}
```

26.6 Non-modifying sequence operations [alg.nonmodifying]

26.6.1 All of [alg.all.of]

```
template<class InputIterator, class Predicate>
  constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `false` for some iterator `i` in the range [`first`, `last`), and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.2 Any of [alg.any.of]

```
template<class InputIterator, class Predicate>
  constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `true` if E is `true` for some iterator `i` in the range [`first`, `last`), and `false` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.3 None of [alg.none.of]

```
template<class InputIterator, class Predicate>
  constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `true` for some iterator `i` in the range [`first`, `last`), and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.4 Contains [alg.contains]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr bool ranges::contains(I first, S last, const T& value, Proj proj = {});
template<input_range R, class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr bool ranges::contains(R&& r, const T& value, Proj proj = {});
```

1 *Returns*: `ranges::find(std::move(first), last, value, proj) != last`.

```
template<forward_iterator I1, sentinel_for<I1> S1,
         forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::contains_subrange(I1 first1, S1 last1, I2 first2, S2 last2,
                                           Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::contains_subrange(R1&& r1, R2&& r2, Pred pred = {},
                                           Proj1 proj1 = {}, Proj2 proj2 = {});
```

2 *Returns*: `first2 == last2 || !ranges::search(first1, last1, first2, last2, pred, proj1, proj2).empty()`.

26.6.5 For each [alg.foreach]

```
template<class InputIterator, class Function>
  constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1 *Preconditions*: `Function` meets the *Cpp17MoveConstructible* requirements (Table 31).

[*Note 1*: `Function` need not meet the requirements of *Cpp17CopyConstructible* (Table 32). — *end note*]

2 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `last`), starting from `first` and proceeding to `last - 1`.

[*Note 2*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

3 *Returns*: `f`.

4 *Complexity*: Applies `f` exactly `last - first` times.

5 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Function>
  void for_each(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Function f);
```

6 *Preconditions*: `Function` meets the *Cpp17CopyConstructible* requirements.

7 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `last`).

[*Note 3*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

8 *Complexity*: Applies `f` exactly `last - first` times.

9 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

10 [*Note 4*: Does not return a copy of its `Function` parameter, since parallelization often does not permit efficient state accumulation. — *end note*]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_result<I, Fun>
    ranges::for_each(I first, S last, Fun f, Proj proj = {});
template<input_range R, class Proj = identity,
         indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
  constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
    ranges::for_each(R&& r, Fun f, Proj proj = {});
```

11 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`, `last`), starting from `first` and proceeding to `last - 1`.

[*Note 5*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

12 *Returns*: `{last, std::move(f)}`.

13 *Complexity*: Applies `f` and `proj` exactly `last - first` times.

14 *Remarks*: If `f` returns a result, the result is ignored.

15 [*Note 6*: The overloads in namespace `ranges` require `Fun` to model `copy_constructible`. — *end note*]

```
template<class InputIterator, class Size, class Function>
  constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

16 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

17 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17MoveConstructible* requirements.

[*Note 7*: `Function` need not meet the requirements of *Cpp17CopyConstructible*. — *end note*]

18 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `first + n`) in order.

[*Note 8*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

19 *Returns*: `first + n`.

20 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
  ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
                             Function f);
```

21 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

22 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17CopyConstructible* requirements.

23 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `first + n`).

[*Note 9*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

24 *Returns*: `first + n`.

25 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_n_result<I, Fun>
    ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

26 *Preconditions*: `n >= 0` is `true`.

27 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`, `first + n`) in order.

[*Note 10*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

28 *Returns*: `{first + n, std::move(f)}`.

29 *Remarks*: If `f` returns a result, the result is ignored.

30 [*Note 11*: The overload in namespace `ranges` requires `Fun` to model `copy_constructible`. — *end note*]

26.6.6 Find [alg.find]

```
template<class InputIterator, class T = iterator_traits<InputIterator>::value_type>
  constexpr InputIterator find(InputIterator first, InputIterator last,
                               const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                       const T& value);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if(InputIterator first, InputIterator last,
                                  Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                          Predicate pred);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
                                      Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if_not(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
```

```
template<input_range R, class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_iterator_t<R>
    ranges::find(R&& r, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::find_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::find_if(R&& r, Pred pred, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::find_if_not(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::find_if_not(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for `find`;

(1.2) — `pred(*i) != false` for `find_if`;

(1.3) — `pred(*i) == false` for `find_if_not`;

(1.4) — `bool(invoke(proj, *i) == value)` for `ranges::find`;

(1.5) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::find_if`;

(1.6) — `bool(!invoke(pred, invoke(proj, *i)))` for `ranges::find_if_not`.

2 *Returns*: The first iterator `i` in the range [`first`, `last`) for which E is `true`. Returns `last` if no such iterator is found.

3 *Complexity*: At most `last - first` applications of the corresponding predicate and any projection.

26.6.7 Find last [alg.find.last]

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr subrange<I> ranges::find_last(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_subrange_t<R> ranges::find_last(R&& r, const T& value, Proj proj = {});
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I> ranges::find_last_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_subrange_t<R> ranges::find_last_if(R&& r, Pred pred, Proj proj = {});
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I> ranges::find_last_if_not(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_subrange_t<R> ranges::find_last_if_not(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `bool(invoke(proj, *i) == value)` for `ranges::find_last`;

(1.2) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::find_last_if`;

(1.3) — `bool(!invoke(pred, invoke(proj, *i)))` for `ranges::find_last_if_not`.

2 *Returns*: Let `i` be the last iterator in the range [`first`, `last`) for which *E* is `true`. Returns `{i, last}`, or `{last, last}` if no such iterator is found.

3 *Complexity*: At most `last - first` applications of the corresponding predicate and projection.

26.6.8 Find end [alg.find.end]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr subrange<I1>
    ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_subrange_t<R1>
    ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;

(1.2) — *E* be:

(1.2.1) — `pred(*(i + n), *(first2 + n))` for the overloads in namespace `std`;

(1.2.2) — `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`;

(1.3) — `i` be `last1` if [`first2`, `last2`) is empty, or if `(last2 - first2) > (last1 - first1)` is `true`, or if there is no iterator in the range [`first1`, `last1 - (last2 - first2)`) such that for every non-negative integer `n < (last2 - first2)`, *E* is `true`. Otherwise `i` is the last such iterator in [`first1`, `last1 - (last2 - first2)`).

2 *Returns*:

(2.1) — `i` for the overloads in namespace `std`.

(2.2) — `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

3 *Complexity*: At most `(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)` applications of the corresponding predicate and any projections.

26.6.9 Find first [alg.find.first.of]

```
template<class InputIterator, class ForwardIterator>
  constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
         class BinaryPredicate>
  constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2,
                  BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
                                     Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_iterator_t<R1>
    ranges::find_first_of(R1&& r1, R2&& r2,
                          Pred pred = {},
                          Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let E be:

(1.1) — `*i == *j` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *j) != false` for the overloads with a parameter `pred` and no parameter `proj1`;

(1.3) — `bool(invoke(pred, invoke(proj1, *i), invoke(proj2, *j)))` for the overloads with parameters `pred` and `proj1`.

2 *Effects*: Finds an element that matches one of a set of values.

3 *Returns*: The first iterator `i` in the range [`first1`, `last1`) such that for some iterator `j` in the range [`first2`, `last2`) E holds. Returns `last1` if [`first2`, `last2`) is empty or if no such iterator is found.

4 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and any projections.

26.6.10 Adjacent find [alg.adjacent.find]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class BinaryPredicate>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_binary_predicate<projected<I, Proj>,
                                   projected<I, Proj>> Pred = ranges::equal_to>
  constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_binary_predicate<projected<iterator_t<R>, Proj>,
                                   projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
  constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == *(i + 1)` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *(i + 1)) != false` for the overloads with a parameter `pred` and no parameter `proj`;

(1.3) — `bool(invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))))` for the overloads with both parameters `pred` and `proj`.

2 *Returns*: The first iterator `i` such that both `i` and `i + 1` are in the range [`first`, `last`) for which E holds. Returns `last` if no such iterator is found.

3 *Complexity*: For the overloads with no `ExecutionPolicy`, exactly

min((i - first) + 1, (last - first) - 1)

applications of the corresponding predicate, where `i` is `adjacent_find`'s return value. For the overloads with an `ExecutionPolicy`, $\mathcal{O}$(`last - first`) applications of the corresponding predicate, and no more than twice as many applications of any projection.

26.6.11 Count [alg.count]

```
template<class InputIterator, class T = iterator_traits<InputIterator>::value_type>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  typename iterator_traits<ForwardIterator>::difference_type
    count(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  typename iterator_traits<ForwardIterator>::difference_type
    count_if(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr iter_difference_t<I>
    ranges::count(I first, S last, const T& value, Proj proj = {});
template<input_range R, class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr range_difference_t<R>
    ranges::count(R&& r, const T& value, Proj proj = {});
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr iter_difference_t<I>
    ranges::count_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr range_difference_t<R>
    ranges::count_if(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for the overloads with no parameter `pred` or `proj`;

(1.2) — `pred(*i) != false` for the overloads with a parameter `pred` but no parameter `proj`;

(1.3) — `invoke(proj, *i) == value` for the overloads with a parameter `proj` but no parameter `pred`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads with both parameters `proj` and `pred`.

2 *Effects*: Returns the number of iterators `i` in the range [`first`, `last`) for which E holds.

3 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

26.6.12 Mismatch [alg.mismatch]

```
template<class InputIterator1, class InputIterator2>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, InputIterator2 last2,
             BinaryPredicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr ranges::mismatch_result<I1, I2>
    ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter `last2` or `r2`.

2 Let E be:

(2.1) — `!(*(first1 + n) == *(first2 + n))` for the overloads with no parameter `pred`;

(2.2) — `pred(*(first1 + n), *(first2 + n)) == false` for the overloads with a parameter `pred` and no parameter `proj1`;

(2.3) — `!invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n)))` for the overloads with both parameters `pred` and `proj1`.

3 Let N be min(`last1 - first1`, `last2 - first2`).

4 *Returns*: `{ first1 + n, first2 + n }`, where `n` is the smallest integer in $[0, N)$ such that E holds, or N if no such integer exists.

5 *Complexity*: At most N applications of the corresponding predicate and any projections.

26.6.13 Equal [alg.equal]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2,
                       BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,
                               Pred pred = {},
                               Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},
                               Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with no parameter `last2` or `r2`;

(1.2) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;

(1.3) — E be:

(1.3.1) — `pred(*i, *(first2 + (i - first1)))` for the overloads with no parameter `proj1`;

(1.3.2) — `invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1))))` for the overloads with parameter `proj1`.

2 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if E holds for every iterator `i` in the range [`first1`, `last1`). Otherwise, returns `false`.

3 *Complexity*: If

(3.1) — the types of `first1`, `last1`, `first2`, and `last2` meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) and `last1 - first1 != last2 - first2` for the overloads in namespace `std`;

(3.2) — the types of `first1`, `last1`, `first2`, and `last2` pairwise model `sized_sentinel_for` (24.3.4.8) and `last1 - first1 != last2 - first2` for the first overload in namespace `ranges`,

(3.3) — `R1` and `R2` each model `sized_range` and `ranges::distance(r1) != ranges::distance(r2)` for the second overload in namespace `ranges`,

then no applications of the corresponding predicate and each projection; otherwise,

(3.4) — For the overloads with no `ExecutionPolicy`, at most min(`last1 - first1`, `last2 - first2`) applications of the corresponding predicate and any projections.

(3.5) — For the overloads with an `ExecutionPolicy`, $\mathscr{O}$(min(`last1 - first1`, `last2 - first2`)) applications of the corresponding predicate.

26.6.14 Is permutation [alg.is.permutation]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2,
                                BinaryPredicate pred);
```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`, and let `pred` be `equal_to{}` for the overloads with no parameter `pred`.

2 *Mandates*: `ForwardIterator1` and `ForwardIterator2` have the same value type.

3 *Preconditions*: The comparison function is an equivalence relation.

4 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range [`first2`, `last2`), beginning with `ForwardIterator2 begin`, such that `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.

5 *Complexity*: No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2, pred)` would return `true`; otherwise, at worst $\mathscr{O}(N^2)$, where N has the value `last1 - first1`.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<I1, Proj1>,
                                       projected<I2, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
                                        Pred pred = {},
                                        Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<iterator_t<R1>, Proj1>,
                                       projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {},
                                        Proj1 proj1 = {}, Proj2 proj2 = {});
```

6 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range [`first2`, `last2`), bounded by [`pfirst`, `plast`), such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.

7 *Complexity*: No applications of the corresponding predicate and projections if

(7.1) — for the first overload,

(7.1.1) — `S1` and `I1` model `sized_sentinel_for<S1, I1>`,

(7.1.2) — `S2` and `I2` model `sized_sentinel_for<S2, I2>`, and

(7.1.3) — `last1 - first1 != last2 - first2`;

(7.2) — for the second overload, `R1` and `R2` each model `sized_range`, and `ranges::distance(r1) != ranges::distance(r2)`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst $\mathscr{O}(N^2)$, where N has the value `last1 - first1`.

26.6.15 Search [alg.search]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
```

1 *Returns*: The first iterator `i` in the range [`first1`, `last1 - (last2 - first2)`] such that for every non-negative integer `n` less than `last2 - first2` the following corresponding conditions hold: `*(i + n) == *(first2 + n)`, `pred(*(i + n), *(first2 + n)) != false`. Returns `first1` if [`first2`, `last2`) is empty, otherwise returns `last1` if no such iterator is found.

2 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr subrange<I1>
    ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_subrange_t<R1>
    ranges::search(R1&& r1, R2&& r2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});
```

3 *Returns*:

(3.1) — `{i, i + (last2 - first2)}`, where `i` is the first iterator in the range [`first1`, `last1 - (last2 - first2)`] such that for every non-negative integer `n` less than `last2 - first2` the condition

```
bool(invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))))
```

is `true`.

(3.2) — Returns `{last1, last1}` if no such iterator exists.

4 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and projections.

```
template<class ForwardIterator, class Size, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value);

template<class ForwardIterator, class Size, class T = iterator_traits<ForwardIterator>::value_type,
         class BinaryPredicate>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type,
         class BinaryPredicate>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
```

5 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

6 Let E be `pred(*(i + n), value) != false` for the overloads with a parameter `pred`, and `*(i + n) == value` otherwise.

7 *Returns*: The first iterator `i` in the range [`first`, `last - count`] such that for every non-negative integer `n` less than `count` the condition E is `true`. Returns `last` if no such iterator is found.

8 *Complexity*: At most `last - first` applications of the corresponding predicate.

```
template<forward_iterator I, sentinel_for<I> S,
         class Pred = ranges::equal_to, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirectly_comparable<I, const T*, Pred, Proj>
  constexpr subrange<I>
    ranges::search_n(I first, S last, iter_difference_t<I> count,
                     const T& value, Pred pred = {}, Proj proj = {});
template<forward_range R, class Pred = ranges::equal_to,
         class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
  constexpr borrowed_subrange_t<R>
    ranges::search_n(R&& r, range_difference_t<R> count,
                     const T& value, Pred pred = {}, Proj proj = {});
```

9 *Returns*: `{i, i + count}` where `i` is the first iterator in the range [`first`, `last - count`] such that for every non-negative integer `n` less than `count`, the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value)`. Returns `{last, last}` if no such iterator is found.

10 *Complexity*: At most `last - first` applications of the corresponding predicate and projection.

```
template<class ForwardIterator, class Searcher>
  constexpr ForwardIterator
    search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);
```

11 *Effects*: Equivalent to: `return searcher(first, last).first;`

12 *Remarks*: `Searcher` need not meet the *Cpp17CopyConstructible* requirements.

26.6.16 Starts with [alg.starts.with]

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns*:

```
ranges::mismatch(std::move(first1), last1, std::move(first2), last2,
                 pred, proj1, proj2).in2 == last2
```

26.6.17 Ends with [alg.ends.with]

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
           (forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
           indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `N1` be `last1 - first1` and `N2` be `last2 - first2`.

2 *Returns*: `false` if `N1` < `N2`, otherwise

```
ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2,
              pred, proj1, proj2)
```

```
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
  requires (forward_range<R1> || sized_range<R1>) &&
           (forward_range<R2> || sized_range<R2>) &&
           indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::ends_with(R1&& r1, R2&& r2, Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});
```

3 Let `N1` be `ranges::distance(r1)` and `N2` be `ranges::distance(r2)`.

4 *Returns*: `false` if `N1` < `N2`, otherwise

```
ranges::equal(views::drop(ranges::ref_view(r1), N1 - static_cast<decltype(N1)>(N2)),
              r2, pred, proj1, proj2)
```

26.6.18 Fold [alg.fold]

```
template<input_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-left-foldable<T, I> F>
  constexpr auto ranges::fold_left(I first, S last, T init, F f);
template<input_range R, class T = range_value_t<R>,
         indirectly-binary-left-foldable<T, iterator_t<R>> F>
  constexpr auto ranges::fold_left(R&& r, T init, F f);
```

1 *Returns*:

```
ranges::fold_left_with_iter(std::move(first), last, std::move(init), f).value
```

```
template<input_iterator I, sentinel_for<I> S,
         indirectly-binary-left-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr auto ranges::fold_left_first(I first, S last, F f);
template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr auto ranges::fold_left_first(R&& r, F f);
```

2 *Returns*:

```
ranges::fold_left_first_with_iter(std::move(first), last, f).value
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-right-foldable<T, I> F>
  constexpr auto ranges::fold_right(I first, S last, T init, F f);
template<bidirectional_range R, class T = range_value_t<R>,
         indirectly-binary-right-foldable<T, iterator_t<R>> F>
  constexpr auto ranges::fold_right(R&& r, T init, F f);
```

3 *Effects*: Equivalent to:

```
using U = decay_t<invoke_result_t<F&, iter_reference_t<I>, T>>;
if (first == last)
  return U(std::move(init));
I tail = ranges::next(first, last);
U accum = invoke(f, *--tail, std::move(init));
```

```
    while (first != tail)
      accum = invoke(f, *--tail, std::move(accum));
    return accum;
```

```
template<bidirectional_iterator I, sentinel_for<I> S,
         indirectly-binary-right-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr auto ranges::fold_right_last(I first, S last, F f);
template<bidirectional_range R,
         indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr auto ranges::fold_right_last(R&& r, F f);
```

4 Let `U` be `decltype(ranges::fold_right(first, last, iter_value_t<I>(*first), f))`.

5 *Effects*: Equivalent to:

```
    if (first == last)
      return optional<U>();
    I tail = ranges::prev(ranges::next(first, std::move(last)));
    return optional<U>(in_place,
      ranges::fold_right(std::move(first), tail, iter_value_t<I>(*tail), std::move(f)));
```

```
template<input_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-left-foldable<T, I> F>
  constexpr see below ranges::fold_left_with_iter(I first, S last, T init, F f);
template<input_range R, class T = range_value_t<R>,
         indirectly-binary-left-foldable<T, iterator_t<R>> F>
  constexpr see below ranges::fold_left_with_iter(R&& r, T init, F f);
```

6 Let `U` be `decay_t<invoke_result_t<F&, T, iter_reference_t<I>>>`.

7 *Effects*: Equivalent to:

```
    if (first == last)
      return {std::move(first), U(std::move(init))};
    U accum = invoke(f, std::move(init), *first);
    for (++first; first != last; ++first)
      accum = invoke(f, std::move(accum), *first);
    return {std::move(first), std::move(accum)};
```

8 *Remarks*: The return type is `fold_left_with_iter_result<I, U>` for the first overload and `fold_left_with_iter_result<borrowed_iterator_t<R>, U>` for the second overload.

```
template<input_iterator I, sentinel_for<I> S,
         indirectly-binary-left-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr see below ranges::fold_left_first_with_iter(I first, S last, F f);
template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr see below ranges::fold_left_first_with_iter(R&& r, F f);
```

9 Let `U` be

```
    decltype(ranges::fold_left(std::move(first), last, iter_value_t<I>(*first), f))
```

10 *Effects*: Equivalent to:

```
    if (first == last)
      return {std::move(first), optional<U>()};
    optional<U> init(in_place, *first);
    for (++first; first != last; ++first)
      *init = invoke(f, std::move(*init), *first);
    return {std::move(first), std::move(init)};
```

11 *Remarks*: The return type is `fold_left_first_with_iter_result<I, optional<U>>` for the first overload and `fold_left_first_with_iter_result<borrowed_iterator_t<R>, optional<U>>` for the second overload.

26.7 Mutating sequence operations [alg.modifying.operations]

26.7.1 Copy [alg.copy]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator copy(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);
```

1 Let N be `last - first`.

2 *Preconditions*: `result` is not in the range [`first`, `last`).

3 *Effects*: Copies elements in the range [`first`, `last`) into the range [`result`, `result +` N) starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result +` n`) = *(first +` n`)`.

4 *Returns*:

(4.1) — `result +` N for the overload in namespace `std`.

(4.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 copy(ExecutionPolicy&& policy,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);
```

6 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + (last - first)`) do not overlap.

7 *Effects*: Copies elements in the range [`first`, `last`) into the range [`result`, `result + (last - first)`). For each non-negative integer `n < (last - first)`, performs `*(result + n) = *(first + n)`.

8 *Returns*: `result + (last - first)`.

9 *Complexity*: Exactly `last - first` assignments.

```
template<class InputIterator, class Size, class OutputIterator>
  constexpr OutputIterator copy_n(InputIterator first, Size n,
                                  OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
  ForwardIterator2 copy_n(ExecutionPolicy&& exec,
                          ForwardIterator1 first, Size n,
                          ForwardIterator2 result);

template<input_iterator I, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_n_result<I, O>
    ranges::copy_n(I first, iter_difference_t<I> n, O result);
```

10 Let N be $\max(0, \texttt{n})$.

11 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

12 *Effects*: For each non-negative integer $i < N$, performs `*(result +` i`) = *(first +` i`)`.

13 *Returns*:

(13.1) — `result +` N for the overloads in namespace `std`.

(13.2) — `{first +` N`, result +` N`}` for the overload in namespace `ranges`.

14 *Complexity*: Exactly N assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
  constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
                                   OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
  ForwardIterator2 copy_if(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_if_result<I, O>
    ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O>
    ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

15 Let E be:

(15.1) — `bool(pred(*i))` for the overloads in namespace `std`;

(15.2) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads in namespace `ranges`,

and N be the number of iterators `i` in the range [`first`, `last`) for which the condition E holds.

16 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + (last - first)`) do not overlap.

[*Note 1*: For the overload with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not *Cpp17MoveConstructible* (Table 31). — *end note*]

17 *Effects*: Copies all of the elements referred to by the iterator `i` in the range [`first`, `last`) for which E is `true`.

18 *Returns*:

(18.1) — `result +` N for the overloads in namespace `std`.

(18.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

20 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    copy_backward(BidirectionalIterator1 first,
                  BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_copyable<I1, I2>
  constexpr ranges::copy_backward_result<I1, I2>
    ranges::copy_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_copyable<iterator_t<R>, I>
  constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I>
    ranges::copy_backward(R&& r, I result);
```

21 Let N be `last - first`.

22 *Preconditions*: `result` is not in the range (`first`, `last`].

23 *Effects*: Copies elements in the range [`first`, `last`) into the range [`result -` N, `result`) starting from `last - 1` and proceeding to `first`.[202] For each positive integer $n \le N$, performs `*(result -` n`) = *(last -` n`)`.

24 *Returns*:

202) `copy_backward` can be used instead of `copy` when `last` is in the range [`result -` N, `result`).

(24.1) — `result - ` N for the overload in namespace `std`.

(24.2) — `{last, result - ` N`}` for the overloads in namespace `ranges`.

25 *Complexity*: Exactly N assignments.

26.7.2 Move [alg.move]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator move(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_movable<I, O>
  constexpr ranges::move_result<I, O>
    ranges::move(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_movable<iterator_t<R>, O>
  constexpr ranges::move_result<borrowed_iterator_t<R>, O>
    ranges::move(R&& r, O result);
```

1 Let E be

(1.1) — `std::move(*(first + ` n`))` for the overload in namespace `std`;

(1.2) — `ranges::iter_move(first + ` n`)` for the overloads in namespace `ranges`.

Let N be `last - first`.

2 *Preconditions*: `result` is not in the range [`first`, `last`).

3 *Effects*: Moves elements in the range [`first`, `last`) into the range [`result`, `result + ` N) starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result + ` n`) = ` E.

4 *Returns*:

(4.1) — `result + ` N for the overload in namespace `std`.

(4.2) — `{last, result + ` N`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 move(ExecutionPolicy&& policy,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);
```

6 Let N be `last - first`.

7 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + ` N) do not overlap.

8 *Effects*: Moves elements in the range [`first`, `last`) into the range [`result`, `result + ` N). For each non-negative integer $n < N$, performs `*(result + ` n`) = std::move(*(first + ` n`))`.

9 *Returns*: `result + ` N.

10 *Complexity*: Exactly N assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_movable<I1, I2>
  constexpr ranges::move_backward_result<I1, I2>
    ranges::move_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_movable<iterator_t<R>, I>
  constexpr ranges::move_backward_result<borrowed_iterator_t<R>, I>
    ranges::move_backward(R&& r, I result);
```

11 Let E be

(11.1) — `std::move(*(last - `n`))` for the overload in namespace `std`;

(11.2) — `ranges::iter_move(last - `n`)` for the overloads in namespace `ranges`.

Let N be `last - first`.

12 *Preconditions*: `result` is not in the range (`first`, `last`].

13 *Effects*: Moves elements in the range [`first`, `last`) into the range [`result - `N, `result`) starting from `last - 1` and proceeding to `first`.[203] For each positive integer $n \le N$, performs `*(result - `n`) = `E.

14 *Returns*:

(14.1) — `result - `N for the overload in namespace `std`.

(14.2) — `{last, result - `N`}` for the overloads in namespace `ranges`.

15 *Complexity*: Exactly N assignments.

26.7.3 Swap [alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator2
    swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    swap_ranges(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
  requires indirectly_swappable<I1, I2>
  constexpr ranges::swap_ranges_result<I1, I2>
    ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
template<input_range R1, input_range R2>
  requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
  constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::swap_ranges(R1&& r1, R2&& r2);
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`;

(1.2) — M be min(`last1 - first1`, `last2 - first2`).

2 *Preconditions*: The two ranges [`first1`, `last1`) and [`first2`, `last2`) do not overlap. For the overloads in namespace `std`, `*(first1 + `n`)` is swappable with (16.4.4.3) `*(first2 + `n`)`.

3 *Effects*: For each non-negative integer $n < M$ performs:

(3.1) — `swap(*(first1 + `n`), *(first2 + `n`))` for the overloads in namespace `std`;

(3.2) — `ranges::iter_swap(first1 + `n`, first2 + `n`)` for the overloads in namespace `ranges`.

4 *Returns*:

(4.1) — `last2` for the overloads in namespace `std`.

(4.2) — `{first1 + `M`, first2 + `M`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly M swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6 *Preconditions*: `a` and `b` are dereferenceable. `*a` is swappable with (16.4.4.3) `*b`.

7 *Effects*: As if by `swap(*a, *b)`.

203) `move_backward` can be used instead of `move` when `last` is in the range [`result - `N, `result`).

26.7.4 Transform [alg.transform]

```
template<class InputIterator, class OutputIterator,
         class UnaryOperation>
  constexpr OutputIterator
    transform(InputIterator first1, InputIterator last1,
              OutputIterator result, UnaryOperation op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class UnaryOperation>
  ForwardIterator2
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    transform(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, OutputIterator result,
              BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class BinaryOperation>
  ForwardIterator
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator result,
              BinaryOperation binary_op);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         copy_constructible F, class Proj = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<I, Proj>>>
  constexpr ranges::unary_transform_result<I, O>
    ranges::transform(I first1, S last1, O result, F op, Proj proj = {});
template<input_range R, weakly_incrementable O, copy_constructible F,
         class Proj = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
  constexpr ranges::unary_transform_result<borrowed_iterator_t<R>, O>
    ranges::transform(R&& r, O result, F op, Proj proj = {});
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, copy_constructible F, class Proj1 = identity,
         class Proj2 = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
                                       projected<I2, Proj2>>>
  constexpr ranges::binary_transform_result<I1, I2, O>
    ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                      F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         copy_constructible F, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
                                       projected<iterator_t<R2>, Proj2>>>
  constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::transform(R1&& r1, R2&& r2, O result,
                      F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with parameter `first2` but no parameter `last2`;

(1.2) — N be `last1 - first1` for unary transforms, or min(`last1 - first1`, `last2 - first2`) for binary transforms;

(1.3) — E be

(1.3.1) — `op(*(first1 + (i - result)))` for unary transforms defined in namespace `std`;

(1.3.2) — `binary_op(*(first1 + (i - result)), *(first2 + (i - result)))` for binary transforms defined in namespace `std`;

(1.3.3) — `invoke(op, invoke(proj, *(first1 + (i - result))))` for unary transforms defined in namespace `ranges`;

(1.3.4) — `invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result))))` for binary transforms defined in namespace `ranges`.

2 *Preconditions*: `op` and `binary_op` do not invalidate iterators or subranges, nor modify elements in the ranges

(2.1) — [`first1`, `first1 + ` N],

(2.2) — [`first2`, `first2 + ` N], and

(2.3) — [`result`, `result + ` N].[204]

3 *Effects*: Assigns through every iterator `i` in the range [`result`, `result + ` N) a new corresponding value equal to E.

4 *Returns*:

(4.1) — `result + ` N for the overloads defined in namespace `std`.

(4.2) — `{first1 + ` N`, result + ` N`}` for unary transforms defined in namespace `ranges`.

(4.3) — `{first1 + ` N`, first2 + ` N`, result + ` N`}` for binary transforms defined in namespace `ranges`.

5 *Complexity*: Exactly N applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.

6 *Remarks*: `result` may be equal to `first1` or `first2`.

26.7.5 Replace [alg.replace]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr void replace(ForwardIterator first, ForwardIterator last,
                         const T& old_value, const T& new_value);

           && output_iterator<O, const T2&>
  constexpr ranges::replace_copy_result<borrowed_iterator_t<R>, O>
```

```
    ranges::replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
                         Proj proj = {});

template<input_iterator I, sentinel_for<I> S,class O, class T = iter_value_t<O>,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O> && output_iterator<O, const T&>
  constexpr ranges::replace_copy_if_result<I, O>
    ranges::replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
                            Proj proj = {});
template<input_range R, class O, class T = iter_value_t<O>, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O> && output_iterator<O, const T&>
  constexpr ranges::replace_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
                            Proj proj = {});
```

6 Let E be

(6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;

(6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;

(6.3) — `bool(invoke(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;

(6.4) — `bool(invoke(pred, invoke(proj, *(first + (i - result)))))` for `ranges::replace_copy_if`.

7 *Mandates*: The results of the expressions `*first` and `new_value` are writable (24.3.1) to `result`.

8 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + (last - first)`) do not overlap.

9 *Effects*: Assigns through every iterator `i` in the range [`result`, `result + (last - first)`) a new corresponding value

(9.1) — `new_value` if E is `true` or

(9.2) — `*(first + (i - result))` otherwise.

10 *Returns*:

(10.1) — `result + (last - first)` for the overloads in namespace `std`.

(10.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

26.7.6 Fill [alg.fill]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  void fill(ExecutionPolicy&& exec,
            ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T = iterator_traits<OutputIterator>::value_type>
  constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator fill_n(ExecutionPolicy&& exec,
                         ForwardIterator first, Size n, const T& value);

template<class O, sentinel_for<O> S, class T = iter_value_t<O>>
  requires output_iterator<O, const T&>
  constexpr O ranges::fill(O first, S last, const T& value);
template<class R, class T = range_value_t<R>>
  requires output_range<R, const T&>
  constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
```

```
template<class O, class T = iter_value_t<O>>
  requires output_iterator<O, const T&>
  constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);
```

1 Let N be $\max(0, \texttt{n})$ for the `fill_n` algorithms, and `last - first` for the `fill` algorithms.

2 *Mandates*: The expression `value` is writable (24.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns `value` through all the iterators in the range [`first`, `first +` N).

4 *Returns*: `first +` N.

5 *Complexity*: Exactly N assignments.

26.7.7 Generate [alg.generate]

```
template<class ForwardIterator, class Generator>
  constexpr void generate(ForwardIterator first, ForwardIterator last,
                          Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
  void generate(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Generator gen);

template<class OutputIterator, class Size, class Generator>
  constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
  ForwardIterator generate_n(ExecutionPolicy&& exec,
                             ForwardIterator first, Size n, Generator gen);

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
  requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
  constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
  requires invocable<F&> && output_range<R, invoke_result_t<F&>>
  constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
  requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
  constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);
```

1 Let N be $\max(0, \texttt{n})$ for the `generate_n` algorithms, and `last - first` for the `generate` algorithms.

2 *Mandates*: `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns the result of successive evaluations of `gen()` through each iterator in the range [`first`, `first +` N).

4 *Returns*: `first +` N.

5 *Complexity*: Exactly N evaluations of `gen()` and assignments.

26.7.8 Remove [alg.remove]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                   const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator remove(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last,
                         const T& value);

template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                      Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator remove_if(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last,
                            Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires permutable<iterator_t<R>> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_subrange_t<R>
    ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::remove_if(R&& r, Pred pred, Proj proj = {});
```

1 Let E be

(1.1) — `bool(*i == value)` for `remove`;

(1.2) — `bool(pred(*i))` for `remove_if`;

(1.3) — `bool(invoke(proj, *i) == value)` for `ranges::remove`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::remove_if`.

2 *Preconditions*: For the algorithms in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: Eliminates all the elements referred to by iterator `i` in the range [`first`, `last`) for which E holds.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — `{`j`, last}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

6 *Remarks*: Stable (16.4.6.8).

7 [*Note 1*: Each element in the range [`ret`, `last`), where `ret` is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — *end note*]

```
template<class InputIterator, class OutputIterator,
         class T = iterator_traits<InputIterator>::value_type>
  constexpr OutputIterator
    remove_copy(InputIterator first, InputIterator last,
                OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class T = iterator_traits<ForwardIterator1>::value_type>
  ForwardIterator2
    remove_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
  constexpr OutputIterator
    remove_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result, Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
  ForwardIterator2
    remove_copy_if(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         class Proj = identity, class T = projected_value_t<I, Proj>>
  requires indirectly_copyable<I, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr ranges::remove_copy_result<I, O>
    ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirectly_copyable<iterator_t<R>, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::remove_copy_if_result<I, O>
    ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});

  constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

8 Let E be

(8.1) — `bool(*i == value)` for `remove_copy`;

(8.2) — `bool(pred(*i))` for `remove_copy_if`;

(8.3) — `bool(invoke(proj, *i) == value)` for `ranges::remove_copy`;

(8.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::remove_copy_if`.

9 Let N be the number of elements in [`first`, `last`) for which E is `false`.

10 *Mandates*: `*first` is writable (24.3.1) to `result`.

11 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + (last - first)`) do not overlap.

[*Note 2*: For the overloads with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 31) requirements. — *end note*]

12 *Effects*: Copies all the elements referred to by the iterator `i` in the range [`first`, `last`) for which E is `false`.

13 *Returns*:

(13.1) — `result +` N, for the algorithms in namespace `std`.

(13.2) — `{last, result +` N`}`, for the algorithms in namespace `ranges`.

14 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

15 *Remarks*: Stable (16.4.6.8).

26.7.9 Unique [alg.unique]

```
template<class ForwardIterator>
  constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator unique(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class BinaryPredicate>
  constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                   BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
  ForwardIterator unique(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last,
                         BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
  constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1 Let `pred` be `equal_to{}` for the overloads with no parameter `pred`, and let E be

(1.1) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;

(1.2) — `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

2 *Preconditions*: For the overloads in namespace `std`, `pred` is an equivalence relation and the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range [`first + 1`, `last`) for which E is `true`.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — `{`j`, last}` for the overloads in namespace `ranges`.

5 *Complexity*: For nonempty ranges, exactly `(last - first) - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
  constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
                OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
  requires indirectly_copyable<I, O> &&
           (forward_iterator<I> ||
            (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
            indirectly_copyable_storable<I, O>)
  constexpr ranges::unique_copy_result<I, O>
```

```
    ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
  requires indirectly_copyable<iterator_t<R>, O> &&
           (forward_iterator<iterator_t<R>> ||
            (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
            indirectly_copyable_storable<iterator_t<R>, O>)
  constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
    ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});
```

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let E be

(6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;

(6.2) — `bool(invoke(comp, invoke(proj, *i), invoke(proj, *(i - 1))))` for the overloads in namespace `ranges`.

7 *Mandates*: `*first` is writable (24.3.1) to `result`.

8 *Preconditions*:

(8.1) — The ranges [`first`, `last`) and [`result`, `result + (last - first)`) do not overlap.

(8.2) — For the overloads in namespace `std`:

(8.2.1) — The comparison function is an equivalence relation.

(8.2.2) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` models `forward_iterator` (24.3.4.11), then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the *Cpp17ForwardIterator* requirements and its value type is the same as `T`, then `T` meets the *Cpp17CopyAssignable* (Table 34) requirements. Otherwise, `T` meets both the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* requirements.

[*Note 1*: For the overloads with an `ExecutionPolicy`, there might be a performance cost if the value type of `ForwardIterator1` does not meet both the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. — *end note*]

9 *Effects*: Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range [`first`, `last`) for which E holds.

10 *Returns*:

(10.1) — `result +` N for the overloads in namespace `std`.

(10.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

26.7.10 Reverse [alg.reverse]

```
template<class BidirectionalIterator>
  constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void reverse(ExecutionPolicy&& exec,
               BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
  requires permutable<I>
  constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

1 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

2 *Effects*: For each non-negative integer `i < (last - first) / 2`, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i, (last - i) - 1`.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first)/2` swaps.

```
template<class BidirectionalIterator, class OutputIterator>
  constexpr OutputIterator
    reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                 OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
  ForwardIterator
    reverse_copy(ExecutionPolicy&& exec,
                 BidirectionalIterator first, BidirectionalIterator last,
                 ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::reverse_copy_result<I, O>
    ranges::reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
    ranges::reverse_copy(R&& r, O result);
```

5 Let N be `last - first`.

6 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result +` N) do not overlap.

7 *Effects*: Copies the range [`first`, `last`) to the range [`result`, `result +` N) such that for every non-negative integer `i <` N the following assignment takes place: `*(result +` N `- 1 - i) = *(first + i)`.

8 *Returns*:

(8.1) — `result +` N for the overloads in namespace `std`.

(8.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

9 *Complexity*: Exactly N assignments.

26.7.11 Rotate [alg.rotate]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    rotate(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::rotate(I first, I middle, S last);
```

1 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

2 *Effects*: For each non-negative integer `i < (last - first)`, places the element from the position `first + i` into position `first + (i + (last - middle)) % (last - first)`.

[*Note 1*: This is a left rotate. — *end note*]

3 *Returns*:

(3.1) — `first + (last - middle)` for the overloads in namespace `std`.

(3.2) — `{first + (last - middle), last}` for the overload in namespace `ranges`.

4 *Complexity*: At most `last - first` swaps.

```
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

5 *Effects*: Equivalent to: `return ranges::rotate(ranges::begin(r), middle, ranges::end(r));`

```
template<class ForwardIterator, class OutputIterator>
  constexpr OutputIterator
    rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    rotate_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
                ForwardIterator2 result);

  template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
    requires indirectly_copyable<I, O>
    constexpr ranges::rotate_copy_result<I, O>
      ranges::rotate_copy(I first, I middle, S last, O result);
```

6 Let N be `last - first`.

7 *Preconditions*: `[first, middle)` and `[middle, last)` are valid ranges. The ranges `[first, last)` and `[result, result +` N`)` do not overlap.

8 *Effects*: Copies the range `[first, last)` to the range `[result, result +` N`)` such that for each non-negative integer $i < N$ the following assignment takes place: `*(result +` i`) = *(first + (`i `+ (middle - first)) %` N`)`.

9 *Returns*:

(9.1) — `result +` N for the overloads in namespace `std`.

(9.2) — `{last, result +` N`}` for the overload in namespace `ranges`.

10 *Complexity*: Exactly N assignments.

```
template<forward_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
    ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);
```

11 *Effects*: Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));
```

26.7.12 Sample [alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
         class Distance, class UniformRandomBitGenerator>
  SampleIterator sample(PopulationIterator first, PopulationIterator last,
                        SampleIterator out, Distance n,
                        UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
  requires (forward_iterator<I> || random_access_iterator<O>) &&
           indirectly_copyable<I, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_incrementable O, class Gen>
  requires (forward_range<R> || random_access_iterator<O>) &&
           indirectly_copyable<iterator_t<R>, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

1 *Mandates*: For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (24.3.1) to `out`.

2 *Preconditions*: `out` is not in the range `[first, last)`. For the overload in namespace `std`:

(2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

(2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (24.3.5.4).

(2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (24.3.5.7) unless `PopulationIterator` models `forward_iterator` (24.3.4.11).

(2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (29.5.3.3).

3 *Effects*: Copies min(`last - first`, `n`) elements (the *sample*) from [`first`, `last`) (the *population*) to `out` such that each possible sample has equal probability of appearance.

[*Note 1*: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — *end note*]

4 *Returns*: The end of the resulting sample range.

5 *Complexity*: $\mathcal{O}$(`last - first`).

6 *Remarks*:

(6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` models `forward_iterator`. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.

(6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

26.7.13 Shuffle [alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
  void shuffle(RandomAccessIterator first,
               RandomAccessIterator last,
               UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
  requires permutable<I> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
  requires permutable<iterator_t<R>> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions*: For the overload in namespace `std`:

(1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

(1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (29.5.3.3) requirements.

2 *Effects*: Permutes the elements in the range [`first`, `last`) such that each possible permutation of those elements has equal probability of appearance.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first) - 1` swaps.

5 *Remarks*: To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

26.7.14 Shift [alg.shift]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
```

```
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)
```

1 *Preconditions*: `n >= 0` is `true`. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements.

2 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

3 *Returns*: Let *`NEW_LAST`* be `first + (last - first - n)` if `n < last - first`, otherwise `first`.

(3.1) — *`NEW_LAST`* for the overloads in namespace `std`.

(3.2) — `{first, `*`NEW_LAST`*`}` for the overloads in namespace `ranges`.

4 *Complexity*: At most `(last - first) - n` assignments.

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);
```

5 *Preconditions*: `n >= 0` is `true`. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements, and `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements (24.3.5.6) or the *Cpp17ValueSwappable* requirements.

6 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer `i < (last - first) - n`. Does so in order starting from `i = (last - first) - n - 1` and proceeding to `i = 0` if

(6.1) — for the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements,

(6.2) — for the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

7 *Returns*: Let *`NEW_FIRST`* be `first + n` if `n < last - first`, otherwise `last`.

(7.1) — *`NEW_FIRST`* for the overloads in namespace `std`.

(7.2) — `{`*`NEW_FIRST`*`, last}` for the overloads in namespace `ranges`.

8 *Complexity*: At most `(last - first) - n` assignments or swaps.

26.8 Sorting and related operations [alg.sorting]

26.8.1 General [alg.sorting.general]

1 The operations in 26.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

2 `Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (26.2). The return value of the function call operation applied to an object of type `Compare`, when converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.

3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 26.8.4, `comp` shall induce a strict weak ordering on the values.

4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

(4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`

(4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[*Note 1*: Under these conditions, it can be shown that

(4.3) — `equiv` is an equivalence relation,

(4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and

(4.5) — the induced relation is a strict total ordering.

— *end note*]

5 A sequence is *sorted with respect to a* `comp` *and* `proj` for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))
```

is `false`.

6 A sequence is *sorted with respect to a comparator* `comp` for a comparator `comp` if it is sorted with respect to `comp` and `identity{}` (the identity projection).

7 A sequence [`start`, `finish`) is *partitioned with respect to an expression* `f(e)` if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is `true` if and only if `i < n`.

8 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

26.8.2 Sorting [alg.sort]

26.8.2.1 `sort` [sort]

```
template<class RandomAccessIterator>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts the elements in the range [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

26.8.2.2 `stable_sort` [stable.sort]

```
template<class RandomAccessIterator>
  constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts the elements in the range [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.

6 *Remarks*: Stable (16.4.6.8).

26.8.2.3 `partial_sort` [partial.sort]

```
template<class RandomAccessIterator>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last,
                              Compare comp);
```

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last,
                    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Places the first `middle - first` elements from the range [`first`, `last`) as sorted with respect to `comp` and `proj` into the range [`first`, `middle`). The rest of the elements in the range [`middle`, `last`) are placed in an unspecified order.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: Approximately `(last - first) * log(middle - first)` comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

26.8.2.4 `partial_sort_copy` [partial.sort.copy]

```
template<class InputIterator, class RandomAccessIterator>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);
```

```
template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
  constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
           sortable<iterator_t<R2>, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                                      projected<iterator_t<R2>, Proj2>>
  constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                              Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let N be min(`last - first`, `result_last - result_first`). Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (24.3.1) to `result_first`.

3 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), the type of `*result_first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

4 For iterators `a1` and `b1` in [`first`, `last`), and iterators `x2` and `y2` in [`result_first`, `result_last`), after evaluating the assignment `*y2 = *b1`, let E be the value of

```
bool(invoke(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment `*x2 = *a1`, E is equal to

```
bool(invoke(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[*Note 1*: Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`. — *end note*]

5 *Effects*: Places the first N elements as sorted with respect to `comp` and `proj2` into the range [`result_first`, `result_first +` N).

6 *Returns*:

(6.1) — `result_first +` N for the overloads in namespace `std`.

(6.2) — `{last, result_first +` N`}` for the overloads in namespace `ranges`.

7 *Complexity*: Approximately `(last - first) * log` N comparisons, and twice as many projections.

26.8.2.5 `is_sorted` [is.sorted]

```
template<class ForwardIterator>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

1 *Effects*: Equivalent to: `return is_sorted_until(first, last) == last;`

```
template<class ExecutionPolicy, class ForwardIterator>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class ForwardIterator, class Compare>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                           Compare comp);
```

3 *Effects*: Equivalent to: `return is_sorted_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last,
                 Compare comp);
```

4 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_sorted_until(first, last, comp, proj) == last;`

```
template<class ForwardIterator>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                    Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last,
                    Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns*: The last iterator `i` in [`first`, `last`] for which the range [`first`, `i`) is sorted with respect to `comp` and `proj`.

8 *Complexity*: Linear.

26.8.3 Nth element [alg.nth.element]

```
template<class RandomAccessIterator>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last,  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last, Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: [`first`, `nth`) and [`nth`, `last`) are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range [`first`, `nth`) and every iterator `j` in the range [`nth`, `last`) it holds that: `bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))` is `false`.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N =$ `last - first`.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

26.8.4 Binary search [alg.binary.search]

26.8.4.1 General [alg.binary.search.general]

1 All of the algorithms in 26.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

26.8.4.2 `lower_bound` [lower.bound]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {},
                                  Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expression `bool(invoke(comp, invoke(proj, e), value))`.

3 *Returns*: The furthermost iterator `i` in the range [`first`, `last`] such that for every iterator `j` in the range [`first`, `i`), `bool(invoke(comp, invoke(proj, *j), value))` is `true`.

4 *Complexity*: At most $\log_2$(`last - first`) + $\mathcal{O}(1)$ comparisons and projections.

26.8.4.3 `upper_bound` [upper.bound]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expression `!bool(invoke(comp, value, invoke(proj, e)))`.

3 *Returns*: The furthermost iterator `i` in the range [`first`, `last`] such that for every iterator `j` in the range [`first`, `i`), `!bool(invoke(comp, value, invoke(proj, *j)))` is `true`.

4 *Complexity*: At most $\log_2$(`last - first`) + $\mathcal{O}(1)$ comparisons and projections.

26.8.4.4 `equal_range` [equal.range]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value,
                Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr subrange<I>
    ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_subrange_t<R>
    ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of [`first`, `last`), `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*:

(3.1) — For the overloads in namespace `std`:

```
{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}
```

(3.2) — For the overloads in namespace `ranges`:

```
{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}
```

4 *Complexity*: At most $2 * \log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.4.5 `binary_search` [binary.search]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                       Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                       Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of [`first`, `last`), `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*: `true` if and only if for some iterator `i` in the range [`first`, `last`), `!bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i)))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.5 Partitions [alg.partitions]

```
template<class InputIterator, class Predicate>
  constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool is_partitioned(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});
```

1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

2 *Returns*: `true` if and only if the elements `e` of [`first`, `last`) are partitioned with respect to the expression `bool(invoke(pred, invoke(proj, e)))`.

3 *Complexity*: Linear. At most `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator
    partition(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last, Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I>
    ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::partition(R&& r, Pred pred, Proj proj = {});
```

4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj,` x`)))`.

5 *Preconditions*: For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

6 *Effects*: Places all the elements `e` in [`first`, `last`) that satisfy E(`e`) before all the elements that do not.

7 *Returns*: Let `i` be an iterator such that E(`*j`) is `true` for every iterator `j` in [`first`, `i`) and `false` for every iterator `j` in [`i`, `last`). Returns:

(7.1) — `i` for the overloads in namespace `std`.

(7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 *Complexity*: Let N = `last - first`:

(8.1) — For the overload with no `ExecutionPolicy`, exactly N applications of the predicate and projection. At most $N/2$ swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.

(8.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    constexpr stable_partition(BidirectionalIterator first, BidirectionalIterator last,
                               Predicate pred);
```

```
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    stable_partition(ExecutionPolicy&& exec,
                     BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  constexpr subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});
```

9 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj,` x`)))`.

10 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

11 *Effects*: Places all the elements `e` in [`first`, `last`) that satisfy E(`e`) before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns*: Let `i` be an iterator such that for every iterator `j` in [`first`, `i`), E(`*j`) is `true`, and for every iterator `j` in the range [`i`, `last`), E(`*j`) is `false`. Returns:

(12.1) — `i` for the overloads in namespace `std`.

(12.2) — `{i, last}` for the overloads in namespace `ranges`.

13 *Complexity*: Let N = `last - first`:

(13.1) — For the overloads with no `ExecutionPolicy`, at most $N \log_2 N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.

(13.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
  constexpr pair<OutputIterator1, OutputIterator2>
    partition_copy(InputIterator first, InputIterator last,
                   OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
         class ForwardIterator2, class Predicate>
  pair<ForwardIterator1, ForwardIterator2>
    partition_copy(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
  constexpr ranges::partition_copy_result<I, O1, O2>
    ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                           Proj proj = {});
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O1> &&
           indirectly_copyable<iterator_t<R>, O2>
  constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
    ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});
```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj,` x`)))`.

15 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (24.3.1) to `out_true` and `out_false`.

16 *Preconditions*: The input range and output ranges do not overlap.

[*Note 1*: For the overload with an `ExecutionPolicy`, there might be a performance cost if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements. — *end note*]

17 *Effects*: For each iterator `i` in [`first`, `last`), copies `*i` to the output range beginning with `out_true` if E(`*i`) is `true`, or to the output range beginning with `out_false` otherwise.

18 *Returns*: Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

(18.1) — `{o1, o2}` for the overloads in namespace `std`.

(18.2) — `{last, o1, o2}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

20 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

21 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to E(`e`).

22 *Returns*: An iterator `mid` such that E(`*i`) is `true` for all iterators `i` in [`first`, `mid`), and `false` for all iterators `i` in [`mid`, `last`).

23 *Complexity*: $\mathcal{O}$(log(`last - first`)) applications of `pred` and `proj`.

26.8.6 Merge [alg.merge]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result, Compare comp);
```

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
         class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::merge_result<I1, I2, O>
    ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::merge(R1&& r1, R2&& r2, O result,
                  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let N be `(last1 - first1) + (last2 - first2)`. Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies all the elements of the two ranges [`first1`, `last1`) and [`first2`, `last2`) into the range [`result`, `result_last`), where `result_last` is `result` + N. If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of [`first1`, `last1`) and `e2` of [`first2`, `last2`), `e2` is copied into the output range before `e1` if and only if `bool(invoke(comp, invoke(proj2, e2), invoke(proj1, e1)))` is `true`.

4 *Returns*:

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*:

(5.1) — For the overloads with no `ExecutionPolicy`, at most $N - 1$ comparisons and applications of each projection.

(5.2) — For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ comparisons.

6 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator>
  constexpr void inplace_merge(BidirectionalIterator first,
                               BidirectionalIterator middle,
                               BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr void inplace_merge(BidirectionalIterator first,
                               BidirectionalIterator middle,
                               BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

9 *Effects*: Merges two sorted consecutive ranges [`first`, `middle`) and [`middle`, `last`), putting the result of the merge into the range [`first`, `last`). The resulting range is sorted with respect to `comp` and `proj`.

10 *Returns*: `last` for the overload in namespace `ranges`.

11 *Complexity*: Let $N =$ `last - first`:

(11.1) — For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, at most $N - 1$ comparisons.

(11.2) — Otherwise, $\mathcal{O}(N \log N)$ comparisons.

In either case, twice as many projections as comparisons.

12 *Remarks*: Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

13 *Effects*: Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

26.8.7 Set operations on sorted structures [alg.set.operations]

26.8.7.1 General [alg.set.operations.general]

1 Subclause 26.8.7 defines all the basic set operations on sorted structures. They also work with `multiset`s (23.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multiset`s in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

26.8.7.2 `includes` [includes]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2,
                          Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                  Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively.

3 *Returns*: `true` if and only if [`first2`, `last2`) is a subsequence of [`first1`, `last1`).

[*Note 1*: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some, all, or none of T's elements and keeping the remaining elements in the same order. — *end note*]

4 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

26.8.7.3 `set_union` [set.union]

```
template<class InputIterator1, class InputIterator2, class OutputIterator>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<I1, I2, O>
    ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, then all m elements from the first range are copied to the output range, in order, and then the final $\max(n-m, 0)$ elements from the second range are copied to the output range, in order.

26.8.7.4 `set_intersection` [set.intersection]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_intersection_result<I1, I2, O>
    ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_intersection(R1&& r1, R2&& r2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, the first $\min(m, n)$ elements are copied from the first range to the output range, in order.

26.8.7.5 `set_difference` [set.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, InputIterator2 last2,
                   OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2, ForwardIterator2 last2,
                   ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, InputIterator2 last2,
                   OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2, ForwardIterator2 last2,
                   ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_difference_result<I1, O>
    ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                           Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
    ranges::set_difference(R1&& r1, R2&& r2, O result,
                           Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies the elements of the range [`first1`, `last1`) which are not present in the range [`first2`, `last2`) to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from [`first1`, `last1`) are copied to the output range, in order.

