compare equal if and only if they were obtained from the same *run\_loop* instance.

4 Let *sch* be an expression of type *run-loop-scheduler*. The expression *schedule(sch)* has type *run-loop-sender* and is not potentially-throwing if *sch* is not potentially-throwing.

```
class run-loop-sender;
```

5 *run-loop-sender* is an exposition-only type that satisfies *sender*. For any type *Env*, *completion\_signatures\_of\_t<run-loop-sender, Env>* is

```
completion_signatures<set_value_t(), set_error_t(exception_ptr), set_stopped_t()>
```

6 An instance of *run-loop-sender* remains valid until the end of the lifetime of its associated *run\_loop* instance.

7 Let *sndr* be an expression of type *run-loop-sender*, let *rcvr* be an expression such that *receiver\_of<decltype((rcvr)), CS>* is true where *CS* is the *completion\_signatures* specialization above. Let *C* be either *set\_value\_t* or *set\_stopped\_t*. Then:

(7.1) — The expression *connect(sndr, rcvr)* has type *run-loop-opstate<decay\_t<decltype((rcvr))>>* and is potentially-throwing if and only if *(void(sndr), auto(rcvr))* is potentially-throwing.

(7.2) — The expression *get\_completion\_scheduler<C>(get\_env(sndr))* is potentially-throwing if and only if *sndr* is potentially-throwing, has type *run-loop-scheduler*, and compares equal to the *run-loop-scheduler* instance from which *sndr* was obtained.

```
template<class Rcvr>
struct run-loop-opstate;
```

8 *run-loop-opstate<Rcvr>* inherits privately and unambiguously from *run-loop-opstate-base*.

9 Let *o* be a non-const lvalue of type *run-loop-opstate<Rcvr>*, and let *REC(o)* be a non-const lvalue reference to an instance of type *Rcvr* that was initialized with the expression *rcvr* passed to the invocation of *connect* that returned *o*. Then:

(9.1) — The object to which *REC(o)* refers remains valid for the lifetime of the object to which *o* refers.

(9.2) — The type *run-loop-opstate<Rcvr>* overrides *run-loop-opstate-base::execute()* such that *o.execute()* is equivalent to:

```
if (get_stop_token(REC(o)).stop_requested()) {
    set_stopped(std::move(REC(o)));
} else {
    set_value(std::move(REC(o)));
}
```

(9.3) — The expression *start(o)* is equivalent to:

```
try {
    o.loop->push-back(addressof(o));
} catch(...) {
    set_error(std::move(REC(o)), current_exception());
}
```

## 33.11.1.3 Constructor and destructor

[exec.run.loop.ctor]

```
run_loop() noexcept;
```

1 *Postconditions:* *count* is 0 and *state* is *starting*.

```
~run_loop();
```

2 *Effects:* If *count* is not 0 or if *state* is *running*, invokes *terminate* (14.6.2). Otherwise, has no effects.

## 33.11.1.4 Member functions

[exec.run.loop.members]

```
run-loop-opstate-base* pop-front();
```

1 *Effects:* Blocks (3.6) until one of the following conditions is true:

- (1.1) — *count* is 0 and *state* is *finishing*, in which case *pop-front* returns *nullptr*; or
- (1.2) — *count* is greater than 0, in which case an item is removed from the front of the queue, *count* is decremented by 1, and the removed item is returned.

```
void push-back(run-loop-opstate-base* item);
```

2 *Effects:* Adds *item* to the back of the queue and increments *count* by 1.

3 *Synchronization:* This operation synchronizes with the *pop-front* operation that obtains *item*.

```
run-loop-scheduler get_scheduler();
```

4 *Returns:* An instance of *run-loop-scheduler* that can be used to schedule work onto this *run\_loop* instance.

```
void run();
```

5 *Preconditions:* *state* is *starting*.

6 *Effects:* Sets the *state* to *running*. Then, equivalent to:

```
while (auto* op = pop-front()) {
    op->execute();
}
```

7 *Remarks:* When *state* changes, it does so without introducing data races.

```
void finish();
```

8 *Effects:* Changes *state* to *finishing*.

9 *Synchronization:* *finish* synchronizes with the *pop-front* operation that returns *nullptr*.

## 33.12 Coroutine utilities

[exec.coro.util]

## 33.12.1 execution::as\_awaitable

[exec.as.awaitable]

1 *as\_awaitable* transforms an object into one that is awaitable within a particular coroutine. Subclause 33.12 makes use of the following exposition-only entities:

```
namespace std::execution {
    template<class Sndr, class Promise>
    concept awaitable-sender =
        single-sender<Sndr, env_of_t<Promise>> &&
        sender_to<Sndr, awaitable-receiver> && // see below
        requires (Promise& p) {
            { p.unhandled_stopped() } -> convertible_to<coroutine_handle<>>;
        };

    template<class Sndr, class Promise>
    class sender-awaitable; // exposition only
}
```

2 The type *sender-awaitable*<Sndr, Promise> is equivalent to:

```
namespace std::execution {
    template<class Sndr, class Promise>
    class sender-awaitable {
        struct unit {}; // exposition only
        using value-type = // exposition only
            single-sender-value-type<Sndr, env_of_t<Promise>>;
        using result-type = // exposition only
            conditional_t<is_void_v<value-type>, unit, value-type>;
        struct awaitable-receiver; // exposition only

        variant<monostate, result-type, exception_ptr> result{}; // exposition only
        connect_result_t<Sndr, awaitable-receiver> state; // exposition only
    };
}
```

```

public:
    sender-awaitable(Sndr&& sndr, Promise& p);
    static constexpr bool await_ready() noexcept { return false; }
    void await_suspend(coroutine_handle<Promise>) noexcept { start(state); }
    value-type await_resume();
};
}

```

<sup>3</sup> *awaitable-receiver* is equivalent to:

```

struct awaitable-receiver {
    using receiver_concept = receiver_t;
    variant<monostate, result-type, exception_ptr>* result_ptr; // exposition only
    coroutine_handle<Promise> continuation; // exposition only
    // see below
};

```

<sup>4</sup> Let *rcvr* be an rvalue expression of type *awaitable-receiver*, let *crcvr* be a const lvalue that refers to *rcvr*, let *vs* be a pack of subexpressions, and let *err* be an expression of type *Err*. Then:

(4.1) — If `constructible_from<result-type, decltype((vs))...>` is satisfied, the expression `set_value(rcvr, vs...)` is equivalent to:

```

try {
    rcvr.result_ptr->template emplace<1>(vs...);
} catch(...) {
    rcvr.result_ptr->template emplace<2>(current_exception());
}
rcvr.continuation.resume();

```

Otherwise, `set_value(rcvr, vs...)` is ill-formed.

(4.2) — The expression `set_error(rcvr, err)` is equivalent to:

```

rcvr.result_ptr->template emplace<2>(AS-EXCEPT-PTR(err)); // see 33.1
rcvr.continuation.resume();

```

(4.3) — The expression `set_stopped(rcvr)` is equivalent to:

```

static_cast<coroutine_handle<>>(rcvr.continuation.promise()).unhandled_stopped().resume();

```

(4.4) — For any expression *tag* whose type satisfies *forwarding-query* and for any pack of subexpressions *as*, `get_env(crcvr).query(tag, as...)` is expression-equivalent to:

```

tag(get_env(as_const(crcvr.continuation.promise())), as...)

```

```

sender-awaitable(Sndr&& sndr, Promise& p);

```

<sup>5</sup> *Effects*: Initializes *state* with

```

connect(std::forward<Sndr>(sndr),
        awaitable-receiver{addressof(result), coroutine_handle<Promise>::from_promise(p)})

```

```

value-type await_resume();

```

<sup>6</sup> *Effects*: Equivalent to:

```

if (result.index() == 2)
    rethrow_exception(get<2>(result));
if constexpr (!is_void_v<value-type>)
    return std::forward<value-type>(get<1>(result));

```

<sup>7</sup> *as\_awaitable* is a customization point object. For subexpressions *expr* and *p* where *p* is an lvalue, *Expr* names the type `decltype((expr))` and *Promise* names the type `decay_t<decltype((p))>`, `as_awaitable(expr, p)` is expression-equivalent to, except that the evaluations of *expr* and *p* are indeterminately sequenced:

(7.1) — `expr.as_awaitable(p)` if that expression is well-formed.

*Mandates*: `is-awaitable<A, Promise>` is true, where *A* is the type of the expression above.

(7.2) — Otherwise, `(void(p), expr)` if `is-awaitable<Expr, U>` is true, where *U* is an unspecified class type that is not *Promise* and that lacks a member named `await_transform`.

*Preconditions:* *is-awaitable*<Expr, Promise> is true and the expression `co_await expr` in a coroutine with promise type U is expression-equivalent to the same expression in a coroutine with promise type Promise.

(7.3) — Otherwise, *sender-awaitable*{*expr*, *p*} if *awaitable-sender*<Expr, Promise> is true.

(7.4) — Otherwise, `(void(p), expr)`.

### 33.12.2 `execution::with_awaitable_senders` [exec.with.awaitable.senders]

<sup>1</sup> `with_awaitable_senders`, when used as the base class of a coroutine promise type, makes senders awaitable in that coroutine type.

In addition, it provides a default implementation of `unhandled_stopped` such that if a sender completes by calling `set_stopped`, it is treated as if an uncatchable "stopped" exception were thrown from the *await-expression*.

[*Note 1:* The coroutine is never resumed, and the `unhandled_stopped` of the coroutine caller's promise type is called. — *end note*]

```
namespace std::execution {
    template<class-type Promise>
        struct with_awaitable_senders {
            template<class OtherPromise>
                requires (!same_as<OtherPromise, void>)
                void set_continuation(coroutine_handle<OtherPromise> h) noexcept;

            coroutine_handle<> continuation() const noexcept { return continuation; }

            coroutine_handle<> unhandled_stopped() noexcept {
                return stopped-handler(continuation.address());
            }

            template<class Value>
                see below await_transform(Value&& value);

        private:
            [[noreturn]] static coroutine_handle<>
                default-unhandled-stopped(void*) noexcept { // exposition only
                    terminate();
                }
            coroutine_handle<> continuation{}; // exposition only
            coroutine_handle<> (*stopped-handler)(void*) noexcept = // exposition only
                &default-unhandled-stopped;
        };
    }

    template<class OtherPromise>
        requires (!same_as<OtherPromise, void>)
        void set_continuation(coroutine_handle<OtherPromise> h) noexcept;

2     Effects: Equivalent to:
        continuation = h;
        if constexpr ( requires(OtherPromise& other) { other.unhandled_stopped(); } ) {
            stopped-handler = [](void* p) noexcept -> coroutine_handle<> {
                return coroutine_handle<OtherPromise>::from_address(p)
                    .promise().unhandled_stopped();
            };
        } else {
            stopped-handler = &default-unhandled-stopped;
        }

    template<class Value>
        call-result-t<as_awaitable_t, Value, Promise&> await_transform(Value&& value);

3     Effects: Equivalent to:
        return as_awaitable(std::forward<Value>(value), static_cast<Promise&>(*this));

```

# Annex A

## (informative)

### Grammar summary [gram]

#### A.1 General [gram.general]

- <sup>1</sup> This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

#### A.2 Keywords [gram.key]

- <sup>1</sup> New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.8.2), `class` (Clause 11), `enumeration` (9.7.1), and `template` (Clause 13) declarations.

*typedef-name:*

*identifier*

*simple-template-id*

*namespace-name:*

*identifier*

*namespace-alias*

*namespace-alias:*

*identifier*

*class-name:*

*identifier*

*simple-template-id*

*enum-name:*

*identifier*

*template-name:*

## (informative)

### Implementation quantities [implimits]

<sup>1</sup> Implementations can exhibit limitations for various quantities; some possibilities are presented in the following list. The bracketed number following each quantity is a potential minimum value for that quantity.

- (1.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
- (1.2) — Nesting levels of conditional inclusion (15.2) [256].
- (1.3) — Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].
- (1.4) — Nesting levels of parenthesized expressions (7.5.4) within a full-expression [256].
- (1.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1 024].
- (1.6) — Number of characters in an external identifier (5.10, 6.6) [1 024].
- (1.7) — External identifiers (6.6) in one translation unit [65 536].
- (1.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].
- (1.9) — Structured bindings (9.6) introduced in one declaration [256].
- (1.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65 536].
- (1.11) — Parameters in one function definition (9.5.1) [256].
- (1.12) — Arguments in one function call (7.6.1.3) [256].
- (1.13) — Parameters in one macro definition (15.6) [256].
- (1.14) — Arguments in one macro invocation (15.6) [256].
- (1.15) — Characters in one logical source line (5.2) [65 536].
- (1.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].
- (1.17) — Size of an object (6.7.2) [262 144].
- (1.18) — Nesting levels for `#include` files (15.3) [256].
- (1.19) — Case labels for a `switch` statement (8.5.3) (excluding those for any nested `switch` statements) [16 384].
- (1.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].
- (1.21) — Lambda-captures in one *lambda-expression* (7.5.6.3) [256].
- (1.22) — Enumeration constants in a single enumeration (9.7.1) [4 096].
- (1.23) — Levels of nested class definitions (11.4.12) in a single *member-specification* [256].
- (1.24) — Functions registered by `atexit()` (17.5) [32].
- (1.25) — Functions registered by `at_quick_exit()` (17.5) [32].
- (1.26) — Direct and indirect base classes (11.7) [16 384].
- (1.27) — Direct base classes for a single class (11.7) [1 024].
- (1.28) — Class members declared in a single *member-specification* (including member functions) (11.4) [4 096].
- (1.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].
- (1.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].
- (1.31) — Static data members of a class (11.4.9.3) [1 024].

- (1.32) — Friend declarations in a class (11.8.4) [4 096].
- (1.33) — Access control declarations in a class (11.8.2) [4 096].
- (1.34) — Member initializers in a constructor definition (11.9.3) [6 144].
- (1.35) — *initializer-clauses* in one *braced-init-list* (9.4) [16 384].
- (1.36) — Scope qualifications of one identifier (7.5.5.3) [256].
- (1.37) — Nested *linkage-specifications* (9.11) [1 024].
- (1.38) — Recursive constexpr function invocations (9.2.6) [512].
- (1.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].
- (1.40) — Template parameters in a template declaration (13.2) [1 024].
- (1.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].
- (1.42) — Handlers per try block (14.4) [256].
- (1.43) — Number of placeholders (22.10.15.5) [10].
- (1.44) — Number of hazard-protectable possibly-reclaimable objects (32.11.3.1) [256].

# Annex C

## (informative)

## Compatibility

[diff]

### C.1 C++ and ISO C++ 2023

[diff.cpp23]

#### C.1.1 General

[diff.cpp23.general]

- <sup>1</sup> Subclause C.1 lists the differences between C++ and ISO C++ 2023, by the chapters of this document.

#### C.1.2 Clause 7: expressions

[diff.cpp23.expr]

- <sup>1</sup> **Affected subclause:** 7.4

**Change:** Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are no longer valid.

**Rationale:** Reinforcing type safety.

**Effect on original feature:** A valid C++ 2023 program that performs operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type is ill-formed.