26.8.7.6 `set_symmetric_difference` [set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, InputIterator2 last2,
                             OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                             ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2,
                             ForwardIterator result);

```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies the elements of the range [`first1`, `last1`) that are not present in the range [`first2`, `last2`), and the elements of the range [`first2`, `last2`) that are not present in the range [`first1`, `last1`) to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, then $|m - n|$ of those elements shall be copied to the output range: the last $m - n$ of these elements from [`first1`, `last1`) if $m > n$, and the last $n - m$ of these elements from [`first2`, `last2`) if $m < n$. In either case, the elements are copied in order.

26.8.8 Heap operations [alg.heap.operations]

26.8.8.1 General [alg.heap.operations.general]

1 A random access range [`a`, `b`) is a *heap with respect to* `comp` *and* `proj` for a comparator and projection `comp` and `proj` if its elements are organized such that:

(1.1) — With N `= b - a`, for all i, $0 < i < N$, `bool(invoke(comp, invoke(proj, a[`$\lfloor \frac{i-1}{2} \rfloor$`]), invoke(proj, a[`$i$`])))` is `false`.

(1.2) — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in $\mathcal{O}(\log N)$ time.

2 These properties make heaps useful as priority queues.

3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

26.8.8.2 `push_heap` [push.heap]

```
template<class RandomAccessIterator>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range [`first`, `last - 1`) is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* requirements (Table 31) and the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: Places the value in the location `last - 1` into the resulting heap [`first`, `last`).

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most log(`last - first`) comparisons and twice as many projections.

26.8.8.3 `pop_heap` [pop.heap]

```
template<class RandomAccessIterator>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                          Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range [`first`, `last`) is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Swaps the value in the location `first` with the value in the location `last - 1` and makes [`first`, `last - 1`) into a heap with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2\log($`last - first`$)$ comparisons and twice as many projections.

26.8.8.4 `make_heap` [make.heap]

```
template<class RandomAccessIterator>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Constructs a heap with respect to `comp` and `proj` out of the range [`first`, `last`).

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $3($`last - first`$)$ comparisons and twice as many projections.

26.8.8.5 `sort_heap` [sort.heap]

```
template<class RandomAccessIterator>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range [`first`, `last`) is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts elements in the heap [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2N \log N$ comparisons, where $N =$ `last - first`, and twice as many projections.

26.8.8.6 `is_heap` [is.heap]

```
template<class RandomAccessIterator>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

1 *Effects*: Equivalent to: `return is_heap_until(first, last) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last);
```

2 *Effects*: Equivalent to:

```
  return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class RandomAccessIterator, class Compare>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                         Compare comp);
```

3 *Effects*: Equivalent to: `return is_heap_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last,
               Compare comp);
```

4 *Effects*: Equivalent to:

```
  return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_heap_until(first, last, comp, proj) == last;`

```
template<class RandomAccessIterator>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
```

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns*: The last iterator `i` in [`first`, `last`] for which the range [`first`, `i`) is a heap with respect to `comp` and `proj`.

8 *Complexity*: Linear.

26.8.9 Minimum and maximum [alg.min.max]

```
template<class T>
  constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

1 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

2 *Returns*: The smaller value. Returns the first argument when the arguments are equivalent.

3 *Complexity*: Exactly one comparison and two applications of the projection, if any.

4 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T min(initializer_list<T> r);
template<class T, class Compare>
  constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::min(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

6 *Returns*: The smallest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the smallest.

7 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

8 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

9 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

10 *Returns*: The larger value. Returns the first argument when the arguments are equivalent.

11 *Complexity*: Exactly one comparison and two applications of the projection, if any.

12 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T max(initializer_list<T> r);
template<class T, class Compare>
  constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::max(R&& r, Comp comp = {}, Proj proj = {});
```

13 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

14 *Returns*: The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

15 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

16 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<const T&>
    ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

17 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

18 *Returns*: `{b, a}` if `b` is smaller than `a`, and `{a, b}` otherwise.

19 *Complexity*: Exactly one comparison and two applications of the projection, if any.

20 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
  constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);
```

```
template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<T>
    ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr ranges::minmax_result<range_value_t<R>>
    ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});
```

21 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

22 *Returns*: Let `X` be the return type. Returns `X{x, y}`, where `x` is a copy of the leftmost element with the smallest value and `y` a copy of the rightmost element with the largest value in the input range.

23 *Complexity*: At most (3/2)`ranges::distance(r)` applications of the corresponding predicate and twice as many applications of the projection, if any.

24 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class ForwardIterator>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});
```

25 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

26 *Returns*: The first iterator `i` in the range [`first`, `last`) such that for every iterator `j` in the range [`first`, `last`),

```
bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))
```

is `false`. Returns `last` if `first == last`.

27 *Complexity*: Exactly $\max($`last - first - 1`$, 0)$ comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});
```

28 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

29 *Returns*: The first iterator `i` in the range [`first`, `last`) such that for every iterator `j` in the range [`first`, `last`),

```
bool(invoke(comp, invoke(proj, *i), invoke(proj, *j)))
```

is `false`. Returns `last` if `first == last`.

30 *Complexity*: Exactly $\max($`last - first - 1`$, 0)$ comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_element_result<I>
    ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_element_result<borrowed_iterator_t<R>>
    ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});
```

31 *Returns*: `{first, first}` if [`first`, `last`) is empty, otherwise `{m, M}`, where `m` is the first iterator in [`first`, `last`) such that no iterator in the range refers to a smaller element, and where `M` is the last iterator[205] in [`first`, `last`) such that no iterator in the range refers to a larger element.

32 *Complexity*: Let N be `last - first`. At most $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$ comparisons and twice as many applications of the projection, if any.

26.8.10 Bounded value [alg.clamp]

```
template<class T>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);
```

205) This behavior intentionally differs from `max_element`.

```
template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T&
    ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` for the overloads with no parameter `comp`, and let `proj` be `identity{}` for the overloads with no parameter `proj`.

2 *Preconditions*: `bool(invoke(comp, invoke(proj, hi), invoke(proj, lo)))` is `false`. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

3 *Returns*: `lo` if `bool(invoke(comp, invoke(proj, v), invoke(proj, lo)))` is `true`, `hi` if `bool(invoke(comp, invoke(proj, hi), invoke(proj, v)))` is `true`, otherwise `v`.

4 [*Note 1*: If NaN is avoided, `T` can be a floating-point type. — *end note*]

5 *Complexity*: At most two comparisons and three applications of the projection.

26.8.11 Lexicographical comparison [alg.lex.comparison]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2,
                            Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2,
                            Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns*: `true` if and only if the sequence of elements defined by the range [`first1`, `last1`) is lexicographically less than the sequence of elements defined by the range [`first2`, `last2`).

2 *Complexity*: At most 2 min(`last1 - first1`, `last2 - first2`) applications of the corresponding comparison and each projection, if any.

3 *Remarks*: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence.

Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 [*Example 1*: `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` can be implemented as:

```
for (; first1 != last1 && first2 != last2; ++first1, (void)++first2) {
  if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
  if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
```

— *end example*]

5 [*Note 1*: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — *end note*]

26.8.12 Three-way comparison algorithms [alg.three.way]

```
template<class InputIterator1, class InputIterator2, class Cmp>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2,
                                      Cmp comp)
      -> decltype(comp(*b1, *b2));
```

1 Let N be $\min($`e1 - b1`$,$ `e2 - b2`$)$. Let $E(n)$ be `comp(*(b1 + `n`), *(b2 + `n`))`.

2 *Mandates*: `decltype(comp(*b1, *b2))` is a comparison category type.

3 *Returns*: $E(i)$, where i is the smallest integer in $[0, N)$ such that $E(i)$ `!= 0` is `true`, or `(e1 - b1) <=> (e2 - b2)` if no such integer exists.

4 *Complexity*: At most N applications of `comp`.

```
template<class InputIterator1, class InputIterator2>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2);
```

5 *Effects*: Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

26.8.13 Permutation generators [alg.permutation.generators]

```
template<class BidirectionalIterator>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::next_permutation_result<I>
    ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
    ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

3 *Effects*: Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted

with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 *Returns*: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

(4.1) — `B` for the overloads in namespace `std`.

(4.2) — `{ last, B }` for the overloads in namespace `ranges`.

5 *Complexity*: At most `(last - first) / 2` swaps.

```
template<class BidirectionalIterator>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::prev_permutation_result<I>
    ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
    ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

8 *Effects*: Takes a sequence defined by the range [`first`, `last`) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 *Returns*: Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

(9.1) — `B` for the overloads in namespace `std`.

(9.2) — `{ last, B }` for the overloads in namespace `ranges`.

10 *Complexity*: At most `(last - first) / 2` swaps.

26.9 Header `<numeric>` synopsis [numeric.ops.overview]

```
// mostly freestanding
namespace std {
  // 26.10.3, accumulate

```

26.10 Generalized numeric operations [numeric.ops]

26.10.1 General [numeric.ops.general]

1 [*Note 1*: The use of closed ranges as well as semi-open ranges to specify requirements throughout 26.10 is intentional. — *end note*]

26.10.2 Definitions [numerics.defns]

1 Define *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aN) as follows:

(1.1) — a1 when N is 1, otherwise

(1.2) — op(*GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aK),
GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) for any K where $1 < \mathtt{K} + 1 = \mathtt{M} \leq \mathtt{N}$.

2 Define *GENERALIZED_SUM*(op, a1, ..., aN) as *GENERALIZED_NONCOMMUTATIVE_SUM*(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

26.10.3 Accumulate [accumulate]

```
template<class InputIterator, class T>
  constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
  constexpr T accumulate(InputIterator first, InputIterator last, T init,
                         BinaryOperation binary_op);
```

1 *Preconditions*: T meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.[206]

2 *Effects*: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.[207]

206) The use of fully closed ranges is intentional.
207) accumulate is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

26.10.4 Reduce [reduce]

```
template<class InputIterator>
  constexpr typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);
```

1 *Effects*: Equivalent to:

```
return reduce(first, last,
              typename iterator_traits<InputIterator>::value_type{});
```

```
template<class ExecutionPolicy, class ForwardIterator>
  typename iterator_traits<ForwardIterator>::value_type
    reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
              typename iterator_traits<ForwardIterator>::value_type{});
```

```
template<class InputIterator, class T>
  constexpr T reduce(InputIterator first, InputIterator last, T init);
```

3 *Effects*: Equivalent to:

```
return reduce(first, last, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator, class T>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init);
```

4 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
  constexpr T reduce(InputIterator first, InputIterator last, T init,
                     BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init,
           BinaryOperation binary_op);
```

5 *Mandates*: All of

(5.1) — `binary_op(init, *first)`,

(5.2) — `binary_op(*first, init)`,

(5.3) — `binary_op(init, init)`, and

(5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 *Preconditions*:

(6.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range [`first`, `last`].

7 *Returns*: *`GENERALIZED_SUM`*`(binary_op, init, *i, ...)` for every `i` in [`first`, `last`).

8 *Complexity*: $\mathscr{O}$(`last - first`) applications of `binary_op`.

9 [*Note 1*: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition. — *end note*]

26.10.5 Inner product [inner.product]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init);
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init,
                            BinaryOperation1 binary_op1,
                            BinaryOperation2 binary_op2);
```

1 *Preconditions*: `T` meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the ranges [`first1`, `last1`] and [`first2`, `first2 + (last1 - first1)`] `binary_op1` and `binary_op2` neither modifies elements nor invalidates iterators or subranges.[208]

2 *Effects*: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range [`first1`, `last1`) and iterator `i2` in the range [`first2`, `first2 + (last1 - first1)`) in order.

26.10.6 Transform reduce [transform.reduce]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init);
```

1 *Effects*: Equivalent to:

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init);
```

2 *Effects*: Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                        first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init,
                               BinaryOperation1 binary_op1,
                               BinaryOperation2 binary_op2);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init,
                     BinaryOperation1 binary_op1,
                     BinaryOperation2 binary_op2);
```

3 *Mandates*: All of

(3.1) — `binary_op1(init, init)`,

(3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,

(3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and

(3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

208) The use of fully closed ranges is intentional.

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges [`first1`, `last1`] and [`first2`, `first2 + (last1 - first1)`].

5 *Returns*:

```
GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)
```

for every iterator `i` in [`first1`, `last1`).

6 *Complexity*: $\mathscr{O}$(`last1 - first1`) applications each of `binary_op1` and `binary_op2`.

```
template<class InputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                               BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator, class T,
         class BinaryOperation, class UnaryOperation>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator first, ForwardIterator last,
                     T init, BinaryOperation binary_op, UnaryOperation unary_op);
```

7 *Mandates*: All of

(7.1) — `binary_op(init, init)`,

(7.2) — `binary_op(init, unary_op(*first))`,

(7.3) — `binary_op(unary_op(*first), init)`, and

(7.4) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

8 *Preconditions*:

(8.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range [`first`, `last`].

9 *Returns*:

```
GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
```

for every iterator `i` in [`first`, `last`).

10 *Complexity*: $\mathscr{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

11 [*Note 1*: `transform_reduce` does not apply `unary_op` to `init`. — *end note*]

26.10.7 Partial sum [partial.sum]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result, BinaryOperation binary_op);
```

1 *Mandates*: `InputIterator`'s value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to `InputIterator`'s value type. `acc` is writable (24.3.1) to `result`.

2 *Preconditions*: In the ranges [`first`, `last`] and [`result`, `result + (last - first)`] `binary_op` neither modifies elements nor invalidates iterators or subranges.[209]

209) The use of fully closed ranges is intentional.

3 *Effects*: For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in [`first + 1`, `last`) in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

4 *Returns*: `result + (last - first)`.

5 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

6 *Remarks*: `result` may be equal to `first`.

26.10.8 Exclusive scan [exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init);
```

1 *Effects*: Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init);
```

2 *Effects*: Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                      first, last, result, init, plus<>());
```

```
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init, BinaryOperation binary_op);
```

3 *Mandates*: All of

(3.1) — `binary_op(init, init)`,

(3.2) — `binary_op(init, *first)`, and

(3.3) — `binary_op(*first, *first)`

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(4.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

5 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

6 *Returns*: The end of the resulting range beginning at `result`.

7 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

8 *Remarks*: `result` may be equal to `first`.

9 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic. — *end note*]

26.10.9 Inclusive scan [inclusive.scan]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result);
```

1 *Effects*: Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result);
```

2 *Effects*: Equivalent to:

```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op, T init);
```

3 Let `U` be the value type of `decltype(first)`.

4 *Mandates*: If `init` is provided, all of

(4.1) — `binary_op(init, init)`,

(4.2) — `binary_op(init, *first)`, and

(4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 *Preconditions*:

(5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

6 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of

(6.1) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*(
`binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))`
if `init` is provided, or

(6.2) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*(
`binary_op, *(first + 0), *(first + 1), ..., *(first + K))`
otherwise.

7 *Returns*: The end of the resulting range beginning at `result`.

8 *Complexity*: $\mathcal{O}($`last - first`$)$ applications of `binary_op`.

9 *Remarks*: `result` may be equal to `first`.

10 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic. — *end note*]

26.10.10 Transform exclusive scan [transform.exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_exclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_exclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
```

1 *Mandates*: All of

(1.1) — `binary_op(init, init)`,

(1.2) — `binary_op(init, unary_op(*first))`, and

(1.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

2 *Preconditions*:

(2.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

3 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1)))
```

4 *Returns*: The end of the resulting range beginning at `result`.

5 *Complexity*: $\mathcal{O}($`last - first`$)$ applications each of `unary_op` and `binary_op`.

6 *Remarks*: `result` may be equal to `first`.

7 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — *end note*]

26.10.11 Transform inclusive scan [transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
```

1 Let `U` be the value type of `decltype(first)`.

2 *Mandates*: If `init` is provided, all of

(2.1) — `binary_op(init, init)`,

(2.2) — `binary_op(init, unary_op(*first))`, and

(2.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to `U`.

3 *Preconditions*:

(3.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

4 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of

(4.1) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*`(`
```
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))
```
if `init` is provided, or

(4.2) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*`(`
```
    binary_op,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))
```
otherwise.

5 *Returns*: The end of the resulting range beginning at `result`.

6 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

7 *Remarks*: `result` may be equal to `first`.

8 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` can be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`. — *end note*]

26.10.12 Adjacent difference [adjacent.difference]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let `T` be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Mandates*:

(2.1) — For the overloads with no `ExecutionPolicy`, `T` is constructible from `*first`. `acc` (defined below) is writable (24.3.1) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to `result`.

(2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

3 *Preconditions*:

(3.1) — For the overloads with no `ExecutionPolicy`, `T` meets the *Cpp17MoveAssignable* (Table 33) requirements.

(3.2) — For all overloads, in the ranges [`first`, `last`] and [`result`, `result + (last - first)`], `binary_op` neither modifies elements nor invalidates iterators or subranges.[210]

4 *Effects*: For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in [`first + 1`, `last`) in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in [`1`, `last - first - 1`], performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

6 *Returns*: `result + (last - first)`.

7 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

8 *Remarks*: For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges [`first`, `last`) and [`result`, `result + (last - first)`) shall not overlap.

26.10.13 Iota [numeric.iota]

```
template<class ForwardIterator, class T>
  constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

1 *Mandates*: `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

210) The use of fully closed ranges is intentional.

2 *Effects*: For each element referred to by the iterator `i` in the range [`first`, `last`), assigns `*i = value` and increments `value` as if by `++value`.

3 *Complexity*: Exactly `last - first` increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
  requires indirectly_writable<O, const T&>
  constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
  constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

4 *Effects*: Equivalent to:

```
while (first != last) {
  *first = as_const(value);
  ++first;
  ++value;
}
return {std::move(first), std::move(value)};
```

26.10.14 Greatest common divisor [numeric.ops.gcd]

```
template<class M, class N>
  constexpr common_type_t<M, N> gcd(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`.

[*Note 1*: These requirements ensure, for example, that `gcd(m, m)` = |`m`| is representable as a value of type `M`. — *end note*]

3 *Returns*: Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of |`m`| and |`n`|.

4 *Throws*: Nothing.

26.10.15 Least common multiple [numeric.ops.lcm]

```
template<class M, class N>
  constexpr common_type_t<M, N> lcm(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`. The least common multiple of |`m`| and |`n`| is representable as a value of type `common_type_t<M, N>`.

3 *Returns*: Zero when either `m` or `n` is zero. Otherwise, returns the least common multiple of |`m`| and |`n`|.

4 *Throws*: Nothing.

26.10.16 Midpoint [numeric.ops.midpoint]

```
template<class T>
  constexpr T midpoint(T a, T b) noexcept;
```

1 *Constraints*: `T` is an arithmetic type other than `bool`.

2 *Returns*: Half the sum of `a` and `b`. If `T` is an integer type and the sum is odd, the result is rounded towards `a`.

3 *Remarks*: No overflow occurs. If `T` is a floating-point type, at most one inexact operation occurs.

```
template<class T>
  constexpr T* midpoint(T* a, T* b);
```

4 *Constraints*: `T` is an object type.

5 *Mandates*: `T` is a complete type.

6 *Preconditions*: `a` and `b` point to, respectively, elements i and j of the same array object `x`.

[*Note 1*: As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. — *end note*]

7 *Returns*: A pointer to array element $i + \frac{j-i}{2}$ of `x`, where the result of the division is truncated towards zero.

26.10.17 Saturation arithmetic [numeric.sat]

26.10.17.1 Arithmetic functions [numeric.sat.func]

1 In the following descriptions, an arithmetic operation is performed as a mathematical operation with infinite range and then it is determined whether the mathematical result fits into the result type.

```
template<class T>
  constexpr T add_sat(T x, T y) noexcept;
```

2 *Constraints*: `T` is a signed or unsigned integer type (6.8.2).

3 *Returns*: If `x` + `y` is representable as a value of type `T`, `x` + `y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x` + `y`.

```
template<class T>
  constexpr T sub_sat(T x, T y) noexcept;
```

4 *Constraints*: `T` is a signed or unsigned integer type (6.8.2).

5 *Returns*: If `x` − `y` is representable as a value of type `T`, `x` − `y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x` − `y`.

```
template<class T>
  constexpr T mul_sat(T x, T y) noexcept;
```

6 *Constraints*: `T` is a signed or unsigned integer type (6.8.2).

7 *Returns*: If `x` × `y` is representable as a value of type `T`, `x` × `y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x` × `y`.

```
template<class T>
  constexpr T div_sat(T x, T y) noexcept;
```

8 *Constraints*: `T` is a signed or unsigned integer type (6.8.2).

9 *Preconditions*: `y != 0` is `true`.

10 *Returns*: If `T` is a signed integer type and `x == numeric_limits<T>::min() && y == -1` is `true`, `numeric_limits<T>::max()`, otherwise, `x / y`.

11 *Remarks*: A function call expression that violates the precondition in the *Preconditions* element is not a core constant expression (7.7).

26.10.17.2 Casting [numeric.sat.cast]

```
template<class R, class T>
  constexpr R saturate_cast(T x) noexcept;
```

1 *Constraints*: `R` and `T` are signed or unsigned integer types (6.8.2).

2 *Returns*: If `x` is representable as a value of type `R`, `x`; otherwise, either the largest or smallest representable value of type `R`, whichever is closer to the value of `x`.

26.11 Specialized `<memory>` algorithms [specialized.algorithms]

26.11.1 General [specialized.algorithms.general]

1 The contents specified in 26.11 are declared in the header `<memory>` (20.2.2).

2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement *new-expression* (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

3 [*Note 1*: When new objects are created by the algorithms specified in 26.11, the lifetime ends for any existing objects (including potentially-overlapping subobjects 6.7.2) in storage that is reused 6.7.4. — *end note*]

4 Some algorithms specified in 26.11 make use of the following exposition-only function templates:

```
template<class T>
  constexpr void* voidify(T& obj) noexcept {
    return addressof(obj);
  }

template<class I>
  decltype(auto) deref-move(I& it) {
    if constexpr (is_lvalue_reference_v<decltype(*it)>)
      return std::move(*it);
    else
      return *it;
  }
```

26.11.2 Special memory concepts [special.mem.concepts]

1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow-input-iterator = // exposition only
  input_iterator<I> &&
  is_lvalue_reference_v<iter_reference_t<I>> &&
  same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

2 A type `I` models *`nothrow-input-iterator`* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

3 [*Note 1*: This concept allows some `input_iterator` (24.3.4.9) operations to throw exceptions. — *end note*]

```
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

4 Types `S` and `I` model *`nothrow-sentinel-for`* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type `I` and `S`.

5 [*Note 2*: This concept allows some `sentinel_for` (24.3.4.7) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-input-range = // exposition only
  range<R> &&
  nothrow-input-iterator<iterator_t<R>> &&
  nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

6 A type `R` models *`nothrow-input-range`* only if no exceptions are thrown from calls to `ranges::begin` and `ranges::end` on an object of type `R`.

```
template<class I>
concept nothrow-forward-iterator = // exposition only
  nothrow-input-iterator<I> &&
  forward_iterator<I> &&
  nothrow-sentinel-for<I, I>;
```

7 [*Note 3*: This concept allows some `forward_iterator` (24.3.4.11) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-forward-range = // exposition only
  nothrow-input-range<R> &&
  nothrow-forward-iterator<iterator_t<R>>;
```

26.11.3 uninitialized_default_construct [uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
  constexpr void uninitialized_default_construct(NoThrowForwardIterator first,
                                                 NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
  for (; first != last; ++first)
    ::new (voidify(*first))
      typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_default_construct(I first, S last);
  template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    constexpr borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator
    uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_default_construct(counted_iterator(first, n),
                                       default_sentinel).base();
```

26.11.4 uninitialized_value_construct [uninitialized.construct.value]

```
template<class NoThrowForwardIterator>
  constexpr void uninitialized_value_construct(NoThrowForwardIterator first,
                                               NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_value_construct(I first, S last);
  template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    constexpr borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator
    uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
    for (; n > 0; (void)++first, --n)
      ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();
    return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
    return uninitialized_value_construct(counted_iterator(first, n),
                                         default_sentinel).base();
```

26.11.5 uninitialized_copy [uninitialized.copy]

```
template<class InputIterator, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                                      NoThrowForwardIterator result);
```

1 *Preconditions*: `result` + [0, `(last - first)`) does not overlap with [`first`, `last`).

2 *Effects*: Equivalent to:

```
    for (; first != last; ++result, (void)++first)
      ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    constexpr uninitialized_copy_result<I, O>
      uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    constexpr uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

4 *Preconditions*: [`ofirst`, `olast`) does not overlap with [`ifirst`, `ilast`).

5 *Effects*: Equivalent to:

```
    for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
      ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
    return {std::move(ifirst), ofirst};
```

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                                        NoThrowForwardIterator result);
```

6 *Preconditions*: `result` + [0, `n`) does not overlap with `first` + [0, `n`).

7 *Effects*: Equivalent to:

```
    for (; n > 0; ++result, (void)++first, --n)
      ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

8 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    constexpr uninitialized_copy_n_result<I, O>
      uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

9 *Preconditions*: [ofirst, olast) does not overlap with ifirst + [0, n).

10 *Effects*: Equivalent to:

```
auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                            default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

26.11.6 uninitialized_move [uninitialized.move]

```
template<class InputIterator, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                                      NoThrowForwardIterator result);
```

1 *Preconditions*: result + [0, (last - first)) does not overlap with [first, last).

2 *Effects*: Equivalent to:

```
for (; first != last; (void)++result, ++first)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(deref-move(first));
return result;
```

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
          nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    constexpr uninitialized_move_result<I, O>
      uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    constexpr uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_move(IR&& in_range, OR&& out_range);
}
```

3 *Preconditions*: [ofirst, olast) does not overlap with [ifirst, ilast).

4 *Effects*: Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
  ::new (voidify(*ofirst))
    remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
return {std::move(ifirst), ofirst};
```

5 [*Note 1*: If an exception is thrown, some objects in the range [ifirst, ilast) are left in a valid, but unspecified state. — *end note*]

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  constexpr pair<InputIterator, NoThrowForwardIterator>
    uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
```

6 *Preconditions*: result + [0, n) does not overlap with first + [0, n).

7 *Effects*: Equivalent to:

```
for (; n > 0; ++result, (void)++first, --n)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(deref-move(first));
return {first, result};
```

```
namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    constexpr uninitialized_move_n_result<I, O>
      uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

8 *Preconditions*: [ofirst, olast) does not overlap with ifirst + [0, n).

9 *Effects*: Equivalent to:

```
auto t = uninitialized_move(counted_iterator(std::move(ifirst), n),
                            default_sentinel, ofirst, olast);
```

```
return {std::move(t.in).base(), t.out};
```

10 [*Note 2*: If an exception is thrown, some objects in the range `ifirst` + [0, `n`) are left in a valid but unspecified state. — *end note*]

26.11.7 `uninitialized_fill` [uninitialized.fill]

```
template<class NoThrowForwardIterator, class T>
  constexpr void uninitialized_fill(NoThrowForwardIterator first,
                                    NoThrowForwardIterator last, const T& x);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type(x);
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T>
    requires constructible_from<iter_value_t<I>, const T&>
    constexpr I uninitialized_fill(I first, S last, const T& x);
  template<nothrow-forward-range R, class T>
    requires constructible_from<range_value_t<R>, const T&>
    constexpr borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
return first;
```

```
template<class NoThrowForwardIterator, class Size, class T>
  constexpr NoThrowForwardIterator
    uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);
```

3 *Effects*: Equivalent to:

```
for (; n--; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type(x);
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I, class T>
    requires constructible_from<iter_value_t<I>, const T&>
    constexpr I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();
```

26.11.8 `construct_at` [specialized.construct]

```
template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
  template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
}
```

1 *Constraints*: `is_unbounded_array_v<T>` is `false`. The expression `::new (declval<void*>()) T(declval<Args>()...)` is well-formed when treated as an unevaluated operand (7.2.3).

2 *Mandates*: If `is_array_v<T>` is `true`, `sizeof...(Args)` is zero.

3 *Effects*: Equivalent to:

```
if constexpr (is_array_v<T>)
  return ::new (voidify(*location)) T[1]();
```

```
    else
      return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

26.11.9 destroy [specialized.destroy]

```
template<class T>
  constexpr void destroy_at(T* location);
namespace ranges {
  template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}
```

1 *Effects*:

(1.1) — If `T` is an array type, equivalent to `destroy(begin(*location), end(*location))`.

(1.2) — Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
  constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2 *Effects*: Equivalent to:

```
    for (; first != last; ++first)
      destroy_at(addressof(*first));
```

```
namespace ranges {
  template<nothrow-input-iterator I, nothrow-sentinel-for<I> S>
    requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
  template<nothrow-input-range R>
    requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3 *Effects*: Equivalent to:

```
    for (; first != last; ++first)
      destroy_at(addressof(*first));
    return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4 *Effects*: Equivalent to:

```
    for (; n > 0; (void)++first, --n)
      destroy_at(addressof(*first));
    return first;
```

```
namespace ranges {
  template<nothrow-input-iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5 *Effects*: Equivalent to:

```
    return destroy(counted_iterator(std::move(first), n), default_sentinel).base();
```

26.12 Specialized <random> algorithms [alg.rand]

26.12.1 General [alg.rand.general]

1 The contents specified in 26.12 are declared in the header `<random>` (29.5.2).

26.12.2 generate_random [alg.rand.generate]

```
template<class R, class G>
  requires output_range<R, invoke_result_t<G&>> && uniform_random_bit_generator<remove_cvref_t<G>>
constexpr borrowed_iterator_t<R> ranges::generate_random(R&& r, G&& g);
```

1 *Effects*:

(1.1) — Calls `g.generate_random(std::forward<R>(r))` if this expression is well-formed.

(1.2) — Otherwise, if `R` models `sized_range`, fills `r` with `ranges::size(r)` values of type `invoke_result_t<G&>` by performing an unspecified number of invocations of the form `g()` or `g.generate_random(s)`, if such an expression is well-formed for a value `N` and an object `s` of type `span<invoke_result_t<G&>, N>`.

[*Note 1*: Values of `N` can differ between invocations. — *end note*]

(1.3) — Otherwise, calls `ranges::generate(std::forward<R>(r), ref(g))`.

2 *Returns*: `ranges::end(r)`.

3 *Remarks*: The effects of `generate_random(r, g)` shall be equivalent to `ranges::generate(std::forward<R>(r), ref(g))`.

[*Note 2*: This implies that `g.generate_random(a)` fills `a` with the same values as produced by invocation of `g()`. — *end note*]

```
template<class G, output_iterator<invoke_result_t<G&>> O, sentinel_for<O> S>
  requires uniform_random_bit_generator<remove_cvref_t<G>>
constexpr O ranges::generate_random(O first, S last, G&& g);
```

4 *Effects*: Equivalent to:

```
return generate_random(subrange<O, S>(std::move(first), last), g);
```

```
template<class R, class G, class D>
  requires output_range<R, invoke_result_t<D&, G&>> && invocable<D&, G&> &&
           uniform_random_bit_generator<remove_cvref_t<G>> &&
           is_arithmetic_v<invoke_result_t<D&, G&>>
constexpr borrowed_iterator_t<R> ranges::generate_random(R&& r, G&& g, D&& d);
```

5 *Effects*:

(5.1) — Calls `d.generate_random(std::forward<R>(r), g)` if this expression is well-formed.

(5.2) — Otherwise, if `R` models `sized_range`, fills `r` with `ranges::size(r)` values of type `invoke_result_t<D&, G&>` by performing an unspecified number of invocations of the form `invoke(d, g)` or `d.generate_random(s, g)`, if such an expression is well-formed for a value `N` and an object `s` of type `span<invoke_result_t<D&, G&>, N>`.

[*Note 3*: Values of N can differ between invocations. — *end note*]

(5.3) — Otherwise, calls

```
ranges::generate(std::forward<R>(r), [&d, &g] { return invoke(d, g); });
```

6 *Returns*: `ranges::end(r)`.

7 *Remarks*: The effects of `generate_random(r, g, d)` shall be equivalent to

```
ranges::generate(std::forward<R>(r), [&d, &g] { return invoke(d, g); })
```

[*Note 4*: This implies that `d.generate_random(a, g)` fills `a` with the values with the same random distribution as produced by invocation of `invoke(d, g)`. — *end note*]

```
template<class G, class D, output_iterator<invoke_result_t<D&, G&>> O, sentinel_for<O> S>
  requires invocable<D&, G&> && uniform_random_bit_generator<remove_cvref_t<G>> &&
           is_arithmetic_v<invoke_result_t<D&, G&>>
constexpr O ranges::generate_random(O first, S last, G&& g, D&& d);
```

8 *Effects*: Equivalent to:

```
return generate_random(subrange<O, S>(std::move(first), last), g, d);
```

26.13 C library algorithms [alg.c.library]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

2 *Preconditions*: For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Throws*: Any exception thrown by `compar` (16.4.6.14).

See also: ISO/IEC 9899:2018, 7.22.5

27 Strings library [strings]

27.1 General [strings.general]

1 This Clause describes components for manipulating sequences of any non-array trivially copyable standard-layout (6.8.1) type `T` where `is_trivially_default_constructible_v<T>` is `true`. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 84.

Table 84 — Strings library summary [tab:strings.summary]

	Subclause	Header
27.2	Character traits	`<string>`
27.3	String view classes	`<string_view>`
27.4	String classes	`<string>`
27.5	Null-terminated sequence utilities	`<cstring>`

27.2 Character traits [char.traits]

27.2.1 General [char.traits.general]

1 Subclause 27.2 defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.

2 Most classes specified in 27.4, 27.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-name*s and functions in the template parameter `traits` used by each such template. Subclause 27.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

27.2.2 Character traits requirements [char.traits.require]

1 In Table 85, `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. No expression which is part of the character traits requirements specified in 27.2.2 shall exit via an exception.

Table 85 — Character traits requirements [tab:char.traits.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::char_type`	`C`		
`X::int_type`		(described in 27.2.3)	
`X::off_type`		(described in 31.2.3 and 31.3)	
`X::pos_type`		(described in 31.2.3 and 31.3)	
`X::state_type`		(described in 27.2.3)	
`X::eq(c,d)`	`bool`	*Returns*: whether `c` is to be treated as equal to `d`.	constant
`X::lt(c,d)`	`bool`	*Returns*: whether `c` is to be treated as less than `d`.	constant

Table 85 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::compare(p,q,n)`	`int`	*Returns*: `0` if for each `i` in [`0`,`n`), `X::eq(p[i],q[i])` is `true`; else, a negative value if, for some `j` in [`0`,`n`), `X::lt(p[j],q[j])` is `true` and for each `i` in [`0`,`j`) `X::eq(p[i],q[i])` is `true`; else a positive value.	linear
`X::length(p)`	`size_t`	*Returns*: the smallest `i` such that `X::eq(p[i],charT())` is `true`.	linear
`X::find(p,n,c)`	`const X::char_type*`	*Returns*: the smallest `q` in [`p`,`p+n`) such that `X::eq(*q,c)` is `true`, `nullptr` otherwise.	linear
`X::move(s,p,n)`	`X::char_type*`	for each `i` in [`0`,`n`), performs `X::assign(s[i],p[i])`. Copies correctly even where the ranges [`p`,`p+n`) and [`s`,`s+n`) overlap. *Returns*: `s`.	linear
`X::copy(s,p,n)`	`X::char_type*`	*Preconditions*: The ranges [`p`,`p+n`) and [`s`,`s+n`) do not overlap. *Returns*: `s`. for each `i` in [`0`,`n`), performs `X::assign(s[i],p[i])`.	linear
`X::assign(r,d)`	(not used)	assigns `r=d`.	constant
`X::assign(s,n,c)`	`X::char_type*`	for each `i` in [`0`,`n`), performs `X::assign(s[i],c)`. *Returns*: `s`.	linear
`X::not_eof(e)`	`int_type`	*Returns*: `e` if `X::eq_int_type(e,X::eof())` is `false`, otherwise a value `f` such that `X::eq_int_type(f,X::eof())` is `false`.	constant
`X::to_char_type(e)`	`X::char_type`	*Returns*: if for some `c`, `X::eq_int_type(e,X::to_int_type(c))` is `true`, `c`; else some unspecified value.	constant
`X::to_int_type(c)`	`X::int_type`	*Returns*: some value `e`, constrained by the definitions of `to_char_type` and `eq_int_type`.	constant
`X::eq_int_type(e,f)`	`bool`	*Returns*: for all `c` and `d`, `X::eq(c,d)` is equal to `X::eq_int_type(X::to_int_type(c), X::to_int_type(d))`; otherwise, yields `true` if `e` and `f` are both copies of `X::eof()`; otherwise, yields `false` if one of `e` and `f` is a copy of `X::eof()` and the other is not; otherwise the value is unspecified.	constant

Table 85 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::eof()`	`X::int_type`	*Returns*: a value `e` such that `X::eq_int_type(e,X::to_int_type(c))` is `false` for all values `c`.	constant

2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header `<string>` (27.4.2) as a basis for explicit specializations.

27.2.3 Traits typedefs [char.traits.typedefs]

`using int_type = `*`see below`*`;`

1 *Preconditions*: `int_type` shall be able to represent all of the valid characters converted from the corresponding `char_type` values, as well as an end-of-file value, `eof()`.[211]

`using state_type = `*`see below`*`;`

2 *Preconditions*: `state_type` meets the *Cpp17Destructible* (Table 35), *Cpp17CopyAssignable* (Table 34), *Cpp17CopyConstructible* (Table 32), and *Cpp17DefaultConstructible* (Table 30) requirements.

27.2.4 `char_traits` specializations [char.traits.specializations]

27.2.4.1 General [char.traits.specializations.general]

```
namespace std {
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;
}
```

1 The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

27.2.4.2 `struct char_traits<char>` [char.traits.specializations.char]

```
namespace std {
  template<> struct char_traits<char> {
    using char_type  = char;
    using int_type   = int;
    using off_type   = streamoff;
    using pos_type   = streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
```

211) If `eof()` can be held in `char_type` then some iostreams operations can give surprising results.

```
      static constexpr int_type not_eof(int_type c) noexcept;
      static constexpr char_type to_char_type(int_type c) noexcept;
      static constexpr int_type to_int_type(char_type c) noexcept;
      static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
      static constexpr int_type eof() noexcept;
    };
  }
```

1 The type `mbstate_t` is defined in `<cwchar>` (28.7.3) and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.

3 The member `eof()` returns `EOF`.

27.2.4.3 `struct char_traits<char8_t>` [char.traits.specializations.char8.t]

```
namespace std {
  template<> struct char_traits<char8_t> {
    using char_type  = char8_t;
    using int_type   = unsigned int;
    using off_type   = streamoff;
    using pos_type   = u8streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

27.2.4.4 `struct char_traits<char16_t>` [char.traits.specializations.char16.t]

```
namespace std {
  template<> struct char_traits<char16_t> {
    using char_type  = char16_t;
    using int_type   = uint_least16_t;
    using off_type   = streamoff;
    using pos_type   = u16streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;
```

```
      static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
      static constexpr size_t length(const char_type* s);
      static constexpr const char_type* find(const char_type* s, size_t n,
                                             const char_type& a);
      static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* assign(char_type* s, size_t n, char_type a);

      static constexpr int_type not_eof(int_type c) noexcept;
      static constexpr char_type to_char_type(int_type c) noexcept;
      static constexpr int_type to_int_type(char_type c) noexcept;
      static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
      static constexpr int_type eof() noexcept;
    };
  }
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

27.2.4.5 `struct char_traits<char32_t>` [char.traits.specializations.char32.t]

```
  namespace std {
    template<> struct char_traits<char32_t> {
      using char_type  = char32_t;
      using int_type   = uint_least32_t;
      using off_type   = streamoff;
      using pos_type   = u32streampos;
      using state_type = mbstate_t;
      using comparison_category = strong_ordering;

      static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
      static constexpr bool eq(char_type c1, char_type c2) noexcept;
      static constexpr bool lt(char_type c1, char_type c2) noexcept;

      static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
      static constexpr size_t length(const char_type* s);
      static constexpr const char_type* find(const char_type* s, size_t n,
                                             const char_type& a);
      static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* assign(char_type* s, size_t n, char_type a);

      static constexpr int_type not_eof(int_type c) noexcept;
      static constexpr char_type to_char_type(int_type c) noexcept;
      static constexpr int_type to_int_type(char_type c) noexcept;
      static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
      static constexpr int_type eof() noexcept;
    };
  }
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a Unicode code point.

27.2.4.6 `struct char_traits<wchar_t>` [char.traits.specializations.wchar.t]

```
  namespace std {
    template<> struct char_traits<wchar_t> {
      using char_type  = wchar_t;
      using int_type   = wint_t;
      using off_type   = streamoff;
      using pos_type   = wstreampos;
      using state_type = mbstate_t;
      using comparison_category = strong_ordering;

      static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
      static constexpr bool eq(char_type c1, char_type c2) noexcept;
      static constexpr bool lt(char_type c1, char_type c2) noexcept;

      static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
      static constexpr size_t length(const char_type* s);
      static constexpr const char_type* find(const char_type* s, size_t n,
                                             const char_type& a);
      static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* assign(char_type* s, size_t n, char_type a);

      static constexpr int_type not_eof(int_type c) noexcept;
      static constexpr char_type to_char_type(int_type c) noexcept;
      static constexpr int_type to_int_type(char_type c) noexcept;
      static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
      static constexpr int_type eof() noexcept;
    };
  }
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns `WEOF`.

27.3 String view classes [string.view]

27.3.1 General [string.view.general]

1 The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (27.1) objects with the first element of the sequence at position zero. In the rest of 27.3, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

2 [*Note 1*: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view<charT>` in order to interoperate with these functions. — *end note*]

27.3.2 Header `<string_view>` synopsis [string.view.synop]

```
// mostly freestanding
#include <compare>              // see 17.12.1

namespace std {
  // 27.3.3, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;                                     // partially freestanding

  template<class charT, class traits>
    constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
  template<class charT, class traits>
    constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

  // 27.3.4, non-member comparison functions
  template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> x,
                              type_identity_t<basic_string_view<charT, traits>> y) noexcept;
  template<class charT, class traits>
    constexpr see below operator<=>(basic_string_view<charT, traits> x,
                                    type_identity_t<basic_string_view<charT,
                                                    traits>> y) noexcept;
  // 27.3.5, inserters and extractors
  template<class charT, class traits>
    basic_ostream<charT, traits>&
      operator<<(basic_ostream<charT, traits>& os,
                 basic_string_view<charT, traits> str);                // hosted

  // basic_string_view typedef-names
  using string_view    = basic_string_view<char>;
  using u8string_view  = basic_string_view<char8_t>;
  using u16string_view = basic_string_view<char16_t>;
  using u32string_view = basic_string_view<char32_t>;
  using wstring_view   = basic_string_view<wchar_t>;

  // 27.3.6, hash support

  template<> struct hash<u32string_view>;
  template<> struct hash<wstring_view>;

  inline namespace literals {
    inline namespace string_view_literals {
      // 27.3.7, suffix for basic_string_view literals
      constexpr string_view    operator""sv(const char* str, size_t len) noexcept;
      constexpr u8string_view  operator""sv(const char8_t* str, size_t len) noexcept;
      constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
      constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
      constexpr wstring_view   operator""sv(const wchar_t* str, size_t len) noexcept;
    }
  }
}
```

1 The function templates defined in 22.2.2 and 24.7 are available when `<string_view>` is included.

27.3.3 Class template `basic_string_view` [string.view.template]

27.3.3.1 General [string.view.template.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view {
  public:
    // types
    using traits_type            = traits;
    using value_type             = charT;
    using pointer                = value_type*;
    using const_pointer          = const value_type*;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using const_iterator         = implementation-defined; // see 27.3.3.4
    using iterator               = const_iterator;[212]
    using const_reverse_iterator = reverse_iterator<const_iterator>;
    using reverse_iterator       = const_reverse_iterator;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    static constexpr size_type npos = size_type(-1);

    // 27.3.3.2, construction and assignment
    constexpr basic_string_view() noexcept;
    constexpr basic_string_view(const basic_string_view&) noexcept = default;
    constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
    constexpr basic_string_view(const charT* str);
    basic_string_view(nullptr_t) = delete;
```

212) Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

```
constexpr basic_string_view(const charT* str, size_type len);
template<class It, class End>
  constexpr basic_string_view(It begin, End end);
template<class R>
  constexpr explicit basic_string_view(R&& r);

// 27.3.3.4, iterator support
constexpr const_iterator begin() const noexcept;

    constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;
    constexpr size_type find_last_not_of(const charT* s, size_type pos,
                                         size_type n) const;
    constexpr size_type find_last_not_of(const charT* s, size_type pos = npos) const;

  private:
    const_pointer data_;        // exposition only
    size_type size_;            // exposition only
  };

  // 27.3.3.3, deduction guides
  template<class It, class End>
    basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
  template<class R>
    basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
}
```

1 In every specialization `basic_string_view<charT, traits>`, the type `traits` shall meet the character traits requirements (27.2).

[*Note 1*: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — *end note*]

2 For a `basic_string_view str`, any operation that invalidates a pointer in the range

$[$`str.data()`, `str.data() + str.size()`$)$

invalidates pointers, iterators, and references to elements of `str`.

3 The complexity of `basic_string_view` member functions is $\mathcal{O}(1)$ unless otherwise specified.

4 `basic_string_view<charT, traits>` is a trivially copyable type (6.8.1).

27.3.3.2 Construction and assignment [string.view.cons]

```
constexpr basic_string_view() noexcept;
```

1 *Postconditions*: `size_ == 0` and `data_ == nullptr`.

```
constexpr basic_string_view(const charT* str);
```

2 *Preconditions*: $[$`str`, `str + traits::length(str)`$)$ is a valid range.

3 *Effects*: Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `traits::length(str)`.

4 *Complexity*: $\mathscr{O}$(`traits::length(str)`).

```
constexpr basic_string_view(const charT* str, size_type len);
```

5 *Preconditions*: [`str`, `str + len`) is a valid range.

6 *Effects*: Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `len`.

```
template<class It, class End>
  constexpr basic_string_view(It begin, End end);
```

7 *Constraints*:

(7.1) — `It` satisfies `contiguous_iterator`.

(7.2) — `End` satisfies `sized_sentinel_for<It>`.

(7.3) — `is_same_v<iter_value_t<It>, charT>` is `true`.

(7.4) — `is_convertible_v<End, size_type>` is `false`.

8 *Preconditions*:

(8.1) — [`begin`, `end`) is a valid range.

(8.2) — `It` models `contiguous_iterator`.

(8.3) — `End` models `sized_sentinel_for<It>`.

9 *Effects*: Initializes `data_` with `to_address(begin)` and initializes `size_` with `end - begin`.

10 *Throws*: When and what `end - begin` throws.

```
template<class R>
  constexpr explicit basic_string_view(R&& r);
```

11 Let `d` be an lvalue of type `remove_cvref_t<R>`.

12 *Constraints*:

(12.1) — `remove_cvref_t<R>` is not the same type as `basic_string_view`,

(12.2) — `R` models `ranges::contiguous_range` and `ranges::sized_range`,

(12.3) — `is_same_v<ranges::range_value_t<R>, charT>` is `true`,

(12.4) — `is_convertible_v<R, const charT*>` is `false`, and

(12.5) — `d.operator ::std::basic_string_view<charT, traits>()` is not a valid expression.

13 *Effects*: Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.

14 *Throws*: Any exception thrown by `ranges::data(r)` and `ranges::size(r)`.

27.3.3.3 Deduction guides [string.view.deduct]

```
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

1 *Constraints*:

(1.1) — `It` satisfies `contiguous_iterator`.

(1.2) — `End` satisfies `sized_sentinel_for<It>`.

```
template<class R>
  basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
```

2 *Constraints*: `R` satisfies `ranges::contiguous_range`.

27.3.3.4 Iterator support [string.view.iterators]

```
using const_iterator = implementation-defined;
```

1 A type that meets the requirements of a constant *Cpp17RandomAccessIterator* (24.3.5.7), models `contiguous_iterator` (24.3.4.14), and meets the constexpr iterator requirements (24.3.1), whose `value_type` is the template parameter `charT`.

2 All requirements on container iterators (23.2) apply to `basic_string_view::const_iterator` as well.

```
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

3 *Returns*: An iterator such that

(3.1) — if `!empty()`, `addressof(*begin()) == data_`,

(3.2) — otherwise, an unspecified value such that [`begin()`, `end()`) is a valid range.

```
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

4 *Returns*: `begin() + size()`.

```
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

5 *Returns*: `const_reverse_iterator(end())`.

```
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

6 *Returns*: `const_reverse_iterator(begin())`.

27.3.3.5 Capacity [string.view.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns*: `size_`.

```
constexpr size_type max_size() const noexcept;
```

2 *Returns*: The largest possible number of char-like objects that can be referred to by a `basic_string_view`.

```
constexpr bool empty() const noexcept;
```

3 *Returns*: `size_ == 0`.

27.3.3.6 Element access [string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 *Hardened preconditions*: `pos < size()` is `true`.

[*Note 1*: This precondition is stronger than the one on `basic_string::operator[]`. — *end note*]

2 *Returns*: `data_[pos]`.

3 *Throws*: Nothing.

```
constexpr const_reference at(size_type pos) const;
```

4 *Returns*: `data_[pos]`.

5 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const_reference front() const;
```

6 *Hardened preconditions*: `empty()` is `false`.

7 *Returns*: `data_[0]`.

8 *Throws*: Nothing.

```
constexpr const_reference back() const;
```

9 *Hardened preconditions*: `empty()` is `false`.

10 *Returns*: `data_[size() - 1]`.

11 *Throws*: Nothing.

```
constexpr const_pointer data() const noexcept;
```

12 *Returns*: `data_`.

13 [*Note 2*: Unlike `basic_string::data()` and *string-literal*s, `data()` can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass `data()` to a function that takes just a `const charT*` and expects a null-terminated string. — *end note*]

27.3.3.7 Modifiers [string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
```

1 *Hardened preconditions*: `n <= size()` is `true`.

2 *Effects*: Equivalent to: `data_ += n; size_ -= n;`

```
constexpr void remove_suffix(size_type n);
```

3 *Hardened preconditions*: `n <= size()` is `true`.

4 *Effects*: Equivalent to: `size_ -= n;`

```
constexpr void swap(basic_string_view& s) noexcept;
```

5 *Effects*: Exchanges the values of `*this` and `s`.

27.3.3.8 String operations [string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 Let `rlen` be the smaller of `n` and `size() - pos`.

2 *Preconditions*: [`s`, `s + rlen`) is a valid range.

3 *Effects*: Equivalent to `traits::copy(s, data() + pos, rlen)`.

4 *Returns*: `rlen`.

5 *Throws*: `out_of_range` if `pos > size()`.

6 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
```

7 Let `rlen` be the smaller of `n` and `size() - pos`.

8 *Effects*: Determines `rlen`, the effective length of the string to reference.

9 *Returns*: `basic_string_view(data() + pos, rlen)`.

10 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

11 Let `rlen` be the smaller of `size()` and `str.size()`.

12 *Effects*: Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

13 *Returns*: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 86.

Table 86 — `compare()` results [tab:string.view.compare]

Condition	Return Value
`size() < str.size()`	`< 0`
`size() == str.size()`	`0`
`size() > str.size()`	`> 0`

14 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                      size_type pos2, size_type n2) const;
```

16 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

17 *Effects*: Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

```
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20 Let `rlen` be the smaller of `size()` and `x.size()`.

21 *Effects*: Equivalent to: `return basic_string_view(data(), rlen) == x;`

```
constexpr bool starts_with(charT x) const noexcept;
```

22 *Effects*: Equivalent to: `return !empty() && traits::eq(front(), x);`

```
constexpr bool starts_with(const charT* x) const;
```

23 *Effects*: Equivalent to: `return starts_with(basic_string_view(x));`

```
constexpr bool ends_with(basic_string_view x) const noexcept;
```

24 Let `rlen` be the smaller of `size()` and `x.size()`.

25 *Effects*: Equivalent to:

```
return basic_string_view(data() + (size() - rlen), rlen) == x;
```

```
constexpr bool ends_with(charT x) const noexcept;
```

26 *Effects*: Equivalent to: `return !empty() && traits::eq(back(), x);`

```
constexpr bool ends_with(const charT* x) const;
```

27 *Effects*: Equivalent to: `return ends_with(basic_string_view(x));`

```
constexpr bool contains(basic_string_view x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

28 *Effects*: Equivalent to: `return find(x) != npos;`

27.3.3.9 Searching [string.view.find]

1 Member functions in this subclause have complexity $\mathscr{O}$(`size() * str.size()`) at worst, although implementations should do better.

2 Let *F* be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(2.1) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view(s), pos);`

(2.2) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view(s, n), pos);`

(2.3) — Each member function of the form

```
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view(addressof(c), 1), pos);`

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

3 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(3.1) — `pos <= xpos`

(3.2) — `xpos + str.size() <= size()`

(3.3) — `traits::eq(data_[xpos + I], str[I])` for all elements `I` of the string referenced by `str`.

4 *Effects*: Determines `xpos`.

5 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(6.1) — `xpos <= pos`

(6.2) — `xpos + str.size() <= size()`

(6.3) — `traits::eq(data_[xpos + I], str[I])` for all elements `I` of the string referenced by `str`.

7 *Effects*: Determines `xpos`.

8 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(9.1) — `pos <= xpos`

(9.2) — `xpos < size()`

(9.3) — `traits::eq(data_[xpos], str[I])` for some element `I` of the string referenced by `str`.

10 *Effects*: Determines `xpos`.

11 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(12.1) — `xpos <= pos`

(12.2) — `xpos < size()`

(12.3) — `traits::eq(data_[xpos], str[I])` for some element `I` of the string referenced by `str`.

13 *Effects*: Determines `xpos`.

14 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(15.1) — `pos <= xpos`

(15.2) — `xpos < size()`

(15.3) — `traits::eq(data_[xpos], str[I])` for no element `I` of the string referenced by `str`.

16 *Effects*: Determines `xpos`.

17 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(18.1) — `xpos <= pos`

(18.2) — `xpos < size()`

(18.3) — `traits::eq(data_[xpos], str[I])` for no element `I` of the string referenced by `str`.

19 *Effects*: Determines `xpos`.

20 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

27.3.4 Non-member comparison functions [string.view.comparison]

```
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
                            type_identity_t<basic_string_view<charT, traits>> rhs) noexcept;
```

1 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class charT, class traits>
  constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
                                  type_identity_t<basic_string_view<charT, traits>> rhs) noexcept;
```

2 Let `R` denote the type `traits::comparison_category` if that *qualified-id* is valid and denotes a type (13.10.3), otherwise `R` is `weak_ordering`.

3 *Mandates*: `R` denotes a comparison category type (17.12.2).

4 *Returns*: `static_cast<R>(lhs.compare(rhs) <=> 0)`.

5 [*Note 1*: The usage of `type_identity_t` as parameter ensures that an object of type `basic_string_view<charT, traits>` can always be compared with an object of a type `T` with an implicit conversion to `basic_string_view<charT, traits>`, and vice versa, as per 12.2.2.3. — *end note*]

27.3.5 Inserters and extractors [string.view.io]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
```

1 *Effects*: Behaves as a formatted output function (31.7.6.3.1) of `os`. Forms a character sequence `seq`, initially consisting of the elements defined by the range [`str.begin()`, `str.end()`). Determines padding for `seq` as described in 31.7.6.3.1. Then inserts `seq` as if by calling `os.rdbuf()->sputn(seq, n)`, where `n` is the larger of `os.width()` and `str.size()`; then calls `os.width(0)`.

2 *Returns*: `os`.

27.3.6 Hash support [string.view.hash]

```
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

1 The specialization is enabled (22.10.19).

[*Note 1*: The hash value of a string view object is equal to the hash value of the corresponding string object (27.4.6). — *end note*]

27.3.7 Suffix for `basic_string_view` literals [string.view.literals]

```
constexpr string_view operator""sv(const char* str, size_t len) noexcept;
```

1 *Returns*: `string_view{str, len}`.

```
constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
```

2 *Returns*: `u8string_view{str, len}`.

```
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
```

3 *Returns*: `u16string_view{str, len}`.

```
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
```

4 *Returns*: `u32string_view{str, len}`.

```
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
```

5 *Returns*: `wstring_view{str, len}`.

27.4 String classes [string.classes]

27.4.1 General [string.classes.general]

1 The header `<string>` defines the `basic_string` class template for manipulating varying-length sequences of char-like objects and five *typedef-name*s, `string`, `u8string`, `u16string`, `u32string`, and `wstring`, that name the specializations `basic_string<char>`, `basic_string<char8_t>`, `basic_string<char16_t>`, `basic_string<char32_t>`, and `basic_string<wchar_t>`, respectively.

27.4.2 Header <string> synopsis [string.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 27.2, character traits
  template<class charT> struct char_traits;                              // freestanding
  template<> struct char_traits<char>;                                   // freestanding
  template<> struct char_traits<char8_t>;                                // freestanding
  template<> struct char_traits<char16_t>;                               // freestanding
  template<> struct char_traits<char32_t>;                               // freestanding
  template<> struct char_traits<wchar_t>;                                // freestanding

```

27.4.3 Class template `basic_string` [basic.string]

27.4.3.1 General [basic.string.general]

1 The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a "string" if the type of the char-like objects that it holds is clear from context. In the rest of 27.4.3, the type of the char-like objects held in a `basic_string` object is designated by `charT`.

2 A specialization of `basic_string` is a contiguous container (23.2.2.2).

3 In all cases, [`data()`, `data() + size()`] is a valid range, `data() + size()` points at an object with value `charT()` (a "null terminator"), and `size() <= capacity()` is `true`.

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_string {
  public:
    // types
    using traits_type            = traits;
    using value_type             = charT;
    using allocator_type         = Allocator;
    using size_type              = typename allocator_traits<Allocator>::size_type;
    using difference_type        = typename allocator_traits<Allocator>::difference_type;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;

    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2

}
```

4 A `size_type` parameter type in a `basic_string` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

5 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

27.4.3.2 General requirements [string.require]

1 If any operation would cause `size()` to exceed `max_size()`, that operation throws an exception object of type `length_error`.

2 If any member function or operator of `basic_string` throws an exception, that function or operator has no other effect on the `basic_string` object.

3 Every object of type `basic_string<charT, traits, Allocator>` uses an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used is obtained as described in 23.2.2.2. In every specialization `basic_string<charT, traits, Allocator>`, the type `traits` shall meet the character traits requirements (27.2).

[*Note 1*: Every specialization `basic_string<charT, traits, Allocator>` is an allocator-aware container (23.2.2.5), but does not use the allocator's `construct` and `destroy` member functions (23.2.1). The program is ill-formed if `Allocator::value_type` is not the same type as `charT`. — *end note*]

[*Note 2*: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — *end note*]

4 References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:

(4.1) — Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.[213]

(4.2) — Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

213) For example, as an argument to non-member functions `swap()` (27.4.4.3), `operator>>()` (27.4.4.4), and `getline()` (27.4.4.4), or as an argument to `basic_string::swap()`.

27.4.3.3 Constructors and assignment operators [string.cons]

```
constexpr explicit basic_string(const Allocator& a) noexcept;
```

1 *Postconditions*: `size()` is equal to `0`.

```
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

2 *Effects*: Constructs an object whose value is that of `str` prior to this call.

3 *Remarks*: In the second form, `str` is left in a valid but unspecified state.

```
constexpr basic_string(const basic_string& str, size_type pos,
                       const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n,
                       const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos,
                       const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos, size_type n,
                       const Allocator& a = Allocator());
```

4 Let

(4.1) — `s` be the value of `str` prior to this call and

(4.2) — `rlen` be `pos + min(n, s.size() - pos)` for the overloads with parameter `n`, and `s.size()` otherwise.

5 *Effects*: Constructs an object whose initial value is the range [`s.data() + pos`, `s.data() + rlen`).

6 *Throws*: `out_of_range` if `pos > s.size()`.

7 *Remarks*: For the overloads with a `basic_string&&` parameter, `str` is left in a valid but unspecified state.

8 *Recommended practice*: For the overloads with a `basic_string&&` parameter, implementations should avoid allocation if `s.get_allocator() == a` is `true`.

```
template<class T>
  constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as:

```
basic_string(sv.substr(pos, n), a);
```

```
template<class T>
  constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

11 *Constraints*:

(11.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(11.2) — `is_convertible_v<const T&, const charT*>` is `false`.

12 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

```
constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

13 *Preconditions*: [`s`, `s + n`) is a valid range.

14 *Effects*: Constructs an object whose initial value is the range [`s`, `s + n`).

15 *Postconditions*: `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to `0`.

```
constexpr basic_string(const charT* s, const Allocator& a = Allocator());
```

16 *Constraints*: `Allocator` is a type that qualifies as an allocator (23.2.2.2).

[*Note 1*: This affects class template argument deduction. — *end note*]

17 *Effects*: Equivalent to: `basic_string(s, traits::length(s), a)`.

```
constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

18 *Constraints*: `Allocator` is a type that qualifies as an allocator (23.2.2.2).

[*Note 2*: This affects class template argument deduction. — *end note*]

19 *Effects*: Constructs an object whose value consists of `n` copies of `c`.

```
template<class InputIterator>
  constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
```

20 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

21 *Effects*: Constructs a string from the values in the range [`begin`, `end`), as specified in 23.2.4.

```
template<container-compatible-range<charT> R>
  constexpr basic_string(from_range_t, R&& rg, const Allocator& = Allocator());
```

22 *Effects*: Constructs a string from the values in the range `rg`, as specified in 23.2.4.

```
constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

23 *Effects*: Equivalent to `basic_string(il.begin(), il.end(), a)`.

```
constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);
```

24 *Effects*: Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

25 *Throws*: The second form throws nothing if `alloc == str.get_allocator()`.

```
template<class InputIterator,
         class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
  basic_string(InputIterator, InputIterator, Allocator = Allocator())
    -> basic_string<typename iterator_traits<InputIterator>::value_type,
                    char_traits<typename iterator_traits<InputIterator>::value_type>,
                    Allocator>;
```

26 *Constraints*: `InputIterator` is a type that qualifies as an input iterator, and `Allocator` is a type that qualifies as an allocator (23.2.2.2).

```
template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  basic_string(basic_string_view<charT, traits>,
               typename see below::size_type, typename see below::size_type,
               const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;
```

27 *Constraints*: `Allocator` is a type that qualifies as an allocator (23.2.2.2).

```
constexpr basic_string& operator=(const basic_string& str);
```

28 *Effects*: If `*this` and `str` are the same object, has no effect. Otherwise, replaces the value of `*this` with a copy of `str`.

29 *Returns*: `*this`.

```
constexpr basic_string& operator=(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

30 *Effects*: Move assigns as a sequence container (23.2.4), except that iterators, pointers and references may be invalidated.

31 *Returns*: `*this`.

```
template<class T>
  constexpr basic_string& operator=(const T& t);
```

32 *Constraints*:

(32.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(32.2) — `is_convertible_v<const T&, const charT*>` is `false`.

33 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv);
```

```
constexpr basic_string& operator=(const charT* s);
```

34 *Effects*: Equivalent to: `return *this = basic_string_view<charT, traits>(s);`

```
constexpr basic_string& operator=(charT c);
```

35 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(addressof(c), 1);
```

```
constexpr basic_string& operator=(initializer_list<charT> il);
```

36 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(il.begin(), il.size());
```

27.4.3.4 Iterator support [string.iterators]

```
constexpr iterator       begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

1 *Returns*: An iterator referring to the first character in the string.

```
constexpr iterator       end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

2 *Returns*: An iterator which is the past-the-end value.

```
constexpr reverse_iterator       rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

3 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(end())`.

```
constexpr reverse_iterator       rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

4 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(begin())`.

27.4.3.5 Capacity [string.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns*: A count of the number of char-like objects currently in the string.

2 *Complexity*: Constant time.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns*: The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity*: Constant time.

```
constexpr void resize(size_type n, charT c);
```

5 *Effects*: Alters the value of `*this` as follows:

(5.1) — If `n <= size()`, erases the last `size() - n` elements.

(5.2) — If `n > size()`, appends `n - size()` copies of `c`.

`constexpr void resize(size_type n);`

6 *Effects*: Equivalent to `resize(n, charT())`.

`template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);`

7 Let

(7.1) — `o = size()` before the call to `resize_and_overwrite`.

(7.2) — `k` be `min(o, n)`.

(7.3) — `p` be a value of type `charT*` or `charT* const`, such that the range [`p`, `p + n`] is valid and `this->compare(0, k, p, k) == 0` is `true` before the call. The values in the range [`p + k`, `p + n`] may be indeterminate (6.7.5).

(7.4) — `m` be a value of type `size_type` or `const size_type` equal to `n`.

(7.5) — *`OP`* be the expression `std::move(op)(p, m)`.

(7.6) — `r` = *`OP`*.

8 *Mandates*: *`OP`* has an integer-like type (24.3.4.4).

9 *Preconditions*:

(9.1) — *`OP`* does not throw an exception or modify `p` or `m`.

(9.2) — `r` $\geq$ 0.

(9.3) — `r` $\leq$ `m`.

(9.4) — After evaluating *`OP`* there are no indeterminate values in the range [`p`, `p + r`).

10 *Effects*: Evaluates *`OP`*, replaces the contents of `*this` with [`p`, `p + r`), and invalidates all pointers and references to the range [`p`, `p + n`].

11 *Recommended practice*: Implementations should avoid unnecessary copies and allocations by, for example, making `p` a pointer into internal storage and by restoring `*(p + r)` to `charT()` after evaluating *`OP`*.

`constexpr size_type capacity() const noexcept;`

12 *Returns*: The size of the allocated storage in the string.

13 *Complexity*: Constant time.

`constexpr void reserve(size_type res_arg);`

14 *Effects*: A directive that informs a `basic_string` of a planned change in size, so that the storage allocation can be managed accordingly. Following a call to `reserve`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve`.

15 *Throws*: `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits <Allocator>::allocate`.

`constexpr void shrink_to_fit();`

16 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

17 *Complexity*: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

18 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[*Note 2*: If no reallocation happens, they remain valid. — *end note*]

`constexpr void clear() noexcept;`

19 *Effects*: Equivalent to: `erase(begin(), end());`

```
constexpr bool empty() const noexcept;
```

20 *Effects*: Equivalent to: `return size() == 0;`

27.4.3.6 Element access [string.access]

```
constexpr const_reference operator[](size_type pos) const;
constexpr reference       operator[](size_type pos);
```

1 *Hardened preconditions*: `pos <= size()` is `true`.

2 *Returns*: `*(begin() + pos)` if `pos < size()`. Otherwise, returns a reference to an object of type `charT` with value `charT()`, where modifying the object to any value other than `charT()` leads to undefined behavior.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

```
constexpr const_reference at(size_type pos) const;
constexpr reference       at(size_type pos);
```

5 *Returns*: `operator[](pos)`.

6 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const charT& front() const;
constexpr charT& front();
```

7 *Hardened preconditions*: `empty()` is `false`.

8 *Effects*: Equivalent to: `return operator[](0);`

```
constexpr const charT& back() const;
constexpr charT& back();
```

9 *Hardened preconditions*: `empty()` is `false`.

10 *Effects*: Equivalent to: `return operator[](size() - 1);`

27.4.3.7 Modifiers [string.modifiers]

27.4.3.7.1 `basic_string::operator+=` [string.op.append]

```
constexpr basic_string& operator+=(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str);`

```
template<class T>
  constexpr basic_string& operator+=(const T& t);
```

2 *Constraints*:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(2.2) — `is_convertible_v<const T&, const charT*>` is `false`.

3 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv);
```

```
constexpr basic_string& operator+=(const charT* s);
```

4 *Effects*: Equivalent to: `return append(s);`

```
constexpr basic_string& operator+=(charT c);
```

5 *Effects*: Equivalent to: `return append(size_type{1}, c);`

```
constexpr basic_string& operator+=(initializer_list<charT> il);
```

6 *Effects*: Equivalent to: `return append(il);`

27.4.3.7.2 `basic_string::append` [string.append]

```
constexpr basic_string& append(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str.data(), str.size());`

```
constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& append(const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

```
constexpr basic_string& append(const charT* s, size_type n);
```

7 *Preconditions*: [`s`, `s + n`) is a valid range.

8 *Effects*: Appends a copy of the range [`s`, `s + n`) to the string.

9 *Returns*: `*this`.

```
constexpr basic_string& append(const charT* s);
```

10 *Effects*: Equivalent to: `return append(s, traits::length(s));`

```
constexpr basic_string& append(size_type n, charT c);
```

11 *Effects*: Appends `n` copies of `c` to the string.

12 *Returns*: `*this`.

```
template<class InputIterator>
  constexpr basic_string& append(InputIterator first, InputIterator last);
```

13 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

14 *Effects*: Equivalent to: `return append(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& append_range(R&& rg);
```

15 *Effects*: Equivalent to: `return append(basic_string(from_range, std::forward<R>(rg), get_-allocator()));`

```
constexpr basic_string& append(initializer_list<charT> il);
```

16 *Effects*: Equivalent to: `return append(il.begin(), il.size());`

```
constexpr void push_back(charT c);
```

17 *Effects*: Equivalent to `append(size_type{1}, c)`.

27.4.3.7.3 basic_string::assign [string.assign]

```
constexpr basic_string& assign(const basic_string& str);
```

1 *Effects*: Equivalent to: `return *this = str;`

```
constexpr basic_string& assign(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

2 *Effects*: Equivalent to: `return *this = std::move(str);`

```
constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
```

3 *Effects*: Equivalent to:

```
return assign(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& assign(const T& t);
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.substr(pos, n));
```

```
constexpr basic_string& assign(const charT* s, size_type n);
```

8 *Preconditions*: [`s`, `s + n`) is a valid range.

9 *Effects*: Replaces the string controlled by `*this` with a copy of the range [`s`, `s + n`).

10 *Returns*: `*this`.

```
constexpr basic_string& assign(const charT* s);
```

11 *Effects*: Equivalent to: `return assign(s, traits::length(s));`

```
constexpr basic_string& assign(initializer_list<charT> il);
```

12 *Effects*: Equivalent to: `return assign(il.begin(), il.size());`

```
constexpr basic_string& assign(size_type n, charT c);
```

13 *Effects*: Equivalent to:

```
clear();
resize(n, c);
return *this;
```

```
template<class InputIterator>
  constexpr basic_string& assign(InputIterator first, InputIterator last);
```

14 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

15 *Effects*: Equivalent to: `return assign(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& assign_range(R&& rg);
```

16 *Effects*: Equivalent to: `return assign(basic_string(from_range, std::forward<R>(rg), get_-allocator()));`

27.4.3.7.4 `basic_string::insert` [string.insert]

```
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

1 *Effects*: Equivalent to: `return insert(pos, str.data(), str.size());`

```
constexpr basic_string& insert(size_type pos1, const basic_string& str,
                               size_type pos2, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

```
template<class T>
  constexpr basic_string& insert(size_type pos, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& insert(size_type pos1, const T& t,
                                 size_type pos2, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));
```

```
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

7 *Preconditions*: [`s`, `s + n`) is a valid range.

8 *Effects*: Inserts a copy of the range [`s`, `s + n`) immediately before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos > size()`,

(10.2) — `length_error` if `n > max_size() - size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& insert(size_type pos, const charT* s);
```

11 *Effects*: Equivalent to: `return insert(pos, s, traits::length(s));`

```
constexpr basic_string& insert(size_type pos, size_type n, charT c);
```

12 *Effects*: Inserts `n` copies of `c` before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

13 *Returns*: `*this`.

14 *Throws*:

(14.1) — `out_of_range` if `pos > size()`, (14.2) — `length_error` if `n > max_size() - size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr iterator insert(const_iterator p, charT c);
```

15 *Preconditions*: `p` is a valid iterator on `*this`.

16 *Effects*: Inserts a copy of `c` at the position `p`.

17 *Returns*: An iterator which refers to the inserted character.

```
constexpr iterator insert(const_iterator p, size_type n, charT c);
```

18 *Preconditions*: `p` is a valid iterator on `*this`.

19 *Effects*: Inserts `n` copies of `c` at the position `p`.

20 *Returns*: An iterator which refers to the first inserted character, or `p` if `n == 0`.

```
template<class InputIterator>
  constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);
```

21 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

22 *Preconditions*: `p` is a valid iterator on `*this`.

23 *Effects*: Equivalent to `insert(p - begin(), basic_string(first, last, get_allocator()))`.

24 *Returns*: An iterator which refers to the first inserted character, or `p` if `first == last`.

```
template<container-compatible-range<charT> R>
  constexpr iterator insert_range(const_iterator p, R&& rg);
```

25 *Preconditions*: `p` is a valid iterator on `*this`.

26 *Effects*: Equivalent to `insert(p - begin(), basic_string(from_range, std::forward<R>(rg), get_allocator()))`.

27 *Returns*: An iterator which refers to the first inserted character, or `p` if `rg` is empty.

```
constexpr iterator insert(const_iterator p, initializer_list<charT> il);
```

28 *Effects*: Equivalent to: `return insert(p, il.begin(), il.end());`

27.4.3.7.5 `basic_string::erase` [string.erase]

```
constexpr basic_string& erase(size_type pos = 0, size_type n = npos);
```

1 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n` and `size() - pos`. Removes the characters in the range [`begin() + pos`, `begin() + pos + xlen`).

2 *Returns*: `*this`.

3 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr iterator erase(const_iterator p);
```

4 *Preconditions*: `p` is a valid dereferenceable iterator on `*this`.

5 *Effects*: Removes the character referred to by `p`.

6 *Returns*: An iterator which points to the element immediately following `p` prior to the element being erased. If no such element exists, `end()` is returned.

7 *Throws*: Nothing.

```
constexpr iterator erase(const_iterator first, const_iterator last);
```

8 *Preconditions*: `first` and `last` are valid iterators on `*this`. [`first`, `last`) is a valid range.

9 *Effects*: Removes the characters in the range [`first`, `last`).

10 *Returns*: An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.

11 *Throws*: Nothing.

```
constexpr void pop_back();
```

12 *Hardened preconditions*: `empty()` is `false`.

13 *Effects*: Equivalent to `erase(end() - 1)`.

14 *Throws*: Nothing.

27.4.3.7.6 `basic_string::replace` [string.replace]

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

1 *Effects*: Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                                size_type pos2, size_type n2 = npos);
```

2 *Effects*: Equivalent to:

```
return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
                                  size_type pos2, size_type n2 = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));
```

```
constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

7 *Preconditions*: [`s`, `s + n2`) is a valid range.

8 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range [`begin() + pos1`, `begin() + pos1 + xlen`) with a copy of the range [`s`, `s + n2`).

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos1 > size()`,

(10.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
```

11 *Effects*: Equivalent to: `return replace(pos, n, s, traits::length(s));`

```
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
```

12 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range [`begin() + pos1`, `begin() + pos1 + xlen`) with `n2` copies of `c`.

13 *Returns*: `*this`.

14 *Throws*:

(14.1) — `out_of_range` if `pos1 > size()`,

(14.2) — `length_error` if the length of the resulting string would exceed`max_size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

15 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(str));`

```
template<class T>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
```

16 *Constraints*:

(16.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(16.2) — `is_convertible_v<const T&, const charT*>` is `false`.

17 *Preconditions*: [`begin()`, `i1`) and [`i1`, `i2`) are valid ranges.

18 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

19 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

20 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);
```

21 *Preconditions*: [`begin()`, `i1`) and [`i1`, `i2`) are valid ranges.

22 *Effects*: Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2,
                                  InputIterator j1, InputIterator j2);
```

23 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

24 *Effects*: Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);
```

25 *Effects*: Equivalent to:

```
return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);
```

26 *Effects*: Equivalent to: `return replace(i1, i2, il.begin(), il.size());`

27.4.3.7.7 `basic_string::copy` [string.copy]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).copy(s, n, pos);`

[*Note 1*: This does not terminate `s` with a null object. — *end note*]

27.4.3.7.8 `basic_string::swap` [string.swap]

```
constexpr void swap(basic_string& s)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions*: `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true` or `get_allocator() == s.get_allocator()`.

2 *Postconditions*: `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

27.4.3.8 String operations [string.ops]

27.4.3.8.1 Accessors [string.accessors]

```
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
```

1 *Returns*: A pointer `p` such that `p + i == addressof(operator[](i))` for each `i` in [`0`, `size()`].

2 *Complexity*: Constant time.

3 *Remarks*: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

```
constexpr charT* data() noexcept;
```

4 *Returns*: A pointer `p` such that `p + i == addressof(operator[](i))` for each `i` in [`0`, `size()`].

5 *Complexity*: Constant time.

6 *Remarks*: The program shall not modify the value stored at `p + size()` to any value other than `charT()`; otherwise, the behavior is undefined.

```
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

7 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(data(), size());`

```
constexpr allocator_type get_allocator() const noexcept;
```

8 *Returns*: A copy of the `Allocator` object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

27.4.3.8.2 Searching [string.find]

1 Let *F* be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(1.1) — Each member function of the form

```
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(str), pos);`

(1.2) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s), pos);`

(1.3) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s, n), pos);`

(1.4) — Each member function of the form

```
constexpr size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
  constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
  constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
  constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
```

```
template<class T>
  constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

2 *Constraints*:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(2.2) — `is_convertible_v<const T&, const charT*>` is `false`.

3 *Effects*: Let *G* be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

4 *Remarks*: The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

27.4.3.8.3 `basic_string::substr` [string.substr]

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const &;
```

1 *Effects*: Equivalent to: `return basic_string(*this, pos, n);`

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) &&;
```

2 *Effects*: Equivalent to: `return basic_string(std::move(*this), pos, n);`

27.4.3.8.4 `basic_string::compare` [string.compare]

```
template<class T>
  constexpr int compare(const T& t) const noexcept(see below);
```

1 *Constraints*:

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(1.2) — `is_convertible_v<const T&, const charT*>` is `false`.

2 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks*: The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t,
                        size_type pos2, size_type n2 = npos) const;
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

```
constexpr int compare(const basic_string& str) const noexcept;
```

8 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 *Effects*: Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
                      size_type pos2, size_type n2 = npos) const;
```

10 *Effects*: Equivalent to:

```
return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

```
constexpr int compare(const charT* s) const;
```

11 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s) const;
```

12 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
```

13 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s, n2));`

27.4.3.8.5 `basic_string::starts_with` [string.starts.with]

```
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).starts_with(x);
```

27.4.3.8.6 `basic_string::ends_with` [string.ends.with]

```
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).ends_with(x);
```

27.4.3.8.7 `basic_string::contains` [string.contains]

```
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).contains(x);
```

27.4.4 Non-member functions [string.nonmembers]

27.4.4.1 `operator+` [string.op.plus]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

1 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);
```

2 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

3 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

[*Note 1*: If `lhs` and `rhs` have equal allocators, the implementation can move from either. — *end note*]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);
```

4 *Effects*: Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

5 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
```

6 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(r.begin(), lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);
```

7 *Effects*: Equivalent to:

```
rhs.insert(rhs.begin(), lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);
```

8 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);
```

9 *Effects*: Equivalent to:

```
lhs.push_back(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              type_identity_t<basic_string_view<charT, traits>> rhs);
```

10 Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              type_identity_t<basic_string_view<charT, traits>> rhs);
```

11 Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(type_identity_t<basic_string_view<charT, traits>> lhs,
              const basic_string<charT, traits, Allocator>& rhs);
```

12 Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(type_identity_t<basic_string_view<charT, traits>> lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

13 Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

14 [*Note 2*: Using a specialization of `type_identity_t` as a parameter type ensures that an object of type `basic_string<charT, traits, Allocator>` can be concatenated with an object of a type `T` having an implicit conversion to `basic_string_view<charT, traits>` (12.2.2.3). — *end note*]

27.4.4.2 Non-member comparison operator functions [string.cmp]

```
template<class charT, class traits, class Allocator>
  constexpr bool
    operator==(const basic_string<charT, traits, Allocator>& lhs,
               const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
  constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                            const charT* rhs);

template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                  const basic_string<charT, traits, Allocator>& rhs) noexcept;
```

```
template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                  const charT* rhs);
```

1 *Effects*: Let *op* be the operator. Equivalent to:

```
return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

27.4.4.3 `swap` [string.special]

```
template<class charT, class traits, class Allocator>
  constexpr void
    swap(basic_string<charT, traits, Allocator>& lhs,
         basic_string<charT, traits, Allocator>& rhs)
      noexcept(noexcept(lhs.swap(rhs)));
```

1 *Effects*: Equivalent to `lhs.swap(rhs)`.

27.4.4.4 Inserters and extractors [string.io]

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);
```

1 *Effects*: Behaves as a formatted input function (31.7.5.3.1). After constructing a `sentry` object, if the `sentry` object returns `true` when converted to a value of type `bool`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)`. If `is.width()` is greater than zero, the maximum number `n` of characters appended is `is.width()`; otherwise `n` is `str.max_size()`. Characters are extracted and appended until any of the following occurs:

(1.1) — *n* characters are stored;

(1.2) — end-of-file occurs on the input sequence;

(1.3) — `isspace(c, is.getloc())` is `true` for the next available input character *c*.

2 After the last character (if any) is extracted, `is.width(0)` is called and the `sentry` object is destroyed.

3 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

4 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const basic_string<charT, traits, Allocator>& str);
```

5 *Effects*: Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
```

6 *Effects*: Behaves as an unformatted input function (31.7.5.4), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a `sentry` object, if the `sentry` object returns `true` when converted to a value of type `bool`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

(6.1) — end-of-file occurs on the input sequence;

(6.2) — `traits::eq(c, delim)` for the next available input character *c* (in which case, *c* is extracted but not appended);

(6.3) — `str.max_size()` characters are stored (in which case, `ios_base::failbit` is set in the input function's local error state).

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the `sentry` object is destroyed.

8 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

9 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str);
```

10 *Returns*: `getline(is, str, is.widen('\n'))`.

27.4.4.5 Erasure [string.erasure]

```
template<class charT, class traits, class Allocator, class U = charT>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class charT, class traits, class Allocator, class Predicate>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

27.4.5 Numeric conversions [string.conversions]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects*: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_-str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns*: The converted result.

3 *Throws*: `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
```

```
long double stold(const string& str, size_t* idx = nullptr);
```

4 *Effects*: These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

5 *Returns*: The converted result.

6 *Throws*: `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

7 *Returns*: `format("{}", val)`.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

8 *Effects*: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_-str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

9 *Returns*: The converted result.

10 *Throws*: `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion can be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

11 *Effects*: These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

12 *Returns*: The converted result.

13 *Throws*: `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion can be performed. Throws `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

14 *Returns*: `format(L"{}", val)`.

27.4.6 Hash support [basic.string.hash]

```
template<class A> struct hash<basic_string<char, char_traits<char>, A>>;
template<class A> struct hash<basic_string<char8_t, char_traits<char8_t>, A>>;
template<class A> struct hash<basic_string<char16_t, char_traits<char16_t>, A>>;
template<class A> struct hash<basic_string<char32_t, char_traits<char32_t>, A>>;
template<class A> struct hash<basic_string<wchar_t, char_traits<wchar_t>, A>>;
```

1 If `S` is one of these string types, `SV` is the corresponding string view type, and `s` is an object of type `S`, then `hash<S>()(s) == hash<SV>()(SV(s))`.

27.4.7 Suffix for `basic_string` literals [basic.string.literals]

```
constexpr string operator""s(const char* str, size_t len);
```

1 *Returns*: `string{str, len}`.

```
constexpr u8string operator""s(const char8_t* str, size_t len);
```

2 *Returns*: `u8string{str, len}`.

```
constexpr u16string operator""s(const char16_t* str, size_t len);
```

3 *Returns*: `u16string{str, len}`.

```
constexpr u32string operator""s(const char32_t* str, size_t len);
```

4 *Returns*: `u32string{str, len}`.

```
constexpr wstring operator""s(const wchar_t* str, size_t len);
```

5 *Returns*: `wstring{str, len}`.

6 [*Note 1*: The same suffix `s` is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — *end note*]

27.5 Null-terminated sequence utilities [c.strings]

27.5.1 Header `<cstring>` synopsis [cstring.syn]

```
namespace std {
  using size_t = see 17.2.4;                                      // freestanding

  void* memcpy(void* s1, const void* s2, size_t n);               // freestanding
  void* memmove(void* s1, const void* s2, size_t n);              // freestanding
  char* strcpy(char* s1, const char* s2);                         // freestanding
  char* strncpy(char* s1, const char* s2, size_t n);              // freestanding
  char* strcat(char* s1, const char* s2);                         // freestanding
  char* strncat(char* s1, const char* s2, size_t n);              // freestanding
  int memcmp(const void* s1, const void* s2, size_t n);           // freestanding
  int strcmp(const char* s1, const char* s2);                     // freestanding
  int strcoll(const char* s1, const char* s2);
  int strncmp(const char* s1, const char* s2, size_t n);          // freestanding
  size_t strxfrm(char* s1, const char* s2, size_t n);
  const void* memchr(const void* s, int c, size_t n);             // freestanding; see 16.2
  void* memchr(void* s, int c, size_t n);                         // freestanding; see 16.2
  const char* strchr(const char* s, int c);                       // freestanding; see 16.2
  char* strchr(char* s, int c);                                   // freestanding; see 16.2
  size_t strcspn(const char* s1, const char* s2);                 // freestanding
  const char* strpbrk(const char* s1, const char* s2);            // freestanding; see 16.2
  char* strpbrk(char* s1, const char* s2);                        // freestanding; see 16.2
  const char* strrchr(const char* s, int c);                      // freestanding; see 16.2
  char* strrchr(char* s, int c);                                  // freestanding; see 16.2
  size_t strspn(const char* s1, const char* s2);                  // freestanding
  const char* strstr(const char* s1, const char* s2);             // freestanding; see 16.2
  char* strstr(char* s1, const char* s2);                         // freestanding; see 16.2
  char* strtok(char* s1, const char* s2);
```

```
    void* memset(void* s, int c, size_t n);                                  // freestanding
    char* strerror(int errnum);
    size_t strlen(const char* s);                                            // freestanding
  }

  #define NULL see 17.2.3                                                    // freestanding
```

1 The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`.

2 The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10).

3 The functions `memcpy` and `memmove` are signal-safe (17.14.5). Each of these functions implicitly creates objects (6.7.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination. Each of these functions returns a pointer to a suitable created object, if any, otherwise the value of the first parameter.

4 [*Note 1*: The functions `strchr`, `strpbrk`, `strrchr`, `strstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

28 Text processing library [text]

28.1 General [text.general]

This Clause describes components for dealing with text. These components are summarized in Table 87.

Table 87 — Text library summary [tab:text.summary]

	Subclause	Header
28.2	Primitive numeric conversions	`<charconv>`
28.3	Localization library	`<locale>`, `<clocale>`
28.5	Formatting	`<format>`
28.4	Text encodings identification	`<text_encoding>`
28.6	Regular expressions library	`<regex>`
28.7	Null-terminated sequence utilities	`<cctype>`, `<cstdlib>`, `<cuchar>`, `<cwchar>`, `<cwctype>`

28.2 Primitive numeric conversions [charconv]

28.2.1 Header `<charconv>` synopsis [charconv.syn]

1 When a function is specified with a type placeholder of *`integer-type`*, the implementation provides overloads for `char` and all cv-unqualified signed and unsigned integer types in lieu of *`integer-type`*. When a function is specified with a type placeholder of *`floating-point-type`*, the implementation provides overloads for all cv-unqualified floating-point types (6.8.2) in lieu of *`floating-point-type`*.

```
namespace std {
  // floating-point format for primitive numerical conversion
  enum class chars_format {
    scientific = unspecified,
    fixed = unspecified,
    hex = unspecified,
    general = fixed | scientific
  };

  // 28.2.2, primitive numerical output conversion
  struct to_chars_result {                                             // freestanding
    char* ptr;
    errc ec;
    friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    constexpr explicit operator bool() const noexcept { return ec == errc{}; }
  };

  constexpr to_chars_result to_chars(char* first, char* last,          // freestanding
                                     integer-type value, int base = 10);
  to_chars_result to_chars(char* first, char* last,                    // freestanding
                           bool value, int base = 10) = delete;

  to_chars_result to_chars(char* first, char* last,                    // freestanding-deleted
                           floating-point-type value);
  to_chars_result to_chars(char* first, char* last,                    // freestanding-deleted
                           floating-point-type value, chars_format fmt);
  to_chars_result to_chars(char* first, char* last,                    // freestanding-deleted
                           floating-point-type value, chars_format fmt, int precision);

  // 28.2.3, primitive numerical input conversion
  struct from_chars_result {                                           // freestanding
    const char* ptr;
    errc ec;
    friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
    constexpr explicit operator bool() const noexcept { return ec == errc{}; }
  };

  constexpr from_chars_result from_chars(const char* first, const char* last,    // freestanding
                                         integer-type& value, int base = 10);

  from_chars_result from_chars(const char* first, const char* last,     // freestanding-deleted
                               floating-point-type& value,
                               chars_format fmt = chars_format::general);
}
```

2 The type `chars_format` is a bitmask type (16.3.3.3.3) with elements `scientific`, `fixed`, and `hex`.

3 The types `to_chars_result` and `from_chars_result` have the data members and special members specified above. They have no base classes or members other than those specified.

28.2.2 Primitive numeric output conversion [charconv.to.chars]

1 All functions named `to_chars` convert `value` into a character string by successively filling the range [`first`, `last`), where [`first`, `last`) is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range [`first`, `last`) are unspecified.

2 The functions that take a floating-point `value` but not a `precision` parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly.

[*Note 1*: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — *end note*]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading `"0x"` in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```
constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
```

4 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

5 *Effects*: The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `'-'`.

6 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value);
```

7 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

8 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
```

9 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

10 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale.

11 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value,
                         chars_format fmt, int precision);
```

12 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

13 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale with the given precision.

14 *Throws*: Nothing.

SEE ALSO: ISO/IEC 9899:2018, 7.21.6.1

28.2.3 Primitive numeric input conversion [charconv.from.chars]

1 All functions named `from_chars` analyze the string [`first`, `last`) for a pattern, where [`first`, `last`) is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`.

[*Note 1*: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — *end note*]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (17.3.4), and the member `ec` is value-initialized.

```
constexpr from_chars_result from_chars(const char* first, const char* last,
                                       integer-type& value, int base = 10);
```

2 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

3 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale for the given nonzero base, as described for `strtol`, except that no `"0x"` or `"0X"` prefix shall appear if the value of `base` is 16, and except that `'-'` is the only sign that may appear, and only if `value` has a signed type.

4 *Throws*: Nothing.

```
from_chars_result from_chars(const char* first, const char* last, floating-point-type& value,
                             chars_format fmt = chars_format::general);
```

5 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

6 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale, as described for `strtod`, except that

(6.1) — the sign `'+'` may only appear in the exponent part;

(6.2) — if `fmt` has `chars_format::scientific` set but not `chars_format::fixed`, the otherwise optional exponent part shall appear;

(6.3) — if `fmt` has `chars_format::fixed` set but not `chars_format::scientific`, the optional exponent part shall not appear; and

(6.4) — if `fmt` is `chars_format::hex`, the prefix `"0x"` or `"0X"` is assumed.

[*Example 1*: The string `0x123` is parsed to have the value `0` with remaining characters `x123`. — *end example*]

In any case, the resulting `value` is one of at most two floating-point values closest to the value of the string matching the pattern.

7 *Throws*: Nothing.

28.3 Localization library [localization]

28.3.1 General [localization.general]

1 Subclause 28.3 describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

2 The following subclauses describe components for locales themselves, the standard facets, and facilities from the C library, as summarized in Table 88.

Table 88 — Localization library summary [tab:localization.summary]

	Subclause	Header
28.3.3	Locales	`<locale>`
28.3.4	Standard `locale` categories	
28.3.5	C library locales	`<clocale>`

28.3.2 Header `<locale>` synopsis [locale.syn]

```
namespace std {
  // 28.3.3.1, locale
  class locale;
  template<class Facet> const Facet& use_facet(const locale&);
  template<class Facet> bool         has_facet(const locale&) noexcept;

  // 28.3.3.3, convenience interfaces
  template<class charT> bool isspace (charT c, const locale& loc);
  template<class charT> bool isprint (charT c, const locale& loc);
  template<class charT> bool iscntrl (charT c, const locale& loc);
  template<class charT> bool isupper (charT c, const locale& loc);
  template<class charT> bool islower (charT c, const locale& loc);
  template<class charT> bool isalpha (charT c, const locale& loc);
  template<class charT> bool isdigit (charT c, const locale& loc);
  template<class charT> bool ispunct (charT c, const locale& loc);
  template<class charT> bool isxdigit(charT c, const locale& loc);
  template<class charT> bool isalnum (charT c, const locale& loc);
  template<class charT> bool isgraph (charT c, const locale& loc);
  template<class charT> bool isblank (charT c, const locale& loc);
  template<class charT> charT toupper(charT c, const locale& loc);
  template<class charT> charT tolower(charT c, const locale& loc);

  // 28.3.4.2, ctype
  class ctype_base;
  template<class charT> class ctype;
  template<>            class ctype<char>;      // specialization
  template<class charT> class ctype_byname;

    class time_get_byname;
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put;
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname;

  // 28.3.4.7, money
  class money_base;
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get;
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put;
  template<class charT, bool Intl = false>
    class moneypunct;
  template<class charT, bool Intl = false>
    class moneypunct_byname;

  // 28.3.4.8, message retrieval
  class messages_base;
  template<class charT> class messages;
  template<class charT> class messages_byname;
}
```

1 The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.[214]

28.3.3 Locales [locales]

28.3.3.1 Class `locale` [locale]

28.3.3.1.1 General [locale.general]

```
namespace std {
  class locale {
  public:
    // 28.3.3.1.2, types
    // 28.3.3.1.2.2, class locale::facet
    class facet;
    // 28.3.3.1.2.3, class locale::id
    class id;
    // 28.3.3.1.2.1, type locale::category
    using category = int;
    static const category    // values assigned here are for exposition only
      none     = 0,
      collate  = 0x010, ctype    = 0x020,
      monetary = 0x040, numeric  = 0x080,
      time     = 0x100, messages = 0x200,
      all = collate | ctype | monetary | numeric | time | messages;

    // 28.3.3.1.3, construct/copy/destroy
    locale() noexcept;
    locale(const locale& other) noexcept;
    explicit locale(const char* std_name);
    explicit locale(const string& std_name);
    locale(const locale& other, const char* std_name, category);
    locale(const locale& other, const string& std_name, category);
    template<class Facet> locale(const locale& other, Facet* f);
    locale(const locale& other, const locale& one, category);
    ~locale();                    // not virtual
    const locale& operator=(const locale& other) noexcept;

    // 28.3.3.1.4, locale operations
    template<class Facet> locale combine(const locale& other) const;
    string name() const;
    text_encoding encoding() const;

    bool operator==(const locale& other) const;
```

214) In this subclause, the type name `tm` is an incomplete type that is defined in `<ctime>` (30.15).

```
    template<class charT, class traits, class Allocator>
      bool operator()(const basic_string<charT, traits, Allocator>& s1,
                      const basic_string<charT, traits, Allocator>& s2) const;

    // 28.3.3.1.6, global locale objects
    static       locale  global(const locale&);
    static const locale& classic();
  };
}
```

1 Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.

2 Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.

3 [*Example 1*: An iostream `operator<<` can be implemented as:[215]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
  typename basic_ostream<charT, traits>::sentry cerberos(s);
  if (cerberos) {
    tm tmbuf; d.extract(tmbuf);
    bool failed =
      use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(
        s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
    if (failed)
      s.setstate(s.badbit);      // can throw
  }
  return s;
}
```

— *end example*]

4 In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.

5 [*Note 1*: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

(5.1) — A member operator template

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.5.3).)

— *end note*]

6 Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

8 A `locale` constructed from a name string (such as `"POSIX"`), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string `"*"`.

9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

215) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

28.3.3.1.2 Types [locale.types]

28.3.3.1.2.1 Type `locale::category` [locale.category]

```
using category = int;
```

1 *Valid* `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 89.

Table 89 — Locale category facets [tab:locale.category.facets]

Category	Includes facets
collate	`collate<char>`, `collate<wchar_t>`

ctype	`ctype<char>`, `ctype<wchar_t>`
	`codecvt<char, char, mbstate_t>`
	`codecvt<wchar_t, char, mbstate_t>`

monetary	`moneypunct<char>`, `moneypunct<wchar_t>`
	`moneypunct<char, true>`, `moneypunct<wchar_t, true>`
	`money_get<char>`, `money_get<wchar_t>`
	`money_put<char>`, `money_put<wchar_t>`

numeric	`numpunct<char>`, `numpunct<wchar_t>`
	`num_get<char>`, `num_get<wchar_t>`
	`num_put<char>`, `num_put<wchar_t>`

	`time_put<char>`, `time_put<wchar_t>`

messages	`messages<char>`, `messages<wchar_t>`

3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 89, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

4 An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 90.

5 The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(l)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

6 In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the *Cpp17InputIterator* requirements or *Cpp17OutputIterator* requirements, respectively (24.3). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character container types (3.10) that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

28.3.3.1.2.2 Class `locale::facet` [locale.facet]

```
namespace std {
  class locale::facet {
  protected:
    explicit facet(size_t refs = 0);
    virtual ~facet();
    facet(const facet&) = delete;
```

Table 90 — Required specializations [tab:locale.spec]

Category	Includes facets
collate	`collate_byname<char>`, `collate_byname<wchar_t>`

ctype	`ctype_byname<char>`, `ctype_byname<wchar_t>`
	`codecvt_byname<char, char, mbstate_t>`
	`codecvt_byname<wchar_t, char, mbstate_t>`

monetary	`moneypunct_byname<char, International>`
	`moneypunct_byname<wchar_t, International>`

	`time_get_byname<wchar_t, InputIterator>`
	`time_put<char, OutputIterator>`
	`time_put_byname<char, OutputIterator>`
	`time_put<wchar_t, OutputIterator>`
	`time_put_byname<wchar_t, OutputIterator>`

messages	`messages_byname<char>`, `messages_byname<wchar_t>`

```
    void operator=(const facet&) = delete;
  };
}
```

1 Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:[216]

```
static ::std::locale::id id;
```

2 Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3 The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4 Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in implicit conversions.

5 For some standard facets a standard "...`_byname`" class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no "...`_byname`" version of a facet, the base class implements named locale semantics itself by reference to other facets.

28.3.3.1.2.3 Class `locale::id` [locale.id]

```
namespace std {
  class locale::id {
  public:
    id();
    void operator=(const id&) = delete;
```

216) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

```
    id(const id&) = delete;
  };
}
```

1 The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

2 [*Note 1*: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). — *end note*]

28.3.3.1.3 Constructors and destructor [locale.cons]

```
locale() noexcept;
```

1 *Effects*: Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[*Note 1*: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — *end note*]

```
explicit locale(const char* std_name);
```

2 *Effects*: Constructs a locale using standard C locale names, e.g., `"POSIX"`. The resulting locale implements semantics defined to be associated with that name.

3 *Throws*: `runtime_error` if the argument is not valid, or is null.

4 *Remarks*: The set of valid string argument values is `"C"`, `""`, and any implementation-defined values.

```
explicit locale(const string& std_name);
```

5 *Effects*: Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

6 *Preconditions*: `cats` is a valid `category` value (28.3.3.1.2.1).

7 *Effects*: Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

8 *Throws*: `runtime_error` if the second argument is not valid, or is null.

9 *Remarks*: The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cats);
```

10 *Effects*: Equivalent to `locale(other, std_name.c_str(), cats)`.

```
template<class Facet> locale(const locale& other, Facet* f);
```

11 *Effects*: Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

12 *Remarks*: If `f` is null, the resulting locale has the same name as `other`. Otherwise, the resulting locale has no name.

```
locale(const locale& other, const locale& one, category cats);
```

13 *Preconditions*: `cats` is a valid `category` value.

14 *Effects*: Constructs a locale incorporating all facets from the first argument except those that implement `cats`, which are instead incorporated from the second argument.

15 *Remarks*: If `cats` is equal to `locale::none`, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

```
const locale& operator=(const locale& other) noexcept;
```

16 *Effects*: Creates a copy of `other`, replacing the current value.

17 *Returns*: `*this`.

28.3.3.1.4 Members [locale.members]

```
template<class Facet> locale combine(const locale& other) const;
```

1 *Effects*: Constructs a locale incorporating all facets from `*this` except for that one facet of `other` that is identified by `Facet`.

2 *Returns*: The newly created locale.

3 *Throws*: `runtime_error` if `has_facet<Facet>(other)` is `false`.

4 *Remarks*: The resulting locale has no name.

```
string name() const;
```

5 *Returns*: The name of `*this`, if it has one; otherwise, the string `"*"`.

```
text_encoding encoding() const;
```

6 *Mandates*: `CHAR_BIT == 8` is `true`.

7 *Returns*: A `text_encoding` object representing the implementation-defined encoding scheme associated with the locale `*this`.

28.3.3.1.5 Operators [locale.operators]

```
bool operator==(const locale& other) const;
```

1 *Returns*: `true` if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; `false` otherwise.

```
template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;
```

2 *Effects*: Compares two strings according to the `collate<charT>` facet.

3 *Returns*:

```
use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                         s2.data(), s2.data() + s2.size()) < 0
```

4 *Remarks*: This member operator template (and therefore `locale` itself) meets the requirements for a comparator predicate template argument (Clause 26) applied to strings.

5 [*Example 1*: A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (26.8.2, 23.3.13):

```
std::sort(v.begin(), v.end(), loc);
```

— *end example*]

28.3.3.1.6 Static members [locale.statics]

```
static locale global(const locale& loc);
```

1 *Effects*: Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined.

2 *Returns*: The previous value of `locale()`.

3 *Remarks*: No library function other than `locale::global()` affects the value returned by `locale()`.

[*Note 1*: See 28.3.5 for data race considerations when `setlocale` is invoked. — *end note*]

```
static const locale& classic();
```

4 The `"C"` locale.

5 *Returns*: A locale that implements the classic `"C"` locale semantics, equivalent to the value `locale("C")`.

6 *Remarks*: This locale, its facets, and their member functions, do not change with time.

28.3.3.2 `locale` globals [locale.global.templates]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1 *Mandates*: `Facet` is a facet class whose definition contains the public static member `id` as defined in 28.3.3.1.2.2.

2 *Returns*: A reference to the corresponding facet of `loc`, if present.

3 *Throws*: `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4 *Remarks*: The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns*: `true` if the facet requested is present in `loc`; otherwise `false`.

28.3.3.3 Convenience interfaces [locale.convenience]

28.3.3.3.1 Character classification [classification]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `is`*F* returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where *F* is the `ctype_base::mask` value corresponding to that function (28.3.4.2).[217]

28.3.3.3.2 Character conversions [conversions.character]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

1 *Returns*: `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template<class charT> charT tolower(charT c, const locale& loc);
```

2 *Returns*: `use_facet<ctype<charT>>(loc).tolower(c)`.

28.3.4 Standard `locale` categories [locale.categories]

28.3.4.1 General [locale.categories.general]

1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators `<<` and `>>`, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.

2 The `put()` members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.

3 Within 28.3.4 it is unspecified whether one virtual function calls another virtual function.

217) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

28.3.4.2 The ctype category [category.ctype]

28.3.4.2.1 General [category.ctype.general]

```
namespace std {
  class ctype_base {
  public:
    using mask = see below;

    // numeric values are for exposition only.
    static constexpr mask space  = 1 << 0;
    static constexpr mask print  = 1 << 1;
    static constexpr mask cntrl  = 1 << 2;
    static constexpr mask upper  = 1 << 3;
    static constexpr mask lower  = 1 << 4;
    static constexpr mask alpha  = 1 << 5;
    static constexpr mask digit  = 1 << 6;
    static constexpr mask punct  = 1 << 7;
    static constexpr mask xdigit = 1 << 8;
    static constexpr mask blank  = 1 << 9;
    static constexpr mask alnum  = alpha | digit;
    static constexpr mask graph  = alnum | punct;
  };
}
```

1 The type `mask` is a bitmask type (16.3.3.3.3).

28.3.4.2.2 Class template ctype [locale.ctype]

28.3.4.2.2.1 General [locale.ctype.general]

```
namespace std {
  template<class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
      using char_type = charT;

      explicit ctype(size_t refs = 0);

      bool         is(mask m, charT c) const;
      const charT* is(const charT* low, const charT* high, mask* vec) const;
      const charT* scan_is(mask m, const charT* low, const charT* high) const;
      const charT* scan_not(mask m, const charT* low, const charT* high) const;
      charT        toupper(charT c) const;
      const charT* toupper(charT* low, const charT* high) const;
      charT        tolower(charT c) const;
      const charT* tolower(charT* low, const charT* high) const;

      charT        widen(char c) const;
      const char*  widen(const char* low, const char* high, charT* to) const;
      char         narrow(charT c, char dfault) const;
      const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

      static locale::id id;

    protected:
      ~ctype();
      virtual bool         do_is(mask m, charT c) const;
      virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
      virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
      virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
      virtual charT        do_toupper(charT) const;
      virtual const charT* do_toupper(charT* low, const charT* high) const;
      virtual charT        do_tolower(charT) const;
      virtual const charT* do_tolower(charT* low, const charT* high) const;
      virtual charT        do_widen(char) const;
      virtual const char*  do_widen(const char* low, const char* high, charT* dest) const;
      virtual char        do_narrow(charT, char dfault) const;
      virtual const charT* do_narrow(const charT* low, const charT* high,
                                     char dfault, char* dest) const;
    };
}
```

1 Class `ctype` encapsulates the C library `<cctype>` (28.7.1) features. `istream` members are required to use `ctype<>` for character classing during input parsing.

2 The specializations required in Table 89 (28.3.3.1.2.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

28.3.4.2.2.2 ctype members [locale.ctype.members]

```
bool         is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
```

1 *Returns*: `do_is(m, c)` or `do_is(low, high, vec)`.

```
const charT* scan_is(mask m, const charT* low, const charT* high) const;
```

2 *Returns*: `do_scan_is(m, low, high)`.

```
const charT* scan_not(mask m, const charT* low, const charT* high) const;
```

3 *Returns*: `do_scan_not(m, low, high)`.

```
charT        toupper(charT c) const;
const charT* toupper(charT* low, const charT* high) const;
```

4 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`.

```
charT        tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
```

5 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`.

```
charT       widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
```

6 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`.

```
char         narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;
```

7 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`.

28.3.4.2.2.3 ctype virtual functions [locale.ctype.virtuals]

```
bool         do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
```

1 *Effects*: Classifies a character or sequence of characters. For each argument character, identifies a value `M` of type `ctype_base::mask`. The second form identifies a value `M` of type `ctype_base::mask` for each `*p` where `(low <= p && p < high)`, and places it into `vec[p - low]`.

2 *Returns*: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

3 *Effects*: Locates a character in a buffer that conforms to a classification `m`.

4 *Returns*: The smallest pointer `p` in the range [`low`, `high`) such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

5 *Effects*: Locates a character in a buffer that fails to conform to a classification `m`.

6 *Returns*: The smallest pointer `p`, if any, in the range [`low`, `high`) such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT        do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects*: Converts a character or characters to upper case. The second form replaces each character `*p` in the range [`low`, `high`) for which a corresponding upper-case character exists, with that character.

8 *Returns*: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects*: Converts a character or characters to lower case. The second form replaces each character `*p` in the range [`low`, `high`) and for which a corresponding lower-case character exists, with that character.

10 *Returns*: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_widen(char c) const;
const char*  do_widen(const char* low, const char* high, charT* dest) const;
```

11 *Effects*: Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.[218] The only characters for which unique transformations are required are those in the basic character set (5.3.1).

For any named `ctype` category with a `ctype<char>` facet `ctc` and valid `ctype_base::mask` value `M`, `(ctc.is(M, c) || !is(M, do_widen(c)) )` is `true`.[219]

The second form transforms each character `*p` in the range [`low`, `high`), placing the result in `dest[p - low]`.

12 *Returns*: The first form returns the transformed value. The second form returns `high`.

```
char         do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

13 *Effects*: Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character `c` in the basic character set (5.3.1) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )
```

is `true` (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range [`low`, `high`), placing the result (or `dfault` if no simple transformation is readily available) in `dest[p - low]`.

14 *Returns*: The first form returns the transformed value; or `dfault` if no mapping is readily available. The second form returns `high`.