[Example 1:

```
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7;      // ill-formed; previously well-formed
int k = f - e;         // ill-formed; previously well-formed
auto x = true ? e : f; // ill-formed; previously well-formed
```

— end example]

- <sup>2</sup> **Affected subclause:** 7.6.2.9

**Change:** Calling `delete` on a pointer to an incomplete class is ill-formed.

**Rationale:** Reduce undefined behavior.

**Effect on original feature:** A valid C++ 2023 program that calls `delete` on an incomplete class type is ill-formed.

[Example 2:

```
struct S;

void f(S *p) {
    delete p;          // ill-formed; previously well-formed
}
```

```
struct S {};
```

— end example]

#### C.1.3 Clause 9: declarations

[diff.cpp23.dcl.dcl]

- <sup>1</sup> **Affected subclause:** 9.4.5

**Change:** Pointer comparisons between `initializer_list` objects' backing arrays are unspecified.

**Rationale:** Permit the implementation to store backing arrays in static read-only memory.

**Effect on original feature:** Valid C++ 2023 code that relies on the result of pointer comparison between backing arrays may change behavior.

[Example 1:

```
bool ne(std::initializer_list<int> a, std::initializer_list<int> b) {
    return a.begin() != b.begin() + 1;
}
bool b = ne({2,3}, {1,2,3}); // unspecified result; previously false
```

— end example]

<sup>2</sup> **Affected subclause:** 9.3.4.5

**Change:** Previously, `T... [n]` would declare a pack of function parameters. `T... [n]` is now a *pack-index-specifier*.

**Rationale:** Improve the handling of packs.

**Effect on original feature:** Valid C++ 2023 code that declares a pack of parameters without specifying a *declarator-id* becomes ill-formed.

[Example 2:

```
template <typename... T>
void f(T... [1]);
template <typename... T>
void g(T... ptr[1]);
int main() {
    f<int, double>(nullptr, nullptr);    // ill-formed, previously void f<int, double>(int [1], double [1])
    g<int, double>(nullptr, nullptr);    // ok
}
```

— end example]

### C.1.4 Clause 13: templates

[diff.cpp23.temp]

<sup>1</sup> **Affected subclause:** 13.5

**Change:** Some atomic constraints become fold expanded constraints.

**Rationale:** Permit the subsumption of fold expressions.

**Effect on original feature:** Valid C++ 2023 code may become ill-formed.

[Example 1:

```
template <typename ...V> struct A;
struct S {
    static constexpr int compare(const S&) { return 1; }
};

template <typename ...T, typename ...U>
void f(A<T ...> *, A<U ...> *)
requires (T::compare(U{}) && ...);    // was well-formed (atomic constraint of type bool),
                                       // now ill-formed (results in an atomic constraint of type int)

void g(A<S, S> *ap) {
    f(ap, ap);
}
```

— end example]

### C.1.5 Clause 16: library introduction

[diff.cpp23.library]

<sup>1</sup> **Affected subclause:** 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<debugging>` (19.7.2), `<hazard_pointer>` (32.11.3.2), `<inplace_vector>` (23.3.13), `<linalg>` (29.9.2), `<rcu>` (32.11.2.2), and `<text_encoding>` (28.4.1). Valid C++ 2023 code that `#includes` headers with these names may be invalid in this revision of C++.

### C.1.6 Clause 27: strings library

[diff.cpp23.strings]

<sup>1</sup> **Affected subclause:** 27.4.5

**Change:** Output of floating-point overloads of `to_string` and `to_wstring`.

**Rationale:** Prevent loss of information and improve consistency with other formatting facilities.

**Effect on original feature:** `to_string` and `to_wstring` function calls that take floating-point arguments may produce a different output.

[Example 1:

```
auto s = std::to_string(1e-7); // "1e-07"
```

```
// previously "0.000000" with '.' possibly
// changed according to the global C locale
```

— end example]

### C.1.7 Clause 23: containers library

[diff.cpp23.containers]

#### 1 Affected subclause: 23.7.2.2.1

**Change:** `span<const T>` is constructible from `initializer_list<T>`.

**Rationale:** Permit passing a braced initializer list to a function taking `span`.

**Effect on original feature:** Valid C++ 2023 code that relies on the lack of this constructor may refuse to compile, or change behavior in this revision of C++.

[Example 1:

```
void one(pair<int, int>);           // #1
void one(span<const int>);        // #2
void t1() { one({1, 2}); }        // ambiguous between #1 and #2; previously called #1
```

```
void two(span<const int, 2>);
void t2() { two({{1, 2}}); }     // ill-formed; previously well-formed
```

```
void *a[10];
int x = span<void* const>{a, 0}.size(); // x is 2; previously 0
any b[10];
int y = span<const any>{b, b + 10}.size(); // y is 2; previously 10
```

— end example]

### C.1.8 Annex D: compatibility features

[diff.cpp23.depr]

#### 1 Change: Remove the type alias `allocator<T>::is_always_equal`.

**Rationale:** Non-empty allocator classes derived from `allocator` needed to explicitly define an `is_always_equal` member type so that `allocator_traits` would not use the one from the allocator base class.

**Effect on original feature:** It is simpler to correctly define an allocator class with an allocator base class.

[Example 1:

```
template <class T>
struct MyAlloc : allocator<T> {
    int tag;
};
```

```
static_assert(!allocator_traits<MyAlloc<int>>::is_always_equal); // Error in C++ 2023,
                                                                // OK in C++ 2026
```

— end example]

#### 2 Change: Removal of atomic access API for `shared_ptr` objects.

**Rationale:** The old behavior was brittle. `shared_ptr` objects using the old API were not protected by the type system, and certain interactions with code not using this API would, in some cases, silently produce undefined behavior. A complete type-safe replacement is provided in the form of `atomic<shared_ptr<T>>`.

**Effect on original feature:** A valid C++ 2023 program that relies on the presence of the removed functions may fail to compile.

#### 3 Change: Remove the `basic_string::reserve()` overload with no parameters.

**Rationale:** The overload of `reserve` with no parameters is redundant. The `shrink_to_fit` member function can be used instead.

**Effect on original feature:** A valid C++ 2023 program that calls `reserve()` on a `basic_string` object may fail to compile. The old functionality can be achieved by calling `shrink_to_fit()` instead, or the function call can be safely eliminated with no side effects.

#### 4 Change: Remove header `<codecvt>` and all its contents.

**Rationale:** The header has been deprecated for the previous three editions of this document and no longer implements the current Unicode standard, supporting only the obsolete UCS-2 encoding. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program `#include`-ing the header or importing the header unit may fail to compile. Code that uses any of the following names by importing the standard library modules may fail to compile:

- (4.1) — `codecvt_mode`,
- (4.2) — `codecvt_utf16`,
- (4.3) — `codecvt_utf8`,
- (4.4) — `codecvt_utf8_utf16`,
- (4.5) — `consume_header`,
- (4.6) — `generate_header`, and
- (4.7) — `little_endian`.

<sup>5</sup> **Change:** Remove header `<strstream>` and all its contents.

**Rationale:** The header has been deprecated since the original C++ standard; the `<spanstream>` header provides an updated, safer facility. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program `#include`-ing the header or importing the header unit may become ill-formed. Code that uses any of the following classes by importing one of the standard library modules may become ill-formed:

- (5.1) — `istrstream`
- (5.2) — `ostrstream`
- (5.3) — `strstream`
- (5.4) — `strstreambuf`

<sup>6</sup> **Change:** Remove convenience interfaces `wstring_convert` and `wbuffer_convert`.

**Rationale:** These features were underspecified with no clear error reporting mechanism and were deprecated for the last three editions of this document. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program using these interfaces may become ill-formed.

## C.2 C++ and ISO C++ 2020

[diff.cpp20]

### C.2.1 General

[diff.cpp20.general]

<sup>1</sup> Subclause C.2 lists the differences between C++ and ISO C++ 2020, in addition to those listed above, by the chapters of this document.

### C.2.2 Clause 5: lexical conventions

[diff.cpp20.lex]

<sup>1</sup> **Affected subclause:** 5.10

**Change:** Previously valid identifiers containing characters not present in UAX #44 properties `XID_Start` or `XID_Continue`, or not in Normalization Form C, are now rejected.

**Rationale:** Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.

**Effect on original feature:** Some identifiers are no longer well-formed.

<sup>2</sup> **Affected subclause:** 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of unimplemented conditionally-supported feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

[Example 1:

```
    auto c = L"a" U"b";           // was conditionally-supported; now ill-formed
— end example]
```

### C.2.3 Clause 7: expressions

[diff.cpp20.expr]

<sup>1</sup> **Affected subclause:** 7.5.5.2

**Change:** Change move-eligible *id-expressions* from lvalues to xvalues.

**Rationale:** Simplify the rules for implicit move.

**Effect on original feature:** Valid C++ 2020 code that relies on a returned *id-expression*'s being an lvalue may change behavior or fail to compile.

[Example 1:

```
decltype(auto) f(int&& x) { return (x); }           // returns int&&; previously returned int&
int& g(int&& x) { return x; }                     // ill-formed; previously well-formed
```

— end example]

## 2 Affected subclause: 7.6.1.2

**Change:** Change the meaning of comma in subscript expressions.

**Rationale:** Enable repurposing a deprecated syntax to support multidimensional indexing.

**Effect on original feature:** Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile.

[Example 2:

```
arr[1, 2]                                     // was equivalent to arr[(1, 2)],
                                              // now equivalent to arr.operator[](1, 2) or ill-formed
```

— end example]

### C.2.4 Clause 8: statements

[diff.cpp20.stmt]

## 1 Affected subclause: 8.6.5

**Change:** The lifetime of temporary objects in the *for-range-initializer* is extended until the end of the loop (6.7.7).

**Rationale:** Improve usability of the range-based `for` statement.

**Effect on original feature:** Destructors of some temporary objects are invoked later.

[Example 1:

```
void f() {
    std::vector<int> v = { 42, 17, 13 };
    std::mutex m;

    for (int x :
        static_cast<void>(std::lock_guard<std::mutex>(m)), v) { // lock released in C++ 2020
        std::lock_guard<std::mutex> guard(m);                 // OK in C++ 2020, now deadlocks
        }
    }
}
```

— end example]

### C.2.5 Clause 9: declarations

[diff.cpp20.dcl]

## 1 Affected subclause: 9.4.3

**Change:** UTF-8 string literals may initialize arrays of `char` or `unsigned char`.

**Rationale:** Compatibility with previously written code that conformed to previous versions of this document.

**Effect on original feature:** Arrays of `char` or `unsigned char` may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates.

[Example 1:

```
struct A {
    char8_t s[10];
};
struct B {
    char s[10];
};

void f(A);
void f(B);

int main() {
    f({u8""}); // ambiguous
}
```

— end example]

**C.2.6 Clause 13: templates**

[diff.cpp20.temp]

<sup>1</sup> **Affected subclause: 13.10.3.6****Change:** Deducing template arguments from exception specifications.**Rationale:** Facilitate generic handling of throwing and non-throwing functions.**Effect on original feature:** Valid ISO C++ 2020 code may be ill-formed in this revision of C++.

[Example 1:

```

template<bool> struct A { };
template<bool B> void f(void (*) (A<B>) noexcept(B));
void g(A<false>) noexcept;
void h() {
    f(g);
}

```

— end example]

**C.2.7 Clause 16: library introduction**

[diff.cpp20.library]

<sup>1</sup> **Affected subclause: 16.4.2.3****Change:** New headers.**Rationale:** New functionality.**Effect on original feature:** The following C++ headers are new: <expected> (22.8.2), <flat\_map> (23.6.7), <flat\_set> (23.6.10), <generator> (25.8.2), <mdspan> (23.7.3.2), <print> (31.7.4), <spanstream> (31.9.2), <stacktrace> (19.6.2), <stdatomic.h> (32.5.12), and <stdfloat> (17.4.2). Valid C++ 2020 code that #includes headers with these names may be invalid in this revision of C++.**C.2.8 Clause 18: concepts library**

[diff.cpp20.concepts]

<sup>1</sup> **Affected subclauses: 17.11.4, 18.5.4, and 18.5.5****Change:** Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.**Rationale:** Allow uncopyable, but movable, types to model these concepts.**Effect on original feature:** Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++.

[Example 1:

```

template<class T, class U>
    requires equality_comparable_with<T, U>
bool attempted_equals(const T&, const U& u);    // previously selected overload

template<class T, class U>
    requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u);  // ambiguous overload; previously
                                                // rejected by partial ordering

bool test(shared_ptr<int> p) {
    return attempted_equals(p, nullptr);
}

```

— end example]

**C.2.9 Clause 20: memory management library**

[diff.cpp20.memory]

<sup>1</sup> **Affected subclause: 20.2.9.1****Change:** Forbid partial and explicit program-defined specializations of `allocator_traits`.**Rationale:** Allow addition of `allocate_at_least` to `allocator_traits`, and potentially other members in the future.**Effect on original feature:** Valid C++ 2020 code that partially or explicitly specializes `allocator_traits` is ill-formed with no diagnostic required in this revision of C++.**C.2.10 Clause 22: general utilities library**

[diff.cpp20.utilities]

<sup>1</sup> **Affected subclause: 28.5****Change:** Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.**Rationale:** Improve safety via compile-time format string checks, avoid unnecessary template instantiations.

**Effect on original feature:** Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed.

[Example 1:

```
auto s = std::format("{:d}", "I am not a number");    // ill-formed,
                                                    // previously threw format_error
```

— end example]

<sup>2</sup> **Affected subclause:** 28.5

**Change:** Signature changes: `format`, `format_to`, `format_to_n`, `formatted_size`.

**Rationale:** Enable formatting of views that do not support iteration when const-qualified and that are not copyable.

**Effect on original feature:** Valid C++ 2020 code that passes bit-fields to formatting functions may become ill-formed.

[Example 2:

```
struct tiny {
    int bit: 1;
};

auto t = tiny();
std::format("{:}", t.bit);    // ill-formed, previously returned "0"
```

— end example]

<sup>3</sup> **Affected subclause:** 28.5.2.2

**Change:** Restrict types of formatting arguments used as *width* or *precision* in a *std-format-spec*.

**Rationale:** Disallow types that do not have useful or portable semantics as a formatting width or precision.

**Effect on original feature:** Valid C++ 2020 code that passes a boolean or character type as *arg-id* becomes invalid.

[Example 3:

```
std::format("{:*^{}}", "", true);    // ill-formed, previously returned "*"
std::format("{:*^{}}", "", '1');    // ill-formed, previously returned an
// implementation-defined number of '*' characters
```

— end example]

<sup>4</sup> **Affected subclause:** 28.5.6.4

**Change:** Removed the `formatter` specialization:

```
template<size_t N> struct formatter<const charT[N], charT>;
```

**Rationale:** The specialization is inconsistent with the design of `formatter`, which is intended to be instantiated only with cv-unqualified object types.

**Effect on original feature:** Valid C++ 2020 code that instantiated the removed specialization can become ill-formed.

## C.2.11 Clause 27: strings library

[diff.cpp20.strings]

<sup>1</sup> **Affected subclause:** 27.4

**Change:** Additional rvalue overload for the `substr` member function and the corresponding constructor.

**Rationale:** Improve efficiency of operations on rvalues.

**Effect on original feature:** Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++.

[Example 1:

```
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2);    // unspecified, previously guaranteed to be true
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2);    // unspecified, previously guaranteed to be true
```

— end example]

**C.2.12 Clause 23: containers library**

[diff.cpp20.containers]

<sup>1</sup> **Affected subclauses:** 23.2.7 and 23.2.8**Change:** Heterogeneous `extract` and `erase` overloads for associative containers.**Rationale:** Improve efficiency of erasing elements from associative containers.**Effect on original feature:** Valid C++ 2020 code may fail to compile in this revision of C++.

[Example 1:

```

struct B {
    auto operator<=>(const B&) const = default;
};

struct D : private B {
    void f(std::set<B, std::less<>>& s) {
        s.erase(*this);           // ill-formed; previously well-formed
    }
};

```

— end example]

**C.2.13 Clause 32: concurrency support library**

[diff.cpp20.thread]

<sup>1</sup> **Affected subclause:** 32.9.3**Change:** In this revision of C++, it is implementation-defined whether a barrier's phase completion step runs if no thread calls `wait`. Previously the phase completion step was guaranteed to run on the last thread that calls `arrive` or `arrive_and_drop` during the phase. In this revision of C++, it can run on any of the threads that arrived or waited at the barrier during the phase.**Rationale:** Correct contradictory wording and improve implementation flexibility for performance.**Effect on original feature:** Valid C++ 2020 code using a barrier might have different semantics in this revision of C++ if it depends on a completion function's side effects occurring exactly once, on a specific thread running the phase completion step, or on a completion function's side effects occurring without `wait` having been called.

[Example 1:

```

auto b0 = std::barrier(1);
b0.arrive();
b0.arrive();           // implementation-defined; previously well-defined

int data = 0;
auto b1 = std::barrier(1, [&] { data++; });
b1.arrive();
assert(data == 1);    // implementation-defined; previously well-defined
b1.arrive();          // implementation-defined; previously well-defined

```

— end example]

**C.3 C++ and ISO C++ 2017**

[diff.cpp17]

**C.3.1 General**

[diff.cpp17.general]

<sup>1</sup> Subclause C.3 lists the differences between C++ and ISO C++ 2017, in addition to those listed above, by the chapters of this document.**C.3.2 Clause 5: lexical conventions**

[diff.cpp17.lex]

<sup>1</sup> **Affected subclauses:** 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5**Change:** New identifiers with special meaning.**Rationale:** Required for new features.**Effect on original feature:** Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++.

[Example 1:

```

class module {};
module m1;           // was variable declaration; now module-declaration
module *m2;         // variable declaration

```

```

class import {};
import j1;           // was variable declaration; now module-import-declaration
::import j2;        // variable declaration
— end example]

```

## 2 Affected subclause: 5.8

**Change:** *header-name* tokens are formed in more contexts.

**Rationale:** Required for new features.

**Effect on original feature:** When the identifier `import` is followed by a `<` character, a *header-name* token may be formed.

[Example 2:

```

template<typename> class import {};
import<int> f();           // ill-formed; previously well-formed
::import<int> g();        // OK
— end example]

```

## 3 Affected subclause: 5.11

**Change:** New keywords.

**Rationale:** Required for new features.

- (3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- (3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).
- (3.3) — The `constexpr` keyword is added to declare immediate functions (9.2.6).
- (3.4) — The `constexpr` keyword is added to prevent unintended dynamic initialization (9.2.7).
- (3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.5.4).
- (3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.8).

**Effect on original feature:** Valid C++ 2017 code using `char8_t`, `concept`, `constexpr`, `constexpr`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

## 4 Affected subclause: 5.12

**Change:** New operator `<=>`.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++.

[Example 3:

```

namespace N {
    struct X {};
    bool operator<=(X, X);
    template<bool(X, X)> struct Y {};
    Y<operator<=> y;           // ill-formed; previously well-formed
}

```

— end example]

## 5 Affected subclause: 5.13

**Change:** Type of UTF-8 string and character literals.

**Rationale:** Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

**Effect on original feature:** Valid C++ 2017 code that depends on UTF-8 string literals having type “array of `const char`” and UTF-8 character literals having type “`char`” is not valid in this revision of C++.

[Example 4:

```

const auto *u8s = u8"text"; // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;       // ill-formed; previously well-formed

auto u8c = u8'c';           // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;           // ill-formed; previously well-formed

```

```

std::string s = u8"text";           // ill-formed; previously well-formed

void f(const char *s);
f(u8"text");                       // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
    using type = char;
};
ct<decltype(u8'c')>::type x;       // ill-formed; previously well-formed.
— end example]

```

### C.3.3 Clause 6: basics

[diff.cpp17.basic]

#### 1 Affected subclause: 6.7.3

**Change:** A pseudo-destructor call ends the lifetime of the object to which it is applied.

**Rationale:** Increase consistency of the language model.

**Effect on original feature:** Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++.

[Example 1:

```

int f() {
    int a = 123;
    using T = int;
    a.~T();
    return a;           // undefined behavior; previously returned 123
}

```

— end example]

#### 2 Affected subclause: 6.9.2.2

**Change:** Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

**Rationale:** Removal of rarely used and confusing feature.

**Effect on original feature:** If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

### C.3.4 Clause 7: expressions

[diff.cpp17.expr]

#### 1 Affected subclause: 7.5.6.3

**Change:** Implicit lambda capture may capture additional entities.

**Rationale:** Rule simplification, necessary to resolve interactions with `constexpr` if.

**Effect on original feature:** Lambdas with a *capture-default* may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

### C.3.5 Clause 9: declarations

[diff.cpp17.dcl.dcl]

#### 1 Affected subclause: 9.2.4

**Change:** Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.

**Rationale:** Necessary for implementability.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++.

[Example 1:

```

typedef struct {
    void f() {}           // ill-formed; previously well-formed
} S;

```

— end example]

#### 2 Affected subclause: 9.3.4.7

**Change:** A function cannot have different default arguments in different translation units.

**Rationale:** Required for modules support.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required.

[*Example 2:*

```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; }           // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); }               // used to return 42
— end example]
```

### 3 Affected subclause: 9.4.2

**Change:** A class that has user-declared constructors is never an aggregate.

**Rationale:** Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.

**Effect on original feature:** Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++.

[*Example 3:*

```
struct A {                               // not an aggregate; previously an aggregate
    A() = delete;
};

struct B {                               // not an aggregate; previously an aggregate
    B() = default;
    int i = 0;
};

struct C {                               // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{};                                   // ill-formed; previously well-formed
B b = {1};                               // ill-formed; previously well-formed
auto* c = new C{2, 3};                   // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y {                               // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y{X{}};                               // copy constructor call; previously aggregate-initialization
— end example]
```

### 4 Affected subclause: 9.4.5

**Change:** Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[*Example 4:*

```
bool y[] = { "bc" };                   // ill-formed; previously well-formed
— end example]
```

## C.3.6 Clause 11: classes

[diff.cpp17.class]

## 1 Affected subclauses: 11.4.5 and 11.4.8.3

**Change:** The class name can no longer be used parenthesized immediately after an `explicit decl-specifier` in a constructor declaration. The `conversion-function-id` can no longer be used parenthesized immediately after an `explicit decl-specifier` in a conversion function declaration.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 1:

```
struct S {
    explicit (S)(const S&);           // ill-formed; previously well-formed
    explicit (operator int)();       // ill-formed; previously well-formed
    explicit(true) (S)(int);        // OK
};
```

— end example]

## 2 Affected subclauses: 11.4.5 and 11.4.7

**Change:** A `simple-template-id` is no longer valid as the `declarator-id` of a constructor or destructor.

**Rationale:** Remove potentially error-prone option for redundancy.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 2:

```
template<class T>
struct A {
    A<T>();           // error: simple-template-id not allowed for constructor
    A(int);          // OK, injected-class-name used
    ~A<T>();        // error: simple-template-id not allowed for destructor
};
```

— end example]

## 3 Affected subclause: 11.9.6

**Change:** A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

**Rationale:** Side effect of making it easier to write more efficient code that takes advantage of moves.

**Effect on original feature:** Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++.

[Example 3:

```
struct base {
    base();
    base(base const &);
private:
    base(base &&);
};

struct derived : base {};

base f(base b) {
    throw b;           // error: base(base &&) is private
    derived d;
    return d;         // error: base(base &&) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
    S(S&& other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S&& s) { return s; }
```

```

void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m;           // undefined behavior; previously ok
}

```

— end example]

### C.3.7 Clause 12: overloading

[diff.cpp17.over]

#### <sup>1</sup> Affected subclause: 12.2.2.3

**Change:** Equality and inequality expressions can now find reversed and rewritten candidates.

**Rationale:** Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

**Effect on original feature:** For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous.

[Example 1:

```

struct A {
    operator int() const;
};

bool operator==(A, int);           // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +             // ill-formed; previously well-formed
           (10 == x) +           // calls #1, previously selected #2
           (10 != x);           // calls #1, previously selected #3
}

```

— end example]

#### <sup>2</sup> Affected subclause: 12.2.2.3

**Change:** Overload resolution may change for equality operators (7.6.10).

**Rationale:** Support calling `operator==` with reversed order of arguments.

**Effect on original feature:** Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++.

[Example 2:

```

struct A {
    operator int() const { return 10; }
};

bool operator==(A, int);           // #1
// #2 is built-in candidate: bool operator==(int, int);
bool b = 10 == A();               // calls #1 with reversed order of arguments; previously selected #2

struct B {
    bool operator==(const B&);     // member function with no cv-qualifier
};
B b1;
bool eq = (b1 == b1);             // ambiguous; previously well-formed

```

— end example]

### C.3.8 Clause 13: templates

[diff.cpp17.temp]

#### <sup>1</sup> Affected subclause: 13.3

**Change:** An *unqualified-id* that is followed by a `<` and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument-dependent lookup to be performed.

**Rationale:** It was problematic to call a function template with an explicit template argument list via

argument-dependent lookup because of the need to have a template with the same name visible via normal lookup.

**Effect on original feature:** Previously valid code that uses a function name as the left operand of a < operator would become ill-formed.

[Example 1:

```
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;    // ill-formed; previously well-formed
    (f) < a;  // still well-formed
}
```

— end example]

### C.3.9 Clause 14: exception handling [diff.cpp17.except]

#### <sup>1</sup> Affected subclause: 14.5

**Change:** Remove `throw()` exception specification.

**Rationale:** Removal of obsolete feature that has been replaced by `noexcept`.

**Effect on original feature:** A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

[Note 1: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — end note]

### C.3.10 Clause 16: library introduction [diff.cpp17.library]

#### <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<barrier>` (32.9.3.2), `<bit>` (22.11.2), `<charconv>` (28.2.1), `<compare>` (17.11.1), `<concepts>` (18.3), `<coroutine>` (17.12.2), `<format>` (28.5.1), `<latch>` (32.9.2.2), `<numbers>` (29.8.1), `<ranges>` (25.2), `<semaphore>` (32.8.2), `<source_location>` (17.8.1), `<span>` (23.7.2.1), `<stop_token>` (32.3.2), `<syncstream>` (31.11.1), and `<version>` (17.3.1). Valid C++ 2017 code that `#includes` headers with these names may be invalid in this revision of C++.

#### <sup>2</sup> Affected subclause: 16.4.2.3

**Change:** Remove vacuous C++ header files.

**Rationale:** The empty headers implied a false requirement to achieve C compatibility with the C++ headers.

**Effect on original feature:** A valid C++ 2017 program that `#includes` any of the following headers may fail to compile: `<ccomplex>`, `<ciso646>`, `<cstdalign>`, `<cstdbool>`, and `<ctgmath>`. To retain the same behavior:

- (2.1) — a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` (29.4.2),
- (2.2) — a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` (29.7.1) and a `#include` of `<complex>`, and
- (2.3) — a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

### C.3.11 Clause 23: containers library [diff.cpp17.containers]

#### <sup>1</sup> Affected subclauses: 23.3.7 and 23.3.9

**Change:** Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.

**Rationale:** Improve efficiency and convenience of finding number of removed elements.

**Effect on original feature:** Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

**C.3.12 Clause 24: iterators library** [diff.cpp17.iterators]<sup>1</sup> **Affected subclause:** 24.3.2.3

**Change:** The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.

**Rationale:** Corrects an issue misidentifying pointer types that are not incrementable as iterator types.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

**C.3.13 Clause 26: algorithms library** [diff.cpp17.alg.reqs]<sup>1</sup> **Affected subclause:** 26.2

**Change:** The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.

**Rationale:** Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.

**Effect on original feature:** A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

**C.3.14 Clause 31: input/output library** [diff.cpp17.input.output]<sup>1</sup> **Affected subclause:** 31.7.5.3.3

**Change:** Character array extraction only takes array types.

**Rationale:** Increase safety via preventing buffer overflow at compile time.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 1:

```
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;           // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;           // OK
```

— end example]

<sup>2</sup> **Affected subclause:** 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with UTF-8 literals.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[Example 2:

```
std::cout << u8"text";                   // previously called operator<<(const char*) and printed a string;
                                           // now ill-formed
std::cout << u8'X';                       // previously called operator<<(char) and printed a character;
                                           // now ill-formed
```

— end example]

<sup>3</sup> **Affected subclause:** 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.

**Rationale:** Removal of surprising behavior.

**Effect on original feature:** Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[Example 3:

```
std::cout << u"text";                   // previously formatted the string as a pointer value;
                                           // now ill-formed
std::cout << u'X';                       // previously formatted the character as an integer value;
                                           // now ill-formed
```

— end example]

<sup>4</sup> **Affected subclause:** 31.12.6

**Change:** Return type of filesystem path format observer member functions.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++.

[*Example 4:*

```
std::filesystem::path p;
std::string s1 = p.u8string();           // ill-formed; previously well-formed
std::string s2 = p.generic_u8string();   // ill-formed; previously well-formed
```

— *end example*]

### C.3.15 Annex D: compatibility features [diff.cpp17.depr]

- 1 **Change:** Remove `uncaught_exception`.  
**Rationale:** The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.  
**Effect on original feature:** A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.
- 2 **Change:** Remove support for adaptable function API.  
**Rationale:** The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.  
**Effect on original feature:** A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.
- 3 **Change:** Remove redundant members from `std::allocator`.  
**Rationale:** `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.  
**Effect on original feature:** A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.
- 4 **Change:** Remove `raw_storage_iterator`.  
**Rationale:** The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.  
**Effect on original feature:** A valid C++ 2017 program that uses this iterator class may fail to compile.
- 5 **Change:** Remove temporary buffers API.  
**Rationale:** The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.  
**Effect on original feature:** A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.
- 6 **Change:** Remove `shared_ptr::unique`.  
**Rationale:** The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.  
**Effect on original feature:** A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.
- 7 **Affected subclause:** [D.14](#)  
**Change:** Remove deprecated type traits.  
**Rationale:** The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.  
**Effect on original feature:** A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

## C.4 C++ and ISO C++ 2014 [diff.cpp14]

### C.4.1 General [diff.cpp14.general]

- <sup>1</sup> Subclause C.4 lists the differences between C++ and ISO C++ 2014, in addition to those listed above, by the chapters of this document.