28.3.4.2.3 Class template `ctype_byname` [locale.ctype.byname]

```
namespace std {
  template<class charT>
    class ctype_byname : public ctype<charT> {
    public:
      using mask = typename ctype<charT>::mask;
      explicit ctype_byname(const char*, size_t refs = 0);
      explicit ctype_byname(const string&, size_t refs = 0);

    protected:
      ~ctype_byname();
```

218) The parameter `c` of `do_widen` is intended to accept values derived from *character-literal*s for conversion to the locale's encoding.

219) In other words, the transformed character is not a member of any character classification that `c` is not also a member of.

```
    };
  }
```

28.3.4.2.4 ctype<char> specialization [facet.ctype.special]

28.3.4.2.4.1 General [facet.ctype.special.general]

```
namespace std {
  template<>
    class ctype<char> : public locale::facet, public ctype_base {
    public:
      using char_type = char;

      explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

      bool is(mask m, char c) const;
      const char* is(const char* low, const char* high, mask* vec) const;
      const char* scan_is (mask m, const char* low, const char* high) const;
      const char* scan_not(mask m, const char* low, const char* high) const;

      virtual const char* do_narrow(const char* low, const char* high,
                                    char dfault, char* to) const;
    };
}
```

1 A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.[220] The implementation-defined value of member `table_size` is at least 256.

28.3.4.2.4.2 Destructor [facet.ctype.char.dtor]

`~ctype();`

1 *Effects*: If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

220) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

28.3.4.2.4.3 Members [facet.ctype.char.members]

1 In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

2 *Preconditions*: Either `tbl == nullptr` is `true` or [`tbl`, `tbl + table_size`) is a valid range.

3 *Effects*: Passes its `refs` argument to its base class constructor.

```
bool        is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

4 *Effects*: The second form, for all `*p` in the range [`low`, `high`), assigns into `vec[p - low]` the value `table()[(unsigned char)*p]`.

5 *Returns*: The first form returns `table()[(unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

6 *Returns*: The smallest `p` in the range [`low`, `high`) such that

```
table()[(unsigned char) *p] & m
```

is `true`.

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

7 *Returns*: The smallest `p` in the range [`low`, `high`) such that

```
table()[(unsigned char) *p] & m
```

is `false`.

```
char        toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

8 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char        tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

9 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char  widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

10 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char        narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

11 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

12 *Returns*: The first constructor argument, if it was nonzero, otherwise `classic_table()`.

28.3.4.2.4.4 Static members [facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

1 *Returns*: A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the `"C"` locale.

28.3.4.2.4.5 Virtual functions [facet.ctype.char.virtuals]

```
  char        do_toupper(char) const;
  const char* do_toupper(char* low, const char* high) const;
  char        do_tolower(char) const;
  const char* do_tolower(char* low, const char* high) const;
```

```
virtual char        do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char        do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                              char dfault, char* to) const;
```

1 These functions are described identically as those members of the same name in the ctype class template (28.3.4.2.2.2).

28.3.4.2.5 Class template codecvt [locale.codecvt]

28.3.4.2.5.1 General [locale.codecvt.general]

```
namespace std {
  class codecvt_base {
  public:
    enum result { ok, partial, error, noconv };
  };

  template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
      using intern_type = internT;
      using extern_type = externT;
      using state_type  = stateT;

      explicit codecvt(size_t refs = 0);

      result out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
              externT*   to,       externT*   to_end,       externT*&   to_next) const;

      result unshift(
        stateT& state,
              externT*    to,      externT*   to_end,       externT*&   to_next) const;

      result in(
        stateT& state,
        const externT* from, const externT* from_end, const externT*& from_next,
              internT*   to,       internT*   to_end,       internT*&   to_next) const;

      int encoding() const noexcept;
      bool always_noconv() const noexcept;
      int length(stateT&, const externT* from, const externT* end, size_t max) const;
      int max_length() const noexcept;

      static locale::id id;

    protected:
      ~codecvt();
      virtual result do_out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
              externT* to,         externT*   to_end,       externT*&   to_next) const;
      virtual result do_in(
        stateT& state,
        const externT* from, const externT* from_end, const externT*& from_next,
              internT* to,         internT*   to_end,       internT*&   to_next) const;
      virtual result do_unshift(
        stateT& state,
              externT* to,         externT*   to_end,       externT*&   to_next) const;

      virtual int do_encoding() const noexcept;
      virtual bool do_always_noconv() const noexcept;
      virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;
      virtual int do_max_length() const noexcept;
    };
  }
```

1 The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

2 The `stateT` argument selects the pair of character encodings being mapped between.

3 The specializations required in Table 89 (28.3.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

28.3.4.2.5.2 Members [locale.codecvt.members]

```
result out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;
```

1 *Returns*: `do_out(state, from, from_end, from_next, to, to_end, to_next)`.

```
result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

2 *Returns*: `do_unshift(state, to, to_end, to_next)`.

```
result in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

3 *Returns*: `do_in(state, from, from_end, from_next, to, to_end, to_next)`.

```
int encoding() const noexcept;
```

4 *Returns*: `do_encoding()`.

```
bool always_noconv() const noexcept;
```

5 *Returns*: `do_always_noconv()`.

```
int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

6 *Returns*: `do_length(state, from, from_end, max)`.

```
int max_length() const noexcept;
```

7 *Returns*: `do_max_length()`.

28.3.4.2.5.3 Virtual functions [locale.codecvt.virtuals]

```
result do_out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;

result do_in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

1 *Preconditions*: `(from <= from_end && to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

2 *Effects*: Translates characters in the source range [`from`, `from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than `(from_end - from)` source elements, and stores no more than `(to_end - to)` destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If it returns `noconv`, `internT` and `externT` are the same type, and the converted sequence is identical to the input sequence [`from`, `from_next`), `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to`, `to_end`).

4 A `codecvt` facet that is used by `basic_filebuf` (31.10) shall have the property that if

```
do_out(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `from != from_end`, then

```
do_out(state, from, from + 1, from_next, to, to_end, to_next)
```

shall also return `ok`, and that if

```
do_in(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `to != to_end`, then

```
do_in(state, from, from_end, from_next, to, to + 1, to_next)
```

shall also return `ok`.[221]

[*Note 1*: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. — *end note*]

5 *Returns*: An enumeration value, as summarized in Table 91.

Table 91 — `do_in/do_out` result values [tab:locale.codecvt.inout]

Value	Meaning
`ok`	completed the conversion
`partial`	not all source characters converted
`error`	encountered a character in [`from`, `from_end`) that cannot be converted
`noconv`	`internT` and `externT` are the same type, and input sequence is identical to converted sequence

A return value of `partial`, if `(from_next == from_end)`, indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

6 *Remarks*: Its operations on `state` are unspecified.

[*Note 2*: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — *end note*]

```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

7 *Preconditions*: `(to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

8 *Effects*: Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.[222] Stores no more than `(to_end - to)` destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

9 *Returns*: An enumeration value, as summarized in Table 92.

221) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.
222) Typically these will be characters to return the state to `stateT()`.

Table 92 — `do_unshift` result values [tab:locale.codecvt.unshift]

Value	Meaning
`ok`	completed the sequence
`partial`	space for more than `to_end - to` destination elements was needed to terminate a sequence given the value of `state`
`error`	an unspecified error has occurred
`noconv`	no termination is needed for this `state_type`

```
int do_encoding() const noexcept;
```

10 *Returns*: `-1` if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or `0` if this number is not a constant.[223]

```
bool do_always_noconv() const noexcept;
```

11 *Returns*: `true` if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns `true`.

```
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

12 *Preconditions*: `(from <= from_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13 *Effects*: The effect on the `state` argument is as if it called `do_in(state, from, from_end, from, to, to + max, to)` for `to` pointing to a buffer of at least `max` elements.

14 *Returns*: `(from_next - from)` where `from_next` is the largest value in the range [`from`, `from_end`] such that the sequence of values in the range [`from`, `from_next`) represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and `(from_end - from)`.

```
int do_max_length() const noexcept;
```

15 *Returns*: The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range [`from`, `from_end`) and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns 1.

28.3.4.2.6 Class template `codecvt_byname` [locale.codecvt.byname]

```
namespace std {
  template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
    public:
      explicit codecvt_byname(const char*, size_t refs = 0);
      explicit codecvt_byname(const string&, size_t refs = 0);

    protected:
      ~codecvt_byname();
    };
}
```

28.3.4.3 The numeric category [category.numeric]

28.3.4.3.1 General [category.numeric.general]

1 The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.[224]

223) If `encoding()` yields `-1`, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.
224) Parsing `"-1"` correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

2 All specifications of member functions for `num_put` and `num_get` in the subclauses of 28.3.4.3 only apply to the specializations required in Tables 89 and 90 (28.3.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (28.3.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

3 Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

28.3.4.3.2 Class template `num_get` [locale.num.get]

28.3.4.3.2.1 General [locale.num.get.general]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = InputIterator;

      explicit num_get(size_t refs = 0);

      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, bool& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned short& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned int& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned long long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, float& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, double& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long double& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, void*& v) const;

      static locale::id id;

    protected:
      ~num_get();
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, bool& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned short& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned int& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned long long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, float& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, double& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long double& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, void*& v) const;
    };
}
```

1 The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

28.3.4.3.2.2 Members [facet.num.get.members]

```
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, void*& val) const;
```

1 *Returns*: `do_get(in, end, str, err, val)`.

28.3.4.3.2.3 Virtual functions [facet.num.get.virtuals]

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, void*& val) const;
```

1 *Effects*: Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages:

(2.1) — Stage 1: Determine a conversion specifier.

(2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results.

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 93. The table is ordered. That is, the first line whose condition is true applies.

Table 93 — Integer conversions [tab:facet.num.get.int]

State	stdio equivalent
`basefield == oct`	`%o`
`basefield == hex`	`%X`
`basefield == 0`	`%i`
`signed` integral type	`%d`
`unsigned` integral type	`%u`

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 94.

Table 94 — Length modifier [tab:facet.num.get.length]

Type	Length modifier
`short`	`h`
`unsigned short`	`h`
`long`	`l`
`unsigned long`	`l`
`long long`	`ll`
`unsigned long long`	`ll`
`double`	`l`
`long double`	`L`

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
  c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>(loc).thousands_sep()
  && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefpxABCDEFPX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

[*Example 1*: Given an input sequence of `"0x1a.bp+07p"`,

(3.1) — if the conversion specifier returned by Stage 1 is `%d`, `"0"` is accumulated;

(3.2) — if the conversion specifier returned by Stage 1 is `%i`, `"0x1a"` are accumulated;

(3.3) — if the conversion specifier returned by Stage 1 is `%g`, `"0x1a.bp+07"` are accumulated.

In all cases, the remainder is left in the input. — *end example*]

Stage 3: The sequence of `char`s accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>` (17.2.2):

(3.4) — For a signed integer value, the function `strtoll`.

(3.5) — For an unsigned integer value, the function `strtoull`.

(3.6) — For a `float` value, the function `strtof`.

(3.7) — For a `double` value, the function `strtod`.

(3.8) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

(3.9) — zero, if the conversion function does not convert the entire field.

(3.10) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.

(3.11) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.

(3.12) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

6 *Effects*: If `(str.flags() & ios_base::boolalpha) == 0` then input proceeds as it would for a `long` except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is `1` then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined "as if" by calling the members `falsename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range [`in`, `end`) (see 23.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit | str.eofbit)` if the reason for the failure was that `(in == end)`.

[*Example 2*: For targets `true`: `"a"` and `false`: `"abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the `'c'` element. For targets `true`: `"1"` and `false`: `"0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets `("")`, any input sequence yields `err == str.failbit`. — *end example*]

9 *Returns*: `in`.

28.3.4.3.3 Class template num_put [locale.nm.put]

28.3.4.3.3.1 General [locale.nm.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit num_put(size_t refs = 0);

      iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
      iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

      static locale::id id;

    protected:
      ~num_put();
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
      virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
    };
}
```

1 The facet `num_put` is used to format numeric values to a character sequence such as an ostream.

28.3.4.3.3.2 Members [facet.num.put.members]

```
iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Returns*: `do_put(out, str, fill, val)`.

28.3.4.3.3.3 Virtual functions [facet.num.put.virtuals]

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Effects*: Writes characters to the sequence `out`, formatting `val` as desired. In the following description, `loc` names a local variable initialized as

```
locale loc = str.getloc();
```

2 The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier `spec` and determine the characters that would be printed by `printf` (31.13) given this conversion specifier for

```
printf(spec, val)
```

assuming that the current locale is the `"C"` locale.

(2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<numpunct<charT>>(loc)`.

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns*: `out`.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield =  (flags & (ios_base::basefield));
fmtflags uppercase =  (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos =    (flags & (ios_base::showpos));
fmtflags showbase =   (flags & (ios_base::showbase));
fmtflags showpoint =  (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 95.

Table 95 — Integer conversions [tab:facet.num.put.int]

State	stdio equivalent
`basefield == ios_base::oct`	`%o`
`(basefield == ios_base::hex) && !uppercase`	`%x`
`(basefield == ios_base::hex)`	`%X`
for a `signed` integral type	`%d`
for an `unsigned` integral type	`%u`

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 96.

Table 96 — Floating-point conversions [tab:facet.num.put.fp]

State	stdio equivalent
`floatfield == ios_base::fixed && !uppercase`	`%f`
`floatfield == ios_base::fixed`	`%F`
`floatfield == ios_base::scientific && !uppercase`	`%e`
`floatfield == ios_base::scientific`	`%E`
`floatfield == (ios_base::fixed | ios_base::scientific) && !uppercase`	`%a`
`floatfield == (ios_base::fixed | ios_base::scientific)`	`%A`
`!uppercase`	`%g`
otherwise	`%G`

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 97.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 98.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

Table 97 — Length modifier [tab:facet.num.put.length]

Type	Length modifier
`long`	`l`
`long long`	`ll`
`unsigned long`	`l`
`unsigned long long`	`ll`
`long double`	`L`
otherwise	*none*

Table 98 — Numeric conversions [tab:facet.num.put.conv]

Type(s)	State	`stdio` equivalent
an integral type	`showpos`	`+`
	`showbase`	`#`
a floating-point type	`showpos`	`+`
	`showpoint`	`#`

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 28.3.4.4.1.3.

Decimal point characters(.) are replaced by `punct.decimal_point()`.

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding[225] is determined according to Table 99.

Table 99 — Fill padding [tab:facet.num.put.fill]

State	Location
`adjustfield == ios_base::left`	pad after
`adjustfield == ios_base::right`	pad before
`adjustfield == internal` and a sign occurs in the representation	pad after the sign
`adjustfield == internal` and representation after stage 1 began with 0x or 0X	pad after x or X
otherwise	pad before

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

225) The conversion specification `#o` generates a leading `0` which is *not* a padding character.

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

5 *Returns*: If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
  val ? use_facet<numpunct<charT>>(loc).truename()
      : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

28.3.4.4 The numeric punctuation facet [facet.numpunct]

28.3.4.4.1 Class template numpunct [locale.numpunct]

28.3.4.4.1.1 General [locale.numpunct.general]

```
namespace std {
  template<class charT>
  class numpunct : public locale::facet {
  public:
    using char_type   = charT;
    using string_type = basic_string<charT>;

    explicit numpunct(size_t refs = 0);

    char_type    decimal_point()   const;
    char_type    thousands_sep()   const;
    string       grouping()        const;
    string_type  truename()        const;
    string_type  falsename()       const;

    static locale::id id;

  protected:
    ~numpunct();                                          // virtual
    virtual char_type    do_decimal_point() const;
    virtual char_type    do_thousands_sep() const;
    virtual string       do_grouping()      const;
    virtual string_type  do_truename()      const;        // for bool
    virtual string_type  do_falsename()     const;        // for bool
  };
}
```

1 `numpunct<>` specifies numeric punctuation. The specializations required in Table 89 (28.3.3.1.2.1), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic `"C"` numeric formats, i.e., they contain information equivalent to that contained in the `"C"` locale or their wide character counterparts as if obtained by a call to `widen`.

2 The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

intval:
  sign$_{opt}$ *units*

sign:
  `+`
  `-`

units:
  digits
  digits thousands-sep units

digits:
  digit digits$_{opt}$

and floating-point values have:

floatval:
  sign$_{opt}$ *units fractional*$_{opt}$ *exponent*$_{opt}$
  sign$_{opt}$ *decimal-point digits exponent*$_{opt}$

fractional:
  decimal-point digits$_{opt}$

exponent:
  e sign$_{opt}$ digits

e:
  `e`
  `E`

where the number of digits between *thousands-sep*s is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

28.3.4.4.1.2 Members [facet.numpunct.members]

```
char_type decimal_point() const;
```

1 *Returns*: `do_decimal_point()`.

```
char_type thousands_sep() const;
```

2 *Returns*: `do_thousands_sep()`.

```
string grouping() const;
```

3 *Returns*: `do_grouping()`.

```
string_type truename()  const;
string_type falsename() const;
```

4 *Returns*: `do_truename()` or `do_falsename()`, respectively.

28.3.4.4.1.3 Virtual functions [facet.numpunct.virtuals]

```
char_type do_decimal_point() const;
```

1 *Returns*: A character for use as the decimal radix separator. The required specializations return `'.'` or `L'.'`.

```
char_type do_thousands_sep() const;
```

2 *Returns*: A character for use as the digit group separator. The required specializations return `','` or `L','`.

```
string do_grouping() const;
```

3 *Returns*: A `string` `vec` used as a vector of integer values, in which each element `vec[i]` represents the number of digits[226] in the group at position `i`, starting with position 0 as the rightmost group. If `vec.size() <= i`, the number is the same as group `(i - 1)`; if `(i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX)`, the size of the digit group is unlimited.

4 The required specializations return the empty string, indicating no grouping.

```
string_type do_truename()  const;
string_type do_falsename() const;
```

5 *Returns*: A string representing the name of the boolean value `true` or `false`, respectively.

6 In the base class implementation these names are `"true"` and `"false"`, or `L"true"` and `L"false"`.

28.3.4.4.2 Class template `numpunct_byname` [locale.numpunct.byname]

```
namespace std {
  template<class charT>
    class numpunct_byname : public numpunct<charT> {
    // this class is specialized for char and wchar_t.
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;
```

226) Thus, the string `"\003"` specifies groups of 3 digits each, and `"3"` probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of `"3"`.

```
      explicit numpunct_byname(const char*, size_t refs = 0);
      explicit numpunct_byname(const string&, size_t refs = 0);

    protected:
      ~numpunct_byname();
    };
}
```

28.3.4.5 The collate category [category.collate]

28.3.4.5.1 Class template collate [locale.collate]

28.3.4.5.1.1 General [locale.collate.general]

```
namespace std {
  template<class charT>
    class collate : public locale::facet {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit collate(size_t refs = 0);

      int compare(const charT* low1, const charT* high1,
                  const charT* low2, const charT* high2) const;
      string_type transform(const charT* low, const charT* high) const;
      long hash(const charT* low, const charT* high) const;

      static locale::id id;

    protected:
      ~collate();
      virtual int do_compare(const charT* low1, const charT* high1,
                             const charT* low2, const charT* high2) const;
      virtual string_type do_transform(const charT* low, const charT* high) const;
      virtual long do_hash (const charT* low, const charT* high) const;
    };
}
```

1 The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 26) and containers operating on strings. The specializations required in Table 89 (28.3.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographical ordering (26.8.11).

2 Each function compares a string of characters `*p` in the range [`low`, `high`).

28.3.4.5.1.2 Members [locale.collate.members]

```
int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;
```

1 *Returns*: `do_compare(low1, high1, low2, high2)`.

```
string_type transform(const charT* low, const charT* high) const;
```

2 *Returns*: `do_transform(low, high)`.

```
long hash(const charT* low, const charT* high) const;
```

3 *Returns*: `do_hash(low, high)`.

28.3.4.5.1.3 Virtual functions [locale.collate.virtuals]

```
int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;
```

1 *Returns*: `1` if the first string is greater than the second, `-1` if less, zero otherwise. The specializations required in Table 89 (28.3.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, implement a lexicographical comparison (26.8.11).

```
string_type do_transform(const charT* low, const charT* high) const;
```

2 *Returns*: A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.[227]

```
long do_hash(const charT* low, const charT* high) const;
```

3 *Returns*: An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings.

4 *Recommended practice*: The probability that the result equals that for another string which does not compare equal should be very small, approaching `(1.0/numeric_limits<unsigned long>::max())`.

28.3.4.5.2 Class template `collate_byname` [locale.collate.byname]

```
namespace std {
  template<class charT>
    class collate_byname : public collate<charT> {
    public:
      using string_type = basic_string<charT>;

      explicit collate_byname(const char*, size_t refs = 0);
      explicit collate_byname(const string&, size_t refs = 0);

    protected:
      ~collate_byname();
    };
}
```

28.3.4.6 The time category [category.time]

28.3.4.6.1 General [category.time.general]

1 Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 28.3.4.6 only apply to the specializations required in Tables 89 and 90 (28.3.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.3.4, and the `ctype<>` facet, to determine formatting details.

28.3.4.6.2 Class template `time_get` [locale.time.get]

28.3.4.6.2.1 General [locale.time.get.general]

```
namespace std {
  class time_base {
  public:
    enum dateorder { no_order, dmy, mdy, ymd, ydm };
  };

  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
    public:
      using char_type = charT;
      using iter_type = InputIterator;

      explicit time_get(size_t refs = 0);

      dateorder date_order() const { return do_date_order(); }
      iter_type get_time(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
      iter_type get_date(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
      iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                            ios_base::iostate& err, tm* t) const;
      iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                              ios_base::iostate& err, tm* t) const;
```

227) This function is useful when one string is being compared to many other strings.

```
      iter_type get_year(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
      iter_type get(iter_type s, iter_type end, ios_base& f,
                    ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
      iter_type get(iter_type s, iter_type end, ios_base& f,
                    ios_base::iostate& err, tm* t, const char_type* fmt,
                    const char_type* fmtend) const;

      static locale::id id;

    protected:
      ~time_get();
      virtual dateorder do_date_order() const;
      virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
                                    ios_base::iostate& err, tm* t) const;
      virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
                                    ios_base::iostate& err, tm* t) const;
      virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
                                       ios_base::iostate& err, tm* t) const;
      virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
                                         ios_base::iostate& err, tm* t) const;
      virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
                                    ios_base::iostate& err, tm* t) const;
      virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                               ios_base::iostate& err, tm* t, char format, char modifier) const;
    };
  }
```

1 `time_get` is used to parse a character sequence, extracting components of a time or date into a `tm` object. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.[228]

2 If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

28.3.4.6.2.2 Members [locale.time.get.members]

```
dateorder date_order() const;
```

1 *Returns*: `do_date_order()`.

```
iter_type get_time(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

2 *Returns*: `do_get_time(s, end, str, err, t)`.

```
iter_type get_date(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

3 *Returns*: `do_get_date(s, end, str, err, t)`.

```
iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
```

4 *Returns*: `do_get_weekday(s, end, str, err, t)` or `do_get_monthname(s, end, str, err, t)`.

```
iter_type get_year(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

5 *Returns*: `do_get_year(s, end, str, err, t)`.

228) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, char format, char modifier = 0) const;
```

6 *Returns*: `do_get(s, end, f, err, t, format, modifier)`.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, const char_type* fmt, const char_type* fmtend) const;
```

7 *Preconditions*: [`fmt`, `fmtend`) is a valid range.

8 *Effects*: The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

(8.1) — The expression `fmt == fmtend` evaluates to `true`.

(8.2) — The expression `err == ios_base::goodbit` evaluates to `false`.

(8.3) — The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.

(8.4) — The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the POSIX function `strptime`. If the number of elements in the range [`fmt`, `fmtend`) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.

(8.5) — The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.

(8.6) — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9 [*Note 1*: The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — *end note*]

10 *Returns*: `s`.

28.3.4.6.2.3 Virtual functions [locale.time.get.virtuals]

```
dateorder do_date_order() const;
```

1 *Returns*: An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.[229] Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

2 *Effects*: Reads characters starting at `s` until it has extracted those `tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

3 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

4 *Effects*: Reads characters starting at `s` until it has extracted those `tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 100.

229) This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

Table 100 — `do_get_date` effects [tab:locale.time.get.dogetdate]

`date_order()`	Format
`no_order`	`"%m%d%y"`
`dmy`	`"%d%m%y"`
`mdy`	`"%m%d%y"`
`ymd`	`"%y%m%d"`
`ydm`	`"%y%d%m"`

5 An implementation may also accept additional implementation-defined formats.

6 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                         ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                           ios_base::iostate& err, tm* t) const;
```

7 *Effects*: Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `tm` member accordingly.

8 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

9 *Effects*: Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

10 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11 *Preconditions*: `t` points to an object.

12 *Effects*: The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `tm` members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function `strptime`, formed by concatenating `'%'`, the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `tm` members from the input sequence [`s`, `end`), it evaluates `err |= ios_base::eofbit`. In such cases the values of those `tm` members are unspecified and may be outside their valid range.

14 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

15 *Remarks*: It is unspecified whether multiple calls to `do_get()` with the address of the same `tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

28.3.4.6.3 Class template `time_get_byname` [locale.time.get.byname]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname : public time_get<charT, InputIterator> {
```

```
    public:
      using dateorder = time_base::dateorder;
      using iter_type = InputIterator;

      explicit time_get_byname(const char*, size_t refs = 0);
      explicit time_get_byname(const string&, size_t refs = 0);

    protected:
      ~time_get_byname();
    };
}
```

28.3.4.6.4 Class template `time_put` [locale.time.put]

28.3.4.6.4.1 General [locale.time.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit time_put(size_t refs = 0);

      // the following is implemented in terms of other member functions.
      iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                    const charT* pattern, const charT* pat_end) const;
      iter_type put(iter_type s, ios_base& f, char_type fill,
                    const tm* tmb, char format, char modifier = 0) const;

      static locale::id id;

    protected:
      ~time_put();
      virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                               char format, char modifier) const;
    };
}
```

28.3.4.6.4.2 Members [locale.time.put.members]

```
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;
```

1 *Effects*: The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c, 0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%'`, followed by an optional modifier character `mod` and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.

2 The second form calls `do_put(s, str, fill, t, format, modifier)`.

3 [*Note 1*: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note*]

4 *Returns*: An iterator pointing immediately after the last character produced.

28.3.4.6.4.3 Virtual functions [locale.time.put.virtuals]

```
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;
```

1 *Effects*: Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

[*Note 1*: Interpretation of the `modifier` argument is implementation-defined. — *end note*]

2 *Returns*: An iterator pointing immediately after the last character produced.

[*Note 2*: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note*]

3 *Recommended practice*: Interpretation of the `modifier` should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

28.3.4.6.5 Class template `time_put_byname` [locale.time.put.byname]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit time_put_byname(const char*, size_t refs = 0);
      explicit time_put_byname(const string&, size_t refs = 0);

    protected:
      ~time_put_byname();
    };
}
```

28.3.4.7 The monetary category [category.monetary]

28.3.4.7.1 General [category.monetary.general]

1 These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

2 All specifications of member functions for `money_put` and `money_get` in the subclauses of 28.3.4.7 only apply to the specializations required in Tables 89 and 90 (28.3.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.3.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

28.3.4.7.2 Class template `money_get` [locale.money.get]

28.3.4.7.2.1 General [locale.money.get.general]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
    public:
      using char_type   = charT;
      using iter_type   = InputIterator;
      using string_type = basic_string<charT>;

      explicit money_get(size_t refs = 0);

      iter_type get(iter_type s, iter_type end, bool intl,
                    ios_base& f, ios_base::iostate& err,
                    long double& units) const;
      iter_type get(iter_type s, iter_type end, bool intl,
                    ios_base& f, ios_base::iostate& err,
                    string_type& digits) const;

      static locale::id id;

    protected:
      ~money_get();
      virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                               ios_base::iostate& err, long double& units) const;
      virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                               ios_base::iostate& err, string_type& digits) const;
    };
}
```

28.3.4.7.2.2 Members [locale.money.get.members]

```
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;
```

1 *Returns*: `do_get(s, end, intl, f, err, quant)`.

28.3.4.7.2.3 Virtual functions [locale.money.get.virtuals]

```
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;
```

1 *Effects*: Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err | str.failbit)`, or `(err | str.failbit | str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `'-'` or in the range from `'0'` through `'9'` (inclusive)) stored in `digits`.

[*Example 1*: The sequence `$1,056.23` in a common United States locale would yield, for `units`, `105623`, or, for `digits`, `"105623"`. — *end example*]

If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

2 Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If `(str.flags() & str.showbase)` is `false`, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

3 If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

[*Example 2*: If `showbase` is off, then for a `neg` value of `"()"` and a currency symbol of `"L"`, in `"(100 L)"` the `"L"` is consumed; but if `neg` is `"-"`, the `"L"` in `"-100 L"` is not consumed. — *end example*]

If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.

4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by[230]

```
for (int i = 0; i < n; ++i)
  buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

5 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

28.3.4.7.3 Class template `money_put` [locale.money.put]

28.3.4.7.3.1 General [locale.money.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
    public:
      using char_type   = charT;
      using iter_type   = OutputIterator;
      using string_type = basic_string<charT>;

      explicit money_put(size_t refs = 0);

      iter_type put(iter_type s, bool intl, ios_base& f,
                    char_type fill, long double units) const;
      iter_type put(iter_type s, bool intl, ios_base& f,
                    char_type fill, const string_type& digits) const;

      static locale::id id;

    protected:
      ~money_put();
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                               long double units) const;
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                               const string_type& digits) const;
    };
}
```

28.3.4.7.3.2 Members [locale.money.put.members]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

1 *Returns*: `do_put(s, intl, f, loc, quant)`.

28.3.4.7.3.3 Virtual functions [locale.money.put.virtuals]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, const string_type& digits) const;
```

1 *Effects*: Writes characters to `s` according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from

230) The semantics here are different from `ct.narrow`.

the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('-')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

2 *Returns*: An iterator pointing immediately after the last character produced.

3 *Remarks*: The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is `true`, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is `true`, they are placed after the other characters; otherwise, they are placed before the other characters.

[*Note 1*: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. — *end note*]

28.3.4.7.4 Class template `moneypunct` [locale.moneypunct]

28.3.4.7.4.1 General [locale.moneypunct.general]

```
namespace std {
  class money_base {
  public:
    enum part { none, space, symbol, sign, value };
    struct pattern { char field[4]; };
  };

  template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit moneypunct(size_t refs = 0);

      charT        decimal_point() const;
      charT        thousands_sep() const;
      string       grouping()      const;
      string_type  curr_symbol()   const;
      string_type  positive_sign() const;
      string_type  negative_sign() const;
      int          frac_digits()   const;
      pattern      pos_format()    const;
      pattern      neg_format()    const;

      static locale::id id;
      static const bool intl = International;

    protected:
      ~moneypunct();
      virtual charT        do_decimal_point() const;
      virtual charT        do_thousands_sep() const;
      virtual string       do_grouping()      const;
      virtual string_type  do_curr_symbol()   const;
      virtual string_type  do_positive_sign() const;
      virtual string_type  do_negative_sign() const;
      virtual int          do_frac_digits()   const;
      virtual pattern      do_pos_format()    const;
      virtual pattern      do_neg_format()    const;
    };
  }
```

1 The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`$^{\text{th}}$ component of the format.[231] In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

2 Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

3 The format of the numeric monetary value is a decimal number:

value:
    units fractional$_{opt}$
    decimal-point digits

fractional:
    decimal-point digits$_{opt}$

if `frac_digits()` returns a positive value, or

value:
    units

otherwise. The symbol *decimal-point* indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

units:
    digits
    digits thousands-sep units

digits:
    adigit digits$_{opt}$

In the syntax specification, the symbol *adigit* is any of the values `ct.widen(c)` for `c` in the range `'0'` through `'9'` (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol *thousands-sep* is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

4 The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

28.3.4.7.4.2 Members [locale.moneypunct.members]

```
charT        decimal_point() const;
charT        thousands_sep() const;
string       grouping()      const;
string_type  curr_symbol()   const;
string_type  positive_sign() const;
string_type  negative_sign() const;
int          frac_digits()   const;
pattern      pos_format()    const;
pattern      neg_format()    const;
```

1 Each of these functions *F* returns the result of calling the corresponding virtual member function `do_`*F*`()`.

231) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

28.3.4.7.4.3 Virtual functions [locale.moneypunct.virtuals]

```
charT do_decimal_point() const;
```

1 *Returns*: The radix separator to use in case `do_frac_digits()` is greater than zero.[232]

```
charT do_thousands_sep() const;
```

2 *Returns*: The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.[233]

```
string do_grouping() const;
```

3 *Returns*: A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.[234]

```
string_type do_curr_symbol() const;
```

4 *Returns*: A string to use as the currency identifier symbol.

[*Note 1*: For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217[1] followed by a space. — *end note*]

```
string_type do_positive_sign() const;
string_type do_negative_sign() const;
```

5 *Returns*: `do_positive_sign()` returns the string to use to indicate a positive monetary value;[235] `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

6 *Returns*: The number of digits after the decimal radix separator, if any.[236]

```
pattern do_pos_format() const;
pattern do_neg_format() const;
```

7 *Returns*: The specializations required in Table 90 (28.3.3.1.2.1), namely

(7.1) — `moneypunct<char>`,

(7.2) — `moneypunct<wchar_t>`,

(7.3) — `moneypunct<char, true>`, and

(7.4) — `moneypunct<wchar_t, true>`,

return an object of type `pattern` initialized to `{ symbol, sign, none, value }`.[237]

28.3.4.7.5 Class template moneypunct_byname [locale.moneypunct.byname]

```
namespace std {
  template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
    public:
      using pattern     = money_base::pattern;
      using string_type = basic_string<charT>;

      explicit moneypunct_byname(const char*, size_t refs = 0);
      explicit moneypunct_byname(const string&, size_t refs = 0);

    protected:
      ~moneypunct_byname();
    };
}
```

28.3.4.8 The message retrieval category [category.messages]

28.3.4.8.1 General [category.messages.general]

1 Class `messages<charT>` implements retrieval of strings from message catalogs.

232) In common U.S. locales this is `'.'`.
233) In common U.S. locales this is `','`.
234) To specify grouping by 3s, the value is `"\003"` *not* `"3"`.
235) This is usually the empty string.
236) In common U.S. locales, this is 2.
237) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, `"USD "`.

28.3.4.8.2 Class template messages [locale.messages]

28.3.4.8.2.1 General [locale.messages.general]

```
namespace std {
  class messages_base {
  public:
    using catalog = unspecified signed integer type;
  };

  template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit messages(size_t refs = 0);

      catalog open(const string& fn, const locale&) const;
      string_type get(catalog c, int set, int msgid,
                      const string_type& dfault) const;
      void close(catalog c) const;

      static locale::id id;

    protected:
      ~messages();
      virtual catalog do_open(const string&, const locale&) const;
      virtual string_type do_get(catalog, int set, int msgid,
                                 const string_type& dfault) const;
      virtual void do_close(catalog) const;
    };
}
```

1 Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

28.3.4.8.2.2 Members [locale.messages.members]

```
catalog open(const string& name, const locale& loc) const;
```

1 *Returns*: `do_open(name, loc)`.

```
string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

2 *Returns*: `do_get(cat, set, msgid, dfault)`.

```
void close(catalog cat) const;
```

3 *Effects*: Calls `do_close(cat)`.

28.3.4.8.2.3 Virtual functions [locale.messages.virtuals]

```
catalog do_open(const string& name, const locale& loc) const;
```

1 *Returns*: A value that may be passed to `get()` to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.

2 Returns a value less than 0 if no such catalog can be opened.

3 *Remarks*: The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```
string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

4 *Preconditions*: `cat` is a catalog obtained from `open()` and not yet closed.

5 *Returns*: A message identified by arguments `set`, `msgid`, and `dfault`, according to an implementation-defined mapping. If no such message can be found, returns `dfault`.

```
void do_close(catalog cat) const;
```

6 *Preconditions*: `cat` is a catalog obtained from `open()` and not yet closed.

7 *Effects*: Releases unspecified resources associated with `cat`.

8 *Remarks*: The limit on such resources, if any, is implementation-defined.

28.3.4.8.3 Class template `messages_byname` [locale.messages.byname]

```
namespace std {
  template<class charT>
    class messages_byname : public messages<charT> {
    public:
      using catalog     = messages_base::catalog;
      using string_type = basic_string<charT>;

      explicit messages_byname(const char*, size_t refs = 0);
      explicit messages_byname(const string&, size_t refs = 0);

    protected:
      ~messages_byname();
    };
}
```

28.3.5 C library locales [c.locales]

28.3.5.1 Header `<clocale>` synopsis [clocale.syn]

```
namespace std {
  struct lconv;

  char* setlocale(int category, const char* locale);
  lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

1 The contents and meaning of the header `<clocale>` are the same as the C standard library header `<locale.h>`.

28.3.5.2 Data races [clocale.data.races]

1 Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 101.

See also: ISO/IEC 9899:2018, 7.11

Table 101 — Potential `setlocale` data races [tab:setlocale.data.races]

`fprintf`	`isprint`	`iswdigit`	`localeconv`	`tolower`
`fscanf`	`ispunct`	`iswgraph`	`mblen`	`toupper`
`isalnum`	`isspace`	`iswlower`	`mbstowcs`	`towlower`
`isalpha`	`isupper`	`iswprint`	`mbtowc`	`towupper`
`isblank`	`iswalnum`	`iswpunct`	`setlocale`	`wcscoll`
`iscntrl`	`iswalpha`	`iswspace`	`strcoll`	`wcstod`
`isdigit`	`iswblank`	`iswupper`	`strerror`	`wcstombs`
`isgraph`	`iswcntrl`	`iswxdigit`	`strtod`	`wcsxfrm`
`islower`	`iswctype`	`isxdigit`	`strxfrm`	`wctomb`

28.4 Text encodings identification [text.encoding]

28.4.1 Header <text_encoding> synopsis [text.encoding.syn]

```
namespace std {
  struct text_encoding;

  // 28.4.2.7, hash support
  template<class T> struct hash;
  template<> struct hash<text_encoding>;
}
```

28.4.2 Class text_encoding [text.encoding.class]

28.4.2.1 Overview [text.encoding.overview]

1 The class `text_encoding` describes an interface for accessing the IANA Character Sets registry[10].

```
namespace std {
  struct text_encoding {
    static constexpr size_t max_name_length = 63;

    // 28.4.2.6, enumeration text_encoding::id
    enum class id : int_least32_t {
      see below
    };
    using enum id;

    constexpr text_encoding() = default;
    constexpr explicit text_encoding(string_view enc) noexcept;
    constexpr text_encoding(id i) noexcept;

    constexpr id mib() const noexcept;
    constexpr const char* name() const noexcept;

    // 28.4.2.5, class text_encoding::aliases_view
    struct aliases_view;
    constexpr aliases_view aliases() const noexcept;

    friend constexpr bool operator==(const text_encoding& a,
                                     const text_encoding& b) noexcept;
    friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;

    static consteval text_encoding literal() noexcept;
    static text_encoding environment();
    template<id i> static bool environment_is();

  private:
    id mib_ = id::unknown;                                          // exposition only
    char name_[max_name_length + 1] = {0};                          // exposition only
    static constexpr bool comp-name(string_view a, string_view b);  // exposition only
  };
}
```

2 Class `text_encoding` is a trivially copyable type (6.8.1).

28.4.2.2 General [text.encoding.general]

1 A *registered character encoding* is a character encoding scheme in the IANA Character Sets registry.

[*Note 1*: The IANA Character Sets registry uses the term “character sets” to refer to character encodings. — *end note*]

The primary name of a registered character encoding is the name of that encoding specified in the IANA Character Sets registry.

2 The set of known registered character encodings contains every registered character encoding specified in the IANA Character Sets registry except for the following:

(2.1) — NATS-DANO (33)

(2.2) — NATS-DANO-ADD (34)

3 Each known registered character encoding is identified by an enumerator in `text_encoding::id`, and has a set of zero or more *aliases*.

4 The set of aliases of a known registered character encoding is an implementation-defined superset of the aliases specified in the IANA Character Sets registry. The set of aliases for US-ASCII includes "ASCII". No two aliases or primary names of distinct registered character encodings are equivalent when compared by `text_encoding::`*`comp-name`*.

5 How a `text_encoding` object is determined to be representative of a character encoding scheme implemented in the translation or execution environment is implementation-defined.

6 An object `e` of type `text_encoding` such that `e.mib() == text_encoding::id::unknown` is `false` and `e.mib() == text_encoding::id::other` is `false` maintains the following invariants:

(6.1) — `*e.name() == '\0'` is `false`, and

(6.2) — `e.mib() == text_encoding(e.name()).mib()` is `true`.

7 *Recommended practice*:

(7.1) — Implementations should not consider registered encodings to be interchangeable.

[*Example 1*: Shift_JIS and Windows-31J denote different encodings. — *end example*]

(7.2) — Implementations should not use the name of a registered encoding to describe another similar yet different non-registered encoding unless there is a precedent on that implementation.

[*Example 2*: Big5 — *end example*]

28.4.2.3 Members [text.encoding.members]

```
constexpr explicit text_encoding(string_view enc) noexcept;
```

1 *Preconditions*:

(1.1) — `enc` represents a string in the ordinary literal encoding consisting only of elements of the basic character set (5.3.1).

(1.2) — `enc.size() <= max_name_length` is `true`.

(1.3) — `enc.contains('\0')` is `false`.

2 *Postconditions*:

(2.1) — If there exists a primary name or alias `a` of a known registered character encoding such that *`comp-name`*`(a, enc)` is `true`, *`mib_`* has the value of the enumerator of `id` associated with that registered character encoding. Otherwise, *`mib_`* `== id::other` is `true`.

(2.2) — `enc.compare(`*`name_`*`) == 0` is `true`.

```
constexpr text_encoding(id i) noexcept;
```

3 *Preconditions*: `i` has the value of one of the enumerators of `id`.

4 *Postconditions*:

(4.1) — *`mib_`* `== i` is `true`.

(4.2) — If `(`*`mib_`* `== id::unknown ||` *`mib_`* `== id::other)` is `true`, `strlen(`*`name_`*`) == 0` is `true`. Otherwise, `ranges::contains(aliases(), string_view(`*`name_`*`))` is `true`.

```
constexpr id mib() const noexcept;
```

5 *Returns*: *`mib_`*.

```
constexpr const char* name() const noexcept;
```

6 *Returns*: *`name_`*.

7 *Remarks*: `name()` is an NTBS and accessing elements of *`name_`* outside of the range `name()` + [0, `strlen(name()) + 1`) is undefined behavior.

```
constexpr aliases_view aliases() const noexcept;
```

Let `r` denote an instance of `aliases_view`. If `*this` represents a known registered character encoding, then:

(7.1) — `r.front()` is the primary name of the registered character encoding,

(7.2) — `r` contains the aliases of the registered character encoding, and

(7.3) — `r` does not contain duplicate values when compared with `strcmp`.

Otherwise, `r` is an empty range.

8 Each element in `r` is a non-null, non-empty NTBS encoded in the literal character encoding and comprising only characters from the basic character set.

9 *Returns*: `r`.

10 [*Note 1*: The order of aliases in `r` is unspecified. — *end note*]

```
static consteval text_encoding literal() noexcept;
```

11 *Mandates*: `CHAR_BIT == 8` is `true`.

12 *Returns*: A `text_encoding` object representing the ordinary character literal encoding (5.3.1).

```
static text_encoding environment();
```

13 *Mandates*: `CHAR_BIT == 8` is `true`.

14 *Returns*: A `text_encoding` object representing the implementation-defined character encoding scheme of the environment. On a POSIX implementation, this is the encoding scheme associated with the POSIX locale denoted by the empty string `""`.

15 [*Note 2*: This function is not affected by calls to `setlocale`. — *end note*]

16 *Recommended practice*: Implementations should return a value that is not affected by calls to the POSIX function `setenv` and other functions which can modify the environment (17.14).

```
template<id i>
  static bool environment_is();
```

17 *Mandates*: `CHAR_BIT == 8` is `true`.

18 *Returns*: `environment() == i`.

```
static constexpr bool comp-name(string_view a, string_view b);
```

19 *Returns*: `true` if the two strings `a` and `b` encoded in the ordinary literal encoding are equal, ignoring, from left-to-right,

(19.1) — all elements that are not digits or letters (16.3.3.3.4.1),

(19.2) — character case, and

(19.3) — any sequence of one or more `0` characters not immediately preceded by a numeric prefix, where a numeric prefix is a sequence consisting of a digit in the range $[1, 9]$ optionally followed by one or more elements which are not digits or letters,

and `false` otherwise.

[*Note 3*: This comparison is identical to the “Charset Alias Matching” algorithm described in the Unicode Technical Standard 22[12]. — *end note*]

[*Example 1*:

```
static_assert(comp-name("UTF-8", "utf8") == true);
static_assert(comp-name("u.t.f-008", "utf8") == true);
static_assert(comp-name("ut8", "utf8") == false);
static_assert(comp-name("utf-80", "utf8") == false);
```

— *end example*]

28.4.2.4 Comparison functions [text.encoding.cmp]

```
friend constexpr bool operator==(const text_encoding& a, const text_encoding& b) noexcept;
```

1 *Returns*: If `a.mib_ == id::other && b.mib_ == id::other` is `true`, then `comp-name(a.name_, b.name_)`. Otherwise, `a.mib_ == b.mib_`.

```
friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;
```

2 *Returns*: `encoding.mib_ == i`.

3 *Remarks*: This operator induces an equivalence relation on its arguments if and only if `i != id::other` is `true`.

28.4.2.5 Class `text_encoding::aliases_view` [text.encoding.aliases]

```
struct text_encoding::aliases_view : ranges::view_interface<text_encoding::aliases_view> {
  constexpr implementation-defined begin() const;
  constexpr implementation-defined end() const;
};
```

1 `text_encoding::aliases_view` models `copyable`, `ranges::view`, `ranges::random_access_range`, and `ranges::borrowed_range`.

[*Note 1*: `text_encoding::aliases_view` is not required to satisfy `ranges::common_range`, nor `default_initializable`. —*end note*]

2 Both `ranges::range_value_t<text_encoding::aliases_view>` and `ranges::range_reference_t<text_encoding::aliases_view>` denote `const char*`.

3 `ranges::iterator_t<text_encoding::aliases_view>` is a constexpr iterator (24.3.1).

28.4.2.6 Enumeration `text_encoding::id` [text.encoding.id]

```

```

[*Note 1*: The `text_encoding::id` enumeration contains an enumerator for each known registered character encoding. For each encoding, the corresponding enumerator is derived from the alias beginning with "`cs`", as follows

— `csUnicode` is mapped to `text_encoding::id::UCS2`,

— `csIBBM904` is mapped to `text_encoding::id::IBM904`, and

— the "`cs`" prefix is removed from other names.

— *end note*]

28.4.2.7 Hash support [text.encoding.hash]

`template<> struct hash<text_encoding>;`

1 The specialization is enabled (22.10.19).

28.5 Formatting [format]

28.5.1 Header <format> synopsis [format.syn]

```

```

1 The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

28.5.2 Format string [format.string]

28.5.2.1 General [format.string.general]

1 A *format string* for arguments `args` is a (possibly empty) sequence of *replacement fields*, *escape sequences*, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{{` or `}}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:
  `{` *arg-id*$_{opt}$ *format-specifier*$_{opt}$ `}`

arg-id:
  `0`
  positive-integer

positive-integer:
  nonzero-digit
  positive-integer digit

nonnegative-integer:
  digit
  nonnegative-integer digit

nonzero-digit: one of
  `1 2 3 4 5 6 7 8 9`

digit: one of
  `0 1 2 3 4 5 6 7 8 9`

format-specifier:
  `:` *format-spec*

format-spec:
  as specified by the `formatter` specialization for the argument type; cannot start with `}`

2 The *arg-id* field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index *arg-id* in `args`, the string is not a format string for `args`. The optional *format-specifier* field explicitly specifies a format for the replacement value.

3 [*Example 1*:

```
string s = format("{0}-{{", 8);            // value of s is "8-{"
```

— *end example*]

4 If all *arg-id*s in a format string are omitted (including those in the *format-spec*, as interpreted by the corresponding `formatter` specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some *arg-id*s are omitted and some are present, the string is not a format string.

[*Note 1*: A format string cannot contain a mixture of automatic and manual indexing. — *end note*]

[*Example 2*:

```
string s0 = format("{} to {}",   "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed
string s3 = format("{} to {1}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed
```

— *end example*]

5 The *format-spec* field contains *format specifications* that define how the value should be presented. Each type can define its own interpretation of the *format-spec* field. If *format-spec* does not conform to the format specifications for the argument type referred to by *arg-id*, the string is not a format string for `args`.

[*Example 3*:

(5.1) — For arithmetic, pointer, and string types the *format-spec* is interpreted as a *std-format-spec* as described in 28.5.2.2.

(5.2) — For chrono types the *format-spec* is interpreted as a *chrono-format-spec* as described in 30.12.

(5.3) — For user-defined `formatter` specializations, the behavior of the `parse` member function determines how the *format-spec* is interpreted.

— *end example*]

28.5.2.2 Standard format specifiers [format.string.std]

1 Each `formatter` specialization described in 28.5.6.4 for fundamental and string types interprets *format-spec* as a *std-format-spec*.

[*Note 1*: The format specification can be used to specify such details as minimum field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — *end note*]

The syntax of format specifications is as follows:

std-format-spec:
  fill-and-align$_{opt}$ *sign*$_{opt}$ `#`$_{opt}$ `0`$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ `L`$_{opt}$ *type*$_{opt}$

fill-and-align:
  fill$_{opt}$ *align*

fill:
  any character other than `{` or `}`

align: one of
  `<` `>` `^`

sign: one of
  `+` `-` space

width:
  positive-integer
  `{` *arg-id*$_{opt}$ `}`

precision:
  `.` *nonnegative-integer*
  `.` `{` *arg-id*$_{opt}$ `}`

type: one of
  `a A b B c d e E f F g G o p P s x X ?`

2 Field widths are specified in *field width units*; the number of column positions required to display a sequence of characters in a terminal. The *minimum field width* is the number of field width units a replacement field minimally requires of the formatted sequence of characters produced for a format argument. The *estimated field width* is the number of field width units that are required for the formatted sequence of characters produced for a format argument independent of the effects of the *width* option. The *padding width* is the greater of `0` and the difference of the minimum field width and the estimated field width.

[*Note 2*: The POSIX `wcswidth` function is an example of a function that, given a string, returns the number of column positions required by a terminal to display the string. — *end note*]

3 The *fill character* is the character denoted by the *fill* option or, if the *fill* option is absent, the space character. For a format specification in UTF-8, UTF-16, or UTF-32, the fill character corresponds to a single Unicode scalar value.

[*Note 3*: The presence of a *fill* option is signaled by the character following it, which must be one of the alignment options. If the second character of *std-format-spec* is not a valid alignment option, then it is assumed that the *fill* and *align* options are both absent. — *end note*]

4 The *align* option applies to all argument types. The meaning of the various alignment options is as specified in Table 102.

[*Example 1*:

```
char c = 120;
string s0 = format("{:6}", 42);              // value of s0 is "    42"
string s1 = format("{:6}", 'x');             // value of s1 is "x     "
string s2 = format("{:*<6}", 'x');           // value of s2 is "x*****"
string s3 = format("{:*>6}", 'x');           // value of s3 is "*****x"
string s4 = format("{:*^6}", 'x');           // value of s4 is "**x***"
string s5 = format("{:6d}", c);              // value of s5 is "   120"
string s6 = format("{:6}", true);            // value of s6 is "true  "
string s7 = format("{:*<6.3}", "123456");    // value of s7 is "123***"
string s8 = format("{:02}", 1234);           // value of s8 is "1234"
string s9 = format("{:*<}", "12");           // value of s9 is "12"
string sA = format("{:*<6}", "12345678");    // value of sA is "12345678"
string sB = format("{:🤡^6}", "x");          // value of sB is "🤡🤡x🤡🤡🤡"
string sC = format("{:*^6}", "🤡🤡🤡");       // value of sC is "🤡🤡🤡"
```

— *end example*]

[*Note 4*: The *fill*, *align*, and `0` options have no effect when the minimum field width is not greater than the estimated field width because padding width is `0` in that case. Since fill characters are assumed to have a field width of `1`, use of a character with a different field width can produce misaligned output. The 🤡 (U+1F921 CLOWN FACE) character has a field width of `2`. The examples above that include that character illustrate the effect of the field width when that character is used as a fill character as opposed to when it is used as a formatting argument. — *end note*]

Table 102 — Meaning of *align* options [tab:format.align]

Option	Meaning
`<`	Forces the formatted argument to be aligned to the start of the field by inserting n fill characters after the formatted argument where n is the padding width. This is the default for non-arithmetic non-pointer types, `charT`, and `bool`, unless an integer presentation type is specified.
`>`	Forces the formatted argument to be aligned to the end of the field by inserting n fill characters before the formatted argument where n is the padding width. This is the default for arithmetic types other than `charT` and `bool`, pointer types, or when an integer presentation type is specified.
`^`	Forces the formatted argument to be centered within the field by inserting $\lfloor \frac{n}{2} \rfloor$ fill characters before and $\lceil \frac{n}{2} \rceil$ fill characters after the formatted argument, where n is the padding width.

5 The *sign* option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. The meaning of the various options is as specified in Table 103.

6 The *sign* option applies to floating-point infinity and NaN.

[*Example 2*:

```
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);      // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);     // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);    // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);    // value of s3 is "nan,+nan,nan, nan"
```

Table 103 — Meaning of *sign* options [tab:format.sign]

Option	Meaning
`+`	Indicates that a sign should be used for both non-negative and negative numbers. The `+` sign is inserted before the output of `to_chars` for non-negative numbers other than negative zero. [*Note 5*: For negative numbers and negative zero the output of `to_chars` will already contain the sign so no additional transformation is performed. — *end note*]
`-`	Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).
space	Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.

— *end example*]

7 The `#` option causes the *alternate form* to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 105 into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for `g` and `G` conversions, trailing zeros are not removed from the result.

8 The `0` option is valid for arithmetic types other than `charT` and `bool`, pointer types, or when an integer presentation type is specified. For formatting arguments that have a value other than an infinity or a NaN, this option pads the formatted argument by inserting the `0` character n times following the sign or base prefix indicators (if any) where n is `0` if the *align* option is present and is the padding width otherwise.

[*Example 3*:

```
char c = 120;
string s1 = format("{:+06d}", c);        // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa);      // value of s2 is "0x000a"
string s3 = format("{:<06}", -42);       // value of s3 is "-42   " (0 has no effect)
string s4 = format("{:06}", inf);        // value of s4 is "   inf" (0 has no effect)
```

— *end example*]

9 The *width* option specifies the minimum field width. If the *width* option is absent, the minimum field width is `0`.

10 If `{` *arg-id*$_{opt}$ `}` is used in a *width* or *precision* option, the value of the corresponding formatting argument is used as the value of the option. The option is valid only if the corresponding formatting argument is of standard signed or unsigned integer type. If its value is negative, an exception of type `format_error` is thrown.

11 If *positive-integer* is used in a *width* option, the value of the *positive-integer* is interpreted as a decimal integer and used as the value of the option.

12 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use either UTF-8, UTF-16, or UTF-32, on platforms capable of displaying Unicode text in a terminal.

[*Note 6*: This is the case for Windows®-based[238] and many POSIX-based operating systems. — *end note*]

13 For a sequence of characters in UTF-8, UTF-16, or UTF-32, an implementation should use as its field width the sum of the field widths of the first code point of each extended grapheme cluster. Extended grapheme clusters are defined by UAX #29 of the Unicode Standard. The following code points have a field width of 2:

(13.1) — any code point with the `East_Asian_Width="W"` or `East_Asian_Width="F"` property as described by UAX #44 of the Unicode Standard

238) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.

(13.2) — U+4DC0 – U+4DFF (Yijing Hexagram Symbols)

(13.3) — U+1F300 – U+1F5FF (Miscellaneous Symbols and Pictographs)

(13.4) — U+1F900 – U+1F9FF (Supplemental Symbols and Pictographs)

The field width of all other code points is 1.

14 For a sequence of characters in neither UTF-8, UTF-16, nor UTF-32, the field width is unspecified.

15 The *precision* option is valid for floating-point and string types. For floating-point types, the value of this option specifies the precision to be used for the floating-point presentation type. For string types, this option specifies the longest prefix of the formatted argument to be included in the replacement field such that the field width of the prefix is no greater than the value of this option.

16 If *nonnegative-integer* is used in a *precision* option, the value of the decimal integer is used as the value of the option.

17 When the `L` option is used, the form used for the conversion is called the *locale-specific form*. The `L` option is only valid for arithmetic types, and its effect depends upon the type.

(17.1) — For integral types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group separator characters.

(17.2) — For floating-point types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group and radix separator characters.

(17.3) — For the textual representation of `bool`, the locale-specific form causes the context's locale to be used to insert the appropriate string as if obtained with `numpunct::truename` or `numpunct::falsename`.

18 The *type* determines how the data should be presented.

19 The available string presentation types are specified in Table 104.

Table 104 — Meaning of *type* options for strings [tab:format.type.string]

Type	Meaning
none, `s`	Copies the string to the output.
`?`	Copies the escaped string (28.5.6.5) to the output.

20 The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let [`first`, `last`) be a range large enough to hold the `to_chars` output and `value` be the formatting argument value. Formatting is done as if by calling `to_chars` as specified and copying the output through the output iterator of the format context.

[*Note 7*: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — *end note*]

21 The available integer presentation types for integral types other than `bool` and `charT` are specified in Table 105.

[*Example 4*:

```
string s0 = format("{}", 42);                        // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42);   // value of s1 is "101010 42 52 2a"
string s2 = format("{0:#x} {0:#X}", 42);             // value of s2 is "0x2a 0X2A"
string s3 = format("{:L}", 1234);                    // value of s3 can be "1,234"
                                                     // (depending on the locale)
```

— *end example*]

22 The available `charT` presentation types are specified in Table 106.

23 The available `bool` presentation types are specified in Table 107.

24 The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 108. For lower-case presentation types, infinity and NaN are formatted as `inf` and `nan`, respectively. For upper-case presentation types, infinity and NaN are formatted as `INF` and `NAN`, respectively.

[*Note 9*: In either case, a sign is included if indicated by the *sign* option. — *end note*]

25 The available pointer presentation types and their mapping to `to_chars` are specified in Table 109.

[*Note 10*: Pointer presentation types also apply to `nullptr_t`. — *end note*]

Table 105 — Meaning of *type* options for integer types [tab:format.type.int]

Type	Meaning
`b`	`to_chars(first, last, value, 2)`; the base prefix is `0b`.
`B`	The same as `b`, except that the base prefix is `0B`.
`c`	Copies the character `static_cast<charT>(value)` to the output. Throws `format_error` if `value` is not in the range of representable values for `charT`.
`d`	`to_chars(first, last, value)`.
`o`	`to_chars(first, last, value, 8)`; the base prefix is `0` if `value` is nonzero and is empty otherwise.
`x`	`to_chars(first, last, value, 16)`; the base prefix is `0x`.
`X`	The same as `x`, except that it uses uppercase letters for digits above 9 and the base prefix is `0X`.
none	The same as `d`. [*Note 8*: If the formatting argument type is `charT` or `bool`, the default is instead `c` or `s`, respectively. — *end note*]

Table 106 — Meaning of *type* options for `charT` [tab:format.type.char]

Type	Meaning
none, `c`	Copies the character to the output.
`b`, `B`, `d`, `o`, `x`, `X`	As specified in Table 105 with `value` converted to the unsigned version of the underlying type.
`?`	Copies the escaped character (28.5.6.5) to the output.

Table 107 — Meaning of *type* options for `bool` [tab:format.type.bool]

Type	Meaning
none, `s`	Copies textual representation, either `true` or `false`, to the output.
`b`, `B`, `d`, `o`, `x`, `X`	As specified in Table 105 for the value `static_cast<unsigned char>(value)`.

28.5.3 Error reporting [format.err.report]

1 Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.14.

28.5.4 Class template `basic_format_string` [format.fmt.string]

```
namespace std {
  template<class charT, class... Args>
  struct basic_format_string {
  private:
    basic_string_view<charT> str;         // exposition only

  public:
    template<class T> consteval basic_format_string(const T& s);
    basic_format_string(runtime-format-string<charT> s) noexcept : str(s.str) {}

    constexpr basic_string_view<charT> get() const noexcept { return str; }
  };
}
```

`template<class T> consteval basic_format_string(const T& s);`

1 *Constraints*: `const T&` models `convertible_to<basic_string_view<charT>>`.

2 *Effects*: Direct-non-list-initializes *`str`* with `s`.

Table 108 — Meaning of *type* options for floating-point types [tab:format.type.float]

Type	Meaning

`a`	If *precision* is specified, equivalent to
	`to_chars(first, last, value, chars_format::hex, precision)`
	where `precision` is the specified formatting precision; equivalent to
	`to_chars(first, last, value, chars_format::hex)`
	otherwise.

`A`	The same as `a`, except that it uses uppercase letters for digits above 9 and `P` to indicate the exponent.
`e`	Equivalent to `to_chars(first, last, value, chars_format::scientific, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`E`	The same as `e`, except that it uses `E` to indicate exponent.
`f`, `F`	Equivalent to `to_chars(first, last, value, chars_format::fixed, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`g`	Equivalent to `to_chars(first, last, value, chars_format::general, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`G`	The same as `g`, except that it uses `E` to indicate exponent.

none	If *precision* is specified, equivalent to
	`to_chars(first, last, value, chars_format::general, precision)`
	where `precision` is the specified formatting precision; equivalent to
	`to_chars(first, last, value)`
	otherwise.

Table 109 — Meaning of *type* options for pointer types [tab:format.type.ptr]

Type	Meaning
none, `p`	If `uintptr_t` is defined, `to_chars(first, last, reinterpret_cast<uintptr_t>(value), 16)` with the prefix `0x` inserted immediately before the output of `to_chars`; otherwise, implementation-defined.
`P`	The same as `p`, except that it uses uppercase letters for digits above `9` and the base prefix is `0X`.

3 *Remarks*: A call to this function is not a core constant expression (7.7) unless there exist `args` of types `Args` such that *`str`* is a format string for `args`.

28.5.5 Formatting functions [format.functions]

1 In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 26.2.