### C.4.2 Clause 5: lexical conventions [diff.cpp14.lex]

- <sup>1</sup> **Affected subclause:** 5.2  
**Change:** Removal of trigraph support as a required feature.  
**Rationale:** Prevents accidental uses of trigraphs in non-raw string literals and comments.  
**Effect on original feature:** Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.
- <sup>2</sup> **Affected subclause:** 5.9  
**Change:** *pp-number* can contain *p sign* and *P sign*.  
**Rationale:** Necessary to enable *hexadecimal-floating-point-literals*.  
**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++.

[Example 1:

```
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
— end example]
```

### C.4.3 Clause 7: expressions [diff.cpp14.expr]

- <sup>1</sup> **Affected subclauses:** 7.6.1.6 and 7.6.2.3  
**Change:** Remove increment operator with `bool` operand.  
**Rationale:** Obsolete feature with occasionally surprising semantics.  
**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this revision of C++.
- <sup>2</sup> **Affected subclauses:** 7.6.2.8 and 7.6.2.9  
**Change:** Dynamic allocation mechanism for over-aligned types.  
**Rationale:** Simplify use of over-aligned types.  
**Effect on original feature:** In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this revision of C++, `::operator new(std::size_t, std::align_val_t)` is used instead.

### C.4.4 Clause 9: declarations [diff.cpp14.dcl.dcl]

- <sup>1</sup> **Affected subclause:** 9.2.2  
**Change:** Removal of `register storage-class-specifier`.  
**Rationale:** Enable repurposing of deprecated keyword in future revisions of C++.  
**Effect on original feature:** A valid C++ 2014 declaration utilizing the `register storage-class-specifier` is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.
- <sup>2</sup> **Affected subclause:** 9.2.9.7  
**Change:** auto deduction from *braced-init-list*.  
**Rationale:** More intuitive deduction behavior.  
**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.

[Example 1:

```
auto x1{1}; // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
— end example]
```

3 **Affected subclause:** 9.3.4.6

**Change:** Make exception specifications be part of the type system.

**Rationale:** Improve type-safety.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or change meaning in this revision of C++.

[*Example 2:*

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);           // ill-formed; previously well-formed
```

— end example]

4 **Affected subclause:** 9.4.2

**Change:** Definition of an aggregate is extended to apply to user-defined types with base classes.

**Rationale:** To increase convenience of aggregate initialization.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types.

[*Example 3:*

```
struct derived;
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {};

derived d1{};           // error; the code was well-formed in C++ 2014
derived d2;           // still OK
```

— end example]

### C.4.5 **Clause 11:** classes

[diff.cpp14.class]

1 **Affected subclause:** 11.9.4

**Change:** Inheriting a constructor no longer injects a constructor into the derived class.

**Rationale:** Better interaction with other language features.

**Effect on original feature:** Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

[*Example 1:*

```
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L);           // now calls B(int), used to call B<long>(long),
                  // which called A(int) due to substitution failure
                  // in A<long>(long).
```

— end example]

### C.4.6 **Clause 13:** templates

[diff.cpp14.temp]

1 **Affected subclause:** 13.10.3.6

**Change:** Allowance to deduce from the type of a non-type template argument.

**Rationale:** In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++.

[*Example 1:*

```
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p);           // ill-formed; previously well-formed
}
```

— *end example*]

#### C.4.7 Clause 14: exception handling [diff.cpp14.except]

##### <sup>1</sup> Affected subclause: 14.5

**Change:** Remove dynamic exception specifications.

**Rationale:** Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.

**Effect on original feature:** A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected`, and it is unspecified whether stack unwinding is performed prior to such a call.

#### C.4.8 Clause 16: library introduction [diff.cpp14.library]

##### <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<any>` (22.7.2), `<charconv>` (28.2.1), `<execution>` (33.4), `<filesystem>` (31.12.4), `<memory_resource>` (20.4.1), `<optional>` (22.5.2), `<string_view>` (27.3.2), and `<variant>` (22.6.2). Valid C++ 2014 code that `#includes` headers with these names may be invalid in this revision of C++.

##### <sup>2</sup> Affected subclause: 16.4.5.2.3

**Change:** New reserved namespaces.

**Rationale:** Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.

**Effect on original feature:** The global namespaces `std` followed by an arbitrary sequence of *digits* (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

#### C.4.9 Clause 22: general utilities library [diff.cpp14.utilities]

##### <sup>1</sup> Affected subclause: 22.10.17

**Change:** Constructors taking allocators removed.

**Rationale:** No implementation consensus.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

##### <sup>2</sup> Affected subclause: 20.3.2.2

**Change:** Different constraint on conversions from `unique_ptr`.

**Rationale:** Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.

[*Example 1:*

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

— *end example*]

#### C.4.10 **Clause 27:** strings library [diff.cpp14.string]

<sup>1</sup> **Affected subclause:** 27.4.3

**Change:** Non-const `.data()` member added.

**Rationale:** The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.

**Effect on original feature:** Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this revision of C++.

[*Example 1:*

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data());           // ill-formed; previously well-formed
— end example]
```

#### C.4.11 **Clause 23:** containers library [diff.cpp14.containers]

<sup>1</sup> **Affected subclause:** 23.2.7

**Change:** Requirements change:

**Rationale:** Increase portability, clarification of associative container requirements.

**Effect on original feature:** Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++.

[*Example 1:*

```
#include <set>

struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};

int main() {
    const std::set<int, compare> s;
    s.find(0);
}
— end example]
```

#### C.4.12 **Annex D:** compatibility features [diff.cpp14.depr]

<sup>1</sup> **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

**Rationale:** Superseded by new features.

**Effect on original feature:** Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

<sup>2</sup> **Change:** Remove old iostreams members [depr.ios.members].

**Rationale:** Redundant feature for compatibility with pre-standard code has served its time.

**Effect on original feature:** A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

### C.5 C++ and ISO C++ 2011 [diff.cpp11]

#### C.5.1 General [diff.cpp11.general]

<sup>1</sup> Subclause C.5 lists the differences between C++ and ISO C++ 2011, in addition to those listed above, by the chapters of this document.

**C.5.2 Clause 5: lexical conventions**

[diff.cpp11.lex]

<sup>1</sup> **Affected subclause: 5.9****Change:** *pp-number* can contain one or more single quotes.**Rationale:** Necessary to enable single quotes as digit separators.**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++.

[Example 1:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5) };
// int x[2] = { 5 };           — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
— end example]
```

**C.5.3 Clause 6: basics**

[diff.cpp11.basic]

<sup>1</sup> **Affected subclause: 6.7.5.5.3****Change:** New usual (non-placement) deallocator.**Rationale:** Required for sized deallocation.**Effect on original feature:** Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).**C.5.4 Clause 7: expressions**

[diff.cpp11.expr]

<sup>1</sup> **Affected subclause: 7.6.16****Change:** A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.**Rationale:** Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.**Effect on original feature:** Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++.

[Example 1:

```
struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.  
— end example]**C.5.5 Clause 9: declarations**

[diff.cpp11.dcl.dcl]

<sup>1</sup> **Affected subclause: 9.2.6****Change:** `constexpr` non-static member functions are not implicitly `const` member functions.**Rationale:** Necessary to allow `constexpr` member functions to mutate the object.**Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++.

[Example 1:

```
struct S {
    constexpr const int &f();
    int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types. — end example]

## 2 Affected subclause: 9.4.2

**Change:** Classes with default member initializers can be aggregates.

**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++.

[Example 2:

```
struct S {                // Aggregate in C++ 2014 onwards.
    int m = 1;
};
struct X {
    operator int();
    operator S();
};
X a{};
S b{a};                  // uses copy constructor in C++ 2011,
                        // performs aggregate initialization in this revision of C++
```

— end example]

## C.5.6 Clause 16: library introduction

[diff.cpp11.library]

### 1 Affected subclause: 16.4.2.3

**Change:** New header.

**Rationale:** New functionality.

**Effect on original feature:** The C++ header <shared\_mutex> (32.6.3) is new. Valid C++ 2011 code that #includes a header with that name may be invalid in this revision of C++.

## C.5.7 Clause 31: input/output library

[diff.cpp11.input.output]

### 1 Affected subclause: 31.13

**Change:** gets is not defined.

**Rationale:** Use of gets is considered dangerous.

**Effect on original feature:** Valid C++ 2011 code that uses the gets function may fail to compile in this revision of C++.

## C.6 C++ and ISO C++ 2003

[diff.cpp03]

### C.6.1 General

[diff.cpp03.general]

- 1 Subclause C.6 lists the differences between C++ and ISO C++ 2003, in addition to those listed above, by the chapters of this document.

### C.6.2 Clause 5: lexical conventions

[diff.cpp03.lex]

#### 1 Affected subclause: 5.4

**Change:** New kinds of *string-literals*.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*.

[Example 1:

```
#define u8 "abc"
const char* s = u8"def";           // Previously "abcdef", now "def"
```

— end example]

2 **Affected subclause:** 5.4

**Change:** User-defined literal string support.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 2:*

```
#define _x "there"
"hello"_x           // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro `_x` would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded. — *end example*]

3 **Affected subclause:** 5.11

**Change:** New keywords.

**Rationale:** Required for new features.

**Effect on original feature:** Added to [Table 5](#), the following identifiers are new keywords: `alignas`, `alignof`, `char16_t`, `char32_t`, `constexpr`, `decltype`, `noexcept`, `nullptr`, `static_assert`, and `thread_local`. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

4 **Affected subclause:** 5.13.2

**Change:** Type of integer literals.

**Rationale:** C99 compatibility.

**Effect on original feature:** Certain integer literals larger than can be represented by `long` could change from an unsigned integer type to `signed long long`.

**C.6.3 Clause 7: expressions**

[diff.cpp03.expr]

1 **Affected subclause:** 7.3.12

**Change:** Only literals are integer null pointer constants.

**Rationale:** Removing surprising interactions with templates and constant expressions.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 1:*

```
void f(void *);           // #1
void f(...);             // #2
template<int N> void g() {
    f(0*N);               // calls #2; used to call #1
}
```

— *end example*]

2 **Affected subclause:** 7.6.1.8

**Change:** Evaluation of operands in `typeid`.

**Rationale:** Introduce additional expression value categories.

**Effect on original feature:** Valid C++ 2003 code that uses `xvalues` as operands for `typeid` may change behavior in this revision of C++.

[*Example 2:*

```
void f() {
    struct B {
        B() {}
        virtual ~B() {}
    };

    struct C { B b; };
    typeid(C().b); // unevaluated in C++ 2003, evaluated in C++ 2011
}
```

— *end example*]

3 **Affected subclause:** 7.6.5

**Change:** Specify rounding for results of integer `/` and `%`.

**Rationale:** Increase portability, C99 compatibility.

**Effect on original feature:** Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

4 **Affected subclause:** 7.6.14

**Change:** `&&` is valid in a *type-name*.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 3:*

```
bool b1 = new int && false;           // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false; // previously false, now ill-formed
```

— end example]

5 **Affected subclause:** 7.6.16

**Change:** Fewer copies in the conditional operator.

**Rationale:** Introduce additional expression value categories.

**Effect on original feature:** Valid C++ 2003 code that uses *xvalues* as operands for the conditional operator may change behavior in this revision of C++.

[*Example 4:*

```
void f() {
    struct B {
        B() {}
        B(const B&) {}
    };
    struct D : B {};

    struct BB { B b; };
    struct DD { D d; };

    true ? BB().b : DD().d;           // additional copy in C++ 2003, no copy or move in C++ 2011
}
```

— end example]

C.6.4 **Clause 9:** declarations

[diff.cpp03.dcl.dcl]

1 **Affected subclause:** 9.2

**Change:** Remove `auto` as a storage class specifier.

**Rationale:** New feature.

**Effect on original feature:** Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier may be invalid in this revision of C++. In this revision of C++, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

2 **Affected subclause:** 9.4.5

**Change:** Narrowing restrictions in aggregate initializers.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++.

[*Example 1:*

```
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion.

— end example]

3 **Affected subclause:** 9.11

**Change:** Names declared in an anonymous namespace changed from external linkage to internal linkage; language linkage applies to names with external linkage only.

**Rationale:** Alignment with user expectations.

**Effect on original feature:** Valid C++ 2003 code may violate the one-definition rule (6.3) in this revision of C++.

[*Example 2:*