```
template<class... Args>
  string format(format_string<Args...> fmt, Args&&... args);
```

2 *Effects*: Equivalent to:

```
return vformat(fmt.str, make_format_args(args...));
```

```
template<class... Args>
  wstring format(wformat_string<Args...> fmt, Args&&... args);
```

3 *Effects*: Equivalent to:

```
return vformat(fmt.str, make_wformat_args(args...));
```

```
template<class... Args>
  string format(const locale& loc, format_string<Args...> fmt, Args&&... args);
```

4 *Effects*: Equivalent to:

```
return vformat(loc, fmt.str, make_format_args(args...));
```

```
template<class... Args>
  wstring format(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

5 *Effects*: Equivalent to:

```
return vformat(loc, fmt.str, make_wformat_args(args...));
```

```
string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

6 *Returns*: A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

7 *Throws*: As specified in 28.5.3.

```
template<class Out, class... Args>
  Out format_to(Out out, format_string<Args...> fmt, Args&&... args);
```

8 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, wformat_string<Args...> fmt, Args&&... args);
```

9 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, format_string<Args...>  fmt, Args&&... args);
```

10 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

11 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));
```

```
template<class Out>
  Out vformat_to(Out out, string_view fmt, format_args args);
template<class Out>
  Out vformat_to(Out out, wstring_view fmt, wformat_args args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, string_view fmt, format_args args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, wstring_view fmt, wformat_args args);
```

12 Let `charT` be `decltype(fmt)::value_type`.

13 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

14 *Preconditions*: `Out` models `output_iterator<const charT&>`.

15 *Effects*: Places the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range [`out`, `out + N`), where `N` is the number of characters in that character representation. If present, `loc` is used for locale-specific formatting.

16 *Returns*: `out + N`.

17 *Throws*: As specified in 28.5.3.

```
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      format_string<Args...> fmt, Args&&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      wformat_string<Args...> fmt, Args&&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, format_string<Args...> fmt,
                                      Args&&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, wformat_string<Args...> fmt,
                                      Args&&... args);
```

18 Let

(18.1) — `charT` be `decltype(fmt.`*`str`*`)::value_type`,

(18.2) — `N` be `formatted_size(fmt, args...)` for the functions without a `loc` parameter and `formatted_size(loc, fmt, args...)` for the functions with a `loc` parameter, and

(18.3) — `M` be `clamp(n, 0, N)`.

19 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

20 *Preconditions*: `Out` models `output_iterator<const charT&>`, and `formatter<remove_cvref_t<`T_i`>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) for each T_i in `Args`.

21 *Effects*: Places the first `M` characters of the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range [`out`, `out + M`). If present, `loc` is used for locale-specific formatting.

22 *Returns*: `{out + M, N}`.

23 *Throws*: As specified in 28.5.3.

```
template<class... Args>
  size_t formatted_size(format_string<Args...> fmt, Args&&... args);
template<class... Args>
  size_t formatted_size(wformat_string<Args...> fmt, Args&&... args);
template<class... Args>
  size_t formatted_size(const locale& loc, format_string<Args...> fmt, Args&&... args);
template<class... Args>
  size_t formatted_size(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

24 Let `charT` be `decltype(fmt.`*`str`*`)::value_type`.

25 *Preconditions*: `formatter<remove_cvref_t<`T_i`>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) for each T_i in `Args`.

26 *Returns*: The number of characters in the character representation of formatting arguments `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

27 *Throws*: As specified in 28.5.3.

28.5.6 Formatter [format.formatter]

28.5.6.1 Formatter requirements [formatter.requirements]

1 A type `F` meets the *BasicFormatter* requirements if it meets the

(1.1) — *Cpp17DefaultConstructible* (Table 30),

(1.2) — *Cpp17CopyConstructible* (Table 32),

(1.3) — *Cpp17CopyAssignable* (Table 34),

(1.4) — *Cpp17Swappable* (16.4.4.3), and

(1.5) — *Cpp17Destructible* (Table 35)

requirements, and the expressions shown in Table 110 are valid and have the indicated semantics.

2 A type `F` meets the *Formatter* requirements if it meets the *BasicFormatter* requirements and the expressions shown in Table 111 are valid and have the indicated semantics.

3 Given character type `charT`, output iterator type `Out`, and formatting argument type `T`, in Table 110 and Table 111:

(3.1) — `f` is a value of type (possibly const) `F`,

(3.2) — `g` is an lvalue of type `F`,

(3.3) — `u` is an lvalue of type `T`,

(3.4) — `t` is a value of a type convertible to (possibly const) `T`,

(3.5) — `PC` is `basic_format_parse_context<charT>`,

(3.6) — `FC` is `basic_format_context<Out, charT>`,

(3.7) — `pc` is an lvalue of type `PC`, and

(3.8) — `fc` is an lvalue of type `FC`.

`pc.begin()` points to the beginning of the *format-spec* (28.5.2) of the replacement field being formatted in the format string. If *format-spec* is not present or empty then either `pc.begin() == pc.end()` or `*pc.begin() == '}'`.

Table 110 — *BasicFormatter* requirements [tab:formatter.basic]

Expression	Return type	Requirement
`g.parse(pc)`	`PC::iterator`	Parses *format-spec* (28.5.2) for type `T` in the range [`pc.begin()`,`pc.end()`) until the first unmatched character. Throws `format_error` unless the whole range is parsed or the unmatched character is `}`. [*Note 1*: This allows formatters to emit meaningful error messages. — *end note*] Stores the parsed format specifiers in `*this` and returns an iterator past the end of the parsed range.
`f.format(u, fc)`	`FC::iterator`	Formats `u` according to the specifiers stored in `*this`, writes the output to `fc.out()`, and returns an iterator past the end of the output range. The output shall only depend on `u`, `fc.locale()`, `fc.arg(n)` for any value `n` of type `size_t`, and the range [`pc.begin()`,`pc.end()`) from the last call to `f.parse(pc)`.

Table 111 — *Formatter* requirements [tab:formatter]

Expression	Return type	Requirement
`f.format(t, fc)`	`FC::iterator`	Formats `t` according to the specifiers stored in `*this`, writes the output to `fc.out()`, and returns an iterator past the end of the output range. The output shall only depend on `t`, `fc.locale()`, `fc.arg(n)` for any value `n` of type `size_t`, and the range [`pc.begin()`,`pc.end()`) from the last call to `f.parse(pc)`.
`f.format(u, fc)`	`FC::iterator`	As above, but does not modify `u`.

28.5.6.2 Formatter locking [format.formatter.locking]

```
template<class T>
  constexpr bool enable_nonlocking_formatter_optimization = false;
```

1 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_nonlocking_formatter_optimization` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

28.5.6.3 Concept `formattable` [format.formattable]

1 Let *`fmt-iter-for`*`<charT>` be an unspecified type that models `output_iterator<const charT&>` (24.3.4.10).

```
template<class T, class Context,
         class Formatter = typename Context::template formatter_type<remove_const_t<T>>>
  concept formattable-with =                // exposition only
    semiregular<Formatter> &&
    requires(Formatter& f, const Formatter& cf, T&& t, Context fc,
             basic_format_parse_context<typename Context::char_type> pc)
    {
      { f.parse(pc) } -> same_as<typename decltype(pc)::iterator>;
      { cf.format(t, fc) } -> same_as<typename Context::iterator>;
    };

template<class T, class charT>
  concept formattable =
    formattable-with<remove_reference_t<T>, basic_format_context<fmt-iter-for<charT>, charT>>;
```

2 A type `T` and a character type `charT` model `formattable` if `formatter<remove_cvref_t<T>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) and, if `remove_reference_t<T>` is const-qualified, the *Formatter* requirements.

28.5.6.4 Formatter specializations [format.formatter.spec]

1 The functions defined in 28.5.5 use specializations of the class template `formatter` to format individual arguments.

2 Let `charT` be either `char` or `wchar_t`. Each specialization of `formatter` is either enabled or disabled, as described below. A *debug-enabled* specialization of `formatter` additionally provides a public, constexpr, non-static member function `set_debug_format()` which modifies the state of the `formatter` to be as if the type of the *std-format-spec* parsed by the last call to `parse` were `?`. Each header that declares the template `formatter` provides the following enabled specializations:

(2.1) — The debug-enabled specializations

```
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```

(2.2) — For each `charT`, the debug-enabled string type specializations

```
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<charT[N], charT>;
template<class traits, class Allocator>
  struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
  struct formatter<basic_string_view<charT, traits>, charT>;
```

(2.3) — For each `charT`, for each cv-unqualified arithmetic type `ArithmeticT` other than `char`, `wchar_t`, `char8_t`, `char16_t`, or `char32_t`, a specialization

```
template<> struct formatter<ArithmeticT, charT>;
```

(2.4) — For each `charT`, the pointer type specializations

```
template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The `parse` member functions of these formatters interpret the format specification as a *std-format-spec* as described in 28.5.2.2.

3 Unless specified otherwise, for each type `T` for which a `formatter` specialization is provided by the library, each of the headers provides the following specialization:

```
template<> inline constexpr bool enable_nonlocking_formatter_optimization<T> = true;
```

[*Note 1*: Specializations such as `formatter<wchar_t, char>` that would require implicit multibyte / wide string or character conversion are disabled. — *end note*]

4 The header `<format>` provides the following disabled specializations:

(4.1) — The string type specializations

```
template<> struct formatter<char*, wchar_t>;
template<> struct formatter<const char*, wchar_t>;
template<size_t N> struct formatter<char[N], wchar_t>;
template<class traits, class Allocator>
  struct formatter<basic_string<char, traits, Allocator>, wchar_t>;
template<class traits>
  struct formatter<basic_string_view<char, traits>, wchar_t>;
```

5 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.

6 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled and meets the *Formatter* requirements except as noted otherwise.

7 If `F` is a disabled specialization of `formatter`, these values are `false`:

(7.1) — `is_default_constructible_v<F>`,

(7.2) — `is_copy_constructible_v<F>`,

(7.3) — `is_move_constructible_v<F>`,

(7.4) — `is_copy_assignable_v<F>`, and

(7.5) — `is_move_assignable_v<F>`.

8 An enabled specialization `formatter<T, charT>` meets the *BasicFormatter* requirements (28.5.6.1).

[*Example 1*:

```
#include <format>
#include <string>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };

template<> struct std::formatter<color> : std::formatter<const char*> {
  auto format(color c, format_context& ctx) const {
    return formatter<const char*>::format(color_names[c], ctx);
  }
};

struct err {};

std::string s0 = std::format("{}", 42);         // OK, library-provided formatter
std::string s1 = std::format("{}", L"foo");     // error: disabled formatter
std::string s2 = std::format("{}", red);        // OK, user-provided formatter
std::string s3 = std::format("{}", err{});      // error: disabled formatter
```

— *end example*]

28.5.6.5 Formatting escaped characters and strings [format.string.escaped]

1 A character or string can be formatted as *escaped* to make it more suitable for debugging or for logging.

2 The escaped string *E* representation of a string *S* is constructed by encoding a sequence of characters as follows. The associated character encoding *CE* for `charT` (Table 12) is used to both interpret *S* and construct *E*.

(2.1) — U+0022 QUOTATION MARK (`"`) is appended to *E*.

(2.2) — For each code unit sequence *X* in *S* that either encodes a single character, is a shift sequence, or is a sequence of ill-formed code units, processing is in order as follows:

(2.2.1) — If X encodes a single character C, then:

(2.2.1.1) — If C is one of the characters in Table 112, then the two characters shown as the corresponding escape sequence are appended to E.

(2.2.1.2) — Otherwise, if C is not U+0020 SPACE and

(2.2.1.2) — CE is UTF-8, UTF-16, or UTF-32 and C corresponds to a Unicode scalar value whose Unicode property `General_Category` has a value in the groups `Separator` (`Z`) or `Other` (`C`), as described by UAX #44 of the Unicode Standard, or

(2.2.1.2) — CE is UTF-8, UTF-16, or UTF-32 and C corresponds to a Unicode scalar value with the Unicode property `Grapheme_Extend=Yes` as described by UAX #44 of the Unicode Standard and C is not immediately preceded in S by a character P appended to E without translation to an escape sequence, or

(2.2.1.2) — CE is neither UTF-8, UTF-16, nor UTF-32 and C is one of an implementation-defined set of separator or non-printable characters

then the sequence `\u{`*`hex-digit-sequence`*`}` is appended to E, where *`hex-digit-sequence`* is the shortest hexadecimal representation of C using lower-case hexadecimal digits.

(2.2.1.3) — Otherwise, C is appended to E.

(2.2.2) — Otherwise, if X is a shift sequence, the effect on E and further decoding of S is unspecified.

Recommended practice: A shift sequence should be represented in E such that the original code unit sequence of S can be reconstructed.

(2.2.3) — Otherwise (X is a sequence of ill-formed code units), each code unit U is appended to E in order as the sequence `\x{`*`hex-digit-sequence`*`}`, where *`hex-digit-sequence`* is the shortest hexadecimal representation of U using lower-case hexadecimal digits.

(2.3) — Finally, U+0022 QUOTATION MARK (`"`) is appended to E.

Table 112 — Mapping of characters to escape sequences [tab:format.escape.sequences]

Character	Escape sequence
U+0009 CHARACTER TABULATION	`\t`
U+000A LINE FEED	`\n`
U+000D CARRIAGE RETURN	`\r`
U+0022 QUOTATION MARK	`\"`
U+005C REVERSE SOLIDUS	`\\`

3 The escaped string representation of a character C is equivalent to the escaped string representation of a string of C, except that:

(3.1) — the result starts and ends with U+0027 APOSTROPHE (`'`) instead of U+0022 QUOTATION MARK (`"`), and

(3.2) — if C is U+0027 APOSTROPHE, the two characters `\'` are appended to E, and

(3.3) — if C is U+0022 QUOTATION MARK, then C is appended unchanged.

[*Example 1*:
```
string s0 = format("[{}]", "h\tllo");                  // s0 has value: [h    llo]
string s1 = format("[{:?}]", "h\tllo");                // s1 has value: ["h\tllo"]
string s2 = format("[{:?}]", "Спасибо, Виктор ❤️!");   // s2 has value: ["Спасибо, Виктор ❤️!"]
string s3 = format("[{:?}, {:?}]", '\'', '"');         // s3 has value: ['\'', '"']

// The following examples assume use of the UTF-8 encoding
string s4 = format("[{:?}]", string("\0 \n \t \x02 \x1b", 9));
                                                // s4 has value: ["\u{0} \n \t \u{2} \u{1b}"]
string s5 = format("[{:?}]", "\xc3\x28");       // invalid UTF-8, s5 has value: ["\x{c3}("]
string s6 = format("[{:?}]", "🤷🏻‍♂️");            // s6 has value: ["🤷🏻\u{200d}♂️"]
string s7 = format("[{:?}]", "\u0301");         // s7 has value: ["\u{301}"]
string s8 = format("[{:?}]", "\\\u0301");       // s8 has value: ["\\\u{301}"]
string s9 = format("[{:?}]", "e\u0301\u0323");  // s9 has value: ["ẹ́"]
```
— *end example*]

28.5.6.6 Class template `basic_format_parse_context` [format.parse.ctx]

```
namespace std {
  template<class charT>
  class basic_format_parse_context {
  public:
    using char_type = charT;
    using const_iterator = typename basic_string_view<charT>::const_iterator;
    using iterator = const_iterator;

  private:
    iterator begin_;                                    // exposition only
    iterator end_;                                      // exposition only
    enum indexing { unknown, manual, automatic };       // exposition only
    indexing indexing_;                                 // exposition only
    size_t next_arg_id_;                                // exposition only
    size_t num_args_;                                   // exposition only

  public:
    constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt) noexcept;
    basic_format_parse_context(const basic_format_parse_context&) = delete;
    basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;

    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr void advance_to(const_iterator it);

    constexpr size_t next_arg_id();
    constexpr void check_arg_id(size_t id);

    template<class... Ts>
      constexpr void check_dynamic_spec(size_t id) noexcept;
    constexpr void check_dynamic_spec_integral(size_t id) noexcept;
    constexpr void check_dynamic_spec_string(size_t id) noexcept;
  };
}
```

1 An instance of `basic_format_parse_context` holds the format string parsing state, consisting of the format string range being parsed and the argument counter for automatic indexing.

2 If a program declares an explicit or partial specialization of `basic_format_parse_context`, the program is ill-formed, no diagnostic required.

```
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt) noexcept;
```

3 *Effects*: Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with `0`, and `num_args_` with `0`.

[*Note 1*: Any call to `next_arg_id`, `check_arg_id`, or `check_dynamic_spec` on an instance of `basic_format_parse_context` initialized using this constructor is not a core constant expression. — *end note*]

```
constexpr const_iterator begin() const noexcept;
```

4 *Returns*: `begin_`.

```
constexpr const_iterator end() const noexcept;
```

5 *Returns*: `end_`.

```
constexpr void advance_to(const_iterator it);
```

6 *Preconditions*: `end()` is reachable from `it`.

7 *Effects*: Equivalent to: `begin_ = it;`

```
constexpr size_t next_arg_id();
```

8 *Effects*: If `indexing_ != manual` is `true`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = automatic;
```

```
return next_arg_id_++;
```

9 *Throws*: `format_error` if `indexing_ == manual` is `true`.

[*Note 2*: This indicates mixing of automatic and manual argument indexing. — *end note*]

10 *Remarks*: Let *`cur-arg-id`* be the value of `next_arg_id_` prior to this call. Call expressions where *`cur-arg-id`* `>= num_args_` is `true` are not core constant expressions (7.7).

```
constexpr void check_arg_id(size_t id);
```

11 *Effects*: If `indexing_ != automatic` is `true`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = manual;
```

12 *Throws*: `format_error` if `indexing_ == automatic` is `true`.

[*Note 3*: This indicates mixing of automatic and manual argument indexing. — *end note*]

13 *Remarks*: A call to this function is a core constant expression (7.7) only if `id < num_args_` is `true`.

```
template<class... Ts>
  constexpr void check_dynamic_spec(size_t id) noexcept;
```

14 *Mandates*: `sizeof...(Ts)` ≥ 1. The types in `Ts...` are unique. Each type in `Ts...` is one of `bool`, `char_type`, `int`, `unsigned int`, `long long int`, `unsigned long long int`, `float`, `double`, `long double`, `const char_type*`, `basic_string_view<char_type>`, or `const void*`.

15 *Remarks*: A call to this function is a core constant expression only if

(15.1) — `id < num_args_` is `true` and

(15.2) — the type of the corresponding format argument (after conversion to `basic_format_arg<Context>`) is one of the types in `Ts...`.

```
constexpr void check_dynamic_spec_integral(size_t id) noexcept;
```

16 *Effects*: Equivalent to:

```
check_dynamic_spec<int, unsigned int, long long int, unsigned long long int>(id);
```

```
constexpr void check_dynamic_spec_string(size_t id) noexcept;
```

17 *Effects*: Equivalent to:

```
check_dynamic_spec<const char_type*, basic_string_view<char_type>>(id);
```

28.5.6.7 Class template `basic_format_context` [format.context]

```
namespace std {
  template<class Out, class charT>
  class basic_format_context {
    basic_format_args<basic_format_context> args_;      // exposition only
    Out out_;                                           // exposition only

    basic_format_context(const basic_format_context&) = delete;
    basic_format_context& operator=(const basic_format_context&) = delete;

  public:
    using iterator = Out;
    using char_type = charT;
    template<class T> using formatter_type = formatter<T, charT>;

    basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
    std::locale locale();

    iterator out();
    void advance_to(iterator it);
  };
}
```

1 An instance of `basic_format_context` holds formatting state consisting of the formatting arguments and the output iterator.

2 If a program declares an explicit or partial specialization of `basic_format_context`, the program is ill-formed, no diagnostic required.

3 `Out` shall model `output_iterator<const charT&>`.

4 `format_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `string`, such as `back_insert_iterator<string>`. Similarly, `wformat_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `wstring`.

5 *Recommended practice*: For a given type `charT`, implementations should provide a single instantiation of `basic_format_context` for appending to `basic_string<charT>`, `vector<charT>`, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a `span<charT>`) and polymorphic reallocation.

```
basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
```

6 *Returns*: `args_.get(id)`.

```
std::locale locale();
```

7 *Returns*: The locale passed to the formatting function if the latter takes one, and `std::locale()` otherwise.

```
iterator out();
```

8 *Effects*: Equivalent to: `return std::move(out_);`

```
void advance_to(iterator it);
```

9 *Effects*: Equivalent to: `out_ = std::move(it);`

[*Example 1*:

```
struct S { int value; };

template<> struct std::formatter<S> {
  size_t width_arg_id = 0;

  // Parses a width argument id in the format { digit }.
  constexpr auto parse(format_parse_context& ctx) {
    auto iter = ctx.begin();
    auto is_digit = [](auto c) { return c >= '0' && c <= '9'; };
    auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; };
    if (get_char() != '{')
      return iter;
    ++iter;
    char c = get_char();
    if (!is_digit(c) || (++iter, get_char()) != '}')
      throw format_error("invalid format");
    width_arg_id = c - '0';
    ctx.check_arg_id(width_arg_id);
    return ++iter;
  }

  // Formats an S with width given by the argument width_arg_id.
  auto format(S s, format_context& ctx) const {
    int width = ctx.arg(width_arg_id).visit([](auto value) -> int {
      if constexpr (!is_integral_v<decltype(value)>)
        throw format_error("width is not integral");
      else if (value < 0 || value > numeric_limits<int>::max())
        throw format_error("invalid width");
      else
        return value;
      });
    return format_to(ctx.out(), "{0:x>{1}}", s.value, width);
  }
};

std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"
```

— *end example*]

28.5.7 Formatting of ranges [format.range]

28.5.7.1 Variable template `format_kind` [format.range.fmtkind]

```
template<ranges::input_range R>
    requires same_as<R, remove_cvref_t<R>>
  constexpr range_format format_kind<R> = see below;
```

1 A program that instantiates the primary template of `format_kind` is ill-formed.

2 For a type `R`, `format_kind<R>` is defined as follows:

(2.1) — If `same_as<remove_cvref_t<ranges::range_reference_t<R>>, R>` is `true`, `format_kind<R>` is `range_format::disabled`.

[*Note 1*: This prevents constraint recursion for ranges whose reference type is the same range type. For example, `std::filesystem::path` is a range of `std::filesystem::path`. — *end note*]

(2.2) — Otherwise, if the *qualified-id* `R::key_type` is valid and denotes a type:

(2.2.1) — If the *qualified-id* `R::mapped_type` is valid and denotes a type, let `U` be `remove_cvref_t<ranges::range_reference_t<R>>`. If either `U` is a specialization of `pair` or `U` is a specialization of `tuple` and `tuple_size_v<U> == 2`, `format_kind<R>` is `range_format::map`.

(2.2.2) — Otherwise, `format_kind<R>` is `range_format::set`.

(2.3) — Otherwise, `format_kind<R>` is `range_format::sequence`.

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `format_kind` for cv-unqualified program-defined types that model `ranges::input_range`. Such specializations shall be usable in constant expressions (7.7) and have type `const range_format`.

28.5.7.2 Class template `range_formatter` [format.range.formatter]

```
namespace std {
  template<class T, class charT = char>
    requires same_as<remove_cvref_t<T>, T> && formattable<T, charT>
  class range_formatter {
    formatter<T, charT> underlying_;                                          // exposition only
    basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", ");       // exposition only
    basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("["); // exposition only
    basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>("]"); // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;
    constexpr formatter<T, charT>& underlying() noexcept { return underlying_; }
    constexpr const formatter<T, charT>& underlying() const noexcept { return underlying_; }

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<ranges::input_range R, class FormatContext>
        requires formattable<ranges::range_reference_t<R>, charT> &&
                 same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
      typename FormatContext::iterator
        format(R&& r, FormatContext& ctx) const;
  };
}
```

1 The class template `range_formatter` is a utility for implementing `formatter` specializations for range types.

2 `range_formatter` interprets *format-spec* as a *range-format-spec*. The syntax of format specifications is as follows:

range-format-spec:
    range-fill-and-align$_{opt}$ *width*$_{opt}$ n$_{opt}$ *range-type*$_{opt}$ *range-underlying-spec*$_{opt}$

range-fill-and-align:
  range-fill$_{opt}$ *align*

range-fill:
  any character other than `{` or `}` or `:`

range-type:
  `m`
  `s`
  `?s`

range-underlying-spec:
  `:` *format-spec*

3 For `range_formatter<T, charT>`, the *format-spec* in a *range-underlying-spec*, if any, is interpreted by `formatter<T, charT>`.

4 The *range-fill-and-align* is interpreted the same way as a *fill-and-align* (28.5.2.2). The productions *align* and *width* are described in 28.5.2.

5 The `n` option causes the range to be formatted without the opening and closing brackets.

[*Note 1*: This is equivalent to invoking `set_brackets({}, {})`. — *end note*]

6 The *range-type* specifier changes the way a range is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 113.

Table 113 — Meaning of *range-type* options [tab:formatter.range.type]

Option	Requirements	Meaning
`m`	`T` shall be either a specialization of `pair` or a specialization of `tuple` such that `tuple_size_v<T>` is 2.	Indicates that the opening bracket should be `"{"`, the closing bracket should be `"}"`, the separator should be `", "`, and each range element should be formatted as if `m` were specified for its *tuple-type*. [*Note 2*: If the `n` option is provided in addition to the `m` option, both the opening and closing brackets are still empty. — *end note*]
`s`	`T` shall be `charT`.	Indicates that the range should be formatted as a `string`.
`?s`	`T` shall be `charT`.	Indicates that the range should be formatted as an escaped string (28.5.6.5).

If the *range-type* is `s` or `?s`, then there shall be no `n` option and no *range-underlying-spec*.

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

7 *Effects*: Equivalent to: *`separator_`* `= sep;`

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

8 *Effects*: Equivalent to:

```
  opening-bracket_ = opening;
  closing-bracket_ = closing;
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

9 *Effects*: Parses the format specifiers as a *range-format-spec* and stores the parsed specifiers in `*this`. Calls *`underlying_`*`.parse(ctx)` to parse *format-spec* in *range-format-spec* or, if the latter is not present, an empty *format-spec*. The values of *`opening-bracket_`*, *`closing-bracket_`*, and *`separator_`* are modified if and only if required by the *range-type* or the `n` option, if present. If:

(9.1) — the *range-type* is neither `s` nor `?s`,

(9.2) — *`underlying_`*`.set_debug_format()` is a valid expression, and

(9.3) — there is no *range-underlying-spec*,

then calls *underlying_*.set_debug_format().

10 *Returns*: An iterator past the end of the *range-format-spec*.

```
template<ranges::input_range R, class FormatContext>
    requires formattable<ranges::range_reference_t<R>, charT> &&
             same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
  typename FormatContext::iterator
    format(R&& r, FormatContext& ctx) const;
```

11 *Effects*: Writes the following into ctx.out(), adjusted according to the *range-format-spec*:

(11.1) — If the *range-type* was s, then as if by formatting basic_string<charT>(from_range, r).

(11.2) — Otherwise, if the *range-type* was ?s, then as if by formatting basic_string<charT>(from_range, r) as an escaped string (28.5.6.5).

(11.3) — Otherwise,

(11.3.1) — *opening-bracket_*,

(11.3.2) — for each element e of the range r:

(11.3.2.1) — the result of writing e via *underlying_* and

(11.3.2.2) — *separator_*, unless e is the last element of r, and

(11.3.3) — *closing-bracket_*.

12 *Returns*: An iterator past the end of the output range.

28.5.7.3 Class template *range-default-formatter* [format.range.fmtdef]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::sequence, R, charT> {     // exposition only
  private:
    using maybe-const-r = fmt-maybe-const<R, charT>;                      // exposition only
    range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-r>>,
                    charT> underlying_;                                   // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(maybe-const-r& elems, FormatContext& ctx) const;
  };
}
```

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

1 *Effects*: Equivalent to: *underlying_*.set_separator(sep);

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

2 *Effects*: Equivalent to: *underlying_*.set_brackets(opening, closing);

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

3 *Effects*: Equivalent to: return *underlying_*.parse(ctx);

```
template<class FormatContext>
  typename FormatContext::iterator
    format(maybe-const-r& elems, FormatContext& ctx) const;
```

4 *Effects*: Equivalent to: `return underlying_.format(elems, ctx);`

28.5.7.4 Specialization of *range-default-formatter* for maps [format.range.fmtmap]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::map, R, charT> {
  private:
    using maybe-const-map = fmt-maybe-const<R, charT>;                // exposition only
    using element-type =                                              // exposition only
      remove_cvref_t<ranges::range_reference_t<maybe-const-map>>;
    range_formatter<element-type, charT> underlying_;                 // exposition only

  public:
    constexpr range-default-formatter();

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(maybe-const-map& r, FormatContext& ctx) const;
  };
}
```

```
constexpr range-default-formatter();
```

1 *Mandates*: Either:

(1.1) — *`element-type`* is a specialization of `pair`, or

(1.2) — *`element-type`* is a specialization of `tuple` and `tuple_size_v<element-type> == 2`.

2 *Effects*: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
underlying_.underlying().set_brackets({}, {});
underlying_.underlying().set_separator(STATICALLY-WIDEN<charT>(": "));
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

3 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  typename FormatContext::iterator
    format(maybe-const-map& r, FormatContext& ctx) const;
```

4 *Effects*: Equivalent to: `return underlying_.format(r, ctx);`

28.5.7.5 Specialization of *range-default-formatter* for sets [format.range.fmtset]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::set, R, charT> {
  private:
    using maybe-const-set = fmt-maybe-const<R, charT>;                // exposition only
    range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-set>>,
                    charT> underlying_;                               // exposition only

  public:
    constexpr range-default-formatter();
    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(maybe-const-set& r, FormatContext& ctx) const;
  };
}
```

```
constexpr range-default-formatter();
```

1 *Effects*: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

2 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  typename FormatContext::iterator
    format(maybe-const-set& r, FormatContext& ctx) const;
```

3 *Effects*: Equivalent to: `return underlying_.format(r, ctx);`

28.5.7.6 Specialization of *range-default-formatter* for strings [format.range.fmtstr]

```
namespace std {
  template<range_format K, ranges::input_range R, class charT>
    requires (K == range_format::string || K == range_format::debug_string)
  struct range-default-formatter<K, R, charT> {
  private:
    formatter<basic_string<charT>, charT> underlying_;                    // exposition only

  public:
    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(see below& str, FormatContext& ctx) const;
  };
}
```

1 *Mandates*: `same_as<remove_cvref_t<range_reference_t<R>>, charT>` is `true`.

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

2 *Effects*: Equivalent to:

```
auto i = underlying_.parse(ctx);
if constexpr (K == range_format::debug_string) {
  underlying_.set_debug_format();
}
return i;
```

```
template<class FormatContext>
  typename FormatContext::iterator
    format(see below& r, FormatContext& ctx) const;
```

3 The type of `r` is `const R&` if `ranges::input_range<const R>` is `true` and `R&` otherwise.

4 *Effects*: Let *s* be a `basic_string<charT>` such that `ranges::equal(s, r)` is `true`. Equivalent to: `return underlying_.format(s, ctx);`

28.5.8 Arguments [format.arguments]

28.5.8.1 Class template `basic_format_arg` [format.arg]

```
namespace std {
  template<class Context>
  class basic_format_arg {
  public:
    class handle;

  private:
    using char_type = typename Context::char_type;                    // exposition only

    variant<monostate, bool, char_type,
            int, unsigned int, long long int, unsigned long long int,
            float, double, long double,
            const char_type*, basic_string_view<char_type>,
            const void*, handle> value;                               // exposition only

    template<class T> explicit basic_format_arg(T& v) noexcept;       // exposition only

  public:
    basic_format_arg() noexcept;

    explicit operator bool() const noexcept;

    template<class Visitor>
      decltype(auto) visit(this basic_format_arg arg, Visitor&& vis);
    template<class R, class Visitor>
      R visit(this basic_format_arg arg, Visitor&& vis);
  };
}
```

1 An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.

2 The behavior of a program that adds specializations of `basic_format_arg` is undefined.

`basic_format_arg() noexcept;`

3 *Postconditions*: `!(*this)`.

`template<class T> explicit basic_format_arg(T& v) noexcept;`

4 *Constraints*: `T` satisfies *`formattable-with`*`<Context>`.

5 *Preconditions*: If `decay_t<T>` is `char_type*` or `const char_type*`, `static_cast<const char_type*>(v)` points to an NTCTS (3.36).

6 *Effects*: Let `TD` be `remove_const_t<T>`.

(6.1) — If `TD` is `bool` or `char_type`, initializes `value` with `v`;

(6.2) — otherwise, if `TD` is `char` and `char_type` is `wchar_t`, initializes `value` with `static_cast<wchar_t>(static_cast<unsigned char>(v))`;

(6.3) — otherwise, if `TD` is a signed integer type (6.8.2) and `sizeof(TD) <= sizeof(int)`, initializes `value` with `static_cast<int>(v)`;

(6.4) — otherwise, if `TD` is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned int)`, initializes `value` with `static_cast<unsigned int>(v)`;

(6.5) — otherwise, if `TD` is a signed integer type and `sizeof(TD) <= sizeof(long long int)`, initializes `value` with `static_cast<long long int>(v)`;

(6.6) — otherwise, if `TD` is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned long long int)`, initializes `value` with `static_cast<unsigned long long int>(v)`;

(6.7) — otherwise, if `TD` is a standard floating-point type, initializes `value` with `v`;

(6.8) — otherwise, if `TD` is a specialization of `basic_string_view` or `basic_string` and `TD::value_type` is `char_type`, initializes `value` with `basic_string_view<char_type>(v.data(), v.size())`;

(6.9) — otherwise, if `decay_t<TD>` is `char_type*` or `const char_type*`, initializes `value` with `static_cast<const char_type*>(v)`;

(6.10) — otherwise, if `is_void_v<remove_pointer_t<TD>>` is `true` or `is_null_pointer_v<TD>` is `true`, initializes `value` with `static_cast<const void*>(v)`;

(6.11) — otherwise, initializes `value` with `handle(v)`.

[*Note 1*: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type. — *end note*]

```
explicit operator bool() const noexcept;
```

7 *Returns*: `!holds_alternative<monostate>(value)`.

```
template<class Visitor>
  decltype(auto) visit(this basic_format_arg arg, Visitor&& vis);
```

8 *Effects*: Equivalent to: `return arg.value.visit(std::forward<Visitor>(vis));`

```
template<class R, class Visitor>
  R visit(this basic_format_arg arg, Visitor&& vis);
```

9 *Effects*: Equivalent to: `return arg.value.visit<R>(std::forward<Visitor>(vis));`

10 The class `handle` allows formatting an object of a user-defined type.

```
  namespace std {
    template<class Context>
    class basic_format_arg<Context>::handle {
      const void* ptr_;                                        // exposition only
      void (*format_)(basic_format_parse_context<char_type>&,
                      Context&, const void*);                  // exposition only

      template<class T> explicit handle(T& val) noexcept;      // exposition only

    public:
      void format(basic_format_parse_context<char_type>&, Context& ctx) const;
    };
  }
```

```
template<class T> explicit handle(T& val) noexcept;
```

11 Let

(11.1) — `TD` be `remove_const_t<T>`,

(11.2) — `TQ` be `const TD` if `const TD` satisfies *`formattable-with`*`<Context>` and `TD` otherwise.

12 *Mandates*: `TQ` satisfies *`formattable-with`*`<Context>`.

13 *Effects*: Initializes `ptr_` with `addressof(val)` and `format_` with

```
[](basic_format_parse_context<char_type>& parse_ctx,
   Context& format_ctx, const void* ptr) {
  typename Context::template formatter_type<TD> f;
  parse_ctx.advance_to(f.parse(parse_ctx));
  format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
                                 format_ctx));
}
```

```
void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;
```

14 *Effects*: Equivalent to: `format_(parse_ctx, format_ctx, ptr_);`

28.5.8.2 Class template *format-arg-store* [format.arg.store]

```
  namespace std {
    template<class Context, class... Args>
    class format-arg-store {                                     // exposition only
      array<basic_format_arg<Context>, sizeof...(Args)> args;    // exposition only
    };
  }
```

1 An instance of *format-arg-store* stores formatting arguments.

```
template<class Context = format_context, class... Args>
  format-arg-store<Context, Args...> make_format_args(Args&... fmt_args);
```

2 *Preconditions*: The type `typename Context::template formatter_type<remove_const_t<`T_i`>>` meets the *BasicFormatter* requirements (28.5.6.1) for each T_i in `Args`.

3 *Returns*: An object of type *format-arg-store*`<Context, Args...>` whose *args* data member is initialized with `{basic_format_arg<Context>(fmt_args)...}`.

```
template<class... Args>
  format-arg-store<wformat_context, Args...> make_wformat_args(Args&... args);
```

4 *Effects*: Equivalent to: `return make_format_args<wformat_context>(args...);`

28.5.8.3 Class template `basic_format_args` [format.args]

```
namespace std {
  template<class Context>
  class basic_format_args {
    size_t size_;                                // exposition only
    const basic_format_arg<Context>* data_;      // exposition only

  public:
    template<class... Args>
      basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

    basic_format_arg<Context> get(size_t i) const noexcept;
  };

  template<class Context, class... Args>
    basic_format_args(format-arg-store<Context, Args...>) -> basic_format_args<Context>;
}
```

1 An instance of `basic_format_args` provides access to formatting arguments. Implementations should optimize the representation of `basic_format_args` for a small number of formatting arguments.

[*Note 1*: For example, by storing indices of type alternatives separately from values and packing the former. — *end note*]

```
template<class... Args>
  basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

2 *Effects*: Initializes `size_` with `sizeof...(Args)` and `data_` with `store.args.data()`.

```
basic_format_arg<Context> get(size_t i) const noexcept;
```

3 *Returns*: `i < size_ ? data_[i] : basic_format_arg<Context>()`.

28.5.9 Tuple formatter [format.tuple]

1 For each of `pair` and `tuple`, the library provides the following formatter specialization where *pair-or-tuple* is the name of the template:

```
namespace std {
  template<class charT, formattable<charT>... Ts>
  struct formatter<pair-or-tuple<Ts...>, charT> {
  private:
    tuple<formatter<remove_cvref_t<Ts>, charT>...> underlying_;               // exposition only
    basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", ");       // exposition only
    basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("("); // exposition only
    basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>(")"); // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;
```

```
      template<class ParseContext>
        constexpr typename ParseContext::iterator
          parse(ParseContext& ctx);

      template<class FormatContext>
        typename FormatContext::iterator
          format(see below& elems, FormatContext& ctx) const;
    };

    template<class... Ts>
      constexpr bool enable_nonlocking_formatter_optimization<pair-or-tuple<Ts...>> =
        (enable_nonlocking_formatter_optimization<Ts> && ...);
  }
```

2 The `parse` member functions of these formatters interpret the format specification as a *tuple-format-spec* according to the following syntax:

> *tuple-format-spec*:
>   *tuple-fill-and-align*$_{opt}$ *width*$_{opt}$ *tuple-type*$_{opt}$
>
> *tuple-fill-and-align*:
>   *tuple-fill*$_{opt}$ *align*
>
> *tuple-fill*:
>   any character other than `{` or `}` or `:`
>
> *tuple-type*:
>   `m`
>   `n`

3 The *tuple-fill-and-align* is interpreted the same way as a *fill-and-align* (28.5.2.2). The productions *align* and *width* are described in 28.5.2.

4 The *tuple-type* specifier changes the way a `pair` or `tuple` is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 114.

Table 114 — Meaning of *tuple-type* options [tab:formatter.tuple.type]

Option	Requirements	Meaning

`m`	`sizeof...(Ts) == 2`	Equivalent to:
		`set_separator(STATICALLY-WIDEN<charT>(": "));`
		`set_brackets({}, {});`

`n`	none	Equivalent to: `set_brackets({}, {});`
none	none	No effects

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

5 *Effects*: Equivalent to: `separator_ = sep;`

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

6 *Effects*: Equivalent to:

```
  opening-bracket_ = opening;
  closing-bracket_ = closing;
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

7 *Effects*: Parses the format specifiers as a *tuple-format-spec* and stores the parsed specifiers in `*this`. The values of *`opening-bracket_`*, *`closing-bracket_`*, and *`separator_`* are modified if and only if required by the *tuple-type*, if present. For each element *`e`* in *`underlying_`*, calls *`e`*`.parse(ctx)` to parse an empty *format-spec* and, if *`e`*`.set_debug_format()` is a valid expression, calls *`e`*`.set_debug_format()`.

8 *Returns*: An iterator past the end of the *tuple-format-spec*.

```
template<class FormatContext>
  typename FormatContext::iterator
    format(see below& elems, FormatContext& ctx) const;
```

9 The type of elems is:

- (9.1) — If `(formattable<const Ts, charT> && ...)` is `true`, `const` *`pair-or-tuple`*`<Ts...>&`.
- (9.2) — Otherwise *`pair-or-tuple`*`<Ts...>&`.

10 *Effects*: Writes the following into `ctx.out()`, adjusted according to the *tuple-format-spec*:

- (10.1) — *`opening-bracket_`*,
- (10.2) — for each index `I` in the $[$`0`, `sizeof...(Ts)`$)$:
  - (10.2.1) — if `I != 0`, *`separator_`*,
  - (10.2.2) — the result of writing `get<I>(elems)` via `get<I>(`*`underlying_`*`)`, and
- (10.3) — *`closing-bracket_`*.

11 *Returns*: An iterator past the end of the output range.

28.5.10 Class `format_error` [format.error]

```
namespace std {
  class format_error : public runtime_error {
  public:
    constexpr explicit format_error(const string& what_arg);
    constexpr explicit format_error(const char* what_arg);
  };
}
```

1 The class `format_error` defines the type of objects thrown as exceptions to report errors from the formatting library.

```
constexpr format_error(const string& what_arg);
```

2 *Postconditions*: `strcmp(what(), what_arg.c_str()) == 0`.