```
namespace { extern "C" { extern int x; } } // #1, previously external linkage and C language linkage,
                                           // now internal linkage and C++ language linkage
namespace A { extern "C" int x = 42; }    // #2, external linkage and C language linkage
int main(void) { return x; }
```

This code is valid in C++ 2003, but #2 is not a definition for #1 in this revision of C++, violating the one-definition rule. — *end example*]

### C.6.5 Clause 11: classes [diff.cpp03.class]

- <sup>1</sup> **Affected subclauses:** 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6

**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

**Rationale:** Improves template argument deduction failure.

**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

- <sup>2</sup> **Affected subclause:** 11.4.7

**Change:** User-declared destructors have an implicit exception specification.

**Rationale:** Clarification of destructor requirements.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

### C.6.6 Clause 13: templates [diff.cpp03.temp]

- <sup>1</sup> **Affected subclause:** 13.2

**Change:** Repurpose `export` for modules (Clause 10, 15.4, 15.5).

**Rationale:** No implementation consensus for the C++ 2003 meaning of `export`.

**Effect on original feature:** A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.

- <sup>2</sup> **Affected subclause:** 13.4

**Change:** Remove whitespace requirement for nested closing template right angle brackets.

**Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.

**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates.

[*Example 1:*

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

This code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates. — *end example*]

- <sup>3</sup> **Affected subclause:** 13.8.4.2

**Change:** Allow dependent calls of functions with internal linkage.

**Rationale:** Overly constrained, simplify overload resolution rules.

**Effect on original feature:** A valid C++ 2003 program can get a different result in this revision of C++.

### C.6.7 Clause 16: library introduction [diff.cpp03.library]

- <sup>1</sup> **Affected:** Clause 16 – Clause 33

**Change:** New reserved identifiers.

**Rationale:** Required by new features.

**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

- <sup>2</sup> **Affected subclause:** 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<array>` (23.3.2), `<atomic>` (32.5.2),

<chrono> (30.2), <condition\_variable> (32.7.2), <forward\_list> (23.3.6), <future> (32.10.2), <initializer\_list> (17.10.2), <mutex> (32.6.2), <random> (29.5.2), <ratio> (21.4.2), <regex> (28.6.3), <scoped\_allocator> (20.5.1), <system\_error> (19.5.2), <thread> (32.4.2), <tuple> (22.4.2), <typeindex> (17.7.6), <type\_traits> (21.3.3), <unordered\_map> (23.5.2), and <unordered\_set> (23.5.5). In addition the following C compatibility headers are new: <cfenv> (29.3.1), < cinttypes> (31.13.2), <cstdint> (17.4.1), and <cuchar> (28.7.4). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

<sup>3</sup> **Affected subclause:** 16.4.4.3

**Effect on original feature:** Function swap moved to a different header

**Rationale:** Remove dependency on <algorithm> (26.4) for swap.

**Effect on original feature:** Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> (26.4) may have to instead include <utility> (22.2.1).

<sup>4</sup> **Affected subclause:** 16.4.5.2.2

**Change:** New reserved namespace.

**Rationale:** New functionality.

**Effect on original feature:** The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this revision of C++.

<sup>5</sup> **Affected subclause:** 16.4.6.3

**Change:** Additional restrictions on macro names.

**Rationale:** Avoid hard to diagnose or non-portable constructs.

**Effect on original feature:** Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this revision of C++.

## C.6.8 Clause 17: language support library [diff.cpp03.language.support]

<sup>1</sup> **Affected subclause:** 17.6.3.2

**Change:** operator new may throw exceptions other than `std::bad_alloc`.

**Rationale:** Consistent application of `noexcept`.

**Effect on original feature:** Valid C++ 2003 code that assumes that global operator new only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator new is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

## C.6.9 Clause 19: diagnostics library [diff.cpp03.diagnostics]

<sup>1</sup> **Affected subclause:** 19.4

**Change:** Thread-local error numbers.

**Rationale:** Support for new thread facilities.

**Effect on original feature:** Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.

## C.6.10 Clause 22: general utilities library [diff.cpp03.utilities]

<sup>1</sup> **Affected subclauses:** 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11

**Change:** Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.

**Rationale:** Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

**Effect on original feature:** Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

## C.6.11 Clause 27: strings library [diff.cpp03.strings]

<sup>1</sup> **Affected subclause:** 27.4

**Change:** `basic_string` requirements no longer allow reference-counted strings.

**Rationale:** Invalidation is subtly different with reference-counted strings. This change regularizes behavior.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++.

<sup>2</sup> **Affected subclause:** 27.4.3.2

**Change:** Loosen `basic_string` invalidation rules.

**Rationale:** Allow small-string optimization.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

### C.6.12 **Clause 23: containers library** [diff.cpp03.containers]

#### 1 **Affected subclause: 23.2**

**Change:** Complexity of `size()` member functions now constant.

**Rationale:** Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.

**Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

#### 2 **Affected subclause: 23.2**

**Change:** Requirements change: relaxation.

**Rationale:** Clarification.

**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- (2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- (2.2) — not all containers are empty after construction (`array`);
- (2.3) — not all containers have constant complexity for `swap()` (`array`).

#### 3 **Affected subclause: 23.2**

**Change:** Requirements change: default constructible.

**Rationale:** Clarification of container requirements.

**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

#### 4 **Affected subclauses: 23.2.4 and 23.2.7**

**Change:** Signature changes: from `void` return types.

**Rationale:** Old signature threw away useful information that may be expensive to recalculate.

**Effect on original feature:** The following member functions have changed:

- (4.1) — `erase(iter)` for `set`, `multiset`, `map`, `multimap`
- (4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- (4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

#### 5 **Affected subclauses: 23.2.4 and 23.2.7**

**Change:** Signature changes: from `iterator` to `const_iterator` parameters.

**Rationale:** Overspecification.

**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- (5.1) — `insert(iter, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- (5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- (5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (5.4) — all forms of `list::splice`
- (5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

#### 6 **Affected subclauses: 23.2.4 and 23.2.7**

**Change:** Signature changes: `resize`.

**Rationale:** Performance, compatibility with move semantics.

**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

**C.6.13 Clause 26: algorithms library** [diff.cpp03.algorithms]<sup>1</sup> **Affected subclause:** 26.1**Change:** Result state of inputs after application of some algorithms.**Rationale:** Required by new feature.**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.**C.6.14 Clause 29: numerics library** [diff.cpp03.numerics]<sup>1</sup> **Affected subclause:** 29.4**Change:** Specified representation of complex numbers.**Rationale:** Compatibility with C99.**Effect on original feature:** Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.**C.6.15 28.3: localization library** [diff.cpp03.locale]<sup>1</sup> **Affected subclause:** 28.3.4.3.2.3**Change:** The `num_get` facet recognizes hexadecimal floating point values.**Rationale:** Required by new feature.**Effect on original feature:** Valid C++ 2003 code may have different behavior in this revision of C++.**C.6.16 Clause 31: input/output library** [diff.cpp03.input.output]<sup>1</sup> **Affected subclauses:** 31.7.5.2.4, 31.7.6.2.4, and 31.5.4.4**Change:** Specify use of `explicit` in existing boolean conversion functions.**Rationale:** Clarify intentions, avoid workarounds.**Effect on original feature:** Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- (1.1) — passing a value to a function that takes an argument of type `bool`;
- (1.2) — using `operator==` to compare to `false` or `true`;
- (1.3) — returning a value from a function with a return type of `bool`;
- (1.4) — initializing members of type `bool` via aggregate initialization;
- (1.5) — initializing a `const bool&` which would bind to a temporary object.

<sup>2</sup> **Affected subclause:** 31.5.2.2.1**Change:** Change base class of `std::ios_base::failure`.**Rationale:** More detailed error messages.**Effect on original feature:** `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.<sup>3</sup> **Affected subclause:** 31.5.2**Change:** Flag types in `std::ios_base` are now bitmasks with values defined as `constexpr` static members.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++.

[Example 1:

```
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);           // error: setf does not take argument of type int
}
```

— end example]

## C.7 C++ and C [diff.iso]

### C.7.1 General [diff.iso.general]

- <sup>1</sup> Subclause C.7 lists the differences between C++ and C, in addition to those listed above, by the chapters of this document.

### C.7.2 Clause 5: lexical conventions [diff.lex]

- <sup>1</sup> **Affected subclause:** 5.11

**Change:** New Keywords

New keywords are added to C++; see 5.11.

**Rationale:** These keywords were added in order to implement the new semantics of C++.

**Effect on original feature:** Change to semantics of well-defined feature. Any C programs that used any of these keywords as identifiers are not valid C++ programs.

**Difficulty of converting:** Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.

**How widely used:** Common.

- <sup>2</sup> **Affected subclause:** 5.13.3

**Change:** Type of *character-literal* is changed from `int` to `char`.

**Rationale:** This is needed for improved overloaded function argument type matching.

[Example 1:

```
int function( int i );
int function( char c );

function( 'x' );
```

It is preferable that this call match the second version of function rather than the first. — end example]

**Effect on original feature:** Change to semantics of well-defined feature. C programs which depend on `sizeof('x') == sizeof(int)`

will not work the same as C++ programs.

**Difficulty of converting:** Simple.

**How widely used:** Programs which depend upon `sizeof('x')` are probably rare.

- <sup>3</sup> **Affected subclause:** 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of non-portable feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

- <sup>4</sup> **Affected subclause:** 5.13.5

**Change:** String literals made `const`.

The type of a *string-literal* is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

**Rationale:** This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Syntactic transformation. The fix is to add a cast:

```
char* p = "abc";           // valid in C, invalid in C++
void f(char*) {
    char* p = (char*)"abc"; // OK, cast added
    f(p);
    f((char*)"def");       // OK, cast added
}
```

**How widely used:** Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

## C.7.3 Clause 6: basics

[diff.basic]

## 1 Affected subclause: 6.2

**Change:** C++ does not have “tentative definitions” as in C.

[*Example 1:* At file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. — *end example*]

This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C.

[*Example 2:*

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

— *end example*]

**Rationale:** This avoids having different initialization rules for fundamental types and user-defined types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

**How widely used:** Seldom.

## 2 Affected subclause: 6.4

**Change:** A `struct` is a scope in C++, not in C.

[*Example 3:*

```
struct X {
    struct Y { int a; } b;
};
struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`. — *end example*]

**Rationale:** Class scope is crucial to C++, and a `struct` is a class.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

## 3 Affected subclause: 6.6 [also 9.2.9]

**Change:** A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

**Rationale:** Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

## 4 Affected subclause: 6.9.3.1

**Change:** The `main` function cannot be called recursively and cannot have its address taken.

**Rationale:** The `main` function may require special actions.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Trivial: create an intermediary function such as `mymain(argc, argv)`.

**How widely used:** Seldom.

## 5 Affected subclause: 6.8

**Change:** C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

**Rationale:** Stricter type checking is essential for C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

**How widely used:** Common.

#### C.7.4 Clause 7: expressions

[diff.expr]

##### <sup>1</sup> Affected subclause: 7.3.12

**Change:** Converting `void*` to a pointer-to-object type requires casting.

[Example 1:

```
char a[10];
void* b=a;
void foo() {
    char* c=b;
}
```

C accepts this usage of pointer to `void` being assigned to a pointer to object type. C++ does not. — end example]

**Rationale:** C++ tries harder than C to enforce compile-time type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast.

[Example 2:

```
char* c = (char*) b;
```

— end example]

**How widely used:** This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some C translators will give a warning if the cast is not used.

##### <sup>2</sup> Affected subclause: 7.4

**Change:** Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are not valid.

[Example 3:

```
enum E1 { e };
enum E2 { f };
int b = e <= 3.7;           // valid in C; ill-formed in C++
int k = f - e;             // valid in C; ill-formed in C++
int x = 1 ? e : f;         // valid in C; ill-formed in C++
```

— end example]

**Rationale:** Reinforcing type safety in C++.

**Effect on original feature:** Well-formed C code will not compile with this International Standard.

**Difficulty of converting:** Violations will be diagnosed by the C++ translator. The original behavior can be restored with a cast or integral promotion.

[Example 4:

```
enum E1 { e };
enum E2 { f };
int b = (int)e <= 3.7;
int k = +f - e;
```

— end example]

**How widely used:** Uncommon.

##### <sup>3</sup> Affected subclauses: 7.6.1.6 and 7.6.2.3

**Change:** Decrement operator is not allowed with `bool` operand.

**Rationale:** Feature with surprising semantics.

**Effect on original feature:** A valid C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` (17.14.5)) is ill-formed in C++.

4 **Affected subclauses:** 7.6.2.5 and 7.6.3

**Change:** In C++, types can only be defined in declarations, not in expressions. In C, a `sizeof` expression or cast expression may define a new type.

[*Example 5:*

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`. — *end example*]

**Rationale:** This prohibition helps to clarify the location of definitions in the source code.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

5 **Affected subclauses:** 7.6.16, 7.6.19, and 7.6.20

**Change:** The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

**Rationale:** C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

**Effect on original feature:** Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results.

[*Example 6:*

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C. — *end example*]

**Difficulty of converting:** Programs must add explicit casts to the appropriate rvalue.

**How widely used:** Rare.

### C.7.5 Clause 8: statements

[diff.stat]

1 **Affected subclauses:** 8.5.3 and 8.7.6

**Change:** It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

**Rationale:** Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

2 **Affected subclause:** 8.7.4

**Change:** It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

**Rationale:** The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with `void` and `int` return types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Add an appropriate return value to the source code, such as zero.

**How widely used:** Seldom. For several years, many existing C implementations have produced warnings in this case.

### C.7.6 Clause 9: declarations

[diff.dcl]

1 **Affected subclause:** 9.2.2

**Change:** In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions.

Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

[Example 1:

```
static struct S {                // valid C, invalid in C++
    int i;
};
```

— end example]

**Rationale:** Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Storage class specifiers on type declarations can be confusing for users.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 9.2.2

**Change:** In C++, `register` is not a storage class specifier.

**Rationale:** The storage class specifier had no effect in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common.

<sup>3</sup> **Affected subclause:** 9.2.4

**Change:** A C++ *typedef-name* must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a *typedef-name* and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

[Example 2:

```
typedef struct name1 { /* ... */ } name1;        // valid C and C++
struct name { /* ... */ };
typedef int name;                               // valid C, invalid C++
```

— end example]

**Rationale:** For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

[Example 3:

```
class name { /* ... */ };
name i;                                         // i has type class name
```

— end example]

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. One of the 2 types has to be renamed.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 9.2.9 [see also 6.6]

**Change:** Const objects must be initialized in C++ but can be left uninitialized in C.

**Rationale:** A const object cannot be assigned to so it must be initialized to hold a useful value.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>5</sup> **Affected subclause:** 9.2.9.7

**Change:** The keyword `auto` cannot be used as a storage class specifier.

[Example 4:

```
void f() {
    auto int x;        // valid C, invalid C++
}
```

— end example]

**Rationale:** Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Rare.

6 **Affected subclause:** 9.3.4.6

**Change:** In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

[Example 5:

```
int f();           // means int f(void) in C++
                  // int f( unknown ) in C
```

— end example]

**Rationale:** This is to avoid function calls with the wrong number or type of arguments.

**Effect on original feature:** Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.

**Difficulty of converting:** Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

**How widely used:** Common.

7 **Affected subclause:** 9.3.4.6 [see 7.6.2.5]

**Change:** In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

[Example 6:

```
void f( struct S { int a; } arg ) {} // valid C, invalid C++
enum E { A, B, C } f() {}         // valid C, invalid C++
```

— end example]

**Rationale:** When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The type definitions must be moved to file scope, or in header files.

**How widely used:** Seldom. This style of type definition is seen as poor coding style.

8 **Affected subclause:** 9.5

**Change:** In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

**Rationale:** Prototypes are essential to type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common in old programs, but already known to be obsolescent.

9 **Affected subclause:** 9.4.2

**Change:** In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

[Example 7:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2}; // valid C, invalid C++
int arr[3] = {[1] = 5};       // valid C, invalid C++
struct B b = {.a.x = 0};      // valid C, invalid C++
struct A c = {.x = 1, 2};     // valid C, invalid C++
```

— end example]

**Rationale:** In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so member initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.

**Effect on original feature:** Deletion of feature that is incompatible with C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Out-of-order initializers are common. The other features are seldom used.

10 **Affected subclause:** 9.4.3

**Change:** In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating '\0') must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating '\0'.

[Example 8:

```
char array[4] = "abcd";           // valid C, invalid C++
— end example]
```

**Rationale:** When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The arrays must be declared one element bigger to contain the string terminating '\0'.

**How widely used:** Seldom. This style of array initialization is seen as poor coding style.

11 **Affected subclause:** 9.7.1

**Change:** C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

[Example 9:

```
enum color { red, blue, green };
enum color c = 1;                // valid C, invalid C++
— end example]
```

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

**How widely used:** Common.

12 **Affected subclause:** 9.7.1

**Change:** In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

[Example 10:

```
enum e { A };
sizeof(A) == sizeof(int)        // in C
sizeof(A) == sizeof(e)         // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
— end example]
```

**Rationale:** In C++, an enumeration is a distinct type.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

13 **Affected subclause:** 9.12.2

**Change:** In C++, an *alignment-specifier* is an *attribute-specifier*. In C, an *alignment-specifier* is a *declaration-specifier*.

[Example 11:

```
#include <stdalign.h>
unsigned alignas(8) int x;      // valid C, invalid C++
unsigned int y alignas(8);     // valid C++, invalid C
— end example]
```

**Rationale:** C++ requires unambiguous placement of the *alignment-specifier*.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

## C.7.7 Clause 11: classes

[diff.class]

<sup>1</sup> Affected subclause: 11.3 [see also 9.2.4]

**Change:** In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

[Example 1:

```
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

— end example]

**Rationale:** This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

**How widely used:** Seldom.

<sup>2</sup> Affected subclause: 11.4.5.3

**Change:** Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue.

[Example 2: The following is valid in C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1;           // invalid C++
struct X x3;
x3 = x1;                   // also invalid C++
```

— end example]

**Rationale:** Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

**How widely used:** Seldom.

<sup>3</sup> Affected subclause: 11.4.10

**Change:** Bit-fields of type plain `int` are signed.

**Rationale:** The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

**Effect on original feature:** The choice is implementation-defined in C, but not so in C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

4 **Affected subclause:** 11.4.12

**Change:** In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

[*Example 3:*

```
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy;           // valid C, invalid C++
```

— *end example*]

**Rationale:** C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined.

[*Example 4:*

```
struct Y;           // struct Y and struct X are at the same scope
struct X {
    struct Y { /* ... */ } y;
};
```

— *end example*]

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.4.

**How widely used:** Seldom.

5 **Affected subclause:** 6.5.2

**Change:** In C++, a *typedef-name* may not be redeclared in a class definition after being used in that definition.

[*Example 5:*

```
typedef int I;
struct S {
    I i;
    int I;           // valid C, invalid C++
};
```

— *end example*]

**Rationale:** When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Either the type or the struct member has to be renamed.

**How widely used:** Seldom.

## C.7.8 Clause 15: preprocessing directives

[diff.cpp]

1 **Affected subclause:** 15.11

**Change:** Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

**Rationale:** C++ is not identical to C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Programs and headers that reference `__STDC__` are quite common.

**C.8 C standard library** [diff.library]**C.8.1 General** [diff.library.general]

- <sup>1</sup> Subclause C.8 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

**C.8.2 Modifications to headers** [diff.mods.to.headers]

- <sup>1</sup> For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.14.
- <sup>2</sup> There are no C++ headers for the C standard library's headers `<stdnoreturn.h>` and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.
- <sup>3</sup> The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

**C.8.3 Modifications to definitions** [diff.mods.to.definitions]**C.8.3.1 Types `char16_t` and `char32_t`** [diff.char16]

- <sup>1</sup> The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in C++ (5.11). They do not appear as macro or type names defined in `<cuchar>` (28.7.4).

**C.8.3.2 Type `wchar_t`** [diff.wchar.t]

- <sup>1</sup> The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ (5.11). It does not appear as a macro or type name defined in any of `<cstddef>` (17.2.1), `<cstdlib>` (17.2.2), or `<wchar>` (28.7.3).

**C.8.3.3 Header `<assert.h>`** [diff.header.assert.h]

- <sup>1</sup> The token `static_assert` is a keyword in C++. It does not appear as a macro name defined in `<cassert>` (19.3.2).

**C.8.3.4 Header `<iso646.h>`** [diff.header.iso646.h]

- <sup>1</sup> The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ (5.11), and are not introduced as macros by `<iso646.h>` (17.14.3).

**C.8.3.5 Header `<stdalign.h>`** [diff.header.stdalign.h]

- <sup>1</sup> The token `alignas` is a keyword in C++ (5.11), and is not introduced as a macro by `<stdalign.h>` (17.14.4).

**C.8.3.6 Header `<stdbool.h>`** [diff.header.stdbool.h]

- <sup>1</sup> The tokens `bool`, `true`, and `false` are keywords in C++ (5.11), and are not introduced as macros by `<stdbool.h>` (17.14.5).

**C.8.3.7 Macro `NULL`** [diff.null]

- <sup>1</sup> The macro `NULL`, defined in any of `<locale>` (28.3.5.1), `<cstddef>` (17.2.1), `<cstdio>` (31.13.1), `<cstdlib>` (17.2.2), `<cstring>` (27.5.1), `<ctime>` (30.15), or `<wchar>` (28.7.3), is an implementation-defined null pointer constant in C++ (17.2).

**C.8.4 Modifications to declarations** [diff.mods.to.declarations]

- <sup>1</sup> Header `<cstring>` (27.5.1): The following functions have different declarations:

- (1.1) — `strchr`
- (1.2) — `strpbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

Subclause 27.5.1 describes the changes.

<sup>2</sup> Header <wchar> (28.7.3): The following functions have different declarations:

- (2.1) — `wcschr`
- (2.2) — `wcspbrk`
- (2.3) — `wcsrchr`
- (2.4) — `wcsstr`
- (2.5) — `wmemchr`

Subclause 28.7.3 describes the changes.

<sup>3</sup> Header <stddef> (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in (17.2.5), in addition to the names declared in <stddef.h> (17.14) in the C standard library.

## C.8.5 Modifications to behavior

[diff.mods.to.behavior]

### C.8.5.1 General

[diff.mods.to.behavior.general]

<sup>1</sup> Header <stdlib> (17.2.2): The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

Subclause 17.5 describes the changes.

<sup>2</sup> Header <setjmp> (17.13.3): The following functions have different behavior:

- (2.1) — `longjmp`

Subclause 17.13.3 describes the changes.

### C.8.5.2 Macro `offsetof(type, member-designator)`

[diff.offsetof]

<sup>1</sup> The macro `offsetof`, defined in <stddef> (17.2.1), accepts a restricted set of *type* arguments in C++. Subclause 17.2.4 describes the change.

### C.8.5.3 Memory allocation functions

[diff.malloc]

<sup>1</sup> The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.

# Annex D

## (normative)

## Compatibility features [depr]

### D.1 General [depr.general]

- <sup>1</sup> This Annex describes features of this document that are specified for compatibility with existing implementations.
- <sup>2</sup> These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the `deprecated` attribute (9.12.5).

### D.2 Implicit capture of `*this` by reference [depr.capture.this]

- <sup>1</sup> For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* = (7.5.6.3) may implicitly capture `*this` by reference.

[Example 1:

```
struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; };           // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; };    // recommended replacement
    }
};
```

— end example]

### D.3 Array comparisons [depr.array.comp]

- <sup>1</sup> Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note]

[Example 1:

```
int arr1[5];
int arr2[5];
bool same = arr1 == arr2;           // deprecated, same as &arr1[0] == &arr2[0],
                                     // does not compare array contents
auto cmp = arr1 <=> arr2;           // error
```

— end example]

### D.4 Deprecated volatile types [depr.volatile.type]

- <sup>1</sup> Postfix `++` and `--` expressions (7.6.1.6) and prefix `++` and `--` expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:

```
volatile int velociraptor;
++velociraptor;                       // deprecated
```

— end example]

- <sup>2</sup> Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:

```
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck;                   // OK
```

```

tail = brachiosaur;           // OK
tail = brachiosaur = neck;   // deprecated
brachiosaur += neck;        // OK

```

— end example]

- <sup>3</sup> A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:

```

volatile struct amber jurassic();           // deprecated
void trex(volatile short left_arm, volatile short right_arm); // deprecated
void fly(volatile struct pterosaur* pteranodon); // OK

```

— end example]

- <sup>4</sup> A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4:

```

struct linhenykus { short forelimb; };
void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid; // deprecated
    // ...
}

```

— end example]

## D.5 Redclaration of static constexpr data members [depr.static constexpr]

- <sup>1</sup> For compatibility with prior revisions of C++, a constexpr static data member may be redundantly redeclared outside the class with no initializer (6.2, 11.4.9.3). This usage is deprecated.

[Example 1:

```

struct A {
    static constexpr int n = 5; // definition (declaration in C++ 2014)
};

constexpr int A::n; // redundant declaration (definition in C++ 2014)

```

— end example]

## D.6 Non-local use of TU-local entities [depr.local]

- <sup>1</sup> A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1:

```

namespace {
    struct A {
        void f() {}
    };
}
A h(); // deprecated: not internal linkage
inline void g() {A().f();} // deprecated: inline and not internal linkage

```

— end example]

## D.7 Implicit declaration of copy functions [depr.impldec]

- <sup>1</sup> The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

## D.8 Literal operator function declarations using an identifier [depr.lit]

- <sup>1</sup> A *literal-operator-id* (12.6) of the form

```
operator unevaluated-string identifier
```

is deprecated.

**D.9 template keyword before qualified names** [depr.template.template]

- <sup>1</sup> The use of the keyword `template` before the qualified name of a class or alias template without a template argument list is deprecated (13.3).

**D.10 has\_denorm members in numeric\_limits** [depr.numeric.limits.has.denorm]

- <sup>1</sup> The following type is defined in addition to those specified in <limits> (17.3.3):

```
namespace std {
    enum float_denorm_style {
        denorm_indeterminate = -1,
        denorm_absent = 0,
        denorm_present = 1
    };
}
```

- <sup>2</sup> The following members are defined in addition to those specified in 17.3.5.1:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

- <sup>3</sup> The values of `has_denorm` and `has_denorm_loss` of specializations of `numeric_limits` are unspecified.

- <sup>4</sup> The following members of the specialization `numeric_limits<bool>` are defined in addition to those specified in 17.3.5.3:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

**D.11 Deprecated C macros** [depr.c.macros]

- <sup>1</sup> The header <stdalign.h> (17.14.4) has the following macros:

```
#define __alignas_is_defined 1
#define __alignof_is_defined 1
```

- <sup>2</sup> The header <stdbool.h> (17.14.5) has the following macro:

```
#define __bool_true_false_are_defined 1
```

**D.12 Relational operators** [depr.relops]

- <sup>1</sup> The header <utility> (22.2.1) has the following additions:

```
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator>(const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
```

- <sup>2</sup> To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

- <sup>3</sup> *Preconditions:* T meets the *Cpp17EqualityComparable* requirements (Table 28).

- <sup>4</sup> *Returns:* `!(x == y)`.

```
template<class T> bool operator>(const T& x, const T& y);
```

- <sup>5</sup> *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

- <sup>6</sup> *Returns:* `y < x`.

```
template<class T> bool operator<=(const T& x, const T& y);
```

- <sup>7</sup> *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

- <sup>8</sup> *Returns:* `!(y < x)`.

```
template<class T> bool operator==(const T& x, const T& y);
```

9     *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

10    *Returns:* !(x < y).

### D.13 Deprecated error numbers

[depr.cerrno]

1 The header <cerrno> (19.4.2) has the following additional macros:

```
#define ENODATA see below
#define ENOSR see below
#define ENOSTR see below
#define ETIME see below
```

2 The meaning of these macros is defined by the POSIX standard.

3 The following enum `errc` enumerators are defined in addition to those specified in 19.5.2:

```
no_message_available,      // ENODATA
no_stream_resources,      // ENOSR
not_a_stream,              // ENOSTR
stream_timeout,           // ETIME
```

4 The value of each enum `errc` enumerator above is the same as the value of the <cerrno> macro shown in the above synopsis.

### D.14 Deprecated type traits

[depr.meta.types]

1 The header <type\_traits> (21.3.3) has the following addition:

```
namespace std {
    template<class T> struct is_pod;
    template<class T> constexpr bool is_pod_v = is_pod<T>::value;
    template<size_t Len, size_t Align = default-alignment> // see below
        struct aligned_storage;
    template<size_t Len, size_t Align = default-alignment> // see below
        using aligned_storage_t = typename aligned_storage<Len, Align>::type;
    template<size_t Len, class... Types>
        struct aligned_union;
    template<size_t Len, class... Types>
        using aligned_union_t = typename aligned_union<Len, Types...>::type;
}

```

2 The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

3 A *POD class* is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A *POD type* is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

```
template<class T> struct is_pod;
```

4     *Preconditions:* `remove_all_extents_t<T>` shall be a complete type or *cv void*.

5     *Remarks:* `is_pod<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if T is a POD type, and `false_type` otherwise.

6     [Note 1: It is unspecified whether a closure type (7.5.6.2) is a POD type. — end note]

```
template<size_t Len, size_t Align = default-alignment>
    struct aligned_storage;
```

7     The value of *default-alignment* is the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.8).

8     *Mandates:* `Len` is not zero. `Align` is equal to `alignof(T)` for some type T or to *default-alignment*.

9     The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`.

10    [Note 2: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`. — end note]

11 [Note 3: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};
```

— end note]

```
template<size_t Len, class... Types>
struct aligned_union;
```

12 *Mandates:* At least one type is provided. Each type in the template parameter pack `Types` is a complete object type.

13 The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` is an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`.

## D.15 Tuple

[depr.tuple]

1 The header `<tuple>` (22.4.2) has the following additions:

```
namespace std {
    template<class T> struct tuple_size<volatile T>;
    template<class T> struct tuple_size<const volatile T>;

    template<size_t I, class T> struct tuple_element<I, volatile T>;
    template<size_t I, class T> struct tuple_element<I, const volatile T>;
}
```

```
template<class T> struct tuple_size<volatile T>;
template<class T> struct tuple_size<const volatile T>;
```

2 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member `value`.

3 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

4 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

5 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

(5.1) — for the first specialization, `add_volatile_t<TE>`, and

(5.2) — for the second specialization, `add_cv_t<TE>`.

6 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

## D.16 Variant

[depr.variant]

1 The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;
```

```

template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}

```

```

template<class T> struct variant_size<volatile T>;
template<class T> struct variant_size<const volatile T>;

```

- 2 Let VS denote `variant_size<T>` of the cv-qualified type T. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```

template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;

```

- 3 Let VA denote `variant_alternative<I, T>` of the cv-qualified type T. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

(3.1) — for the first specialization, `add_volatile_t<VA::type>`, and

(3.2) — for the second specialization, `add_cv_t<VA::type>`.

## D.17 Deprecated iterator class template

[depr.iterator]

- 1 The header `<iterator>` (24.2) has the following addition:

```

namespace std {
  template<class Category, class T, class Distance = ptrdiff_t,
           class Pointer = T*, class Reference = T&>
  struct iterator {
    using iterator_category = Category;
    using value_type       = T;
    using difference_type  = Distance;
    using pointer          = Pointer;
    using reference        = Reference;
  };
}

```

- 2 The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

- 3 [Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]

- 4 [Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```

class MyIterator :
  public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
  // code implementing ++, etc.
};

```

— end example]

## D.18 Deprecated move\_iterator access

[depr.move.iter.elem]

- 1 The following member is declared in addition to those members specified in 24.5.4.6:

```

namespace std {
  template<class Iterator>
  class move_iterator {
  public:
    constexpr pointer operator->() const;
  };
}

```

```
constexpr pointer operator->() const;
```

- 2 *Returns:* current.

**D.19 Deprecated formatting** [depr.format]**D.19.1 Header <format> synopsis** [depr.format.syn]

- 1 The header <format> (28.5.1)format.syn has the following additions:

```
namespace std {
    template<class Visitor, class Context>
        decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
}
```

**D.19.2 Formatting arguments** [depr.format.arg]

```
template<class Visitor, class Context>
    decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

- 1 *Effects:* Equivalent to: return visit(std::forward<Visitor>(vis), arg.value);

**D.20 Deprecated locale category facets** [depr.locale.category]

- 1 The ctype locale category includes the following facets as if they were specified in table Table 86 of 28.3.3.1.2.1.

```
codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>
codecvt<char16_t, char8_t, mbstate_t>
codecvt<char32_t, char8_t, mbstate_t>
```

- 2 The ctype locale category includes the following facets as if they were specified in table Table 87 of 28.3.3.1.2.1.

```
codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>
codecvt_byname<char16_t, char8_t, mbstate_t>
codecvt_byname<char32_t, char8_t, mbstate_t>
```

- 3 The following class template specializations are required in addition to those specified in 28.3.4.2.5. The specializations codecvt<char16\_t, char, mbstate\_t> and codecvt<char16\_t, char8\_t, mbstate\_t> convert between the UTF-16 and UTF-8 encoding forms, and the specializations codecvt<char32\_t, char, mbstate\_t> and codecvt<char32\_t, char8\_t, mbstate\_t> convert between the UTF-32 and UTF-8 encoding forms.