```
constexpr format_error(const char* what_arg);
```

3 *Postconditions*: `strcmp(what(), what_arg) == 0`.

28.6 Regular expressions library [re]

28.6.1 General [re.general]

1 Subclause 28.6 describes components that C++ programs may use to perform operations involving regular expression matching and searching.

2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (27.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 115.

3 The ECMAScript Language Specification described in Standard Ecma-262 is called *ECMA-262* in this Clause.

28.6.2 Requirements [re.req]

1 This subclause defines requirements on classes representing regular expression traits.

[*Note 1*: The class template `regex_traits`, defined in 28.6.6, meets these requirements. — *end note*]

2 The class template `basic_regex`, defined in 28.6.7, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member *typedef-name*s and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.

3 To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.

4 In the following requirements,

Table 115 — Regular expressions library summary [tab:re.summary]

	Subclause	Header
28.6.2	Requirements	
28.6.4	Constants	`<regex>`
28.6.5	Exception type	
28.6.6	Traits	
28.6.7	Regular expression template	
28.6.8	Submatches	
28.6.9	Match results	
28.6.10	Algorithms	
28.6.11	Iterators	
28.6.12	Grammar	

(4.1) — `X` denotes a traits class defining types and functions for the character container type `charT`;

(4.2) — `u` is an object of type `X`;

(4.3) — `v` is an object of type `const X`;

(4.4) — `p` is a value of type `const charT*`;

(4.5) — `I1` and `I2` are input iterators (24.3.5.3);

(4.6) — `F1` and `F2` are forward iterators (24.3.5.5);

(4.7) — `c` is a value of type `const charT`;

(4.8) — `s` is an object of type `X::string_type`;

(4.9) — `cs` is an object of type `const X::string_type`;

(4.10) — `b` is a value of type `bool`;

(4.11) — `I` is a value of type `int`;

(4.12) — `cl` is an object of type `X::char_class_type`; and

(4.13) — `loc` is an object of type `X::locale_type`.

5 A traits class `X` meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

`typename X::char_type`

6 *Result*: `charT`, the character container type used in the implementation of class template `basic_regex`.

`typename X::string_type`

7 *Result*: `basic_string<charT>`

`typename X::locale_type`

8 *Result*: A copy constructible type that represents the locale used by the traits class.

`typename X::char_class_type`

9 *Result*: A bitmask type (16.3.3.3.3) representing a particular character classification.

`X::length(p)`

10 *Result*: `size_t`

11 *Returns*: The smallest `i` such that `p[i] == 0`.

12 *Complexity*: Linear in `i`.

`v.translate(c)`

13 *Result*: `X::char_type`

14 *Returns*: A character such that for any character `d` that is to be considered equivalent to `c` then `v.translate(c) == v.translate(d)`.

`v.translate_nocase(c)`

15 *Result*: `X::char_type`

16 *Returns*: For all characters `C` that are to be considered equivalent to `c` when comparisons are to be performed without regard to case, then `v.translate_nocase(c) == v.translate_nocase(C)`.

`v.transform(F1, F2)`

17 *Result*: `X::string_type`

18 *Returns*: A sort key for the character sequence designated by the iterator range [`F1`, `F2`) such that if the character sequence [`G1`, `G2`) sorts before the character sequence [`H1`, `H2`) then `v.transform(G1, G2) < v.transform(H1, H2)`.

`v.transform_primary(F1, F2)`

19 *Result*: `X::string_type`

20 *Returns*: A sort key for the character sequence designated by the iterator range [`F1`, `F2`) such that if the character sequence [`G1`, `G2`) sorts before the character sequence [`H1`, `H2`) when character case is not considered then `v.transform_primary(G1, G2) < v.transform_primary(H1, H2)`.

`v.lookup_collatename(F1, F2)`

21 *Result*: `X::string_type`

22 *Returns*: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [`F1`, `F2`). Returns an empty string if the character sequence is not a valid collating element.

`v.lookup_classname(F1, F2, b)`

23 *Result*: `X::char_class_type`

24 *Returns*: Converts the character sequence designated by the iterator range [`F1`, `F2`) into a value of a bitmask type that can subsequently be passed to `isctype`. Values returned from `lookup_classname` can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If `b` is `true`, the returned bitmask is suitable for matching characters without regard to their case. Returns `0` if the character sequence is not the name of a character class recognized by `X`. The value returned shall be independent of the case of the characters in the sequence.

`v.isctype(c, cl)`

25 *Result*: `bool`

26 *Returns*: Returns `true` if character `c` is a member of one of the character classes designated by `cl`, `false` otherwise.

`v.value(c, I)`

27 *Result*: `int`

28 *Returns*: Returns the value represented by the digit c in base I if the character c is a valid digit in base I; otherwise returns `-1`.

[*Note 2*: The value of I will only be 8, 10, or 16. — *end note*]

`u.imbue(loc)`

29 *Result*: `X::locale_type`

30 *Effects*: Imbues `u` with the locale `loc` and returns the previous locale used by `u` if any.

`v.getloc()`

31 *Result*: `X::locale_type`

32 *Returns*: Returns the current locale used by `v`, if any.

33 [*Note 3*: Class template `regex_traits` meets the requirements for a regular expression traits class when it is specialized for `char` or `wchar_t`. This class template is described in the header `<regex>`, and is described in 28.6.6. — *end note*]

28.6.3 Header <regex> synopsis [re.syn]

```
#include <compare>              // see 17.12.1

  // 28.6.11.2, class template regex_token_iterator
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
    class regex_token_iterator;

  using cregex_token_iterator  = regex_token_iterator<const char*>;
  using wcregex_token_iterator = regex_token_iterator<const wchar_t*>;
  using sregex_token_iterator  = regex_token_iterator<string::const_iterator>;
  using wsregex_token_iterator = regex_token_iterator<wstring::const_iterator>;

  namespace pmr {
    template<class BidirectionalIterator>
      using match_results =
        std::match_results<BidirectionalIterator,
                           polymorphic_allocator<sub_match<BidirectionalIterator>>>;

    using cmatch  = match_results<const char*>;
    using wcmatch = match_results<const wchar_t*>;
    using smatch  = match_results<string::const_iterator>;
    using wsmatch = match_results<wstring::const_iterator>;
  }
}
```

28.6.4 Namespace `std::regex_constants` [re.const]

28.6.4.1 General [re.const.general]

1 The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

28.6.4.2 Bitmask type `syntax_option_type` [re.synopt]

```
namespace std::regex_constants {
  using syntax_option_type = T1;
  inline constexpr syntax_option_type icase = unspecified;
  inline constexpr syntax_option_type nosubs = unspecified;
  inline constexpr syntax_option_type optimize = unspecified;
  inline constexpr syntax_option_type collate = unspecified;
  inline constexpr syntax_option_type ECMAScript = unspecified;
```

```
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
  }
```

1 The type `syntax_option_type` is an implementation-defined bitmask type (16.3.3.3.3). Setting its elements has the effects listed in Table 116. A valid value of type `syntax_option_type` shall have at most one of the grammar elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep`, set. If no grammar element is set, the default grammar is `ECMAScript`.

Table 116 — `syntax_option_type` effects [tab:re.synopt]

Element	Effect(s) if set
`icase`	Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.
`nosubs`	Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied `match_results` object.
`optimize`	Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.
`collate`	Specifies that character ranges of the form `"[a-b]"` shall be locale sensitive.
`ECMAScript`	Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in 28.6.12. See also: ECMA-262 15.10
`basic`	Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX. See also: POSIX, Base Definitions and Headers, Section 9.3
`extended`	Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX. See also: POSIX, Base Definitions and Headers, Section 9.4
`awk`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility awk in POSIX.
`grep`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep in POSIX.
`egrep`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep when given the -E option in POSIX.
`multiline`	Specifies that `^` shall match the beginning of a line and `$` shall match the end of a line, if the `ECMAScript` engine is selected.

28.6.4.3 Bitmask type `match_flag_type` [re.matchflag]

```
namespace std::regex_constants {
  using match_flag_type = T2;
  inline constexpr match_flag_type match_default = {};
  inline constexpr match_flag_type match_not_bol = unspecified;
  inline constexpr match_flag_type match_not_eol = unspecified;
  inline constexpr match_flag_type match_not_bow = unspecified;
  inline constexpr match_flag_type match_not_eow = unspecified;
  inline constexpr match_flag_type match_any = unspecified;
  inline constexpr match_flag_type match_not_null = unspecified;
  inline constexpr match_flag_type match_continuous = unspecified;
  inline constexpr match_flag_type match_prev_avail = unspecified;
  inline constexpr match_flag_type format_default = {};
  inline constexpr match_flag_type format_sed = unspecified;
  inline constexpr match_flag_type format_no_copy = unspecified;
  inline constexpr match_flag_type format_first_only = unspecified;
}
```

1 The type `match_flag_type` is an implementation-defined bitmask type (16.3.3.3.3). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters [`first`, `last`) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 117 for any bitmask elements set.

Table 117 — `regex_constants::match_flag_type` effects [tab:re.matchflag]

Element	Effect(s) if set
`match_not_bol`	The first character in the sequence [`first`, `last`) shall be treated as though it is not at the beginning of a line, so the character ^ in the regular expression shall not match [`first`, `first`).
`match_not_eol`	The last character in the sequence [`first`, `last`) shall be treated as though it is not at the end of a line, so the character `"$"` in the regular expression shall not match [`last`, `last`).
`match_not_bow`	The expression `"\\b"` shall not match the sub-sequence [`first`, `first`).
`match_not_eow`	The expression `"\\b"` shall not match the sub-sequence [`last`, `last`).
`match_any`	If more than one match is possible then any match is an acceptable result.
`match_not_null`	The expression shall not match an empty sequence.
`match_continuous`	The expression shall only match a sub-sequence that begins at `first`.
`match_prev_avail`	`--first` is a valid iterator position. When this flag is set the flags `match_not_bol` and `match_not_bow` shall be ignored by the regular expression algorithms (28.6.10) and iterators (28.6.11).
`format_default`	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string.
`format_sed`	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.
`format_no_copy`	During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.
`format_first_only`	When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

28.6.4.4 Implementation-defined `error_type` [re.err]

```
namespace std::regex_constants {
  using error_type = T3;
  inline constexpr error_type error_collate = unspecified;
  inline constexpr error_type error_ctype = unspecified;
  inline constexpr error_type error_escape = unspecified;
  inline constexpr error_type error_backref = unspecified;
  inline constexpr error_type error_brack = unspecified;
  inline constexpr error_type error_paren = unspecified;
  inline constexpr error_type error_brace = unspecified;
  inline constexpr error_type error_badbrace = unspecified;
  inline constexpr error_type error_range = unspecified;
  inline constexpr error_type error_space = unspecified;
  inline constexpr error_type error_badrepeat = unspecified;
  inline constexpr error_type error_complexity = unspecified;
  inline constexpr error_type error_stack = unspecified;
}
```

1 The type `error_type` is an implementation-defined enumerated type (16.3.3.3.2). Values of type `error_type` represent the error conditions described in Table 118:

Table 118 — `error_type` values in the C locale [tab:re.err]

Value	Error condition
`error_collate`	The expression contains an invalid collating element name.
`error_ctype`	The expression contains an invalid character class name.
`error_escape`	The expression contains an invalid escaped character, or a trailing escape.
`error_backref`	The expression contains an invalid back reference.
`error_brack`	The expression contains mismatched `[` and `]`.
`error_paren`	The expression contains mismatched `(` and `)`.
`error_brace`	The expression contains mismatched `{` and `}`.
`error_badbrace`	The expression contains an invalid range in a `{}` expression.
`error_range`	The expression contains an invalid character range, such as `[b-a]` in most encodings.
`error_space`	There is insufficient memory to convert the expression into a finite state machine.
`error_badrepeat`	One of `*?+{` is not preceded by a valid regular expression.
`error_complexity`	The complexity of an attempted match against a regular expression exceeds a pre-set level.
`error_stack`	There is insufficient memory to determine whether the regular expression matches the specified character sequence.

28.6.5 Class `regex_error` [re.badexp]

```
namespace std {
  class regex_error : public runtime_error {
  public:
    explicit regex_error(regex_constants::error_type ecode);
    regex_constants::error_type code() const;
  };
}
```

1 The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```
regex_error(regex_constants::error_type ecode);
```

2 *Postconditions*: `ecode == code()`.

```
regex_constants::error_type code() const;
```

3 *Returns*: The error code that was passed to the constructor.

28.6.6 Class template `regex_traits` [re.traits]

```
namespace std {
  template<class charT>
    struct regex_traits {
      using char_type       = charT;
      using string_type     = basic_string<char_type>;
      using locale_type     = locale;
      using char_class_type = bitmask_type;

      regex_traits();
      static size_t length(const char_type* p);
      charT translate(charT c) const;
      charT translate_nocase(charT c) const;
      template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        string_type transform_primary(
          ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        string_type lookup_collatename(
          ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        char_class_type lookup_classname(
          ForwardIterator first, ForwardIterator last, bool icase = false) const;
      bool isctype(charT c, char_class_type f) const;
      int value(charT ch, int radix) const;
      locale_type imbue(locale_type l);
      locale_type getloc() const;
    };
  }
```

1 The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (28.6.2).

```
using char_class_type = bitmask_type;
```

2 The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```
static size_t length(const char_type* p);
```

3 *Returns*: `char_traits<charT>::length(p)`.

```
charT translate(charT c) const;
```

4 *Returns*: `c`.

```
charT translate_nocase(charT c) const;
```

5 *Returns*: `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```
template<class ForwardIterator>
  string_type transform(ForwardIterator first, ForwardIterator last) const;
```

6 *Effects*: As if by:

```
string_type str(first, last);
return use_facet<collate<charT>>(
  getloc()).transform(str.data(), str.data() + str.length());
```

```
template<class ForwardIterator>
  string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
```

7 *Effects*: If

```
typeid(use_facet<collate<charT>>(getloc())) == typeid(collate_byname<charT>)
```

and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```
template<class ForwardIterator>
  string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
```

8 *Returns*: A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [`first`, `last`). Returns an empty string if the character sequence is not a valid collating element.

```
template<class ForwardIterator>
  char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last, bool icase = false) const;
```

9 *Returns*: An unspecified value that represents the character classification named by the character sequence designated by the iterator range [`first`, `last`). If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.[239] The value returned shall

239) For example, if the parameter `icase` is `true` then `[[:lower:]]` is the same as `[[:alpha:]]`.

be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.

10 *Remarks*: For `regex_traits<char>`, at least the narrow character names in Table 119 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 119 shall be recognized.

```
bool isctype(charT c, char_class_type f) const;
```

11 *Effects*: Determines if the character `c` is a member of the character classification represented by `f`.

12 *Returns*: Given the following function declaration:

```
// for exposition only
template<class C>
  ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in Table 119 is set, then the result is determined as if by:

```
ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
  return true;
} else if (c == ct.widen('_')) {
  charT w[1] = { ct.widen('w') };
  char_class_type x = lookup_classname(w, w+1);
  return (f&x) == x;
} else {
  return false;
}
```

[*Example 1*:

```
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f);  // m == ctype_base::digit | ctype_base::upper
```

— *end example*]

[*Example 2*:

```
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f);   // returns true
t.isctype('_', f);   // returns true
t.isctype(' ', f);   // returns false
```

— *end example*]

```
int value(charT ch, int radix) const;
```

13 *Preconditions*: The value of `radix` is 8, 10, or 16.

14 *Returns*: The value represented by the digit `ch` in base `radix` if the character `ch` is a valid digit in base `radix`; otherwise returns `-1`.

```
locale_type imbue(locale_type loc);
```

15 *Effects*: Imbues `*this` with a copy of the locale `loc`.

[*Note 1*: Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`. — *end note*]

16 *Postconditions*: `getloc() == loc`.

17 *Returns*: If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

```
locale_type getloc() const;
```

18 *Returns*: If no locale has been imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

Table 119 — Character class names and corresponding `ctype` masks [tab:re.traits.classnames]

Narrow character name	Wide character name	Corresponding `ctype_base::mask` value
`"alnum"`	`L"alnum"`	`ctype_base::alnum`
`"alpha"`	`L"alpha"`	`ctype_base::alpha`
`"blank"`	`L"blank"`	`ctype_base::blank`
`"cntrl"`	`L"cntrl"`	`ctype_base::cntrl`
`"digit"`	`L"digit"`	`ctype_base::digit`
`"d"`	`L"d"`	`ctype_base::digit`
`"graph"`	`L"graph"`	`ctype_base::graph`
`"lower"`	`L"lower"`	`ctype_base::lower`
`"print"`	`L"print"`	`ctype_base::print`
`"punct"`	`L"punct"`	`ctype_base::punct`
`"space"`	`L"space"`	`ctype_base::space`
`"s"`	`L"s"`	`ctype_base::space`
`"upper"`	`L"upper"`	`ctype_base::upper`
`"w"`	`L"w"`	`ctype_base::alnum`
`"xdigit"`	`L"xdigit"`	`ctype_base::xdigit`

28.6.7 Class template `basic_regex` [re.regex]

28.6.7.1 General [re.regex.general]

1 For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of 28.6.7, `charT` denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.

2 Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[*Note 1*: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. — *end note*]

3 The functions described in 28.6.7 report errors by throwing exceptions of type `regex_error`.

```
namespace std {
  template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
    public:
      // types
      using value_type  =          charT;
      using traits_type =          traits;
      using string_type = typename traits::string_type;
      using flag_type   =          regex_constants::syntax_option_type;
      using locale_type = typename traits::locale_type;

      // 28.6.4.2, constants
      static constexpr flag_type icase = regex_constants::icase;
      static constexpr flag_type nosubs = regex_constants::nosubs;
      static constexpr flag_type optimize = regex_constants::optimize;
      static constexpr flag_type collate = regex_constants::collate;
      static constexpr flag_type ECMAScript = regex_constants::ECMAScript;
      static constexpr flag_type basic = regex_constants::basic;
      static constexpr flag_type extended = regex_constants::extended;
      static constexpr flag_type awk = regex_constants::awk;
      static constexpr flag_type grep = regex_constants::grep;
      static constexpr flag_type egrep = regex_constants::egrep;
      static constexpr flag_type multiline = regex_constants::multiline;

      // 28.6.7.2, construct/copy/destroy
      basic_regex();
      explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
      basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
      basic_regex(const basic_regex&);
      basic_regex(basic_regex&&) noexcept;
      template<class ST, class SA>
        explicit basic_regex(const basic_string<charT, ST, SA>& s,
                             flag_type f = regex_constants::ECMAScript);
      template<class ForwardIterator>
        basic_regex(ForwardIterator first, ForwardIterator last,
                    flag_type f = regex_constants::ECMAScript);
      basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

      ~basic_regex();

      // 28.6.7.3, assign
      basic_regex& operator=(const basic_regex& e);
      basic_regex& operator=(basic_regex&& e) noexcept;
      basic_regex& operator=(const charT* p);
      basic_regex& operator=(initializer_list<charT> il);
      template<class ST, class SA>
        basic_regex& operator=(const basic_string<charT, ST, SA>& s);

      basic_regex& assign(const basic_regex& e);
      basic_regex& assign(basic_regex&& e) noexcept;
      basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
      basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
      template<class ST, class SA>
        basic_regex& assign(const basic_string<charT, ST, SA>& s,
                            flag_type f = regex_constants::ECMAScript);
      template<class InputIterator>
        basic_regex& assign(InputIterator first, InputIterator last,
                            flag_type f = regex_constants::ECMAScript);
      basic_regex& assign(initializer_list<charT>,
                          flag_type f = regex_constants::ECMAScript);

      // 28.6.7.4, const operations
      unsigned mark_count() const;
      flag_type flags() const;

      // 28.6.7.5, locale
      locale_type imbue(locale_type loc);
      locale_type getloc() const;

      // 28.6.7.6, swap
      void swap(basic_regex&);
    };

  template<class ForwardIterator>
    basic_regex(ForwardIterator, ForwardIterator,
                regex_constants::syntax_option_type = regex_constants::ECMAScript)
      -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;
}
```

28.6.7.2 Constructors [re.regex.construct]

`basic_regex();`

1 *Postconditions*: `*this` does not match any character sequence.

```
explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
```

2 *Preconditions*: [p, p + char_traits<charT>::length(p)) is a valid range.

3 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [p, p + char_traits<charT>::length(p)), and interpreted according to the flags f.

4 *Postconditions*: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

5 *Throws*: regex_error if [p, p + char_traits<charT>::length(p)) is not a valid regular expression.

```
basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
```

6 *Preconditions*: [p, p + len) is a valid range.

7 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [p, p + len), and interpreted according the flags specified in f.

8 *Postconditions*: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

9 *Throws*: regex_error if [p, p + len) is not a valid regular expression.

```
basic_regex(const basic_regex& e);
```

10 *Postconditions*: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

```
basic_regex(basic_regex&& e) noexcept;
```

11 *Postconditions*: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before construction.

```
template<class ST, class SA>
  explicit basic_regex(const basic_string<charT, ST, SA>& s,
                       flag_type f = regex_constants::ECMAScript);
```

12 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the string s, and interpreted according to the flags specified in f.

13 *Postconditions*: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

14 *Throws*: regex_error if s is not a valid regular expression.

```
template<class ForwardIterator>
  basic_regex(ForwardIterator first, ForwardIterator last,
              flag_type f = regex_constants::ECMAScript);
```

15 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [first, last), and interpreted according to the flags specified in f.

16 *Postconditions*: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

17 *Throws*: regex_error if the sequence [first, last) is not a valid regular expression.

```
basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
```

18 *Effects*: Same as basic_regex(il.begin(), il.end(), f).

28.6.7.3 Assignment [re.regex.assign]

```
basic_regex& operator=(const basic_regex& e);
```

1 *Postconditions*: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

```
basic_regex& operator=(basic_regex&& e) noexcept;
```

2 *Postconditions*: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before assignment. e is in a valid state with unspecified value.

```
basic_regex& operator=(const charT* p);
```

3 *Effects*: Equivalent to: `return assign(p);`

```
basic_regex& operator=(initializer_list<charT> il);
```

4 *Effects*: Equivalent to: `return assign(il.begin(), il.end());`

```
template<class ST, class SA>
  basic_regex& operator=(const basic_string<charT, ST, SA>& s);
```

5 *Effects*: Equivalent to: `return assign(s);`

```
basic_regex& assign(const basic_regex& e);
```

6 *Effects*: Equivalent to: `return *this = e;`

```
basic_regex& assign(basic_regex&& e) noexcept;
```

7 *Effects*: Equivalent to: `return *this = std::move(e);`

```
basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
```

8 *Effects*: Equivalent to: `return assign(string_type(p), f);`

```
basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
```

9 *Effects*: Equivalent to: `return assign(string_type(p, len), f);`

```
template<class ST, class SA>
  basic_regex& assign(const basic_string<charT, ST, SA>& s,
                      flag_type f = regex_constants::ECMAScript);
```

10 *Effects*: Assigns the regular expression contained in the string `s`, interpreted according the flags specified in `f`. If an exception is thrown, `*this` is unchanged.

11 *Postconditions*: If no exception is thrown, `flags()` returns `f` and `mark_count()` returns the number of marked sub-expressions within the expression.

12 *Returns*: `*this`.

13 *Throws*: `regex_error` if `s` is not a valid regular expression.

```
template<class InputIterator>
  basic_regex& assign(InputIterator first, InputIterator last,
                      flag_type f = regex_constants::ECMAScript);
```

14 *Effects*: Equivalent to: `return assign(string_type(first, last), f);`

```
basic_regex& assign(initializer_list<charT> il,
                    flag_type f = regex_constants::ECMAScript);
```

15 *Effects*: Equivalent to: `return assign(il.begin(), il.end(), f);`

28.6.7.4 Constant operations [re.regex.operations]

```
unsigned mark_count() const;
```

1 *Effects*: Returns the number of marked sub-expressions within the regular expression.

```
flag_type flags() const;
```

2 *Effects*: Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.

28.6.7.5 Locale [re.regex.locale]

```
locale_type imbue(locale_type loc);
```

1 *Effects*: Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.

```
locale_type getloc() const;
```

2 *Effects*: Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.

28.6.7.6 Swap [re.regex.swap]

```
void swap(basic_regex& e);
```

1 *Effects*: Swaps the contents of the two regular expressions.

2 *Postconditions*: `*this` contains the regular expression that was in `e`, `e` contains the regular expression that was in `*this`.

3 *Complexity*: Constant time.

28.6.7.7 Non-member functions [re.regex.nonmemb]

```
template<class charT, class traits>
  void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
```

1 *Effects*: Calls `lhs.swap(rhs)`.

28.6.8 Class template `sub_match` [re.submatch]

28.6.8.1 General [re.submatch.general]

1 Class template `sub_match` denotes the sequence of characters matched by a particular marked sub-expression.

```
namespace std {
  template<class BidirectionalIterator>
    class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
    public:
      using value_type      =
              typename iterator_traits<BidirectionalIterator>::value_type;
      using difference_type =
              typename iterator_traits<BidirectionalIterator>::difference_type;
      using iterator        = BidirectionalIterator;
      using string_type     = basic_string<value_type>;

      bool matched;

      constexpr sub_match();

      difference_type length() const;
      operator string_type() const;
      string_type str() const;

      int compare(const sub_match& s) const;
      int compare(const string_type& s) const;
      int compare(const value_type* s) const;

      void swap(sub_match& s) noexcept(see below);
    };
}
```

28.6.8.2 Members [re.submatch.members]

```
constexpr sub_match();
```

1 *Effects*: Value-initializes the `pair` base class subobject and the member `matched`.

```
difference_type length() const;
```

2 *Returns*: `matched ? distance(first, second) : 0`.

```
operator string_type() const;
```

3 *Returns*: `matched ? string_type(first, second) : string_type()`.

```
string_type str() const;
```

4 *Returns*: `matched ? string_type(first, second) : string_type()`.

```
int compare(const sub_match& s) const;
```

5 *Returns*: `str().compare(s.str())`.

```
int compare(const string_type& s) const;
```

6 *Returns*: `str().compare(s)`.

```
int compare(const value_type* s) const;
```

7 *Returns*: `str().compare(s)`.

```
void swap(sub_match& s) noexcept(see below);
```

8 *Preconditions*: `BidirectionalIterator` meets the *Cpp17Swappable* requirements (16.4.4.3).

9 *Effects*: Equivalent to:

```
this->pair<BidirectionalIterator, BidirectionalIterator>::swap(s);
std::swap(matched, s.matched);
```

10 *Remarks*: The exception specification is equivalent to `is_nothrow_swappable_v<BidirectionalIterator>`.

28.6.8.3 Non-member operators [re.submatch.op]

1 Let *SM-CAT*(I) be

```
compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>
```

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

2 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

3 *Returns*: `static_cast<`*SM-CAT*`(BiIter)>(lhs.compare(rhs) <=> 0)`.

```
template<class BiIter, class ST, class SA>
  bool operator==(
      const sub_match<BiIter>& lhs,
      const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

4 *Returns*:

```
lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0
```

```
template<class BiIter, class ST, class SA>
  auto operator<=>(
      const sub_match<BiIter>& lhs,
      const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

5 *Returns*:

```
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
      <=> 0
    )
```

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type* rhs);
```

6 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs,
                   const typename iterator_traits<BiIter>::value_type* rhs);
```

7 *Returns*: `static_cast<`*SM-CAT*`(BiIter)>(lhs.compare(rhs) <=> 0)`.

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type& rhs);
```

8 *Returns*: `lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs,
                   const typename iterator_traits<BiIter>::value_type& rhs);
```

9 *Returns*:

```
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(1, rhs))
      <=> 0
    )
```

```
template<class charT, class ST, class BiIter>
  basic_ostream<charT, ST>&
    operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
```

10 *Returns*: `os << m.str()`.

28.6.9 Class template `match_results` [re.results]

28.6.9.1 General [re.results.general]

1 Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

2 The class template `match_results` meets the requirements of an allocator-aware container (23.2.2.5) and of a sequence container (23.2.2, 23.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.

3 A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.

4 The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

[*Note 1*: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — *end note*]

```
namespace std {
  template<class BidirectionalIterator,
           class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {
    public:
      using value_type      = sub_match<BidirectionalIterator>;
      using const_reference = const value_type&;
      using reference       = value_type&;
      using const_iterator  = implementation-defined;
      using iterator        = const_iterator;
      using difference_type =
              typename iterator_traits<BidirectionalIterator>::difference_type;
      using size_type       = typename allocator_traits<Allocator>::size_type;
      using allocator_type  = Allocator;
      using char_type       =
              typename iterator_traits<BidirectionalIterator>::value_type;
      using string_type     = basic_string<char_type>;
      // 28.6.9.2, construct/copy/destroy
      match_results() : match_results(Allocator()) {}
      explicit match_results(const Allocator& a);
      match_results(const match_results& m);
      match_results(const match_results& m, const Allocator& a);
      match_results(match_results&& m) noexcept;
      match_results(match_results&& m, const Allocator& a);
      match_results& operator=(const match_results& m);
      match_results& operator=(match_results&& m);
      ~match_results();

      // 28.6.9.3, state
      bool ready() const;

      // 28.6.9.4, size
      size_type size() const;
      size_type max_size() const;
      bool empty() const;

      // 28.6.9.5, element access
      difference_type length(size_type sub = 0) const;
      difference_type position(size_type sub = 0) const;
      string_type str(size_type sub = 0) const;
      const_reference operator[](size_type n) const;

      const_reference prefix() const;
      const_reference suffix() const;
      const_iterator begin() const;
      const_iterator end() const;
      const_iterator cbegin() const;
      const_iterator cend() const;

      // 28.6.9.6, format
      template<class OutputIter>
        OutputIter
          format(OutputIter out,
                 const char_type* fmt_first, const char_type* fmt_last,
                 regex_constants::match_flag_type flags = regex_constants::format_default) const;
      template<class OutputIter, class ST, class SA>
        OutputIter
          format(OutputIter out,
                 const basic_string<char_type, ST, SA>& fmt,
                 regex_constants::match_flag_type flags = regex_constants::format_default) const;
      template<class ST, class SA>
        basic_string<char_type, ST, SA>
          format(const basic_string<char_type, ST, SA>& fmt,
                 regex_constants::match_flag_type flags = regex_constants::format_default) const;
      string_type
        format(const char_type* fmt,
               regex_constants::match_flag_type flags = regex_constants::format_default) const;

      // 28.6.9.7, allocator
      allocator_type get_allocator() const;

      // 28.6.9.8, swap
      void swap(match_results& that);
    };
}
```

28.6.9.2 Constructors [re.results.const]

1 Table 120 lists the postconditions of `match_results` copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter `m` denote the values they had before the respective function calls.

```
explicit match_results(const Allocator& a);
```

2 *Effects*: The stored `Allocator` value is constructed from `a`.

3 *Postconditions*: `ready()` returns `false`. `size()` returns `0`.

```
match_results(const match_results& m);
match_results(const match_results& m, const Allocator& a);
```

4 *Effects*: For the first form, the stored `Allocator` value is obtained as specified in 23.2.2.2. For the second form, the stored `Allocator` value is constructed from `a`.

5 *Postconditions*: As specified in Table 120.

```
match_results(match_results&& m) noexcept;
match_results(match_results&& m, const Allocator& a);
```

6 *Effects*: For the first form, the stored `Allocator` value is move constructed from `m.get_allocator()`. For the second form, the stored `Allocator` value is constructed from `a`.

7 *Postconditions*: As specified in Table 120.

8 *Throws*: The second form throws nothing if `a == m.get_allocator()` is `true`.

```
match_results& operator=(const match_results& m);
```

9 *Postconditions*: As specified in Table 120.

```
match_results& operator=(match_results&& m);
```

10 *Postconditions*: As specified in Table 120.

Table 120 — `match_results` copy/move operation postconditions [tab:re.results.const]

Element	Value
`ready()`	`m.ready()`
`size()`	`m.size()`
`str(n)`	`m.str(n)` for all non-negative integers `n < m.size()`
`prefix()`	`m.prefix()`
`suffix()`	`m.suffix()`
`(*this)[n]`	`m[n]` for all non-negative integers `n < m.size()`
`length(n)`	`m.length(n)` for all non-negative integers `n < m.size()`
`position(n)`	`m.position(n)` for all non-negative integers `n < m.size()`

28.6.9.3 State [re.results.state]

```
bool ready() const;
```

1 *Returns*: `true` if `*this` has a fully established result state, otherwise `false`.

28.6.9.4 Size [re.results.size]

```
size_type size() const;
```

1 *Returns*: One plus the number of marked sub-expressions in the regular expression that was matched if `*this` represents the result of a successful match. Otherwise returns `0`.

[*Note 1*: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Subclauses 28.6.10.2 and 28.6.10.3 specify the effects of those algorithms on their `match_results` arguments. — *end note*]

```
size_type max_size() const;
```

2 *Returns*: The maximum number of `sub_match` elements that can be stored in `*this`.

```
bool empty() const;
```

3 *Returns*: `size() == 0`.

28.6.9.5 Element access [re.results.acc]

```
difference_type length(size_type sub = 0) const;
```

1 *Preconditions*: `ready() == true`.

2 *Returns*: `(*this)[sub].length()`.

```
difference_type position(size_type sub = 0) const;
```

3 *Preconditions*: `ready() == true`.

4 *Returns*: The distance from the start of the target sequence to `(*this)[sub].first`.

```
string_type str(size_type sub = 0) const;
```

5 *Preconditions*: `ready() == true`.

6 *Returns*: `string_type((*this)[sub])`.

```
const_reference operator[](size_type n) const;
```

7 *Preconditions*: `ready() == true`.

8 *Returns*: A reference to the `sub_match` object representing the character sequence that matched marked sub-expression `n`. If `n == 0` then returns a reference to a `sub_match` object representing the character sequence that matched the whole regular expression. If `n >= size()` then returns a `sub_match` object representing an unmatched sub-expression.

```
const_reference prefix() const;
```

9 *Preconditions*: `ready() == true`.

10 *Returns*: A reference to the `sub_match` object representing the character sequence from the start of the string being matched/searched to the start of the match found.

```
const_reference suffix() const;
```

11 *Preconditions*: `ready() == true`.

12 *Returns*: A reference to the `sub_match` object representing the character sequence from the end of the match found to the end of the string being matched/searched.

```
const_iterator begin() const;
const_iterator cbegin() const;
```

13 *Returns*: A starting iterator that enumerates over all the sub-expressions stored in `*this`.

```
const_iterator end() const;
const_iterator cend() const;
```

14 *Returns*: A terminating iterator that enumerates over all the sub-expressions stored in `*this`.

28.6.9.6 Formatting [re.results.form]

```
template<class OutputIter>
  OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

1 *Preconditions*: `ready() == true` and `OutputIter` meets the requirements for a *Cpp17OutputIterator* (24.3.5.4).

2 *Effects*: Copies the character sequence [`fmt_first`, `fmt_last`) to OutputIter `out`. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within `*this` to which it refers. The bitmasks specified in `flags` determine which format specifiers and escape sequences are recognized.

3 *Returns*: `out`.

```
template<class OutputIter, class ST, class SA>
  OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

4 *Effects*: Equivalent to:

```
return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```
template<class ST, class SA>
  basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

5 *Preconditions*: `ready() == true`.

6 *Effects*: Constructs an empty string `result` of type `basic_string<char_type, ST, SA>` and calls:

```
format(back_inserter(result), fmt, flags);
```

7 *Returns*: `result`.

```
string_type format(
  const char_type* fmt,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

8 *Preconditions*: `ready() == true`.

9 *Effects*: Constructs an empty string `result` of type `string_type` and calls:

```
format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
```

10 *Returns*: `result`.

28.6.9.7 Allocator [re.results.all]

```
allocator_type get_allocator() const;
```

1 *Returns*: A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

28.6.9.8 Swap [re.results.swap]

```
void swap(match_results& that);
```

1 *Effects*: Swaps the contents of the two sequences.

2 *Postconditions*: `*this` contains the sequence of matched sub-expressions that were in `that`, `that` contains the sequence of matched sub-expressions that were in `*this`.

3 *Complexity*: Constant time.

```
template<class BidirectionalIterator, class Allocator>
  void swap(match_results<BidirectionalIterator, Allocator>& m1,
            match_results<BidirectionalIterator, Allocator>& m2);
```

4 *Effects*: As if by `m1.swap(m2)`.

28.6.9.9 Non-member functions [re.results.nonmember]

```
template<class BidirectionalIterator, class Allocator>
  bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
                  const match_results<BidirectionalIterator, Allocator>& m2);
```

1 *Returns*: `true` if neither match result is ready, `false` if one match result is ready and the other is not. If both match results are ready, returns `true` only if

(1.1) — `m1.empty() && m2.empty()`, or

(1.2) — `!m1.empty() && !m2.empty()`, and the following conditions are satisfied:

(1.2.1) — `m1.prefix() == m2.prefix()`,

(1.2.2) — `m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin())`, and

(1.2.3) — `m1.suffix() == m2.suffix()`.

[*Note 1*: The algorithm `equal` is defined in Clause 26. — *end note*]

28.6.10 Regular expression algorithms [re.alg]

28.6.10.1 Exceptions [re.except]

1 The algorithms described in subclause 28.6.10 may throw an exception of type `regex_error`. If such an exception `e` is thrown, `e.code()` shall return either `regex_constants::error_complexity` or `regex_constants::error_stack`.

28.6.10.2 `regex_match` [re.alg.match]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
  bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                   match_results<BidirectionalIterator, Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions*: `BidirectionalIterator` models `bidirectional_iterator` (24.3.4.12).

2 *Effects*: Determines whether there is a match between the regular expression `e`, and all of the character sequence [`first`, `last`). The parameter `flags` is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns `true` if such a match exists, `false` otherwise.

[*Example 1*:

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re);        // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re);        // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re);       // returns true, and m[0] contains "Get"
regex_match ("GetValues", m, re);       // returns false
```

— *end example*]

3 *Postconditions*: `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns `0` and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 121.

Table 121 — Effects of `regex_match` algorithm [tab:re.alg.match]

Element	Value
`m.size()`	`1 + e.mark_count()`
`m.empty()`	`false`
`m.prefix().first`	`first`
`m.prefix().second`	`first`
`m.prefix().matched`	`false`
`m.suffix().first`	`last`
`m.suffix().second`	`last`
`m.suffix().matched`	`false`
`m[0].first`	`first`
`m[0].second`	`last`
`m[0].matched`	`true`
`m[n].first`	For all integers `0 < n < m.size()`, the start of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].second`	For all integers `0 < n < m.size()`, the end of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].matched`	For all integers `0 < n < m.size()`, `true` if sub-expression `n` participated in the match, `false` otherwise.

```
template<class BidirectionalIterator, class charT, class traits>
  bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

4 *Effects*: Behaves "as if" by constructing an instance of `match_results<BidirectionalIterator> what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```
template<class charT, class Allocator, class traits>
  bool regex_match(const charT* str,
                   match_results<const charT*, Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Returns*: `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```
template<class ST, class SA, class Allocator, class charT, class traits>
  bool regex_match(const basic_string<charT, ST, SA>& s,
                   match_results<typename basic_string<charT, ST, SA>::const_iterator,
                                 Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

6 *Returns*: `regex_match(s.begin(), s.end(), m, e, flags)`.

```
template<class charT, class traits>
  bool regex_match(const charT* str,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

7 *Returns*: `regex_match(str, str + char_traits<charT>::length(str), e, flags)`.

```
template<class ST, class SA, class charT, class traits>
  bool regex_match(const basic_string<charT, ST, SA>& s,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

8 *Returns*: `regex_match(s.begin(), s.end(), e, flags)`.

28.6.10.3 `regex_search` [re.alg.search]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
  bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                    match_results<BidirectionalIterator, Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions*: `BidirectionalIterator` models `bidirectional_iterator` (24.3.4.12).

2 *Effects*: Determines whether there is some sub-sequence within [`first`, `last`) that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

3 *Postconditions*: `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns `0` and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 122.

Table 122 — Effects of `regex_search` algorithm [tab:re.alg.search]

Element	Value
`m.size()`	`1 + e.mark_count()`
`m.empty()`	`false`
`m.prefix().first`	`first`
`m.prefix().second`	`m[0].first`
`m.prefix().matched`	`m.prefix().first != m.prefix().second`

Table 122 — Effects of `regex_search` algorithm (continued)

Element	Value
`m.suffix().first`	`m[0].second`
`m.suffix().second`	`last`
`m.suffix().matched`	`m.suffix().first != m.suffix().second`
`m[0].first`	The start of the sequence of characters that matched the regular expression
`m[0].second`	The end of the sequence of characters that matched the regular expression
`m[0].matched`	`true`
`m[n].first`	For all integers `0 < n < m.size()`, the start of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].second`	For all integers `0 < n < m.size()`, the end of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].matched`	For all integers `0 < n < m.size()`, `true` if sub-expression `n` participated in the match, `false` otherwise.

```
template<class charT, class Allocator, class traits>
  bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

4 *Returns*: `regex_search(str, str + char_traits<charT>::length(str), m, e, flags)`.

```
template<class ST, class SA, class Allocator, class charT, class traits>
  bool regex_search(const basic_string<charT, ST, SA>& s,
                    match_results<typename basic_string<charT, ST, SA>::const_iterator,
                                  Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Returns*: `regex_search(s.begin(), s.end(), m, e, flags)`.

```
template<class BidirectionalIterator, class charT, class traits>
  bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

6 *Effects*: Behaves “as if” by constructing an object `what` of type `match_results<Bidirectional-Iterator>` and returning `regex_search(first, last, what, e, flags)`.

```
template<class charT, class traits>
  bool regex_search(const charT* str,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

7 *Returns*: `regex_search(str, str + char_traits<charT>::length(str), e, flags)`.

```
template<class ST, class SA, class charT, class traits>
  bool regex_search(const basic_string<charT, ST, SA>& s,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

8 *Returns*: `regex_search(s.begin(), s.end(), e, flags)`.

28.6.10.4 regex_replace [re.alg.replace]

```
template<class OutputIterator, class BidirectionalIterator,
         class traits, class charT, class ST, class SA>
  OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
  OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Effects*: Constructs a `regex_iterator` object `i` as if by

```
regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence [`first`, `last`). If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
out = copy(first, last, out)
```

If any matches are found then, for each such match:

(1.1) — If `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(m.prefix().first, m.prefix().second, out)
```

(1.2) — Then calls

```
out = m.format(out, fmt, flags)
```

for the first form of the function and

```
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

2 *Returns*: `out`.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
  basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, FST, FSA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT, class ST, class SA>
  basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

3 *Effects*: Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4 *Returns*: `result`.

```
template<class traits, class charT, class ST, class SA>
  basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT>
  basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Effects*: Constructs an empty string `result` of type `basic_string<charT>` and calls:

```
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6 *Returns*: `result`.

28.6.11 Regular expression iterators [re.iter]

28.6.11.1 Class template `regex_iterator` [re.regiter]

28.6.11.1.1 General [re.regiter.general]

1 The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a const `match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
    class regex_iterator {
    public:
      using regex_type        = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using iterator_concept  = input_iterator_tag;
      using value_type        = match_results<BidirectionalIterator>;
      using difference_type   = ptrdiff_t;
      using pointer           = const value_type*;
      using reference         = const value_type&;

      regex_iterator();
      regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     regex_constants::match_flag_type m = regex_constants::match_default);
      regex_iterator(BidirectionalIterator, BidirectionalIterator,
                     const regex_type&&,
                     regex_constants::match_flag_type = regex_constants::match_default) = delete;
      regex_iterator(const regex_iterator&);
      regex_iterator& operator=(const regex_iterator&);
      bool operator==(const regex_iterator&) const;
      bool operator==(default_sentinel_t) const { return *this == regex_iterator(); }
      const value_type& operator*() const;
      const value_type* operator->() const;
      regex_iterator& operator++();
      regex_iterator operator++(int);

    private:
      BidirectionalIterator               begin;                // exposition only
      BidirectionalIterator               end;                  // exposition only
      const regex_type*                   pregex;               // exposition only
      regex_constants::match_flag_type    flags;                // exposition only
      match_results<BidirectionalIterator> match;               // exposition only
    };
}
```

2 An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

[*Note 1*: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as `'^'`, `'$'`, `'\b'`, `'\B'`). — *end note*]

28.6.11.1.2 Constructors [re.regiter.cnstr]

```
regex_iterator();
```

1 *Effects*: Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
               const regex_type& re,
               regex_constants::match_flag_type m = regex_constants::match_default);
```

2 *Effects*: Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

28.6.11.1.3 Comparisons [re.regiter.comp]

```
bool operator==(const regex_iterator& right) const;
```

1 *Returns*: `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

(1.1) — `begin == right.begin`,

(1.2) — `end == right.end`,

(1.3) — `pregex == right.pregex`,

(1.4) — `flags == right.flags`, and

(1.5) — `match[0] == right.match[0]`;

otherwise `false`.

28.6.11.1.4 Indirection [re.regiter.deref]

```
const value_type& operator*() const;
```

1 *Returns*: `match`.

```
const value_type* operator->() const;
```

2 *Returns*: `addressof(match)`.

28.6.11.1.5 Increment [re.regiter.incr]

```
regex_iterator& operator++();
```

1 *Effects*: Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.

2 If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

3 Otherwise, if the iterator holds a zero-length match, the operator calls:

```
regex_search(start, end, match, *pregex,
             flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.

4 If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns `*this`.

5 In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to the previous value of `match[0].second`, and for each index `i` in the half-open range $[0, $`match.size()`$)$ for which `match[i].matched` is `true`, `match.position(i)` shall return `distance(begin, match[i].first)`.

6 [*Note 1*: This means that `match.position(i)` gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to `regex_search`. — *end note*]

7 It is unspecified how the implementation makes these adjustments.

8 [*Note 2*: This means that an implementation can call an implementation-specific search function, in which case a program-defined specialization of `regex_search` will not be called. — *end note*]

```
regex_iterator operator++(int);
```

9 *Effects*: As if by:

```
  regex_iterator tmp = *this;
  ++(*this);
  return tmp;
```

28.6.11.2 Class template `regex_token_iterator` [re.tokiter]

28.6.11.2.1 General [re.tokiter.general]

1 The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.

2 When class `regex_token_iterator` is used to enumerate a single sub-expression with index -1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

3 After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator> position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.

4 If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

5 The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.

6 It is impossible to store things into `regex_token_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
    class regex_token_iterator {
    public:
```

```
    using regex_type        = basic_regex<charT, traits>;
    using iterator_category = forward_iterator_tag;
    using iterator_concept  = input_iterator_tag;
    using value_type        = sub_match<BidirectionalIterator>;
    using difference_type   = ptrdiff_t;
    using pointer           = const value_type*;
    using reference         = const value_type&;

    regex_token_iterator();
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                         const regex_type& re,
                         int submatch = 0,
                         regex_constants::match_flag_type m =
                           regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                         const regex_type& re,
                         const vector<int>& submatches,
                         regex_constants::match_flag_type m =
                           regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                         const regex_type& re,
                         initializer_list<int> submatches,
                         regex_constants::match_flag_type m =
                           regex_constants::match_default);
    template<size_t N>
      regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           const int (&submatches)[N],
                           regex_constants::match_flag_type m =
                             regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                         const regex_type&& re,
                         int submatch = 0,
                         regex_constants::match_flag_type m =
                           regex_constants::match_default) = delete;

    template<size_t N>
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                         const regex_type&& re,
                         const int (&submatches)[N],
                         regex_constants::match_flag_type m =
                           regex_constants::match_default) = delete;
    regex_token_iterator(const regex_token_iterator&);
    regex_token_iterator& operator=(const regex_token_iterator&);
    bool operator==(const regex_token_iterator&) const;
    bool operator==(default_sentinel_t) const { return *this == regex_token_iterator(); }
    const value_type& operator*() const;
    const value_type* operator->() const;
    regex_token_iterator& operator++();
    regex_token_iterator operator++(int);

  private:
    using position_iterator =
      regex_iterator<BidirectionalIterator, charT, traits>;   // exposition only
    position_iterator position;                               // exposition only
```

```
        const value_type* result;                              // exposition only
        value_type suffix;                                     // exposition only
        size_t N;                                              // exposition only
        vector<int> subs;                                      // exposition only
      };
    }
```

7 A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.

8 [*Note 1*: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence. — *end note*]

9 The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

28.6.11.2.2 Constructors [re.tokiter.cnstr]

```
regex_token_iterator();
```

1 *Effects*: Constructs the end-of-sequence iterator.

```
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     int submatch = 0,
                     regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     const vector<int>& submatches,
                     regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     initializer_list<int> submatches,
                     regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
  regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                       const regex_type& re,
                       const int (&submatches)[N],
                       regex_constants::match_flag_type m = regex_constants::match_default);
```

2 *Preconditions*: Each of the initialization values of `submatches` is `>= -1`.

3 *Effects*: The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range [`begin(submatches)`, `end(submatches)`).

4 Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range [`a`, `b`), otherwise the constructor sets `*this` to an end-of-sequence iterator.

28.6.11.2.3 Comparisons [re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

1 *Returns*: `true` if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns `false` if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns `true` if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns `false`.

28.6.11.2.4 Indirection [re.tokiter.deref]

```
const value_type& operator*() const;
```

1 *Returns*: `*result`.

```
const value_type* operator->() const;
```

2 *Returns*: `result`.

28.6.11.2.5 Increment [re.tokiter.incr]

```
regex_token_iterator& operator++();
```

1 *Effects*: Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.

2 If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.

3 Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.

4 Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

5 Otherwise, if any of the values stored in `subs` is equal to -1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range [`prev->suffix().first`, `prev->suffix().second`).

6 Otherwise, sets `*this` to an end-of-sequence iterator.

7 *Returns*: `*this`.

```
regex_token_iterator& operator++(int);
```

8 *Effects*: Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

9 *Returns*: `tmp`.

28.6.12 Modified ECMAScript regular expression grammar [re.grammar]

1 The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

2 Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

3 The following productions within the ECMAScript grammar are modified as follows:

ClassAtom ::
  `-`
  ClassAtomNoDash
  ClassAtomExClass
  ClassAtomCollatingElement
  ClassAtomEquivalence

IdentityEscape ::
  SourceCharacter **but not** `c`

4 The following new productions are then added:

ClassAtomExClass ::
  `[:` *ClassName* `:]`

ClassAtomCollatingElement ::
  `[.` *ClassName* `.]`

ClassAtomEquivalence ::
  `[=` *ClassName* `=]`

ClassName ::
  ClassNameCharacter
  ClassNameCharacter ClassName

ClassNameCharacter ::
    SourceCharacter **but not one of `.` or `=` or `:`**

5 The productions *ClassAtomExClass*, *ClassAtomCollatingElement* and *ClassAtomEquivalence* provide functionality equivalent to that of the same features in regular expressions in POSIX.

6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 116.

7 A *ClassName* production, when used in *ClassAtomExClass*, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid *ClassName*s are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

`\d` and `[[:digit:]]`

`\D` and `[^[:digit:]]`

`\s` and `[[:space:]]`

`\S` and `[^[:space:]]`

`\w` and `[_[:alnum:]]`

`\W` and `[^_[:alnum:]]`

8 A *ClassName* production when used in a *ClassAtomCollatingElement* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.

9 The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.

10 A *ClassName* production when used in a *ClassAtomEquivalence* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

11 When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

12 If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[*Note 1*: This means that values of the form `"\uxxxx"` that do not fit in a character are invalid. — *end note*]

13 Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

14 The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (28.6.4.3) specified when using the regular expression object in one of the regular expression algorithms (28.6.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:

(14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;

(14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;

(14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is `false` then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```
string_type str1 = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
      <= traits_inst.transform(str.begin(), str.end())
  && traits_inst.transform(str.begin(), str.end())
      <= traits_inst.transform(str2.begin(), str2.end());
```

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range [`first`, `last`) if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is `true`.

  }
```

1 The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it declares the additional `mbrtoc8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

SEE ALSO: ISO/IEC 9899:2018, 7.28

28.7.5 Multibyte / wide string and character conversion functions [c.mb.wcs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2), `<cuchar>` (28.7.4), and `<cwchar>` (28.7.3) declare the functions described in this subclause. — *end note*]

```
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

2 *Effects*: These functions have the semantics specified in the C standard library.

See also: ISO/IEC 9899:2018, 7.22.7.1, 7.22.8, 7.29.6.2.1

```
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Remarks*: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO/IEC 9899:2018, 7.22.7

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

5 *Effects*: These functions have the semantics specified in the C standard library.

6 *Remarks*: Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

See also: ISO/IEC 9899:2018, 7.29.6.3

```
size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
```

7 *Effects*: If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `pc8` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `pc8`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000 NULL, the resulting state described is the initial conversion state.

8 *Returns*: The first of the following that applies (given the current conversion state):

(8.1) — `0`, if the next `n` or fewer bytes complete the multibyte character that corresponds to the U+0000 NULL Unicode character (which is the value stored).

(8.2) — between `1` and `n` (inclusive), if the next `n` or fewer bytes complete a valid multibyte character (whose first (or only) code unit is stored); the value returned is the number of bytes that complete the multibyte character.

(8.3) — `(size_t)(-3)`, if the next code unit resulting from a previous call has been stored (no bytes from the input have been consumed by this call).

(8.4) — `(size_t)(-2)`, if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).

(8.5) — `(size_t)(-1)`, if an encoding error occurs, in which case the next `n` or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro `EILSEQ` is stored in `errno`, and the conversion state is unspecified.

```
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
```

9 *Effects*: If `s` is a null pointer, equivalent to `c8rtomb(buf, u8'\0', ps)` where `buf` is an internal buffer. Otherwise, if `c8` completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by `s`. At most `MB_CUR_MAX` bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

10 *Returns*: The number of bytes stored in the array object (including any shift sequences). If `c8` does not contribute to a sequence of `char8_t` corresponding to a valid multibyte character, the value of the macro `EILSEQ` is stored in `errno`, `(size_t) (-1)` is returned, and the conversion state is unspecified.

11 *Remarks*: Calls to `c8rtomb` with a null pointer argument for `s` may introduce a data race (16.4.6.10) with other calls to `c8rtomb` with a null pointer argument for `s`.

29 Numerics library [numerics]

29.1 General [numerics.general]

1 This Clause describes components that C++ programs may use to perform seminumerical operations.

2 The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 123.

Table 123 — Numerics library summary [tab:numerics.summary]

	Subclause	Header
29.2	Requirements	
29.3	Floating-point environment	`<cfenv>`
29.4	Complex numbers	`<complex>`
29.5	Random number generation	`<random>`
29.6	Numeric arrays	`<valarray>`
29.7	Mathematical functions for floating-point types	`<cmath>`, `<cstdlib>`
29.8	Numbers	`<numbers>`
29.9	Linear algebra	`<linalg>`
29.10	Data-parallel types	`<simd>`

29.2 Numeric type requirements [numeric.requirements]

1 The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type `T` that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2).[240]

2 If any operation on `T` throws an exception the effects are undefined.

3 In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if `T` meets additional requirements specified for each such member or related function.

4 [*Example 1*: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. — *end example*]

29.3 The floating-point environment [cfenv]

29.3.1 Header `<cfenv>` synopsis [cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below    // optional
#define FE_INEXACT see below      // optional
#define FE_INVALID see below      // optional
#define FE_OVERFLOW see below     // optional
#define FE_UNDERFLOW see below    // optional

#define FE_DOWNWARD see below     // optional
#define FE_TONEAREST see below    // optional
#define FE_TOWARDZERO see below   // optional
#define FE_UPWARD see below       // optional

#define FE_DFL_ENV see below
```

240) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

```
namespace std {
  // types
  using fenv_t    = object type;
  using fexcept_t = object type;

  // functions
  int feclearexcept(int except);
  int fegetexceptflag(fexcept_t* pflag, int except);
  int feraiseexcept(int except);
  int fesetexceptflag(const fexcept_t* pflag, int except);
  int fetestexcept(int except);

  int fegetround();
  int fesetround(int mode);

  int fegetenv(fenv_t* penv);
  int feholdexcept(fenv_t* penv);
  int fesetenv(const fenv_t* penv);
  int feupdateenv(const fenv_t* penv);
}
```

1 The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

[*Note 1*: This document does not require an implementation to support the `FENV_ACCESS` pragma; it is implementation-defined (15.10) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — *end note*]

SEE ALSO: ISO/IEC 9899:2018, 7.6

29.3.2 Threads [cfenv.thread]

1 The floating-point environment has thread storage duration (6.7.6.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding `thread` object (32.4.3) or `jthread` object (32.4.4) at the time it constructed the object.

[*Note 1*: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — *end note*]

2 A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

29.4 Complex numbers [complex.numbers]

29.4.1 General [complex.numbers.general]

1 The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the template `complex` for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of `complex` for cv-unqualified floating-point types are trivially copyable literal types (6.8.1).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If `z` is an lvalue of type *cv* `complex<T>` then:

(4.1) — the expression `reinterpret_cast<`*cv* `T(&)[2]>(z)` is well-formed,

(4.2) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[0]` designates the real part of `z`, and

(4.3) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[1]` designates the imaginary part of `z`.

Moreover, if `a` is an expression of type *cv* `complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

(4.4) — `reinterpret_cast<`*cv* `T*>(a)[2 * i]` designates the real part of `a[i]`, and

(4.5) — `reinterpret_cast<`*cv* `T*>(a)[2 * i + 1]` designates the imaginary part of `a[i]`.

29.4.2 Header `<complex>` synopsis [complex.syn]

```
namespace std {
  // 29.4.3, class template complex
  template<class T> class complex;

  // 29.4.6, operators
  template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);

  template<class T> constexpr complex<T> operator-(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator-(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator-(const T&, const complex<T>&);

  template<class T> constexpr complex<T> exp  (const complex<T>&);
  template<class T> constexpr complex<T> log  (const complex<T>&);
  template<class T> constexpr complex<T> log10(const complex<T>&);

  template<class T> constexpr complex<T> pow  (const complex<T>&, const T&);
  template<class T> constexpr complex<T> pow  (const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> pow  (const T&, const complex<T>&);
```

```
    template<class T> constexpr complex<T> sin  (const complex<T>&);
    template<class T> constexpr complex<T> sinh (const complex<T>&);
    template<class T> constexpr complex<T> sqrt (const complex<T>&);
    template<class T> constexpr complex<T> tan  (const complex<T>&);
    template<class T> constexpr complex<T> tanh (const complex<T>&);

    // 29.4.9, tuple interface
    template<class T> struct tuple_size;
    template<size_t I, class T> struct tuple_element;
    template<class T> struct tuple_size<complex<T>>;
    template<size_t I, class T> struct tuple_element<I, complex<T>>;
    template<size_t I, class T>
      constexpr T& get(complex<T>&) noexcept;
    template<size_t I, class T>
      constexpr T&& get(complex<T>&&) noexcept;
    template<size_t I, class T>
      constexpr const T& get(const complex<T>&) noexcept;
    template<size_t I, class T>
      constexpr const T&& get(const complex<T>&&) noexcept;

    // 29.4.11, complex literals
    inline namespace literals {
      inline namespace complex_literals {
        constexpr complex<long double> operator""il(long double);
        constexpr complex<long double> operator""il(unsigned long long);
        constexpr complex<double> operator""i(long double);
        constexpr complex<double> operator""i(unsigned long long);
        constexpr complex<float> operator""if(long double);
        constexpr complex<float> operator""if(unsigned long long);
      }
    }
  }
```

29.4.3 Class template complex [complex]

```
  namespace std {
    template<class T> class complex {
    public:
      using value_type = T;

      constexpr complex(const T& re = T(), const T& im = T());
      constexpr complex(const complex&) = default;
      template<class X> constexpr explicit(see below) complex(const complex<X>&);

      constexpr T real() const;
      constexpr void real(T);
      constexpr T imag() const;
      constexpr void imag(T);

      constexpr complex& operator= (const T&);
      constexpr complex& operator+=(const T&);
      constexpr complex& operator-=(const T&);
      constexpr complex& operator*=(const T&);
      constexpr complex& operator/=(const T&);

      constexpr complex& operator=(const complex&);
      template<class X> constexpr complex& operator= (const complex<X>&);
      template<class X> constexpr complex& operator+=(const complex<X>&);
      template<class X> constexpr complex& operator-=(const complex<X>&);
      template<class X> constexpr complex& operator*=(const complex<X>&);
      template<class X> constexpr complex& operator/=(const complex<X>&);
    };
  }
```

1 The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

29.4.4 Member functions [complex.members]

```
constexpr complex(const T& re = T(), const T& im = T());
```

1 *Postconditions*: `real() == re && imag() == im` is `true`.

```
template<class X> constexpr explicit(see below) complex(const complex<X>& other);
```

2 *Effects*: Initializes the real part with `other.real()` and the imaginary part with `other.imag()`.

3 *Remarks*: The expression inside `explicit` evaluates to `false` if and only if the floating-point conversion rank of `T` is greater than or equal to the floating-point conversion rank of `X`.

```
constexpr T real() const;
```

4 *Returns*: The value of the real component.

```
constexpr void real(T val);
```

5 *Effects*: Assigns `val` to the real component.

```
constexpr T imag() const;
```

6 *Returns*: The value of the imaginary component.

```
constexpr void imag(T val);
```

7 *Effects*: Assigns `val` to the imaginary component.

29.4.5 Member operators [complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
```

1 *Effects*: Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

2 *Returns*: `*this`.

```
constexpr complex& operator-=(const T& rhs);
```

3 *Effects*: Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

4 *Returns*: `*this`.

```
constexpr complex& operator*=(const T& rhs);
```

5 *Effects*: Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

6 *Returns*: `*this`.

```
constexpr complex& operator/=(const T& rhs);
```

7 *Effects*: Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

8 *Returns*: `*this`.

```
template<class X> constexpr complex& operator=(const complex<X>& rhs);
```

9 *Effects*: Assigns the value `rhs.real()` to the real part and the value `rhs.imag()` to the imaginary part of the complex value `*this`.

10 *Returns*: `*this`.

```
template<class X> constexpr complex& operator+=(const complex<X>& rhs);
```

11 *Effects*: Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

12 *Returns*: `*this`.

```
template<class X> constexpr complex& operator-=(const complex<X>& rhs);
```

13 *Effects*: Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

14 *Returns*: `*this`.

```
template<class X> constexpr complex& operator*=(const complex<X>& rhs);
```

15 *Effects*: Multiplies the complex value `rhs` by the complex value `*this` and stores the product in `*this`.

16 *Returns*: `*this`.

```
template<class X> constexpr complex& operator/=(const complex<X>& rhs);
```

17 *Effects*: Divides the complex value `rhs` into the complex value `*this` and stores the quotient in `*this`.

18 *Returns*: `*this`.

29.4.6 Non-member operations [complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
```

1 *Returns*: `complex<T>(lhs)`.

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

2 *Returns*: `complex<T>(lhs) += rhs`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
```

3 *Returns*: `complex<T>(-lhs.real(),-lhs.imag())`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

4 *Returns*: `complex<T>(lhs) -= rhs`.

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

5 *Returns*: `complex<T>(lhs) *= rhs`.

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

6 *Returns*: `complex<T>(lhs) /= rhs`.

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
```

7 *Returns*: `lhs.real() == rhs.real() && lhs.imag() == rhs.imag()`.

8 *Remarks*: The imaginary part is assumed to be `T()`, or 0.0, for the `T` arguments.

```
template<class T, class charT, class traits>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

9 *Preconditions*: The input values are convertible to `T`.

10 *Effects*: Extracts a complex number `x` of the form: `u`, `(u)`, or `(u,v)`, where `u` is the real part and `v` is the imaginary part (31.7.5.3).

11 If bad input is encountered, calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

12 *Returns*: `is`.

13 *Remarks*: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

14 *Effects*: Inserts the complex number `x` onto the stream `o` as if it were implemented as follows:

```
  basic_ostringstream<charT, traits> s;
  s.flags(o.flags());
  s.imbue(o.getloc());
  s.precision(o.precision());
  s << '(' << x.real() << ',' << x.imag() << ')';
  return o << s.str();
```

15 [*Note 1*: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting `showpoint` into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — *end note*]

29.4.7 Value operations [complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

1 *Returns*: `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

2 *Returns*: `x.imag()`.

```
template<class T> constexpr T abs(const complex<T>& x);
```

3 *Returns*: The magnitude of `x`.

```
template<class T> constexpr T arg(const complex<T>& x);
```

4 *Returns*: The phase angle of `x`, or `atan2(imag(x), real(x))`.

```
template<class T> constexpr T norm(const complex<T>& x);
```

5 *Returns*: The squared magnitude of `x`.

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
```

6 *Returns*: The complex conjugate of `x`.

```
template<class T> constexpr complex<T> proj(const complex<T>& x);
```

7 *Returns*: The projection of `x` onto the Riemann sphere.

8 *Remarks*: Behaves the same as the C function `cproj`. See also: ISO/IEC 9899:2018, 7.3.9.5

```
template<class T> constexpr complex<T> polar(const T& rho, const T& theta = T());
```

9 *Preconditions*: `rho` is non-negative and non-NaN. `theta` is finite.

10 *Returns*: The `complex` value corresponding to a complex number whose magnitude is `rho` and whose phase angle is `theta`.

29.4.8 Transcendentals [complex.transcendentals]

```
template<class T> constexpr complex<T> acos(const complex<T>& x);
```

1 *Returns*: The complex arc cosine of `x`.

2 *Remarks*: Behaves the same as the C function `cacos`. See also: ISO/IEC 9899:2018, 7.3.5.1

```
template<class T> constexpr complex<T> asin(const complex<T>& x);
```

3 *Returns*: The complex arc sine of `x`.

4 *Remarks*: Behaves the same as the C function `casin`. See also: ISO/IEC 9899:2018, 7.3.5.2

```
template<class T> constexpr complex<T> atan(const complex<T>& x);
```

5 *Returns*: The complex arc tangent of `x`.

6 *Remarks*: Behaves the same as the C function `catan`. See also: ISO/IEC 9899:2018, 7.3.5.3

```
template<class T> constexpr complex<T> acosh(const complex<T>& x);
```

7 *Returns*: The complex arc hyperbolic cosine of `x`.

8 *Remarks*: Behaves the same as the C function `cacosh`. See also: ISO/IEC 9899:2018, 7.3.6.1

```
template<class T> constexpr complex<T> asinh(const complex<T>& x);
```

9 *Returns*: The complex arc hyperbolic sine of `x`.

10 *Remarks*: Behaves the same as the C function `casinh`. SEE ALSO: ISO/IEC 9899:2018, 7.3.6.2

```
template<class T> constexpr complex<T> atanh(const complex<T>& x);
```

11 *Returns*: The complex arc hyperbolic tangent of `x`.

12 *Remarks*: Behaves the same as the C function `catanh`. SEE ALSO: ISO/IEC 9899:2018, 7.3.6.3

```
template<class T> constexpr complex<T> cos(const complex<T>& x);
```

13 *Returns*: The complex cosine of `x`.

```
template<class T> constexpr complex<T> cosh(const complex<T>& x);
```

14 *Returns*: The complex hyperbolic cosine of `x`.

```
template<class T> constexpr complex<T> exp(const complex<T>& x);
```

15 *Returns*: The complex base-e exponential of `x`.

```
template<class T> constexpr complex<T> log(const complex<T>& x);
```

16 *Returns*: The complex natural (base-e) logarithm of `x`. For all `x`, `imag(log(x))` lies in the interval $[-\pi, \pi]$.

[*Note 1*: The semantics of this function are intended to be the same in C++ as they are for `clog` in C. — *end note*]

17 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> log10(const complex<T>& x);
```

18 *Returns*: The complex common (base-10) logarithm of `x`, defined as `log(x) / log(10)`.

19 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> constexpr complex<T> pow(const complex<T>& x, const T& y);
template<class T> constexpr complex<T> pow(const T& x, const complex<T>& y);
```

20 *Returns*: The complex power of base `x` raised to the $\mathtt{y}^{\text{th}}$ power, defined as `exp(y * log(x))`. The value returned for `pow(0, 0)` is implementation-defined.

21 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> sin(const complex<T>& x);
```

22 *Returns*: The complex sine of `x`.

```
template<class T> constexpr complex<T> sinh(const complex<T>& x);
```

23 *Returns*: The complex hyperbolic sine of `x`.

```
template<class T> constexpr complex<T> sqrt(const complex<T>& x);
```

24 *Returns*: The complex square root of `x`, in the range of the right half-plane.

[*Note 2*: The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C. — *end note*]

25 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> tan(const complex<T>& x);
```

26 *Returns*: The complex tangent of `x`.

```
template<class T> constexpr complex<T> tanh(const complex<T>& x);
```

27 *Returns*: The complex hyperbolic tangent of `x`.

29.4.9 Tuple interface [complex.tuple]

```
template<class T>
struct tuple_size<complex<T>> : integral_constant<size_t, 2> {};
```

```
template<size_t I, class T>
struct tuple_element<I, complex<T>> {
  using type = T;
};
```

1 *Mandates*: `I < 2` is `true`.

```
template<size_t I, class T>
  constexpr T& get(complex<T>& z) noexcept;
template<size_t I, class T>
  constexpr T&& get(complex<T>&& z) noexcept;
template<size_t I, class T>
  constexpr const T& get(const complex<T>& z) noexcept;
template<size_t I, class T>
  constexpr const T&& get(const complex<T>&& z) noexcept;
```

2 *Mandates*: `I < 2` is `true`.

3 *Returns*: A reference to the real part of `z` if `I == 0` is `true`, otherwise a reference to the imaginary part of `z`.

29.4.10 Additional overloads [cmplx.over]

1 The following function templates have additional constexpr overloads:

```
arg                   norm
conj                  proj
imag                  real
```

2 The additional constexpr overloads are sufficient to ensure:

(2.1) — If the argument has a floating-point type `T`, then it is effectively cast to `complex<T>`.

(2.2) — Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

3 Function template `pow` has additional constexpr overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type `T2` or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T3>>`, where `T3` is `double` if `T2` is an integer type and `T2` otherwise. If `common_type_t<T1, T3>` is not well-formed, then the program is ill-formed.

29.4.11 Suffixes for complex number literals [complex.literals]

1 This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

2 *Returns*: `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

3 *Returns*: `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

4 *Returns*: `complex<float>{0.0f, static_cast<float>(d)}`.

29.5 Random number generation [rand]

29.5.1 General [rand.general]

1 Subclause 29.5 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[*Note 1*: These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — *end note*]

3 Each of the entities specified in 29.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

(3.1) — as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;

(3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;

(3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

4 Unless otherwise specified, all descriptions of calculations in 29.5 use mathematical real numbers.

5 Throughout 29.5, the operators bitand, bitor, and xor denote the respective conventional bitwise operations. Further:

(5.1) — the operator rshift denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

(5.2) — the operator lshift_w denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w.

29.5.2 Header `<random>` synopsis [rand.synopsis]

```
#include <initializer_list>      // see 17.11.2

```

29.5.3 Requirements [rand.req]

29.5.3.1 General requirements [rand.req.genl]

1 Throughout 29.5, the effect of instantiating a template:

(1.1) — that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (29.5.3.2).

(1.2) — that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (29.5.3.3).

(1.3) — that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (29.5.3.4).

(1.4) — that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.

(1.5) — that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

(1.6) — that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

2 Throughout 29.5, phrases of the form "`x` is an iterator of a specific kind" shall be interpreted as equivalent to the more formal requirement that "`x` is a value of a type meeting the requirements of the specified iterator type".

3 Throughout 29.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

29.5.3.2 Seed sequence requirements [rand.req.seedseq]

1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i, $0 \leq i < 2^{32}$, based on the consumed data.

[*Note 1*: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — *end note*]

2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 124 are valid and have the indicated semantics, and if `S` also meets all other requirements of 29.5.3.2. In Table 124 and throughout this subclause:

(2.1) — `T` is the type named by `S`'s associated `result_type`;

(2.2) — `q` is a value of type `S` and `r` is a value of type `S` or `const S`;

(2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;

(2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;

(2.5) — `ob` is an output iterator; and

(2.6) — `il` is a value of type `initializer_list<T>`.

Table 124 — Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
`S::result_type`	`T`	`T` is an unsigned integer type (6.8.2) of at least 32 bits.	
`S()`		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type `S`.	constant
`S(ib,ie)`		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence [`ib`, `ie`).	$\mathcal{O}($`ie` − `ib`$)$

Table 124 — Seed sequence requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
`S(il)`		Same as `S(il.begin(), il.end())`.	same as `S(il.begin(), il.end())`
`q.generate(rb,re)`	`void`	Does nothing if `rb == re`. Otherwise, fills the supplied sequence `[rb, re)` with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of `generate`'s previous invocations.	$\mathscr{O}$(`re` − `rb`)
`r.size()`	`size_t`	The number of 32-bit units that would be copied by a call to `r.param`.	constant
`r.param(ob)`	`void`	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type `S`, and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathscr{O}$(`r.size()`)

29.5.3.3 Uniform random bit generator requirements [rand.req.urng]

1 A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[*Note 1*: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note*]

```
template<class G>
  concept uniform_random_bit_generator =
    invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
    requires {
      { G::min() } -> same_as<invoke_result_t<G&>>;
      { G::max() } -> same_as<invoke_result_t<G&>>;
      requires bool_constant<(G::min() < G::max())>::value;
    };
```

2 Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

(2.1) — `G::min() <= g()`,

(2.2) — `g() <= G::max()`, and

(2.3) — `g()` has amortized constant complexity.

3 A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.8.2), and `G` provides a nested *typedef-name* `result_type` that denotes the same type as `invoke_result_t<G&>`.

29.5.3.4 Random number engine requirements [rand.req.eng]

1 A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2 At any given time, `e` has a state $\mathtt{e}_i$ for some integer $i \geq 0$. Upon construction, `e` has an initial state $\mathtt{e}_0$. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

3 `E`'s specification shall define:

(3.1) — the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;

(3.2) — the *transition algorithm* TA by which `e`'s state e_i is advanced to its *successor state* e_{i+1}; and

(3.3) — the *generation algorithm* GA by which an engine's state is mapped to a value of type `result_type`.

4 A class `E` that meets the requirements of a uniform random bit generator (29.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 125 are valid and have the indicated semantics, and if `E` also meets all other requirements of 29.5.3.4. In Table 125 and throughout this subclause:

(4.1) — `T` is the type named by `E`'s associated `result_type`;

(4.2) — `e` is a value of `E`, `v` is an lvalue of `E`, `x` and `y` are (possibly const) values of `E`;

(4.3) — `s` is a value of `T`;

(4.4) — `q` is an lvalue meeting the requirements of a seed sequence (29.5.3.2);

(4.5) — `z` is a value of type `unsigned long long`;

(4.6) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(4.7) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 27 and Clause 31.

Table 125 — Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
`E()`		Creates an engine with the same initial state as all other default-constructed engines of type `E`.	$\mathcal{O}$(size of state)
`E(x)`		Creates an engine that compares equal to `x`.	$\mathcal{O}$(size of state)
`E(s)`		Creates an engine with initial state determined by `s`.	$\mathcal{O}$(size of state)
`E(q)`[241]		Creates an engine with an initial state that depends on a sequence produced by one call to `q.generate`.	same as complexity of `q.generate` called on a sequence whose length is size of state
`e.seed()`	`void`	*Postconditions*: `e == E()`.	same as `E()`
`e.seed(s)`	`void`	*Postconditions*: `e == E(s)`.	same as `E(s)`
`e.seed(q)`	`void`	*Postconditions*: `e == E(q)`.	same as `E(q)`
`e()`	`T`	Advances `e`'s state e_i to e_{i+1} $=$ TA(e_i) and returns GA(e_i).	per 29.5.3.3
`e.discard(z)`[242]	`void`	Advances `e`'s state e_i to e_{i+z} by any means equivalent to `z` consecutive calls `e()`.	no worse than the complexity of `z` consecutive calls `e()`
`x == y`	`bool`	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to `x()` and `y()`, respectively, returns `true` if $S_x = S_y$; else returns `false`.	$\mathcal{O}$(size of state)
`x != y`	`bool`	`!(x == y)`.	$\mathcal{O}$(size of state)

241) This constructor (as well as the subsequent corresponding `seed()` function) can be particularly useful to applications requiring a large number of independent random sequences.

242) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes `z` consecutive calls `e()`.

5 `E` shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. These operations shall each be of complexity no worse than $\mathcal{O}$(size of state).

6 On hosted implementations, the following expressions are well-formed and have the specified semantics.

`os << x`

7 *Effects*: With `os.`*`fmtflags`* set to `ios_base::dec|ios_base::left` and the fill character set to the space character, writes to `os` the textual representation of `x`'s current state. In the output, adjacent numbers are separated by one or more space characters.

8 *Postconditions*: The `os.`*`fmtflags`* and fill character are unchanged.

9 *Result*: reference to the type of `os`.

10 *Returns*: `os`.

11 *Complexity*: $\mathcal{O}$(size of state)

`is >> v`

12 *Preconditions*: `is` provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of `is`, and whose type's template specialization arguments `charT` and `traits` were respectively the same as those of `is`.

13 *Effects*: With `is.`*`fmtflags`* set to `ios_base::dec`, sets `v`'s state as determined by reading its textual representation from `is`. If bad input is encountered, ensures that `v`'s state is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If a textual representation written via `os << x` was subsequently read via `is >> v`, then `x == v` provided that there have been no intervening invocations of `x` or of `v`.

14 *Postconditions*: The `is.`*`fmtflags`* are unchanged.

15 *Result*: reference to the type of `is`.

16 *Returns*: `is`.

17 *Complexity*: $\mathcal{O}$(size of state)

29.5.3.5 Random number engine adaptor requirements [rand.req.adapt]

1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

3 *Effects*: The base engine is initialized as if by its default constructor.

`bool operator==(const A& a1, const A& a2);`

4 *Returns*: `true` if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns `false`.

`A::A(result_type s);`

5 *Effects*: The base engine is initialized with `s`.

`template<class Sseq> A::A(Sseq& q);`

6 *Effects*: The base engine is initialized with `q`.

`void seed();`

7 *Effects*: With `b` as the base engine, invokes `b.seed()`.

`void seed(result_type s);`

8 *Effects*: With `b` as the base engine, invokes `b.seed(s)`.

`template<class Sseq> void seed(Sseq& q);`

9 *Effects*: With `b` as the base engine, invokes `b.seed(q)`.

10 `A` shall also meet the following additional requirements:

(10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

(10.2) — The state of `A` shall include the state of its base engine. The size of `A`'s state shall be no less than the size of the base engine.

(10.3) — Copying `A`'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of `A`.

(10.4) — The textual representation of `A` shall include the textual representation of its base engine.

29.5.3.6 Random number distribution requirements [rand.req.dist]

1 A *random number distribution* (commonly shortened to *distribution*) `d` of type `D` is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.

2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z \,|\, a, b)$ or $P(z_i \,|\, a, b)$, to name specific parameters, or by writing, for example, $p(z \,|\, \{\texttt{p}\})$ or $P(z_i \,|\, \{\texttt{p}\})$, to denote a distribution's parameters `p` taken as a whole.

3 A class `D` meets the requirements of a *random number distribution* if the expressions shown in Table 126 are valid and have the indicated semantics, and if `D` and its associated types also meet all other requirements of 29.5.3.6. In Table 126 and throughout this subclause,

(3.1) — `T` is the type named by `D`'s associated `result_type`;

(3.2) — `P` is the type named by `D`'s associated `param_type`;

(3.3) — `d` is a value of `D`, and `x` and `y` are (possibly const) values of `D`;

(3.4) — `glb` and `lub` are values of `T` respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by `d`'s `operator()`, as determined by the current values of `d`'s parameters;

(3.5) — `p` is a (possibly const) value of `P`;

(3.6) — `g`, `g1`, and `g2` are lvalues of a type meeting the requirements of a uniform random bit generator (29.5.3.3);

(3.7) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(3.8) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 27 and Clause 31.

Table 126 — Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
`D::result_type`	`T`	`T` is an arithmetic type (6.8.2).	
`D::param_type`	`P`		
`D()`		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type `D`.	constant
`D(p)`		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct `p`.	same as `p`'s construction

Table 126 — Random number distribution requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
`d.reset()`	`void`	Subsequent uses of `d` do not depend on values produced by any engine prior to invoking `reset`.	constant
`x.param()`	`P`	Returns a value `p` such that `D(p).param() == p`.	no worse than the complexity of `D(p)`
`d.param(p)`	`void`	*Postconditions*: `d.param() == p`.	no worse than the complexity of `D(p)`
`d(g)`	`T`	With `p` $=$ `d.param()`, the sequence of numbers returned by successive invocations with the same object `g` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`d(g,p)`	`T`	The sequence of numbers returned by successive invocations with the same objects `g` and `p` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`x.min()`	`T`	Returns `glb`.	constant
`x.max()`	`T`	Returns `lub`.	constant
`x == y`	`bool`	This operator is an equivalence relation. Returns `true` if `x.param() == y.param()` and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to `x(g1)` and `y(g2)` whenever `g1 == g2`. Otherwise returns `false`.	constant
`x != y`	`bool`	`!(x == y)`.	same as `x == y`.

4 `D` shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements.

5 The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations of `d(g)`.

6 If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.

7 It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In 29.5, declarations of `D::param_type` are in the form of `typedef`s for convenience of exposition only.

8 `P` shall meet the *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17EqualityComparable* (Table 28) requirements.

9 For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.

10 `P` shall have a declaration of the form

```
using distribution_type =  D;
```

11 On hosted implementations, the following expressions are well-formed and have the specified semantics.

`os << x`

12 *Effects*: Writes to `os` a textual representation for the parameters and the additional internal data of `x`.

13 *Postconditions*: The `os.`*`fmtflags`* and fill character are unchanged.

14 *Result*: reference to the type of `os`.

15 *Returns*: `os`.

`is >> d`

16 *Preconditions*: `is` provides a textual representation that was previously written using an `os` whose imbued locale and whose type's template specialization arguments `charT` and `traits` were the same as those of `is`.

17 *Effects*: Restores from `is` the parameters and additional internal data of the lvalue `d`. If bad input is encountered, ensures that `d` is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

18 *Postconditions*: The `is.`*`fmtflags`* are unchanged.

19 *Result*: reference to the type of `is`.

20 *Returns*: `is`.

29.5.4 Random number engine class templates [rand.eng]

29.5.4.1 General [rand.eng.general]

1 Each type instantiated from a class template specified in 29.5.4 meets the requirements of a random number engine (29.5.3.4) type.

2 Except where specified otherwise, the complexity of each function specified in 29.5.4 is constant.

3 Except where specified otherwise, no function described in 29.5.4 throws an exception.

4 Every function described in 29.5.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 29.5.4 only for engine operations that are not described in 29.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 29.5.4 requires one or more relationships, involving the value(s) of its constant template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

7 For every random number engine and for every random number engine adaptor `X` defined in 29.5.4 and in 29.5.5:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to `X::result_type`.

29.5.4.2 Class template `linear_congruential_engine` [rand.eng.lcong]

1 A `linear_congruential_engine` random number engine produces unsigned integer random numbers. The state $\mathtt{x}_i$ of a `linear_congruential_engine` object `x` is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $\mathsf{TA}(\mathtt{x}_i) = (a \cdot \mathtt{x}_i + c) \bmod m$; the generation algorithm is $\mathsf{GA}(\mathtt{x}_i) = \mathtt{x}_{i+1}$.

```
namespace std {
  template<class UIntType, UIntType a, UIntType c, UIntType m>
  class linear_congruential_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type multiplier = a;
    static constexpr result_type increment = c;
    static constexpr result_type modulus = m;
    static constexpr result_type min() { return c == 0u ? 1u: 0u; }
    static constexpr result_type max() { return m - 1u; }
    static constexpr result_type default_seed = 1u;

    // constructors and seeding functions
    linear_congruential_engine() : linear_congruential_engine(default_seed) {}
    explicit linear_congruential_engine(result_type s);
    template<class Sseq> explicit linear_congruential_engine(Sseq& q);
    void seed(result_type s = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const linear_congruential_engine& x,
                           const linear_congruential_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,            // hosted
                   const linear_congruential_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,            // hosted
                   linear_congruential_engine& x);
  };
}
```

2 If the template parameter `m` is 0, the modulus m used throughout 29.5.4.2 is `numeric_limits<result_type>::max()` plus 1.

[*Note 1*: m need not be representable as a value of type `result_type`. — *end note*]

3 If the template parameter `m` is not 0, the following relations shall hold: `a < m` and `c < m`.

4 The textual representation consists of the value of $\mathtt{x}_i$.

```
explicit linear_congruential_engine(result_type s);
```

5 *Effects*: If $c \bmod m$ is 0 and `s` $\bmod m$ is 0, sets the engine's state to 1, otherwise sets the engine's state to `s` $\bmod m$.

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

6 *Effects*: With $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$ and a an array (or equivalent) of length $k+3$, invokes `q.generate(`$a+0$`,` $a+k+3$`)` and then computes $S = \left(\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j}\right) \bmod m$. If $c \bmod m$ is 0 and S is 0, sets the

engine's state to 1, else sets the engine's state to S.

29.5.4.3 Class template `mersenne_twister_engine` [rand.eng.mers]

1 A `mersenne_twister_engine` random number engine[243] produces unsigned integer random numbers in the closed interval $[0, 2^w - 1]$. The state $\mathtt{x}_i$ of a `mersenne_twister_engine` object `x` is of size n and consists of a sequence X of n values of the type delivered by `x`; all subscripts applied to X are to be taken modulo n.

2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values n and m, a twist value r, and a conditional xor-mask a. To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values u, d, s, b, t, c, and ℓ.

The state transition is performed as follows:

(2.1) — Concatenate the upper $w - r$ bits of X_{i-n} with the lower r bits of X_{i+1-n} to obtain an unsigned integer value Y.

(2.2) — With $\alpha = a \cdot (Y \mathsf{\ bitand\ } 1)$, set X_i to $X_{i+m-n} \mathsf{\ xor\ } (Y \mathsf{\ rshift\ } 1) \mathsf{\ xor\ } \alpha$.

The sequence X is initialized with the help of an initialization multiplier f.

3 The generation algorithm determines the unsigned integer values z_1, z_2, z_3, z_4 as follows, then delivers z_4 as its result:

(3.1) — Let $z_1 = X_i \mathsf{\ xor\ } \big((X_i \mathsf{\ rshift\ } u) \mathsf{\ bitand\ } d\big)$.

(3.2) — Let $z_2 = z_1 \mathsf{\ xor\ } \big((z_1 \mathsf{\ lshift}_w\ s) \mathsf{\ bitand\ } b\big)$.

(3.3) — Let $z_3 = z_2 \mathsf{\ xor\ } \big((z_2 \mathsf{\ lshift}_w\ t) \mathsf{\ bitand\ } c\big)$.

(3.4) — Let $z_4 = z_3 \mathsf{\ xor\ } (z_3 \mathsf{\ rshift\ } \ell)$.

```
namespace std {
  template<class UIntType, size_t w, size_t n, size_t m, size_t r,
           UIntType a, size_t u, UIntType d, size_t s,
           UIntType b, size_t t,
           UIntType c, size_t l, UIntType f>
  class mersenne_twister_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
    static constexpr size_t shift_size = m;
    static constexpr size_t mask_bits = r;
    static constexpr UIntType xor_mask = a;
    static constexpr size_t tempering_u = u;
    static constexpr UIntType tempering_d = d;
    static constexpr size_t tempering_s = s;
    static constexpr UIntType tempering_b = b;
    static constexpr size_t tempering_t = t;
    static constexpr UIntType tempering_c = c;
    static constexpr size_t tempering_l = l;
    static constexpr UIntType initialization_multiplier = f;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return  2^w − 1; }
    static constexpr result_type default_seed = 5489u;

    // constructors and seeding functions
    mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
    explicit mersenne_twister_engine(result_type value);
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);
```

243) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```
    // equality operators
    friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,            // hosted
                   const mersenne_twister_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,            // hosted
                   mersenne_twister_engine& x);
  };
}
```

4 The following relations shall hold: `0 < m`, `m <= n`, `2u < w`, `r <= w`, `u <= w`, `s <= w`, `t <= w`, `l <= w`, `w <= numeric_limits<UIntType>::digits`, `a <= (1u << w) - 1u`, `b <= (1u << w) - 1u`, `c <= (1u << w) - 1u`, `d <= (1u << w) - 1u`, and `f <= (1u << w) - 1u`.

5 The textual representation of $\texttt{x}_i$ consists of the values of $X_{i-n}, \dots, X_{i-1}$, in that order.

```
explicit mersenne_twister_engine(result_type value);
```

6 *Effects*: Sets X_{-n} to `value` mod 2^w. Then, iteratively for $i = 1 - n, \dots, -1$, sets X_i to

$$\left[f \cdot \left(X_{i-1} \,\mathsf{xor}\, \left(X_{i-1} \,\mathsf{rshift}\, (w-2)\right)\right) + i \bmod n\right] \bmod 2^w .$$

7 *Complexity*: $\mathcal{O}(n)$.

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

8 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $n \cdot k$, invokes `q.generate(`$a + 0$`,` $a + n \cdot k$`)` and then, iteratively for $i = -n, \dots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}\right) \bmod 2^w$. Finally, if the most significant $w - r$ bits of X_{-n} are zero, and if each of the other resulting X_i is 0, changes X_{-n} to 2^{w-1}.

29.5.4.4 Class template `subtract_with_carry_engine` [rand.eng.sub]

1 A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

2 The state $\texttt{x}_i$ of a `subtract_with_carry_engine` object `x` is of size $\mathcal{O}(r)$, and consists of a sequence X of r integer values $0 \le X_i < m = 2^w$; all subscripts applied to X are to be taken modulo r. The state $\texttt{x}_i$ additionally consists of an integer c (known as the *carry*) whose value is either 0 or 1.

3 The state transition is performed as follows:

(3.1) — Let $Y = X_{i-s} - X_{i-r} - c$.

(3.2) — Set X_i to $y = Y \bmod m$. Set c to 1 if $Y < 0$, otherwise set c to 0.

[*Note 1*: This algorithm corresponds to a modular linear function of the form $\mathsf{TA}(\texttt{x}_i) = (a \cdot \texttt{x}_i) \bmod b$, where b is of the form $m^r - m^s + 1$ and $a = b - (b-1)/m$. — *end note*]

4 The generation algorithm is given by $\mathsf{GA}(\texttt{x}_i) = y$, where y is the value produced as a result of advancing the engine's state as described above.

```
namespace std {
  template<class UIntType, size_t w, size_t s, size_t r>
  class subtract_with_carry_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m − 1; }
    static constexpr uint_least32_t default_seed = 19780503u;

    // constructors and seeding functions
    subtract_with_carry_engine() : subtract_with_carry_engine(0u) {}
    explicit subtract_with_carry_engine(result_type value);
    template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
    void seed(result_type value = 0u);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const subtract_with_carry_engine& x,
                           const subtract_with_carry_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,           // hosted
                   const subtract_with_carry_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,           // hosted
                   subtract_with_carry_engine& x);
  };
}
```

5 The following relations shall hold: `0u < s`, `s < r`, `0 < w`, and `w <= numeric_limits<UIntType>::digits`.

6 The textual representation consists of the values of $X_{i-r}, \dots, X_{i-1}$, in that order, followed by c.

```
explicit subtract_with_carry_engine(result_type value);
```

7 *Effects*: Sets the values of $X_{-r}, \dots, X_{-1}$, in that order, as specified below. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

To set the values X_k, first construct `e`, a `linear_congruential_engine` object, as if by the following definition:

```
  linear_congruential_engine<uint_least32_t, 40014u, 0u, 2147483563u> e(
    value == 0u ? default_seed : static_cast<uint_least32_t>(value % 2147483563u));
```

Then, to set each X_k, obtain new values $z_0, \dots, z_{n-1}$ from $n = \lceil w/32 \rceil$ successive invocations of `e`. Set X_k to $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right) \bmod m$.

8 *Complexity*: Exactly $n \cdot$ `r` invocations of `e`.

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

9 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes `q.generate(`$a + 0$`,` $a + r \cdot k$`)` and then, iteratively for $i = -r, \dots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \bmod m$. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

29.5.4.5 Class template `philox_engine` [rand.eng.philox]

1 A `philox_engine` random number engine produces unsigned integer random numbers in the interval $[0, m)$, where $m = 2^w$ and the template parameter w defines the range of the produced numbers. The state of a `philox_engine` object consists of a sequence X of n unsigned integer values of width w, a sequence K of $n/2$ values of `result_type`, a sequence Y of n values of `result_type`, and a scalar i, where

(1.1) — X is the interpretation of the unsigned integer *counter* value $Z := \sum_{j=0}^{n-1} X_j \cdot 2^{wj}$ of $n \cdot w$ bits, (1.2) — K are keys, which are generated once from the seed (see constructors below) and remain constant unless the `seed` function (29.5.3.4) is invoked,

(1.3) — Y stores a batch of output values, and

(1.4) — i is an index for an element of the sequence Y.

2 The generation algorithm returns Y_i, the value stored in the i^{th} element of Y after applying the transition algorithm.

3 The state transition is performed as if by the following algorithm:

```
i = i + 1
if (i == n) {
  Y = Philox(K, X) // see below
  Z = Z + 1
  i = 0
}
```

4 The `Philox` function maps the length-$n/2$ sequence K and the length-n sequence X into a length-n output sequence Y. Philox applies an r-round substitution-permutation network to the values in X. A single round of the generation algorithm performs the following steps:

(4.1) — The output sequence X' of the previous round (X in case of the first round) is permuted to obtain the intermediate state V:

$$V_j = X'_{f_n(j)}$$

where $j = 0, \dots, n-1$ and $f_n(j)$ is defined in Table 127.

Table 127 — Values for the word permutation $f_n(j)$ [tab:rand.eng.philox.f]

$f_n(j)$		j			
		0	1	2	3
n	2	0	1		
	4	2	1	0	3

[*Note 1*: For $n = 2$ the sequence is not permuted. — *end note*]

(4.2) — The following computations are applied to the elements of the V sequence:

$$X_{2k+0} = \mathrm{mulhi}(V_{2k}, M_k, w) \text{ xor } key_k^q \text{ xor } V_{2k+1}$$
$$X_{2k+1} = \mathrm{mullo}(V_{2k}, M_k, w)$$

where:

(4.2.1) — $\mathrm{mullo}(\mathtt{a}, \mathtt{b}, \mathtt{w})$ is the low half of the modular multiplication of `a` and `b`: $(\mathtt{a} \cdot \mathtt{b}) \mod 2^w$,

(4.2.2) — $\mathrm{mulhi}(\mathtt{a}, \mathtt{b}, \mathtt{w})$ is the high half of the modular multiplication of `a` and `b`: $(\lfloor(\mathtt{a} \cdot \mathtt{b})/2^w\rfloor)$,

(4.2.3) — $k = 0, \dots, n/2 - 1$ is the index in the sequences,

(4.2.4) — $q = 0, \dots, r - 1$ is the index of the round,

(4.2.5) — key_k^q is the k^{th} round key for round q, $key_k^q := (K_k + q \cdot C_k) \mod 2^w$,

(4.2.6) — K_k are the elements of the key sequence K,

(4.2.7) — M_k is `multipliers[`k`]`, and

(4.2.8) — C_k is `round_consts[`k`]`.

5 After r applications of the single-round function, `Philox` returns the sequence $Y = X'$.

```
namespace std {
  template<class UIntType, size_t w, size_t n, size_t r, UIntType... consts>
  class philox_engine {
    static constexpr size_t array-size = n / 2;    // exposition only
  public:
    // types
    using result_type = UIntType;
    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t word_count = n;
    static constexpr size_t round_count = r;
    static constexpr array<result_type, array-size> multipliers;
    static constexpr array<result_type, array-size> round_consts;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr result_type default_seed = 20111115u;

    // constructors and seeding functions
    philox_engine() : philox_engine(default_seed) {}
    explicit philox_engine(result_type value);
    template<class Sseq> explicit philox_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    void set_counter(const array<result_type, n>& counter);

    // equality operators
    friend bool operator==(const philox_engine& x, const philox_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const philox_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, philox_engine& x);
  };
}
```

6 *Mandates*:

(6.1) — `sizeof...(consts) == n` is `true`, and

(6.2) — `n == 2 || n == 4` is `true`, and

(6.3) — `0 < r` is `true`, and

(6.4) — `0 < w && w <= numeric_limits<UIntType>::digits` is `true`.

7 The template parameter pack `consts` represents the M_k and C_k constants which are grouped as follows: $[M_0, C_0, M_1, C_1, M_2, C_2, \ldots, M_{n/2-1}, C_{n/2-1}]$.

8 The textual representation consists of the values of $K_0, \ldots, K_{n/2-1}, X_0, \ldots, X_{n-1}, i$, in that order.

[*Note 2*: The stream extraction operator can reconstruct Y from K and X, as needed. — *end note*]

`explicit philox_engine(result_type value);`

9 *Effects*: Sets the K_0 element of sequence K to `value` $\bmod 2^w$. All elements of sequences X and K (except K_0) are set to `0`. The value of i is set to $n - 1$.

`template<class Sseq> explicit philox_engine(Sseq& q);`

10 *Effects*: With $p = \lceil w/32 \rceil$ and an array (or equivalent) `a` of length $(n/2) \cdot p$, invokes `q.generate(a + 0, a + n / 2 * p)` and then iteratively for $k = 0, \ldots, n/2 - 1$, sets K_k to $\left(\sum_{j=0}^{p-1} a_{kp+j} \cdot 2^{32j}\right) \bmod 2^w$. All elements of sequence X are set to `0`. The value of i is set to $n - 1$.

`void set_counter(const array<result_type, n>& c);`

11 *Effects*: For $j = 0, \ldots, n - 1$ sets X_j to $C_{n-1-j} \bmod 2^w$. The value of i is set to $n - 1$.

[*Note 3*: The counter is the value Z introduced at the beginning of this subclause. — *end note*]

29.5.5 Random number engine adaptor class templates [rand.adapt]

29.5.5.1 General [rand.adapt.general]

1 Each type instantiated from a class template specified in 29.5.5 meets the requirements of a random number engine adaptor (29.5.3.5) type.

2 Except where specified otherwise, the complexity of each function specified in 29.5.5 is constant.

3 Except where specified otherwise, no function described in 29.5.5 throws an exception.

4 Every function described in 29.5.5 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 29.5.5 only for adaptor operations that are not described in subclause 29.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 29.5.5 requires one or more relationships, involving the value(s) of its constant template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

29.5.5.2 Class template `discard_block_engine` [rand.adapt.disc]

1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine e. The state $\mathtt{x}_i$ of a `discard_block_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e` and an additional integer n. The size of the state is the size of e's state plus 1.

2 The transition algorithm discards all but $r > 0$ values from each block of $p \geq r$ values delivered by e. The state transition is performed as follows: If $n \geq r$, advance the state of `e` from $\mathtt{e}_i$ to $\mathtt{e}_{i+p-r}$ and set n to 0. In any case, then increment n and advance `e`'s then-current state $\mathtt{e}_j$ to $\mathtt{e}_{j+1}$.

3 The generation algorithm yields the value returned by the last invocation of `e()` while advancing `e`'s state as described above.

```
namespace std {
  template<class Engine, size_t p, size_t r>
  class discard_block_engine {
  public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t block_size = p;
    static constexpr size_t used_block = r;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    discard_block_engine();
    explicit discard_block_engine(const Engine& e);
    explicit discard_block_engine(Engine&& e);
    explicit discard_block_engine(result_type s);
    template<class Sseq> explicit discard_block_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);    // hosted
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);          // hosted

  private:
    Engine e;     // exposition only
    size_t n;     // exposition only
  };
}
```

4 The following relations shall hold: `0 < r` and `r <= p`.

5 The textual representation consists of the textual representation of `e` followed by the value of `n`.

6 In addition to its behavior pursuant to subclause 29.5.3.5, each constructor that is not a copy constructor sets `n` to 0.

29.5.5.3 Class template `independent_bits_engine` [rand.adapt.ibits]

1 An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine e, so as to produce random numbers with a specified number of bits w. The state $\mathtt{x}_i$ of an `independent_bits_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`; the size of the state is the size of e's state.

2 The transition and generation algorithms are described in terms of the following integral constants:

(2.1) — Let $R = $ `e.max() - e.min() + 1` and $m = \lfloor \log_2 R \rfloor$.

(2.2) — With n as determined below, let $w_0 = \lfloor w/n \rfloor$, $n_0 = n - w \bmod n$, $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$, and $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$.

(2.3) — Let $n = \lceil w/m \rceil$ if and only if the relation $R - y_0 \le \lfloor y_0/n \rfloor$ holds as a result. Otherwise let $n = 1 + \lceil w/m \rceil$.

[*Note 1*: The relation $w = n_0 w_0 + (n - n_0)(w_0 + 1)$ always holds. — *end note*]

3 The transition algorithm is carried out by invoking `e()` as often as needed to obtain n_0 values less than $y_0 +$ `e.min()` and $n - n_0$ values less than $y_1 +$ `e.min()`.

4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity S obtained as if by the following algorithm:

```
S = 0;
for (k = 0; $k \neq n_0$; k += 1)  {
 do u = e() - e.min(); while ($u \ge y_0$);
 S = $2^{w_0} \cdot S + u \bmod 2^{w_0}$;
}
for (k = $n_0$; $k \neq n$; k += 1)  {
 do u = e() - e.min(); while ($u \ge y_1$);
 S = $2^{w_0+1} \cdot S + u \bmod 2^{w_0+1}$;
}
```

```
namespace std {
  template<class Engine, size_t w, class UIntType>
  class independent_bits_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w - 1; }
    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x); // hosted
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);       // hosted

  private:
    Engine e;    // exposition only
  };
}
```

5 The following relations shall hold: `0 < w` and `w <= numeric_limits<result_type>::digits`.

6 The textual representation consists of the textual representation of `e`.

29.5.5.4 Class template `shuffle_order_engine` [rand.adapt.shuf]

1 A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine e, but delivers them in a different sequence. The state $\mathtt{x}_i$ of a `shuffle_order_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`, an additional value Y of the type delivered by `e`, and an additional sequence V of k values also of the type delivered by `e`. The size of the state is the size of e's state plus $k + 1$.

2 The transition algorithm permutes the values produced by e. The state transition is performed as follows:

(2.1) — Calculate an integer $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$.

(2.2) — Set Y to V_j and then set V_j to `e()`.

3 The generation algorithm yields the last value of `Y` produced while advancing `e`'s state as described above.

```
namespace std {
  template<class Engine, size_t k>
  class shuffle_order_engine {
  public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    shuffle_order_engine();
```

```
      explicit shuffle_order_engine(const Engine& e);
      explicit shuffle_order_engine(Engine&& e);
      explicit shuffle_order_engine(result_type s);
      template<class Sseq> explicit shuffle_order_engine(Sseq& q);
      void seed();
      void seed(result_type s);
      template<class Sseq> void seed(Sseq& q);

      // equality operators
      friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

      // generating functions
      result_type operator()();
      void discard(unsigned long long z);

      // property functions
      const Engine& base() const noexcept { return e; }

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

    private:
      Engine e;           // exposition only
      result_type V[k];   // exposition only
      result_type Y;      // exposition only
    };
  }
```

4 The following relation shall hold: `0 < k`.

5 The textual representation consists of the textual representation of `e`, followed by the `k` values of V, followed by the value of Y.

6 In addition to its behavior pursuant to subclause 29.5.3.5, each constructor that is not a copy constructor initializes `V[0]`, ..., `V[k - 1]` and Y, in that order, with values returned by successive invocations of `e()`.

29.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
      linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

1 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```
using minstd_rand =
      linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

2 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```
using mt19937 =
      mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
       0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;
```

3 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```
using mt19937_64 =
      mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
       0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
       0x71d6'7fff'eda6'0000, 37, 0xfff7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;
```

4 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```
using ranlux24_base =
      subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

5 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```
using ranlux48_base =
      subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

6 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

7 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

8 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

9 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

10 *Remarks*: The choice of engine type named by this `typedef` is implementation-defined.

[*Note 1*: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations. — *end note*]

```
using philox4x32 =
      philox_engine<uint_fast32_t, 32, 4, 10,
       0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85>;
```

11 *Required behavior*: The 10000th consecutive invocation a default-constructed object of type `philox4x32` produces the value 1955073260.

```
using philox4x64 =
      philox_engine<uint_fast64_t, 64, 4, 10,
       0xCA5A826395121157, 0x9E3779B97F4A7C15, 0xD2E7470EE14C6C93, 0xBB67AE8584CAA73B>;
```

12 *Required behavior*: The 10000th consecutive invocation a default-constructed object of type `philox4x64` produces the value 3409172418970261260.

29.5.7 Class `random_device` [rand.device]

1 A `random_device` uniform random bit generator produces nondeterministic random numbers.

2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
namespace std {
  class random_device {
  public:
    // types
    using result_type = unsigned int;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }
    // constructors
    random_device() : random_device(implementation-defined) {}
    explicit random_device(const string& token);

    // generating functions
    result_type operator()();

    // property functions
    double entropy() const noexcept;

    // no copy functions
    random_device(const random_device&) = delete;
    void operator=(const random_device&) = delete;
  };
}
```

`explicit random_device(const string& token);`

3 *Throws*: A value of an implementation-defined type derived from `exception` if the `random_device` cannot be initialized.

4 *Remarks*: The semantics of the `token` parameter and the token value used by the default constructor are implementation-defined.[244]

`double entropy() const noexcept;`

5 *Returns*: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate[245] for the random numbers returned by `operator()`, in the range `min()` to $\log_2(\texttt{max()} + 1)$.

`result_type operator()();`

6 *Returns*: A nondeterministic random value, uniformly distributed between `min()` and `max()` (inclusive). It is implementation-defined how these values are generated.

7 *Throws*: A value of an implementation-defined type derived from `exception` if a random number cannot be obtained.

29.5.8 Utilities [rand.util]

29.5.8.1 Class seed_seq [rand.util.seedseq]

```
namespace std {
  class seed_seq {
  public:
    // types
    using result_type = uint_least32_t;

    // constructors
    seed_seq() noexcept;
    template<class T>
      seed_seq(initializer_list<T> il);
    template<class InputIterator>
      seed_seq(InputIterator begin, InputIterator end);

    // generating functions
    template<class RandomAccessIterator>
      void generate(RandomAccessIterator begin, RandomAccessIterator end);

    // property functions
    size_t size() const noexcept;
    template<class OutputIterator>
      void param(OutputIterator dest) const;
```

244) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

245) If a device has n states whose respective probabilities are $P_0, \dots, P_{n-1}$, the device entropy S is defined as $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$.

```
    // no copy functions
    seed_seq(const seed_seq&) = delete;
    void operator=(const seed_seq&) = delete;

  private:
    vector<result_type> v;      // exposition only
  };
}
```

```
seed_seq() noexcept;
```

1 *Postconditions*: `v.empty()` is `true`.

```
template<class T>
  seed_seq(initializer_list<T> il);
```

2 *Constraints*: `T` is an integer type.

3 *Effects*: Same as `seed_seq(il.begin(), il.end())`.

```
template<class InputIterator>
  seed_seq(InputIterator begin, InputIterator end);
```

4 *Mandates*: `iterator_traits<InputIterator>::value_type` is an integer type.

5 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

6 *Effects*: Initializes `v` by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
 v.push_back((*s) mod 2^32);
```

```
template<class RandomAccessIterator>
  void generate(RandomAccessIterator begin, RandomAccessIterator end);
```

7 *Mandates*: `iterator_traits<RandomAccessIterator>::value_type` is an unsigned integer type capable of accommodating 32-bit quantities.

8 *Preconditions*: `RandomAccessIterator` meets the *Cpp17RandomAccessIterator* requirements (24.3.5.7) and the requirements of a mutable iterator.

9 *Effects*: Does nothing if `begin == end`. Otherwise, with $s =$ `v.size()` and $n =$ `end` $-$ `begin`, fills the supplied range [`begin`, `end`) according to the following algorithm in which each operation is to be carried out modulo 2^{32}, each indexing operator applied to `begin` is to be taken modulo n, and $T(x)$ is defined as $x \mathsf{\ xor\ } (x \mathsf{\ rshift\ } 27)$:

(9.1) — By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let $p = (n - t)/2$ and let $q = p + t$, where

$$t = (n \geq 623) \ ? \ 11 : (n \geq 68) \ ? \ 7 : (n \geq 39) \ ? \ 5 : (n \geq 7) \ ? \ 3 : (n - 1)/2;$$

(9.2) — With m as the larger of $s + 1$ and n, transform the elements of the range: iteratively for $k = 0, \dots, m - 1$, calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\texttt{begin}[k] \mathsf{\ xor\ } \texttt{begin}[k+p] \mathsf{\ xor\ } \texttt{begin}[k-1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + \texttt{v}[k-1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment `begin`$[k + p]$ by r_1, increment `begin`$[k + q]$ by r_2, and set `begin`$[k]$ to r_2.

(9.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for $k = m, \dots, m + n - 1$, calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\texttt{begin}[k] + \texttt{begin}[k+p] + \texttt{begin}[k-1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update `begin`$[k + p]$ by xoring it with r_3, update `begin`$[k + q]$ by xoring it with r_4, and set `begin`$[k]$ to r_4.

10 *Throws*: What and when `RandomAccessIterator` operations of `begin` and `end` throw.

```
size_t size() const noexcept;
```

11 *Returns*: The number of 32-bit units that would be returned by a call to `param()`.

12 *Complexity*: Constant time.

```
template<class OutputIterator>
  void param(OutputIterator dest) const;
```

13 *Mandates*: Values of type `result_type` are writable (24.3.1) to `dest`.

14 *Preconditions*: `OutputIterator` meets the *Cpp17OutputIterator* requirements (24.3.5.4).

15 *Effects*: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

16 *Throws*: What and when `OutputIterator` operations of `dest` throw.

29.5.8.2 Function template `generate_canonical` [rand.util.canonical]

```
template<class RealType, size_t digits, class URBG>
  RealType generate_canonical(URBG& g);
```

1 Let

(1.1) — r be `numeric_limits<RealType>::radix`,

(1.2) — R be `g.max()` $-$ `g.min()` $+ 1$,

(1.3) — d be the smaller of `digits` and `numeric_limits<RealType>::digits`,[246]

(1.4) — k be the smallest integer such that $R^k \geq r^d$, and

(1.5) — x be $\lfloor R^k / r^d \rfloor$.

An *attempt* is k invocations of `g()` to obtain values $g_0, \ldots, g_{k-1}$, respectively, and the calculation of a quantity S given by Formula 29.1:

$$S = \sum_{i=0}^{k-1} (g_i - \texttt{g.min()}) \cdot R^i \tag{29.1}$$

2 *Effects*: Attempts are made until $S < xr^d$.

[*Note 1*: When R is a power of r, precisely one attempt is made. — *end note*]

3 *Returns*: $\lfloor S/x \rfloor / r^d$.

[*Note 2*: The return value c satisfies $0 \leq c < 1$. — *end note*]

4 *Throws*: What and when `g` throws.

5 *Complexity*: Exactly k invocations of `g` per attempt.

6 [*Note 3*: If the values g_i produced by `g` are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — *end note*]

7 [*Note 4*: When R is a power of r, an implementation can avoid using an arithmetic type that is wider than the output when computing S. — *end note*]

29.5.9 Random number distribution class templates [rand.dist]

29.5.9.1 General [rand.dist.general]

1 Each type instantiated from a class template specified in 29.5.9 meets the requirements of a random number distribution (29.5.3.6) type.

2 Descriptions are provided in 29.5.9 only for distribution operations that are not described in 29.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors,

246) d is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

3 The algorithms for producing each of the specified distributions are implementation-defined.

4 The value of each probability density function $p(z)$ and of each discrete probability function $P(z_i)$ specified in this subclause is 0 everywhere outside its stated domain.