**D.21 Deprecated filesystem path factory functions** [depr.fs.path.factory]

- 1 The header <filesystem> (31.12.4) has the following additions:

```
template<class Source>
    path u8path(const Source& source);
template<class InputIterator>
    path u8path(InputIterator first, InputIterator last);
```

- 2 *Mandates:* The value type of Source and InputIterator is char or char8\_t.

- 3 *Preconditions:* The source and [first,last) sequences are UTF-8 encoded. Source meets the requirements specified in 31.12.6.4.

- 4 *Returns:*

- (4.1) — If path::value\_type is char and the current native narrow encoding (31.12.6.3.2) is UTF-8, return path(source) or path(first, last); otherwise,
- (4.2) — if path::value\_type is wchar\_t and the native wide encoding is UTF-16, or if path::value\_type is char16\_t or char32\_t, convert source or [first,last) to a temporary, tmp, of type path::string\_type and return path(tmp); otherwise,
- (4.3) — convert source or [first,last) to a temporary, tmp, of type u32string and return path(tmp).

- 5 *Remarks:* Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

- 6 *[Example 1:* A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*]

[*Note 1*: The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`'s constructor is preferred as it is consistent with `path`'s handling of other encodings. — *end note*]

## D.22 Deprecated atomic operations [depr.atomics]

### D.22.1 General [depr.atomics.general]

- <sup>1</sup> The header `<atomic>` (32.5.2) has the following additions.

```
namespace std {
    template<class T>
        void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
    template<class T>
        void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

    #define ATOMIC_VAR_INIT(value) see below
}
```

### D.22.2 Volatile access [depr.atomics.volatile]

- <sup>1</sup> If an `atomic` (32.5.8) specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is `false`:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
```

### D.22.3 Non-member functions [depr.atomics.nonmembers]

```
template<class T>
    void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
    void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

- <sup>1</sup> *Effects*: Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed)`;

### D.22.4 Operations on atomic types [depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

- <sup>1</sup> The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

[*Note 1*: This operation possibly needs to initialize locks. — *end note*]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[*Example 1:*

```
    atomic<int> v = ATOMIC_VAR_INIT(5);
```

— *end example*]

# Annex E

## (informative)

### Conformance with UAX #31

[uaxid]

#### E.1 General

[uaxid.general]

- <sup>1</sup> This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to this document. In terms of UAX #31, this document conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers” from UAX #31. The other requirements from UAX #31, also listed below, are either alternatives not taken or do not apply to this document.

#### E.2 R1 Default identifiers

[uaxid.def]

##### E.2.1 General

[uaxid.def.general]

- <sup>1</sup> UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

```
<Identifier> := <Start> <Continue>* (<Medial> <Continue>+)*
```

where <Start> has the `XID_Start` property, <Continue> has the `XID_Continue` property, and <Medial> is a list of characters permitted between continue characters. For C++ we add the character `U+005F` `LOW LINE`, or `_`, to the set of permitted <Start> characters, the <Medial> set is empty, and the <Continue> characters are unmodified. In the grammar used in UAX #31, this is

```
<Identifier> := <Start> <Continue>*
<Start> := XID_Start + U+005F
<Continue> := <Start> + XID_Continue
```

- <sup>2</sup> This is described in the C++ grammar in 5.10, where *identifier* is formed from *identifier-start* or *identifier* followed by *identifier-continue*.

##### E.2.2 R1a Restricted format characters

[uaxid.def.rfmt]

- <sup>1</sup> If an implementation of UAX #31 wishes to allow format characters such as `U+200D` `ZERO WIDTH JOINER` or `U+200C` `ZERO WIDTH NON-JOINER` it must define a profile allowing them, or describe precisely which combinations are permitted.
- <sup>2</sup> C++ does not allow format characters in identifiers, so this does not apply.

##### E.2.3 R1b Stable identifiers

[uaxid.def.stable]

- <sup>1</sup> An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.
- <sup>2</sup> C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the `XID_Start` and `XID_Continue` properties.

#### E.3 R2 Immutable identifiers

[uaxid.immutable]

- <sup>1</sup> An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.
- <sup>2</sup> C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

#### E.4 R3 Pattern\_White\_Space and Pattern\_Syntax characters

[uaxid.pattern]

- <sup>1</sup> UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.

<sup>2</sup> This document does not claim conformance with this requirement from UAX #31.

**E.5 R4 Equivalent normalized identifiers** [uaxid.eqn]

<sup>1</sup> UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.

<sup>2</sup> This document requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.10.

**E.6 R5 Equivalent case-insensitive identifiers** [uaxid.eqci]

<sup>1</sup> This document considers case to be significant in identifier comparison, and does not do any case folding. This requirement from UAX #31 does not apply to this document.

**E.7 R6 Filtered normalized identifiers** [uaxid.filter]

<sup>1</sup> If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.

<sup>2</sup> This document does not make any such exclusions.

**E.8 R7 Filtered case-insensitive identifiers** [uaxid.filterci]

<sup>1</sup> C++ identifiers are case sensitive, and therefore this requirement from UAX #31 does not apply.

**E.9 R8 Hashtag identifiers** [uaxid.hashtag]

<sup>1</sup> There are no hashtags in C++, so this requirement from UAX #31 does not apply.

  keyword, 3, 21, 24, 27, 79, 80, 84, 103, 104, 106, 140, 192, 193, 220, 227, 490, 492, 498, 525, 526, 709, 1448, 1470, 1505, 1516, 1520, 1522, 1556, 1695, 1787, 1790, 1867, 1885, 1892, 1894, 1896, 1905, 1964, 1972, 2108, 2134, 2148, 2157, 2165  
weakly parallel forward progress guarantees, 92  
well-formed program, *see* program, well-formed  
**while**  
  keyword, 21, 161, 168, 169, 172–174, 2105  
whitespace, 17, 18  
wide literal encoding, *see* encoding, wide literal  
wide-character, 24  
  null, 16  
wide-character set  
  execution, 498  
width, 78, 301  
  of integer-class type, 1056  
  padding, 1496  
worse conversion sequence, *see* conversion sequence, worse

## X

**xor**  
  keyword, 18, 21, 2097, 2157  
**xor\_eq**

keyword, [18](#), [21](#), [2097](#), [2157](#)  
xvalue, [98](#)

## Y

$Y_\ell^m$  (spherical associated Legendre functions),  
[1644](#)  
*yield-expression*, [156](#), [2104](#)

## Z

zero  
    division by undefined, [97](#)  
    remainder undefined, [97](#)  
    undefined division by, [149](#)  
zero-initialization, [218](#)  
zeta functions  $\zeta$ , [1643](#)

# Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

- abstract-declarator*, 200, **202**, 202, 203, 211, 214, 215, **2109**
- abstract-pack-declarator*, **202**, **2109**
- access-specifier*, **307**, 307, 316–318, **2114**
- additive-expression*, **150**, **2103**
- alias-declaration*, 33, 42, **180**, 186, 202, 212, 270, 273, 283, 376, 397, 416, **2106**
- alignment-specifier*, 73, **258**, 259, 260, 403, 404, **2111**, 2154
- and-expression*, **154**, **2104**
- asm-declaration*, 161, 181, **255**, 255, **2111**
- assignment-expression*, 126, **157**, 181, 198, 222, 241, 300, 325, 348, 593, **2104**
- assignment-operator*, **157**, **2104**
- attribute*, **258**, 259, 403, **2112**
- attribute-argument-clause*, **258**, 259–266, **2112**
- attribute-declaration*, 33, **181**, 183, **2107**
- attribute-list*, **258**, 259, 403, **2112**
- attribute-namespace*, **258**, 259, **2112**
- attribute-scoped-token*, **258**, 259, **2112**
- attribute-specifier*, **258**, 259, **2111**, 2154
- attribute-specifier-seq*, 44, 112, 114, 142, 168–170, 172, 181, 183, 186, 190, 194, 204–206, 208–211, 235, 241–243, 247, 248, 255, **258**, 259, 263, 267, 271, 278, 284, 288, 294, 298, 301, 307, 417, 438, 465, **2111**
- attribute-token*, 20, **258**, 259–266, 477, 517, **2112**
- attribute-using-prefix*, **258**, 259, **2111**
- attributed-identifier*, **180**, 241, **2106**
- attributed-identifier-list*, **180**, 241, 242, **2106**
- await-expression*, 87, **138**, 138, 139, 160, 238, 239, 573, 2061, 2094, **2103**
- balanced-token*, **258**, **2112**
- balanced-token-seq*, 255, **258**, 259, **2112**
- base-clause*, 279, **307**, 433, **2113**
- base-specifier*, 46, 54, **307**, 307, 308, 316, 320, 402, **2114**
- base-specifier-list*, 293, **307**, 307, 316, 328, 330, 337, 350, 402, 404, **2114**
- basic-c-char*, **24**, 25, **2098**
- basic-s-char*, **27**, 28, **2099**
- binary-digit*, **22**, 22, **2097**
- binary-exponent-part*, **26**, 26, **2099**
- binary-literal*, **22**, 23, **2097**
- block-declaration*, 32, **180**, **2106**
- boolean-literal*, **29**, **2100**
- brace-or-equal-initializer*, 85, 182, 198, **218**, 218, 219, 222, 283, 284, 288, 289, 300, 427, **2109**
- braced-init-list*, 73, 85, 128, 142, 158, 166, 176, 198, **218**, 219–222, 224, 229, 230, 233, 325, 327, 329, 350, 386, 423, 428, **2110**, 2119, 2136
- c-char*, **24**, 24, **2098**
- c-char-sequence*, 13, 16, **23**, 24, 25, **2098**
- capture*, **117**, 118, 403, **2101**
- capture-default*, 36, **117**, 117, 118, 120, **2101**, 2129, 2159
- capture-list*, **117**, 403, **2101**
- cast-expression*, 122, 138, **147**, 147, 149, 166, 302, 370, 403, 404, 429, **2103**
- character-literal*, 16, **23**, 24, 25, 477, 482, 484, 1455, **2098**, 2140, 2148
- class-head*, 42, 260, **278**, 278, **2112**
- class-head-name*, 44, 110, **278**, 278, 279, **2113**
- class-key*, 57, 181, 194, **278**, 278–280, 304, 318, 398, **2113**
- class-name*, 12, 45, 181, 186, 194, **278**, 278, 281, 282, 294, **2112**
- class-or-decltype*, 53, 279, **307**, 307, 326, 350, 419, **2114**
- class-specifier*, 32, 42, 44, 46, 61, 181, 190, **278**, 278, 284, 287, **2112**
- class-virt-specifier*, **278**, 279, 682, **2113**
- compare-expression*, **151**, **2104**
- compound-requirement*, **124**, 124, 125, **2102**
- compound-statement*, 43, 44, 85, 93, 109, 110, 116, 120, 121, 138, 165, 168, **169**, 169, 171, 172, 176, 289, 327, 328, 335, 436, 465–468, 470, **2105**
- computed-type-specifier*, 52, 109–111, 138, **192**, 295, **2108**
- concept-definition*, 33, 43, **417**, 417, 418, **2115**
- concept-name*, 43, 60, 272, 378, 384, **417**, 417, **2115**
- condition*, 32, **168**, 168, 169, 171–174, 181, 219, 220, 241, 466, **2105**
- conditional-escape-sequence*, **24**, 25, 29, **2099**
- conditional-escape-sequence-char*, **24**, **2099**
- conditional-expression*, 4, **155**, 155, 161, **2104**
- conditionally-supported-directive*, **474**, 475, 483, **2117**
- constant-expression*, 3, 85, 111, 142, **158**, 158, 166, 171, 172, 182, 185, 192, 209, 243, 260, 284, 301, 342, 387, 397, 470, 495, **2104**
- constraint-expression*, 43, 108, 125, 201, 349, 377, 378, 384, 391, **393**, 393–395, 413, 418, 421, 495, **2115**

# Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in *italics* are for exposition only.

- advanceable*, 1133, **1134**, 1135–1139
- all-bidirectional*, **1147**, 1189, 1213–1215
- all-forward*, **1147**, 1191, 1193, 1213, 1214
- all-random-access*, **1147**, 1189, 1191, 1194, 1213–1215, 1258, 1261
- always-true*, **2088**
- assignable\_from*, 579, **582**, 582, 583, 588, 837, 1058, 1067, 1068, 1071, 1074, 1086, 1089–1091, 1094, 1096, 1284
- await-suspend-result*, **2061**, 2061
- awaitable-sender*, **2092**, 2094
- bidirectional-common*, **1173**, 1175, 1177, 1178
- bidirectional\_iterator*, 1042, 1044, 1048, **1060**, 1060, 1071–1073, 1080, 1082, 1083, 1086, 1095, 1097, 1117, 1118, 1122, 1126, 1128, 1269, 1285, 1287, 1294, 1302, 1304, 1313, 1330, 1331, 1333, 1335, 1344, 1345, 1348, 1357, 1358, 1360, 1374, 1375, 1543, 1544

# Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

- #pragma, 487
- additional execution policies supported by parallel algorithms, 1272, 1273
- additional `file_type` enumerators for file systems supporting additional types of file, 1907
- additional formats for `time_get::do_get_date`, 1475
- additional supported forms of preprocessing directive, 475
- algorithms for producing the standard random number distributions, 1592
- alignment, 72
- alignment additional values, 73
- alignment of bit-fields within a class object, 301
- allocation of bit-fields within a class object, 301
- argument values to construct
  - `ios_base::failure`, 1804
- assignability of placeholder objects, 806
- barrier phrase completion without `wait`, 2017
- behavior of `iostream` classes when
  - `traits::pos_type` is not `streampos` or when `traits::off_type` is not `streamoff`, 1787
- behavior of non-standard attributes, 259
- bits in a byte, 62
- character encoding scheme of the environment, 1487
- choice of larger or smaller value of
  - floating-point-literal*, 26
- code unit sequence for *conditional-escape-sequence*, 29
- column value of `source_location::current`, 554
- conversions between pointers and integers, 135
- converting function pointer to object pointer and vice versa, 135
- default configuration of a pool, 664
- default `next_buffer_size` for a
  - `monotonic_buffer_resource`, 665
- default number of buckets in `unordered_map`, 925, 926
- default number of buckets in
  - `unordered_multimap`, 933
- default number of buckets in
  - `unordered_multiset`, 944, 945
- default number of buckets in `unordered_set`, 939
- default semantics of `is_debugger_present`, 610
- default value for `least_max_value` template parameter of `counting_semaphore`, 2014
- defining `main` in freestanding environment, 92
- definition and meaning of `__STDC__`, 490, 2156
- definition and meaning of `__STDC_VERSION__`, 490
- definition of `NULL`, 526, 2157
- derived type for `typeid`, 131
- determination of kind of input file, 13
- diagnostic message, 4
- dynamic initialization of static inline variables before `main`, 95
- dynamic initialization of static variables before `main`, 94, 95
- dynamic initialization of thread-local variables before entry, 95
- effect of calling associated Laguerre polynomials with `n >= 128` or `m >= 128`, 1639
- effect of calling associated Legendre polynomials with `l >= 128`, 1640
- effect of calling `basic_filebuf::setbuf` with nonzero arguments, 1872
- effect of calling `basic_filebuf::sync` when a get area exists, 1873
- effect of calling `basic_streambuf::setbuf` with nonzero arguments, 1850
- effect of calling cylindrical Bessel functions of the first kind with `nu >= 128`, 1641
- effect of calling cylindrical Neumann functions with `nu >= 128`, 1642
- effect of calling Hermite polynomials with `n >= 128`, 1643
- effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 1798
- effect of calling irregular modified cylindrical Bessel functions with `nu >= 128`, 1641
- effect of calling Laguerre polynomials with `n >= 128`, 1643
- effect of calling Legendre polynomials with `l >= 128`, 1643
- effect of calling regular modified cylindrical Bessel functions with `nu >= 128`, 1641
- effect of calling spherical associated Legendre functions with `l >= 128`, 1644
- effect of calling spherical Bessel functions with `n >= 128`, 1644
- effect of calling spherical Neumann functions with `n >= 128`, 1644

- effect of *conditional-escape-sequence* on encoding state, 29
- effect of `filesystem::copy`, 1919
- effect on C locale of calling `locale::global`, 1451
- encoding assumption for `format` width computation, 1498
- `error_category` for errors originating outside the operating system, 523
- exception type when `random_device` constructor fails, 1589
- exception type when `random_device::operator()` fails, 1589
- exception type when `shared_ptr` constructor fails, 640, 641
- exceptions thrown by standard library functions that have a potentially-throwing exception specification, 523
- exit status, 543
- extended signed integer types, 78
- file type of the file argument of `filesystem::status`, 1930
- floating-point conversion subrank, 84
- format of diagnostic created by `assert` macro's expression, 593
- formatted character sequence generated by `time_put::do_put` in C locale, 1477
- forward progress guarantees for implicit threads of parallel algorithms (if not defined for thread), 1271
- growth factor for `monotonic_buffer_resource`, 665, 666
- headers for freestanding implementation, 504
- how `random_device::operator()` generates values, 1589
- how `text_encoding` objects are determined to be representative of a character encoding scheme, 1486
- how the set of importable headers is determined, 271
- interactive device, 11
- interpretation of the path character sequence with `path::auto_format`, 1906
- invalid pointer value in the context of an evaluation, 82
- largest supported value to configure the largest allocation satisfied directly by a pool, 663
- largest supported value to configure the maximum number of blocks to replenish a pool, 663
- last enumerator of `launch`, 2019
- linkage of `main`, 93
- linkage of names from C standard library, 504
- linkage of objects between C++ and other languages, 258
- locale names, 1450
- locales with Unicode support for chrono types, 1777
- lvalue-to-rvalue conversion of an invalid pointer value, 102
- manner of search for included source file, 479
- mapping from name to catalog when calling `messages::do_open`, 1483
- mapping header name to header or external source file, 19
- mapping input source file characters to translation character set, 2136
- mapping of pointer to integer, 134
- mapping physical source file characters to translation character set, 13
- mapping to message when calling `messages::do_get`, 1483
- maximum depth of recursive template instantiations, 437
- maximum size of an allocated object, 142, 549
- meaning of `'`, `\`, `/*`, or `//` in a *q-char-sequence* or an *h-char-sequence*, 19
- meaning of `asm` declaration, 255
- meaning of attribute declaration, 183
- meaning of dot-dot in *root-directory*, 1893
- nesting limit for `#include` directives, 479
- NTCTS in `basic_ostream<charT, traits>& operator<<(nullptr_t)`, 1834
- number of placeholders for bind expressions, 789, 806
- number of threads in a program under a freestanding implementation, 88
- operating system on which implementation depends, 1885
- `operator<<` for large extended floating-point types, 1833
- `operator>>` for large extended floating-point types, 1821
- ordinary and wide literal encodings, 16
- parameters to `main`, 92
- passing argument of class type through ellipsis, 128
- presence and meaning of `native_handle_type` and `native_handle`, 1934
- presence and value of `__STDC_ISO_10646__`, 490
- rank of extended signed integer type, 84
- representation of floating-point types, 80
- required alignment for `atomic_ref` type's operations, 1961, 1964, 1966, 1967
- resource limits on a message catalog, 1484
- result of `filesystem::file_size`, 1924
- result of inexact floating-point conversion, 104, 134
- resuming a coroutine on a different execution agent, 570

- return type of `cartesian_product_view::size`, 1257
- return value of `bad_alloc::what`, 548
- return value of `bad_any_cast::what`, 756
- return value of `bad_array_new_length::what`, 549
- return value of `bad_cast::what`, 551
- return value of `bad_exception::what`, 556
- return value of `bad_function_call::what`, 807
- return value of `bad_optional_access::what`, 741
- return value of `bad_typeid::what`, 551
- return value of `bad_variant_access::what`, 755
- return value of `bad_weak_ptr::what`, 638
- return value of `char_traits<char16_t>::eof`, 1401
- return value of `char_traits<char32_t>::eof`, 1401
- return value of `char_traits<char8_t>::eof`, 1400
- return value of `exception::what`, 556
- return value of `source_location::current`, 553
- return value of `type_info::name()`, 551
  
- search locations for "" header, 479
- search locations for <> header, 478
- semantics of an access through a volatile glvalue, 191
- semantics of `breakpoint`, 610
- semantics of linkage specifiers, 256
- semantics of parallel algorithms invoked with implementation-defined execution policies, 1272
- semantics of
  - `stacktrace_entry::native_handle`, 605
- semantics of `token` parameter and default token value used by `random_device` constructors, 1589
- sequence of places searched for a header, 478
- set of aliases of a known registered character encoding, 1486
- set of character container types that iostreams templates can be instantiated for, 1448, 1787
- set of integer-class types, 1056
- signedness of `char`, 192
- `sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, 140
- stack unwinding before invocation of
  - `std::terminate`, 469, 473
- `stacktrace_entry::native_handle_type`, 604
- startup and termination in freestanding environment, 92
- strict total order over pointer values, 5
- string resulting from `__func__`, 235
- support for extended alignments, 73
- support for *module-import-declarations* with non-C++ language linkage, 256
- supported input files, 13
- supported multibyte character encoding rules, 1400
- supported *root-names* in addition to any operating system dependent *root-names*, 1892, 1893
  
- text of `__DATE__` when date of translation is not available, 488
- text of `__TIME__` when time of translation is not available, 489
- threads and program points at which deferred dynamic initialization is performed, 94, 95
- transcoding of a formatted path when `charT` and `path::value_type` differ, 1905
- type of a directory-like file, 1914, 1916
- type of `array::const_iterator`, 863
- type of `array::iterator`, 863
- type of `basic_stacktrace::const_iterator`, 605
- type of `basic_stacktrace::difference_type`, 606
- type of `basic_stacktrace::size_type`, 606
- type of `basic_string::const_iterator`, 1415
- type of `basic_string::iterator`, 1415
- type of `basic_string_view::const_iterator`, 1403, 1406
- type of `default_random_engine`, 1588
- type of `deque::const_iterator`, 866
- type of `deque::difference_type`, 866
- type of `deque::iterator`, 866
- type of `deque::size_type`, 866
- type of `flat_map::const_iterator`, 959
- type of `flat_map::iterator`, 959
- type of `flat_multimap::const_iterator`, 971
- type of `flat_multimap::iterator`, 971
- type of `flat_multiset::const_iterator`, 985
- type of `flat_multiset::iterator`, 985
- type of `flat_set::const_iterator`, 978
- type of `flat_set::iterator`, 978
- type of `forward_list::const_iterator`, 871
- type of `forward_list::difference_type`, 871
- type of `forward_list::iterator`, 871
- type of `forward_list::size_type`, 871
- type of `inplace_vector::const_iterator`, 894
- type of `inplace_vector::iterator`, 894
- type of `list::const_iterator`, 879
- type of `list::difference_type`, 879
- type of `list::iterator`, 879
- type of `list::size_type`, 879
- type of `map::const_iterator`, 900
- type of `map::difference_type`, 900
- type of `map::iterator`, 900
- type of `map::size_type`, 900
- type of `match_results::const_iterator`, 1538
- type of `multimap::const_iterator`, 907
- type of `multimap::difference_type`, 907

- type of `multimap::iterator`, 907
- type of `multimap::size_type`, 907
- type of `multiset::const_iterator`, 916
- type of `multiset::difference_type`, 916
- type of `multiset::iterator`, 916
- type of `multiset::size_type`, 916
- type of `native_handle_type`, 1867
- type of `ptrdiff_t`, 150, 527
- type of `ranges::cartesian_product_-view::iterator::difference_type`, 1259
- type of `regex_constants::error_type`, 1529
- type of `regex_constants::match_flag_type`, 1528
- type of `set::const_iterator`, 912
- type of `set::difference_type`, 912
- type of `set::iterator`, 912
- type of `set::size_type`, 912
- type of `size_t`, 527
- type of `span::iterator`, 993, 998
- type of `std::bfloat16_t`, 542
- type of `std::float128_t`, 542
- type of `std::float16_t`, 542
- type of `std::float32_t`, 542
- type of `std::float64_t`, 542
- type of `streamoff`, 1787
- type of `syntax_option_type`, 1527
- type of `text_encoding::aliases_-view::begin()`, 1488
- type of `text_encoding::aliases_view::end()`, 1488
- type of `unordered_map::const_iterator`, 921
- type of `unordered_map::const_local_-iterator`, 921
- type of `unordered_map::difference_type`, 921
- type of `unordered_map::iterator`, 921
- type of `unordered_map::local_iterator`, 921
- type of `unordered_map::size_type`, 921
- type of `unordered_multimap::const_iterator`, 929
- type of `unordered_multimap::const_local_iterator`, 929
- type of `unordered_multimap::difference_-type`, 929
- type of `unordered_multimap::iterator`, 929
- type of `unordered_multimap::local_iterator`, 929
- type of `unordered_multimap::size_type`, 929
- type of `unordered_multiset::const_iterator`, 941
- type of `unordered_multiset::const_local_iterator`, 941
- type of `unordered_multiset::difference_-type`, 941
- type of `unordered_multiset::iterator`, 941
- type of `unordered_multiset::local_iterator`, 941
- type of `unordered_multiset::size_type`, 941
- type of `unordered_set::const_iterator`, 935
- type of `unordered_set::const_local_-iterator`, 935
- type of `unordered_set::difference_type`, 935
- type of `unordered_set::iterator`, 935
- type of `unordered_set::local_iterator`, 935
- type of `unordered_set::size_type`, 935
- type of `vector::const_iterator`, 885
- type of `vector::difference_type`, 885
- type of `vector::iterator`, 885
- type of `vector::size_type`, 885
- type of `vector<bool>::const_iterator`, 890
- type of `vector<bool>::const_pointer`, 890
- type of `vector<bool>::difference_type`, 890
- type of `vector<bool>::iterator`, 890
- type of `vector<bool>::pointer`, 890
- type of `vector<bool>::size_type`, 890
- underlying type for enumeration, 244
- underlying type of `bool`, 80
- underlying type of `char`, 79
- underlying type of `wchar_t`, 79
- unit suffix when `Period::type` is `micro`, 1718
- value of bit-field that cannot represent assigned value, 157
- initializer, 221
- value of *conditional-escape-sequence*, 25
- value of `ctype<char>::table_size`, 1456
- value of `future_errc::broken_promise`, 2019
- value of `future_errc::future_already_-retrieved`, 2019
- value of `future_errc::no_state`, 2019
- value of `future_errc::promise_already_-satisfied`, 2019
- value of *has-attribute-expression* for non-standard attributes, 477
- value of *has-attribute-expression* for standard attributes, 477
- value of non-encodable character literal or multicharacter literal, 25
- value of `pow(0,0)`, 1566
- value of result of inexact integer to floating-point conversion, 104
- value representation of pointer types, 82
- values of a trivially copyable type, 77
- values of various `ATOMIC_..._LOCK_FREE` macros, 1960
- whether `<cfenv>` functions can be used to manage floating-point status, 1560
- whether a freestanding deleted function is a deleted function, 500
- whether a given atomic type's operations are always lock free, 1968, 1969, 1972, 1975, 1976, 1979, 1981
- whether a given `atomic_ref` type's operations are always lock free, 1961, 1964, 1966, 1967

- whether a parameter is destroyed when the function exits or at the end of the enclosing full-expression, [127](#)
- whether `basic_spanbuf`'s move source is empty after a move, [1861](#)
- whether freestanding default replaceable global allocation functions satisfy required behavior, [544](#)
- whether functions from Annex K of the C standard library are declared when C++ headers are included, [503](#)
- whether locale object is global or per-thread, [1447](#)
- whether pragma `FENV_ACCESS` is supported, [1560](#)
- whether `rand` may introduce a data race, [1613](#)
- whether sequence pointers are copied by `basic_filebuf` move constructor, [1869](#)
- whether sequence pointers are copied by `basic_stringbuf` move constructor, [1846](#)
- whether sequence pointers are initialized to null pointers, [1845](#)
- whether source file inclusion of importable header is replaced with `import` directive, [479](#)
- whether source of translation units must be available to locate template definitions, [14](#)
- whether stack is unwound before invoking the function `std::terminate` when a `noexcept` specification is violated, [473](#)
- whether the implementation is hosted or freestanding, [504](#)
- whether the sources for module units and header units on which the current translation unit has an interface dependency are required to be available during translation, [14](#)
- whether the thread that executes `main` and the threads created by `std::thread` or `std::jthread` provide concurrent forward progress guarantees, [92](#)
- whether `time_get::do_get_year` accepts two-digit year numbers, [1475](#)
- whether values are rounded or truncated to the required precision when converting between `time_t` values and `time_point` objects, [1722](#)
- which functions in the C++ standard library may be recursively reentered, [521](#)
- which non-standard-layout objects containing no data are considered empty, [64](#)
- which scalar types have unique object representations, [688](#)
- width of integral type, [79](#)