29.5.9.2 Uniform distributions [rand.dist.uni]

29.5.9.2.1 Class template `uniform_int_distribution` [rand.dist.uni.int]

1 A `uniform_int_distribution` random number distribution produces random integers i, $a \le i \le b$, distributed according to the constant discrete probability function in Formula 29.2.

$$P(i \,|\, a, b) = 1/(b - a + 1) \tag{29.2}$$

```
namespace std {
  template<class IntType = int>
  class uniform_int_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_int_distribution() : uniform_int_distribution(0) {}
    explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,            // hosted
                   const uniform_int_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,            // hosted
                   uniform_int_distribution& x);
  };
}
```

`explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());`

2 *Preconditions*: `a` $\le$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.2.2 Class template `uniform_real_distribution` [rand.dist.uni.real]

1 A `uniform_real_distribution` random number distribution produces random numbers x, $a \leq x < b$, distributed according to the constant probability density function in Formula 29.3.

$$p(x \mid a, b) = 1/(b - a) \tag{29.3}$$

[*Note 1*: This implies that $p(x \mid a, b)$ is undefined when `a == b`. — *end note*]

```
namespace std {
  template<class RealType = double>
  class uniform_real_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {}
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const uniform_real_distribution& x,
                           const uniform_real_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
  };
}
```

```
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: `a` ≤ `b` and `b` − `a` ≤ `numeric_limits<RealType>::max()`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.3 Bernoulli distributions [rand.dist.bern]

29.5.9.3.1 Class `bernoulli_distribution` [rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values b distributed according to the discrete probability function in Formula 29.4.

$$P(b\,|\,p) = \begin{cases} p & \text{if } b = \texttt{true} \\ 1-p & \text{if } b = \texttt{false} \end{cases} \qquad (29.4)$$

```
namespace std {
  class bernoulli_distribution {
  public:
    // types
    using result_type = bool;
    using param_type  = unspecified;

    // constructors and reset functions
    bernoulli_distribution() : bernoulli_distribution(0.5) {}
    explicit bernoulli_distribution(double p);
    explicit bernoulli_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
  };
}
```

```
explicit bernoulli_distribution(double p);
```

2 *Preconditions*: $0 \leq$ `p` ≤ 1.

3 *Remarks*: `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the `p` parameter with which the object was constructed.

29.5.9.3.2 Class template `binomial_distribution` [rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function in Formula 29.5.

$$P(i\,|\,t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i} \tag{29.5}$$

```
namespace std {
  template<class IntType = int>
  class binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    binomial_distribution() : binomial_distribution(1) {}
    explicit binomial_distribution(IntType t, double p = 0.5);
    explicit binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType t() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
  };
}
```

`explicit binomial_distribution(IntType t, double p = 0.5);`

2 *Preconditions*: $0 \le \texttt{p} \le 1$ and $0 \le \texttt{t}$.

3 *Remarks*: `t` and `p` correspond to the respective parameters of the distribution.

`IntType t() const;`

4 *Returns*: The value of the `t` parameter with which the object was constructed.

`double p() const;`

5 *Returns*: The value of the `p` parameter with which the object was constructed.

29.5.9.3.3 Class template `geometric_distribution` [rand.dist.bern.geo]

1 A `geometric_distribution` random number distribution produces integer values $i \ge 0$ distributed according to the discrete probability function in Formula 29.6.

$$P(i\,|\,p) = p \cdot (1-p)^i \tag{29.6}$$

```
namespace std {
  template<class IntType = int>
  class geometric_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    geometric_distribution() : geometric_distribution(0.5) {}
    explicit geometric_distribution(double p);
    explicit geometric_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
  };
}
```

```
explicit geometric_distribution(double p);
```

2 *Preconditions*: $0 < \texttt{p} < 1$.

3 *Remarks*: `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the `p` parameter with which the object was constructed.

29.5.9.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

1 A `negative_binomial_distribution` random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function in Formula 29.7.

$$P(i \,|\, k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i \tag{29.7}$$

[*Note 1*: This implies that $P(i \,|\, k, p)$ is undefined when `p == 1`. — *end note*]

```
namespace std {
  template<class IntType = int>
  class negative_binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;
    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {}
    explicit negative_binomial_distribution(IntType k, double p = 0.5);
    explicit negative_binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const negative_binomial_distribution& x,
                           const negative_binomial_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
  };
}
```

```
explicit negative_binomial_distribution(IntType k, double p = 0.5);
```

2 *Preconditions*: $0 < \texttt{p} \leq 1$ and $0 < \texttt{k}$.

3 *Remarks*: `k` and `p` correspond to the respective parameters of the distribution.

```
IntType k() const;
```

4 *Returns*: The value of the `k` parameter with which the object was constructed.

```
double p() const;
```

5 *Returns*: The value of the `p` parameter with which the object was constructed.

29.5.9.4 Poisson distributions [rand.dist.pois]

29.5.9.4.1 Class template `poisson_distribution` [rand.dist.pois.poisson]

1 A `poisson_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function in Formula 29.8.

$$P(i\,|\,\mu) = \frac{e^{-\mu}\mu^i}{i\,!} \tag{29.8}$$

The distribution parameter μ is also known as this distribution's *mean*.

```
namespace std {
  template<class IntType = int>
  class poisson_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;
    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
  };
}
```

`explicit poisson_distribution(double mean);`

2 *Preconditions*: $0 <$ `mean`.

3 *Remarks*: `mean` corresponds to the parameter of the distribution.

`double mean() const;`

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

29.5.9.4.2 Class template `exponential_distribution` [rand.dist.pois.exp]

1 An `exponential_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.9.

$$p(x \,|\, \lambda) = \lambda e^{-\lambda x} \tag{29.9}$$

```
namespace std {
  template<class RealType = double>
  class exponential_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    exponential_distribution() : exponential_distribution(1.0) {}
    explicit exponential_distribution(RealType lambda);
    explicit exponential_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);
```

```
      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

      // property functions
      RealType lambda() const;
      param_type param() const;
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
    };
  }
```

```
explicit exponential_distribution(RealType lambda);
```

2 *Preconditions*: $0 <$ `lambda`.

3 *Remarks*: `lambda` corresponds to the parameter of the distribution.

```
RealType lambda() const;
```

4 *Returns*: The value of the `lambda` parameter with which the object was constructed.

29.5.9.4.3 Class template `gamma_distribution` [rand.dist.pois.gamma]

1 A `gamma_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.10.

$$p(x \,|\, \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^{\alpha} \cdot \Gamma(\alpha)} \cdot x^{\,\alpha-1} \tag{29.10}$$

```
  namespace std {
    template<class RealType = double>
    class gamma_distribution {
    public:
      // types
      using result_type = RealType;
      using param_type  = unspecified;

      // constructors and reset functions
      gamma_distribution() : gamma_distribution(1.0) {}
      explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
      explicit gamma_distribution(const param_type& parm);
      void reset();

      // equality operators
      friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);
      // property functions
      RealType alpha() const;
      RealType beta() const;
      param_type param() const;
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
    };
  }
```

`explicit gamma_distribution(RealType alpha, RealType beta = 1.0);`

2 *Preconditions*: $0 <$ `alpha` and $0 <$ `beta`.

3 *Remarks*: `alpha` and `beta` correspond to the parameters of the distribution.

`RealType alpha() const;`

4 *Returns*: The value of the `alpha` parameter with which the object was constructed.

`RealType beta() const;`

5 *Returns*: The value of the `beta` parameter with which the object was constructed.

29.5.9.4.4 Class template `weibull_distribution` [rand.dist.pois.weibull]

1 A `weibull_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function in Formula 29.11.

$$p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^{a}\right) \tag{29.11}$$

```
namespace std {
  template<class RealType = double>
  class weibull_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    weibull_distribution() : weibull_distribution(1.0) {}
    explicit weibull_distribution(RealType a, RealType b = 1.0);
    explicit weibull_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
```

```
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
    };
  }
```

```
explicit weibull_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `a` and $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

1 An `extreme_value_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.12.[247]

$$p(x \mid a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right) \tag{29.12}$$

```
  namespace std {
    template<class RealType = double>
    class extreme_value_distribution {
    public:
      // types
      using result_type = RealType;
      using param_type  = unspecified;

      // constructor and reset functions
      extreme_value_distribution() : extreme_value_distribution(0.0) {}
      explicit extreme_value_distribution(RealType a, RealType b = 1.0);
      explicit extreme_value_distribution(const param_type& parm);
      void reset();

      // equality operators
      friend bool operator==(const extreme_value_distribution& x,
                             const extreme_value_distribution& y);

      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

      // property functions
      RealType a() const;
      RealType b() const;
      param_type param() const;
```

247) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

```
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
  };
}
```

```
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.5 Normal distributions [rand.dist.norm]

29.5.9.5.1 Class template `normal_distribution` [rand.dist.norm.normal]

1 A `normal_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.13.

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \tag{29.13}$$

The distribution parameters μ and σ are also known as this distribution's *mean* and *standard deviation*.

```
namespace std {
  template<class RealType = double>
  class normal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const normal_distribution& x, const normal_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
  };
}
```

`explicit normal_distribution(RealType mean, RealType stddev = 1.0);`

2 *Preconditions*: $0 <$ `stddev`.

3 *Remarks*: `mean` and `stddev` correspond to the respective parameters of the distribution.

`RealType mean() const;`

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

`RealType stddev() const;`

5 *Returns*: The value of the `stddev` parameter with which the object was constructed.

29.5.9.5.2 Class template `lognormal_distribution` [rand.dist.norm.lognormal]

1 A `lognormal_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.14.

$$p(x \mid m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right) \tag{29.14}$$

```
namespace std {
  template<class RealType = double>
  class lognormal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    lognormal_distribution() : lognormal_distribution(0.0) {}
    explicit lognormal_distribution(RealType m, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType s() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
  };
}
```

```
explicit lognormal_distribution(RealType m, RealType s = 1.0);
```

2 *Preconditions*: $0 <$ `s`.

3 *Remarks*: `m` and `s` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4 *Returns*: The value of the `m` parameter with which the object was constructed.

```
RealType s() const;
```

5 *Returns*: The value of the `s` parameter with which the object was constructed.

29.5.9.5.3 Class template `chi_squared_distribution` [rand.dist.norm.chisq]

1 A `chi_squared_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.15.

$$p(x\,|\,n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} \tag{29.15}$$

```
namespace std {
  template<class RealType = double>
  class chi_squared_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    chi_squared_distribution() : chi_squared_distribution(1.0) {}
    explicit chi_squared_distribution(RealType n);
    explicit chi_squared_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
  };
}
```

```
explicit chi_squared_distribution(RealType n);
```

2 *Preconditions*: $0 < \texttt{n}$.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.5.4 Class template `cauchy_distribution` [rand.dist.norm.cauchy]

1 A `cauchy_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.16.

$$p(x \mid a, b) = \left(\pi b \left(1 + \left(\frac{x-a}{b}\right)^2\right)\right)^{-1} \tag{29.16}$$

```
  namespace std {
    template<class RealType = double>
    class cauchy_distribution {
    public:
      // types
      using result_type = RealType;
      using param_type  = unspecified;

      // constructor and reset functions
      cauchy_distribution() : cauchy_distribution(0.0) {}
      explicit cauchy_distribution(RealType a, RealType b = 1.0);
      explicit cauchy_distribution(const param_type& parm);
      void reset();

      // equality operators
      friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

      // property functions
      RealType a() const;
      RealType b() const;
      param_type param() const;
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
    };
  }
```

```
explicit cauchy_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.5.5 Class template `fisher_f_distribution` [rand.dist.norm.f]

1 A `fisher_f_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function in Formula 29.17.

$$p(x\,|\,m,n) = \frac{\Gamma\big((m+n)/2\big)}{\Gamma(m/2)\,\Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2} \tag{29.17}$$

```
namespace std {
  template<class RealType = double>
  class fisher_f_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    fisher_f_distribution() : fisher_f_distribution(1.0) {}
    explicit fisher_f_distribution(RealType m, RealType n = 1.0);
    explicit fisher_f_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
  };
}
```

```
explicit fisher_f_distribution(RealType m, RealType n = 1);
```

2 *Preconditions*: $0 <$ `m` and $0 <$ `n`.

3 *Remarks*: `m` and `n` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4 *Returns*: The value of the `m` parameter with which the object was constructed.

```
RealType n() const;
```

5 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.5.6 Class template `student_t_distribution` [rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.18.

$$p(x\,|\,n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma\big((n+1)/2\big)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2} \tag{29.18}$$

```
namespace std {
  template<class RealType = double>
  class student_t_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    student_t_distribution() : student_t_distribution(1.0) {}
    explicit student_t_distribution(RealType n);
    explicit student_t_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
  };
}
```

```
explicit student_t_distribution(RealType n);
```

2 *Preconditions*: $0 <$ `n`.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.6 Sampling distributions [rand.dist.samp]

29.5.9.6.1 Class template `discrete_distribution` [rand.dist.samp.discrete]

1 A `discrete_distribution` random number distribution produces random integers i, $0 \leq i < n$, distributed according to the discrete probability function in Formula 29.19.

$$P(i \,|\, p_0, \ldots, p_{n-1}) = p_i \tag{29.19}$$

2 Unless specified otherwise, the distribution parameters are calculated as: $p_k = w_k / S$ for $k = 0, \ldots, n-1$, in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
namespace std {
  template<class IntType = int>
  class discrete_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructor and reset functions
    discrete_distribution();
    template<class InputIterator>
      discrete_distribution(InputIterator firstW, InputIterator lastW);
    discrete_distribution(initializer_list<double> wl);
    template<class UnaryOperation>
      discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
    explicit discrete_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<double> probabilities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
  };
}
```

```
discrete_distribution();
```

3 *Effects*: Constructs a `discrete_distribution` object with $n = 1$ and $p_0 = 1$.

[*Note 1*: Such an object will always deliver the value 0. — *end note*]

```
template<class InputIterator>
  discrete_distribution(InputIterator firstW, InputIterator lastW);
```

4 *Mandates*: `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is `true`.

5 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3). If `firstW == lastW`, let $n = 1$ and $w_0 = 1$. Otherwise, $\bigl[$`firstW`, `lastW`$\bigr)$ forms a sequence w of length $n > 0$.

6 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the Formula 29.19.

```
discrete_distribution(initializer_list<double> wl);
```

7 *Effects*: Same as `discrete_distribution(wl.begin(), wl.end())`.

```
template<class UnaryOperation>
  discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
```

8 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

9 *Preconditions*: If $\texttt{nw} = 0$, let $n = 1$, otherwise let $n = \texttt{nw}$. The relation $0 < \delta = (\texttt{xmax} - \texttt{xmin})/n$ holds.

10 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If $\texttt{nw} = 0$, let $w_0 = 1$. Otherwise, let $w_k = \texttt{fw}(\texttt{xmin} + k \cdot \delta + \delta/2)$ for $k = 0, \ldots, n - 1$.

11 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<double> probabilities() const;
```

12 *Returns*: A `vector<double>` whose `size` member returns n and whose `operator[]` member returns p_k when invoked with argument k for $k = 0, \ldots, n - 1$.

29.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

1 A `piecewise_constant_distribution` random number distribution produces random numbers x, $b_0 \le x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function in Formula 29.20.

$$p(x \,|\, b_0, \ldots, b_n,\ \rho_0, \ldots, \rho_{n-1}) = \rho_i \text{ , for } b_i \le x < b_{i+1} \tag{29.20}$$

2 The $n + 1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n - 1$. Unless specified otherwise, the remaining n distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1 \text{ ,}$$

in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
namespace std {
  template<class RealType = double>
  class piecewise_constant_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);
    template<class UnaryOperation>
      piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                      UnaryOperation fw);
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const piecewise_constant_distribution& x,
                           const piecewise_constant_distribution& y);
    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
  };
}
```

```
piecewise_constant_distribution();
```

3 *Effects*: Constructs a `piecewise_constant_distribution` object with $n = 1$, $\rho_0 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
  piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                  InputIteratorW firstW);
```

4 *Mandates*: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (24.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $\big[$`firstB`, `lastB`$\big)$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least n, and any w_k for $k \geq n$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
  piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $\big[$`bl.begin()`, `bl.end()`$\big)$ form a sequence $b_0, \dots, b_n$, and let $w_k =$ `fw`$\big(\big(b_{k+1} + b_k\big)/2\big)$ for $k = 0, \dots, n-1$.

9 *Complexity*: The number of invocations of `fw` does not exceed n.

```
template<class UnaryOperation>
  piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If `nw` $= 0$, let $n = 1$, otherwise let $n =$ `nw`. The relation $0 < \delta = ($`xmax` $-$ `xmin`$)/n$ holds.

12 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let $b_k =$ `xmin`$+ k \cdot \delta$ for $k = 0, \dots, n$, and $w_k =$ `fw`$(b_k + \delta/2)$ for $k = 0, \dots, n-1$.

13 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<result_type> intervals() const;
```

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n - 1$.

29.5.9.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

1 A `piecewise_linear_distribution` random number distribution produces random numbers x, $b_0 \leq x < b_n$, distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function in Formula 29.21.

$$p(x \,|\, b_0, \ldots, b_n,\ \rho_0, \ldots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}\ , \text{ for } b_i \leq x < b_{i+1}. \tag{29.21}$$

2 The $n + 1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n - 1$. Unless specified otherwise, the remaining $n + 1$ distribution parameters are calculated as $\rho_k = w_k / S$ for $k = 0, \ldots, n$, in which the values w_k, commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k)\ .$$

```
namespace std {
  template<class RealType = double>
  class piecewise_linear_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                    InputIteratorW firstW);
    template<class UnaryOperation>
      piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const piecewise_linear_distribution& x,
                           const piecewise_linear_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
  };
}
```

```
piecewise_linear_distribution();
```

3 *Effects*: Constructs a `piecewise_linear_distribution` object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
  piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                InputIteratorW firstW);
```

4 *Mandates*: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (24.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $\bigl[$`firstB`, `lastB`$\bigr)$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least $n + 1$, and any w_k for $k \geq n + 1$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
  piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $\bigl[$`bl.begin()`,`bl.end()`$\bigr)$ form a sequence $b_0, \ldots, b_n$, and let $w_k =$ `fw`(b_k) for $k = 0, \ldots, n$.

9 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

```
template<class UnaryOperation>
  piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If `nw` $= 0$, let $n = 1$, otherwise let $n =$ `nw`. The relation $0 < \delta = ($`xmax` $-$ `xmin`$)/n$ holds.

12 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let $b_k =$ `xmin` $+ k \cdot \delta$ for $k = 0, \ldots, n$, and $w_k =$ `fw`(b_k) for $k = 0, \ldots, n$.

13 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

```
vector<result_type> intervals() const;
```

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n$.

29.5.10 Low-quality random number generation [c.math.rand]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
int rand();
```

```
void srand(unsigned int seed);
```

2 *Effects*: The `rand` and `srand` functions have the semantics specified in the C standard library.

3 *Remarks*: The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

[*Note 2*: The other random number generation facilities in this document (29.5) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — *end note*]

  template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
  template<class T> valarray<T> atan2(const valarray<T>&,
                                      const typename valarray<T>::value_type&);
  template<class T> valarray<T> atan2(const typename valarray<T>::value_type&,
                                      const valarray<T>&);

  template<class T> valarray<T> cos  (const valarray<T>&);
  template<class T> valarray<T> cosh (const valarray<T>&);
  template<class T> valarray<T> exp  (const valarray<T>&);
  template<class T> valarray<T> log  (const valarray<T>&);
  template<class T> valarray<T> log10(const valarray<T>&);

  template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);
  template<class T> valarray<T> pow(const valarray<T>&, const typename valarray<T>::value_type&);
  template<class T> valarray<T> pow(const typename valarray<T>::value_type&, const valarray<T>&);

  template<class T> valarray<T> sin  (const valarray<T>&);
  template<class T> valarray<T> sinh (const valarray<T>&);
  template<class T> valarray<T> sqrt (const valarray<T>&);
  template<class T> valarray<T> tan  (const valarray<T>&);
  template<class T> valarray<T> tanh (const valarray<T>&);

  template<class T> unspecified1 begin(valarray<T>& v);
  template<class T> unspecified2 begin(const valarray<T>& v);
  template<class T> unspecified1 end(valarray<T>& v);
  template<class T> unspecified2 end(const valarray<T>& v);
}
```

1 The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

2 The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

3 Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the const member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.[248]

4 Implementations introducing such replacement types shall provide additional functions and operators as follows:

(4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (29.6.10), identical functions taking the replacement types shall be added;

(4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

5 In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

6 These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

248) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

29.6.2 Class template valarray [template.valarray]

29.6.2.1 Overview [template.valarray.overview]

```
namespace std {
  template<class T> class valarray {
  public:
    using value_type = T;

    // 29.6.2.2, construct/destroy
    valarray();
    explicit valarray(size_t);
    valarray(const T&, size_t);
    valarray(const T*, size_t);
    valarray(const valarray&);
    valarray(valarray&&) noexcept;
    valarray(const slice_array<T>&);
    valarray(const gslice_array<T>&);
    valarray(const mask_array<T>&);
    valarray(const indirect_array<T>&);
    valarray(initializer_list<T>);
    ~valarray();

    // 29.6.2.3, assignment
    valarray& operator=(const valarray&);
    valarray& operator=(valarray&&) noexcept;
    valarray& operator=(initializer_list<T>);
    valarray& operator=(const T&);
    valarray& operator=(const slice_array<T>&);
    valarray& operator=(const gslice_array<T>&);
    valarray& operator=(const mask_array<T>&);
    valarray& operator=(const indirect_array<T>&);

    // 29.6.2.4, element access
    const T&          operator[](size_t) const;
    T&                operator[](size_t);

    // 29.6.2.5, subset operations
    valarray          operator[](slice) const;
    slice_array<T>    operator[](slice);
    valarray          operator[](const gslice&) const;
    gslice_array<T>   operator[](const gslice&);
    valarray          operator[](const valarray<bool>&) const;
    mask_array<T>     operator[](const valarray<bool>&);
    valarray          operator[](const valarray<size_t>&) const;
    indirect_array<T> operator[](const valarray<size_t>&);

    // 29.6.2.6, unary operators
    valarray operator+() const;
    valarray operator-() const;
    valarray operator~() const;
    valarray<bool> operator!() const;

    // 29.6.2.7, compound assignment
    valarray& operator*= (const T&);
    valarray& operator/= (const T&);
    valarray& operator%= (const T&);
    valarray& operator+= (const T&);
    valarray& operator-= (const T&);
    valarray& operator^= (const T&);
    valarray& operator&= (const T&);
    valarray& operator|= (const T&);
    valarray& operator<<=(const T&);
    valarray& operator>>=(const T&);
```

```
      valarray& operator*= (const valarray&);
      valarray& operator/= (const valarray&);
      valarray& operator%= (const valarray&);
      valarray& operator+= (const valarray&);
      valarray& operator-= (const valarray&);
      valarray& operator^= (const valarray&);
      valarray& operator|= (const valarray&);
      valarray& operator&= (const valarray&);
      valarray& operator<<=(const valarray&);
      valarray& operator>>=(const valarray&);

      // 29.6.2.8, member functions
      void swap(valarray&) noexcept;

      size_t size() const;

      T sum() const;
      T min() const;
      T max() const;

      valarray shift (int) const;
      valarray cshift(int) const;
      valarray apply(T func(T)) const;
      valarray apply(T func(const T&)) const;
      void resize(size_t sz, T c = T());
    };

    template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
  }
```

1 The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an "array" throughout the remainder of 29.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.[249]

29.6.2.2 Constructors [valarray.cons]

`valarray();`

1 *Effects*: Constructs a `valarray` that has zero length.[250]

`explicit valarray(size_t n);`

2 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.5).

`valarray(const T& v, size_t n);`

3 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

`valarray(const T* p, size_t n);`

4 *Preconditions*: [`p`, `p + n`) is a valid range.

5 *Effects*: Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.[251]

249) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.
250) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.
251) This constructor is the preferred method for converting a C array to a `valarray` object.

`valarray(const valarray& v);`

6 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.[252]

`valarray(valarray&& v) noexcept;`

7 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

8 *Complexity*: Constant.

`valarray(initializer_list<T> il);`

9 *Effects*: Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

10 These conversion constructors convert one of the four reference templates to a `valarray`.

`~valarray();`

11 *Effects*: The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

29.6.2.3 Assignment [valarray.assign]

`valarray& operator=(const valarray& v);`

1 *Effects*: Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

2 *Postconditions*: `size() == v.size()`.

3 *Returns*: `*this`.

`valarray& operator=(valarray&& v) noexcept;`

4 *Effects*: `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

5 *Returns*: `*this`.

6 *Complexity*: Linear.

`valarray& operator=(initializer_list<T> il);`

7 *Effects*: Equivalent to: `return *this = valarray(il);`

`valarray& operator=(const T& v);`

8 *Effects*: Assigns `v` to each element of `*this`.

9 *Returns*: `*this`.

```
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
```

10 *Preconditions*: The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

11 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

252) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

29.6.2.4 Element access [valarray.access]

```
const T& operator[](size_t n) const;
T& operator[](size_t n);
```

1 *Hardened preconditions*: `n < size()` is `true`.

2 *Returns*: A reference to the corresponding element of the array.

[*Note 1*: The expression `(a[i] = q, a[i]) == q` evaluates to `true` for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`. — *end note*]

3 *Remarks*: The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to `true` for all `size_t i` and `size_t j` such that `i+j < a.size()`.

4 The expression `addressof(a[i]) != addressof(b[j])` evaluates to `true` for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that `i < a.size()` and `j < b.size()`.

[*Note 2*: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarray`s. — *end note*]

5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (29.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

29.6.2.5 Subset operations [valarray.sub]

1 The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

2 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `slicearr`.

[*Example 1*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

— *end example*]

```
slice_array<T> operator[](slice slicearr);
```

3 *Returns*: An object that holds references to elements of the controlled sequence selected by `slicearr`.

[*Example 2*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

— *end example*]

```
valarray operator[](const gslice& gslicearr) const;
```

4 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.

[*Example 3*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

— *end example*]

`gslice_array<T> operator[](const gslice& gslicearr);`

5 *Returns*: An object that holds references to elements of the controlled sequence selected by `gslicearr`.

[*Example 4*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

— *end example*]

`valarray operator[](const valarray<bool>& boolarr) const;`

6 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `boolarr`.

[*Example 5*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

— *end example*]

`mask_array<T> operator[](const valarray<bool>& boolarr);`

7 *Returns*: An object that holds references to elements of the controlled sequence selected by `boolarr`.

[*Example 6*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```

— *end example*]

`valarray operator[](const valarray<size_t>& indarr) const;`

8 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `indarr`.

[*Example 7*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
```

— *end example*]

`indirect_array<T> operator[](const valarray<size_t>& indarr);`

9 *Returns*: An object that holds references to elements of the controlled sequence selected by `indarr`.

[*Example 8*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
```

— *end example*]

29.6.2.6 Unary operators [valarray.unary]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
```

```
valarray<bool> operator!() const;
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).

2 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

29.6.2.7 Compound assignment [valarray.cassign]

```
valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);
```

1 *Mandates*: The indicated operator can be applied to two operands of type `T`.

2 *Preconditions*: `size() == v.size()` is `true`.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

3 *Effects*: Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

4 *Returns*: `*this`.

5 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
```

6 *Mandates*: The indicated operator can be applied to two operands of type `T`.

7 *Effects*: Each of these operators applies the indicated operation to each element of `*this` and `v`.

8 *Returns*: `*this`

9 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

29.6.2.8 Member functions [valarray.members]

```
void swap(valarray& v) noexcept;
```

1 *Effects*: `*this` obtains the value of `v`. `v` obtains the value of `*this`.

2 *Complexity*: Constant.

```
size_t size() const;
```

3 *Returns*: The number of elements in the array.

4 *Complexity*: Constant time.

```
T sum() const;
```

5 *Mandates*: `operator+=` can be applied to operands of type `T`.

6 *Preconditions*: `size() > 0` is `true`.

7 *Returns*: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying `operator+=` to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

8 *Preconditions*: `size() > 0` is `true`.

9 *Returns*: The minimum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
T max() const;
```

10 *Preconditions*: `size() > 0` is `true`.

11 *Returns*: The maximum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
valarray shift(int n) const;
```

12 *Returns*: A `valarray` of length `size()`, each of whose elements *I* is `(*this)[`*I*` + n]` if *I* `+ n` is non-negative and less than `size()`, otherwise `T()`.

[*Note 1*: If element zero is taken as the leftmost element, a positive value of `n` shifts the elements left `n` places, with zero fill. — *end note*]

13 [*Example 1*: If the argument has the value -2, the first two elements of the result will be value-initialized (9.5); the third element of the result will be assigned the value of the first element of `*this`; etc. — *end example*]

```
valarray cshift(int n) const;
```

14 *Returns*: A `valarray` of length `size()` that is a circular shift of `*this`. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right $-n$ places.

```
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
```

15 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of `*this`.

```
void resize(size_t sz, T c = T());
```

16 *Effects*: Changes the length of the `*this` array to `sz` and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

29.6.3 valarray non-member operations [valarray.nonmembers]

29.6.3.1 Binary operators [valarray.binary]

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

2 *Preconditions*: The argument arrays have the same length.

3 *Returns*: A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<T> operator* (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

5 *Returns*: A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

29.6.3.2 Logical operators [valarray.comparison]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

2 *Preconditions*: The two array arguments have the same length.

3 *Returns*: A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

5 *Returns*: A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

29.6.3.3 Transcendentals [valarray.transcend]

```
template<class T> valarray<T> abs  (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos  (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp  (const valarray<T>&);
template<class T> valarray<T> log  (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow  (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin  (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
```

```
template<class T> valarray<T> tan  (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

1 *Mandates*: A unique function with the indicated name can be applied (unqualified) to an operand of type `T`. This function returns a value of type `T` or which can be unambiguously implicitly converted to type `T`.

29.6.3.4 Specialized algorithms [valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

1 *Effects*: Equivalent to `x.swap(y)`.

29.6.4 Class `slice` [class.slice]

29.6.4.1 Overview [class.slice.overview]

```
namespace std {
  class slice {
  public:
    slice();
    slice(size_t, size_t, size_t);
    slice(const slice&);

    size_t start() const;
    size_t size() const;
    size_t stride() const;

    friend bool operator==(const slice& x, const slice& y);
  };
}
```

1 The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.[253]

29.6.4.2 Constructors [cons.slice]

```
slice();
slice(size_t start, size_t length, size_t stride);
```

1 The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

2 [*Example 1*: `slice(3, 8, 2)` constructs a slice which selects elements $3, 5, 7, \dots, 17$ from an array. — *end example*]

29.6.4.3 Access functions [slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

1 *Returns*: The start, length, or stride specified by a `slice` object.

2 *Complexity*: Constant time.

29.6.4.4 Operators [slice.ops]

```
friend bool operator==(const slice& x, const slice& y);
```

1 *Effects*: Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

253) BLAS stands for *Basic Linear Algebra Subprograms.* C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

29.6.5 Class template slice_array [template.slice.array]

29.6.5.1 Overview [template.slice.array.overview]

```
namespace std {
  template<class T> class slice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    slice_array(const slice_array&);
    ~slice_array();
    const slice_array& operator=(const slice_array&) const;
    void operator=(const T&) const;

    slice_array() = delete;       // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

2 It has reference semantics to a subset of an array specified by a `slice` object.

[*Example 1*: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are $1, 4, \ldots, 13$. — *end example*]

29.6.5.2 Assignment [slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.5.3 Compound assignment [slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.5.4 Fill function [slice.arr.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.6 The `gslice` class [class.gslice]

29.6.6.1 Overview [class.gslice.overview]

```
namespace std {
  class gslice {
  public:
    gslice();
    gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

    size_t           start() const;
    valarray<size_t> size() const;
    valarray<size_t> stride() const;
  };
}
```

1 This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset (s), a set of lengths (l_j), and a set of strides (d_j). The number of lengths shall equal the number of strides.

2 A `gslice` represents a mapping from a set of indices (i_j), equal in number to the number of strides, to a single index k. It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices i_j range in value from 0 to $l_{ij} - 1$.

3 [*Example 1*: The `gslice` specification

```
start  = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0,1) \times 19 + (0,1,2,3) \times 4 + (0,1,2) \times 1$$

which are ordered as shown in the following table:

$$\begin{array}{lllll}
(i_0, & i_1, & i_2, & k) & = \\
 & (0, & 0, & 0, & 3), \\
 & (0, & 0, & 1, & 4), \\
 & (0, & 0, & 2, & 5), \\
 & (0, & 1, & 0, & 7), \\
 & (0, & 1, & 1, & 8), \\
 & (0, & 1, & 2, & 9), \\
 & (0, & 2, & 0, & 11), \\
 & (0, & 2, & 1, & 12), \\
 & (0, & 2, & 2, & 13), \\
 & (0, & 3, & 0, & 15), \\
 & (0, & 3, & 1, & 16), \\
 & (0, & 3, & 2, & 17), \\
 & (1, & 0, & 0, & 22), \\
 & (1, & 0, & 1, & 23), \\
 & \ldots & & & \\
 & (1, & 3, & 2, & 36)
\end{array}$$

That is, the highest-ordered index turns fastest. — *end example*]

4 It is possible to have degenerate generalized slices in which an address is repeated.

5 [*Example 2*: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

$$\begin{array}{llll}
(0, & 0, & 0, & 3), \\
(0, & 0, & 1, & 4), \\
(0, & 0, & 2, & 5), \\
(0, & 1, & 0, & 4),
\end{array}$$

```
(0,   1,   1,    5),
(0,   1,   2,    6),
...
```

— *end example*]

6 If a degenerate slice is used as the argument to the non-`const` version of `operator[](const gslice&)`, the behavior is undefined.

29.6.6.2 Constructors [gslice.cons]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
```

1 The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

29.6.6.3 Access functions [gslice.access]

```
size_t           start()  const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

1 *Returns*: The representation of the start, lengths, or strides specified for the `gslice`.

2 *Complexity*: `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

29.6.7 Class template gslice_array [template.gslice.array]

29.6.7.1 Overview [template.gslice.array.overview]

```
namespace std {
  template<class T> class gslice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    gslice_array(const gslice_array&);
    ~gslice_array();
    const gslice_array& operator=(const gslice_array&) const;
    void operator=(const T&) const;

    gslice_array() = delete;     // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

2 It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

29.6.7.2 Assignment [gslice.array.assign]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

29.6.7.3 Compound assignment [gslice.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

29.6.7.4 Fill function [gslice.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

29.6.8 Class template `mask_array` [template.mask.array]

29.6.8.1 Overview [template.mask.array.overview]

```
namespace std {
  template<class T> class mask_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    mask_array(const mask_array&);
    ~mask_array();
    const mask_array& operator=(const mask_array&) const;
    void operator=(const T&) const;

    mask_array() = delete;       // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[](const valarray<bool>&);
```

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

29.6.8.2 Assignment [mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.8.3 Compound assignment [mask.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.8.4 Fill function [mask.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.9 Class template `indirect_array` [template.indirect.array]

29.6.9.1 Overview [template.indirect.array.overview]

```
namespace std {
  template<class T> class indirect_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    indirect_array(const indirect_array&);
    ~indirect_array();
    const indirect_array& operator=(const indirect_array&) const;
    void operator=(const T&) const;

    indirect_array() = delete;   // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&);
```

2 It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

29.6.9.2 Assignment [indirect.array.assign]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

3 [*Example 1*:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — *end example*]

29.6.9.3 Compound assignment [indirect.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

29.6.9.4 Fill function [indirect.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

29.6.10 valarray range access [valarray.range]

1 In the `begin` and `end` function templates that follow, *`unspecified`*1 is a type that meets the requirements of a mutable *Cpp17RandomAccessIterator* (24.3.5.7) and models `contiguous_iterator` (24.3.4.14), whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. *`unspecified`*2 is a type that meets the requirements of a constant *Cpp17RandomAccessIterator* and models `contiguous_iterator`, whose `value_type` is the template parameter `T` and whose `reference` type is `const T&`.

2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (29.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

3 *Returns*: An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

4 *Returns*: An iterator referencing one past the last value in the array.

  }
```

1 The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (29.7.3), a linear interpolation function (29.7.4), and the mathematical special functions described in 29.7.6.

[*Note 1*: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

2 For each function with at least one parameter of type *floating-point-type*, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of *floating-point-type* in the function signature are replaced with that floating-point type.

3 For each function with at least one parameter of type *floating-point-type* other than `abs`, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a *floating-point-type* parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

4 An invocation of `nexttoward` is ill-formed if the argument corresponding to the *floating-point-type* parameter has extended floating-point type.

SEE ALSO: ISO/IEC 9899:2018, 7.12

29.7.2 Absolute values [c.math.abs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2) and `<cmath>` (29.7.1) declare the functions described in this subclause. — *end note*]

```
constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
```

2 *Effects*: These functions have the semantics specified in the C standard library for the functions `abs`, `labs`, and `llabs`, respectively.

3 *Remarks*: If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[*Note 2*: Allowing arguments that can be promoted to `int` provides compatibility with C. — *end note*]

```
constexpr floating-point-type abs(floating-point-type x);
```

4 *Returns*: The absolute value of `x`.

SEE ALSO: ISO/IEC 9899:2018, 7.12.7.2, 7.22.6.1

29.7.3 Three-dimensional hypotenuse [c.math.hypot3]

```
constexpr floating-point-type hypot(floating-point-type x, floating-point-type y,
                                    floating-point-type z);
```

1 *Returns*: $\sqrt{x^2 + y^2 + z^2}$.

29.7.4 Linear interpolation [c.math.lerp]

```
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b,
                                   floating-point-type t) noexcept;
```

1 *Returns*: $a + t(b - a)$.

2 *Remarks*: Let `r` be the value returned. If `isfinite(a) && isfinite(b)`, then:

(2.1) — If `t == 0`, then `r == a`.

(2.2) — If `t == 1`, then `r == b`.

(2.3) — If `t >= 0 && t <= 1`, then `isfinite(r)`.

(2.4) — If `isfinite(t) && a == b`, then `r == a`.

(2.5) — If `isfinite(t) || !isnan(t) && b-a != 0`, then `!isnan(r)`.

Let *`CMP`*`(x,y)` be `1` if `x > y`, `-1` if `x < y`, and `0` otherwise. For any `t1` and `t2`, the product of *`CMP`*`(lerp(a, b, t2), lerp(a, b, t1))`, *`CMP`*`(t2, t1)`, and *`CMP`*`(b, a)` is non-negative.

29.7.5 Classification / comparison functions [c.math.fpclass]

1 The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library.

SEE ALSO: ISO/IEC 9899:2018, 7.12.3, 7.12.4

29.7.6 Mathematical special functions [sf.cmath]

29.7.6.1 General [sf.cmath.general]

1 If any argument value to any of the functions specified in 29.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

(1.1) — the function description's *Returns*: element explicitly specifies a domain and those argument values fall outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or

(1.3) — the corresponding mathematical function is not mathematically defined.[254]

2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

29.7.6.2 Associated Laguerre polynomials [sf.cmath.assoc.laguerre]

```
floating-point-type assoc_laguerre(unsigned n, unsigned m, floating-point-type x);
float       assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Laguerre polynomials of their respective arguments `n`, `m`, and `x`.

2 *Returns*: $\mathsf{L}_n^m(x)$, where L_n^m is given by Formula 29.22, L_{n+m} is given by Formula 29.37, n is `n`, m is `m`, and x is `x`.

$$\mathsf{L}_n^m(x) = (-1)^m \frac{\mathsf{d}^m}{\mathsf{d}x^m} \mathsf{L}_{n+m}(x) \ , \quad \text{for } x \ge 0 \tag{29.22}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128` or if `m >= 128`.

29.7.6.3 Associated Legendre functions [sf.cmath.assoc.legendre]

```
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float       assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Legendre functions of their respective arguments `l`, `m`, and `x`.

254) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

2 *Returns*: $\mathsf{P}_\ell^m(x)$, where P_ℓ^m is given by Formula 29.23, P_ℓ is given by Formula 29.38, ℓ is `l`, m is `m`, and x is `x`.

$$\mathsf{P}_\ell^m(x) = (1-x^2)^{m/2}\,\frac{\mathsf{d}^m}{\mathsf{d}x^m}\,\mathsf{P}_\ell(x)\ , \quad \text{for } |x| \le 1 \tag{29.23}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

29.7.6.4 Beta function [sf.cmath.beta]

```
floating-point-type beta(floating-point-type x, floating-point-type y);
float       betaf(float x, float y);
long double betal(long double x, long double y);
```

1 *Effects*: These functions compute the beta function of their respective arguments `x` and `y`.

2 *Returns*: $\mathsf{B}(x,y)$, where B is given by Formula 29.24, x is `x` and y is `y`.

$$\mathsf{B}(x,y) = \frac{\Gamma(x)\,\Gamma(y)}{\Gamma(x+y)}\ , \quad \text{for } x>0,\ y>0 \tag{29.24}$$

29.7.6.5 Complete elliptic integral of the first kind [sf.cmath.comp.ellint.1]

```
floating-point-type comp_ellint_1(floating-point-type k);
float       comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the first kind of their respective arguments `k`.

2 *Returns*: $\mathsf{K}(k)$, where K is given by Formula 29.25 and k is `k`.

$$\mathsf{K}(k) = \mathsf{F}(k,\pi/2)\ , \quad \text{for } |k| \le 1 \tag{29.25}$$

3 See also 29.7.6.12.

29.7.6.6 Complete elliptic integral of the second kind [sf.cmath.comp.ellint.2]

```
floating-point-type comp_ellint_2(floating-point-type k);
float       comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the second kind of their respective arguments `k`.

2 *Returns*: $\mathsf{E}(k)$, where E is given by Formula 29.26 and k is `k`.

$$\mathsf{E}(k) = \mathsf{E}(k,\pi/2)\ , \quad \text{for } |k| \le 1 \tag{29.26}$$

3 See also 29.7.6.13.

29.7.6.7 Complete elliptic integral of the third kind [sf.cmath.comp.ellint.3]

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float       comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1 *Effects*: These functions compute the complete elliptic integral of the third kind of their respective arguments `k` and `nu`.

2 *Returns*: $\mathsf{\Pi}(\nu,k)$, where $\mathsf{\Pi}$ is given by Formula 29.27, k is `k`, and ν is `nu`.

$$\mathsf{\Pi}(\nu,k) = \mathsf{\Pi}(\nu,k,\pi/2)\ , \quad \text{for } |k| \le 1 \tag{29.27}$$

3 See also 29.7.6.14.

29.7.6.8 Regular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.i]

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float       cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects*: These functions compute the regular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{I}_\nu(x)$, where I_ν is given by Formula 29.28, ν is `nu`, and x is `x`.

$$\mathsf{I}_\nu(x) = \mathrm{i}^{-\nu}\mathsf{J}_\nu(\mathrm{i}x) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)}\ , \quad \text{for } x \geq 0 \tag{29.28}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.9.

29.7.6.9 Cylindrical Bessel functions of the first kind [sf.cmath.cyl.bessel.j]

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float       cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{J}_\nu(x)$, where J_ν is given by Formula 29.29, ν is `nu`, and x is `x`.

$$\mathsf{J}_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k(x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)}\ , \quad \text{for } x \geq 0 \tag{29.29}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

29.7.6.10 Irregular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.k]

```
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float       cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects*: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{K}_\nu(x)$, where K_ν is given by Formula 29.30, ν is `nu`, and x is `x`.

$$\mathsf{K}_\nu(x) = (\pi/2)\mathrm{i}^{\nu+1}(\mathsf{J}_\nu(\mathrm{i}x) + \mathrm{i}\mathsf{N}_\nu(\mathrm{i}x)) = \begin{cases} \dfrac{\pi}{2}\dfrac{\mathsf{I}_{-\nu}(x) - \mathsf{I}_\nu(x)}{\sin\nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\[2ex] \dfrac{\pi}{2}\lim\limits_{\mu\to\nu}\dfrac{\mathsf{I}_{-\mu}(x) - \mathsf{I}_\mu(x)}{\sin\mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \tag{29.30}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.8, 29.7.6.9, 29.7.6.11.

29.7.6.11 Cylindrical Neumann functions [sf.cmath.cyl.neumann]

```
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float       cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{N}_\nu(x)$, where N_ν is given by Formula 29.31, ν is `nu`, and x is `x`.

$$\mathsf{N}_\nu(x) = \begin{cases} \dfrac{\mathsf{J}_\nu(x)\cos\nu\pi - \mathsf{J}_{-\nu}(x)}{\sin\nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\[2ex] \lim\limits_{\mu\to\nu}\dfrac{\mathsf{J}_\mu(x)\cos\mu\pi - \mathsf{J}_{-\mu}(x)}{\sin\mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \tag{29.31}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.9.

29.7.6.12 Incomplete elliptic integral of the first kind [sf.cmath.ellint.1]

```
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float        ellint_1f(float k, float phi);
long double  ellint_1l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the first kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*: $\mathsf{F}(k, \phi)$, where F is given by Formula 29.32, k is `k`, and ϕ is `phi`.

$$\mathsf{F}(k, \phi) = \int_0^\phi \frac{\mathsf{d}\theta}{\sqrt{1 - k^2 \sin^2 \theta}}\ , \quad \text{for } |k| \le 1 \tag{29.32}$$

29.7.6.13 Incomplete elliptic integral of the second kind [sf.cmath.ellint.2]

```
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float        ellint_2f(float k, float phi);
long double  ellint_2l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the second kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*: $\mathsf{E}(k, \phi)$, where E is given by Formula 29.33, k is `k`, and ϕ is `phi`.

$$\mathsf{E}(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta}\, \mathsf{d}\theta\ , \quad \text{for } |k| \le 1 \tag{29.33}$$

29.7.6.14 Incomplete elliptic integral of the third kind [sf.cmath.ellint.3]

```
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
                             floating-point-type phi);
float        ellint_3f(float k, float nu, float phi);
long double  ellint_3l(long double k, long double nu, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the third kind of their respective arguments `k`, `nu`, and `phi` (`phi` measured in radians).

2 *Returns*: $\mathsf{\Pi}(\nu, k, \phi)$, where $\mathsf{\Pi}$ is given by Formula 29.34, ν is `nu`, k is `k`, and ϕ is `phi`.

$$\mathsf{\Pi}(\nu, k, \phi) = \int_0^\phi \frac{\mathsf{d}\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}}\ , \quad \text{for } |k| \le 1 \tag{29.34}$$

29.7.6.15 Exponential integral [sf.cmath.expint]

```
floating-point-type expint(floating-point-type x);
float        expintf(float x);
long double  expintl(long double x);
```

1 *Effects*: These functions compute the exponential integral of their respective arguments `x`.

2 *Returns*: $\mathsf{Ei}(x)$, where Ei is given by Formula 29.35 and x is `x`.

$$\mathsf{Ei}(x) = -\int_{-x}^\infty \frac{e^{-t}}{t}\, \mathsf{d}t \tag{29.35}$$

29.7.6.16 Hermite polynomials [sf.cmath.hermite]

```
floating-point-type hermite(unsigned n, floating-point-type x);
float       hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Hermite polynomials of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{H}_n(x)$, where H_n is given by Formula 29.36, n is `n`, and x is `x`.

$$\mathsf{H}_n(x) = (-1)^n e^{x^2} \frac{\mathsf{d}^n}{\mathsf{d}x^n} e^{-x^2} \tag{29.36}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

29.7.6.17 Laguerre polynomials [sf.cmath.laguerre]

```
floating-point-type laguerre(unsigned n, floating-point-type x);
float       laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Laguerre polynomials of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{L}_n(x)$, where L_n is given by Formula 29.37, n is `n`, and x is `x`.

$$\mathsf{L}_n(x) = \frac{e^x}{n!} \frac{\mathsf{d}^n}{\mathsf{d}x^n} \left(x^n e^{-x}\right), \quad \text{for } x \ge 0 \tag{29.37}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

29.7.6.18 Legendre polynomials [sf.cmath.legendre]

```
floating-point-type legendre(unsigned l, floating-point-type x);
float       legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects*: These functions compute the Legendre polynomials of their respective arguments `l` and `x`.

2 *Returns*: $\mathsf{P}_\ell(x)$, where P_ℓ is given by Formula 29.38, l is `l`, and x is `x`.

$$\mathsf{P}_\ell(x) = \frac{1}{2^\ell\, \ell!} \frac{\mathsf{d}^\ell}{\mathsf{d}x^\ell} (x^2 - 1)^\ell, \quad \text{for } |x| \le 1 \tag{29.38}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

29.7.6.19 Riemann zeta function [sf.cmath.riemann.zeta]

```
floating-point-type riemann_zeta(floating-point-type x);
float       riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1 *Effects*: These functions compute the Riemann zeta function of their respective arguments `x`.

2 *Returns*: $\zeta(x)$, where ζ is given by Formula 29.39 and x is `x`.

$$\zeta(x) = \begin{cases} \displaystyle\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \displaystyle\frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \le x \le 1 \\ 2^x \pi^{x-1} \sin(\frac{\pi x}{2})\, \Gamma(1-x)\, \zeta(1-x), & \text{for } x < 0 \end{cases} \tag{29.39}$$

29.7.6.20 Spherical Bessel functions of the first kind [sf.cmath.sph.bessel]

```
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float       sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Bessel functions of the first kind of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{j}_n(x)$, where j_n is given by Formula 29.40, n is `n`, and x is `x`.

$$\mathsf{j}_n(x) = (\pi/2x)^{1/2}\mathsf{J}_{n+1/2}(x)\ , \quad \text{for } x \geq 0 \tag{29.40}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

4 See also 29.7.6.9.

29.7.6.21 Spherical associated Legendre functions [sf.cmath.sph.legendre]

```
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float       sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1 *Effects*: These functions compute the spherical associated Legendre functions of their respective arguments `l`, `m`, and `theta` (`theta` measured in radians).

2 *Returns*: $\mathsf{Y}_\ell^m(\theta, 0)$, where Y_ℓ^m is given by Formula 29.41, l is `l`, m is `m`, and θ is `theta`.

$$\mathsf{Y}_\ell^m(\theta, \phi) = (-1)^m \left[\frac{(2\ell+1)}{4\pi}\frac{(\ell-m)!}{(\ell+m)!}\right]^{1/2} \mathsf{P}_\ell^m(\cos\theta)e^{im\phi}\ , \quad \text{for } |m| \leq \ell \tag{29.41}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

4 See also 29.7.6.3.

29.7.6.22 Spherical Neumann functions [sf.cmath.sph.neumann]

```
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float       sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{n}_n(x)$, where n_n is given by Formula 29.42, n is `n`, and x is `x`.

$$\mathsf{n}_n(x) = (\pi/2x)^{1/2}\mathsf{N}_{n+1/2}(x)\ , \quad \text{for } x \geq 0 \tag{29.42}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

4 See also 29.7.6.11.

29.8.2 Mathematical constants [math.constants]

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e, $\log_2 e$, $\log_{10} e$, π, $\frac{1}{\pi}$, $\frac{1}{\sqrt{\pi}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni γ constant, and the golden ratio ϕ constant $\frac{1+\sqrt{5}}{2}$, respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

29.9 Basic linear algebra algorithms [linalg]

29.9.1 Overview [linalg.overview]

1 Subclause 29.9 defines basic linear algebra algorithms. The algorithms that access the elements of arrays view those elements through `mdspan` (23.7.3).

29.9.2 Header <linalg> synopsis [linalg.syn]

```
namespace std::linalg {
  // 29.9.5.1, storage order tags
  struct column_major_t;
  inline constexpr column_major_t column_major;
  struct row_major_t;
  inline constexpr row_major_t row_major;

  // 29.9.5.2, triangle tags
  struct upper_triangle_t;
  inline constexpr upper_triangle_t upper_triangle;
  struct lower_triangle_t;
  inline constexpr lower_triangle_t lower_triangle;

  // 29.9.5.3, diagonal tags
  struct implicit_unit_diagonal_t;
  inline constexpr implicit_unit_diagonal_t implicit_unit_diagonal;
  struct explicit_diagonal_t;
  inline constexpr explicit_diagonal_t explicit_diagonal;
```

```

```

29.9.3 General [linalg.general]

1 For the effects of all functions in 29.9, when the effects are described as "computes $R = E$" or "compute $R = E$" (for some R and mathematical expression E), the following apply:

(1.1) — E has the conventional mathematical meaning as written.

(1.2) — The pattern x^T should be read as "the transpose of x."

(1.3) — The pattern x^H should be read as "the conjugate transpose of x."

(1.4) — When R is the same name as a function parameter whose type is a template parameter with `Out` in its name, the intent is that the result of the computation is written to the elements of the function parameter `R`.

2 Some of the functions and types in 29.9 distinguish between the "rows" and the "columns" of a matrix. For a matrix `A` and a multidimensional index `i, j` in `A.extents()`,

(2.1) — *row* `i` of `A` is the set of elements `A[i, k1]` for all `k1` such that `i, k1` is in `A.extents()`; and

(2.2) — *column* `j` of `A` is the set of elements `A[k0, j]` for all `k0` such that `k0, j` is in `A.extents()`.

3 Some of the functions in 29.9 distinguish between the "upper triangle," "lower triangle," and "diagonal" of a matrix.

(3.1) — The *diagonal* is the set of all elements of `A` accessed by `A[i,i]` for 0 ≤ `i` < min(`A.extent(0)`, `A.extent(1)`).

(3.2) — The *upper triangle* of a matrix `A` is the set of all elements of `A` accessed by `A[i,j]` with `i` ≤ `j`. It includes the diagonal.

(3.3) — The *lower triangle* of `A` is the set of all elements of `A` accessed by `A[i,j]` with `i` ≥ `j`. It includes the diagonal.

4 For any function `F` that takes a parameter named `t`, `t` applies to accesses done through the parameter preceding `t` in the parameter list of `F`. Let `m` be such an access-modified function parameter. `F` will only access the triangle of `m` specified by `t`. For accesses `m[i, j]` outside the triangle specified by `t`, `F` will use the value

(4.1) — *`conj-if-needed`*`(m[j, i])` if the name of `F` starts with `hermitian`,

(4.2) — `m[j, i]` if the name of `F` starts with `symmetric`, or

(4.3) — the additive identity if the name of `F` starts with `triangular`.

[*Example 1*: Small vector product accessing only specified triangle. It would not be a precondition violation for the non-accessed matrix element to be non-zero.

```
template<class Triangle>
void triangular_matrix_vector_2x2_product(
       mdspan<const float, extents<int, 2, 2>> m,
       Triangle t,
       mdspan<const float, extents<int, 2>> x,
       mdspan<float, extents<int, 2>> y) {

  static_assert(is_same_v<Triangle, lower_triangle_t> ||
                is_same_v<Triangle, upper_triangle_t>);

  if constexpr (is_same_v<Triangle, lower_triangle_t>) {
    y[0] = m[0,0] * x[0];       // + 0 * x[1]
    y[1] = m[1,0] * x[0] + m[1,1] * x[1];
  } else {                      // upper_triangle_t
    y[0] = m[0,0] * x[0] + m[0,1] * x[1];
    y[1] = /* 0 * x[0] + */ m[1,1] * x[1];
  }
}
```

— *end example*]

5 For any function `F` that takes a parameter named `d`, `d` applies to accesses done through the previous-of-the-previous parameter of `d` in the parameter list of `F`. Let `m` be such an access-modified function parameter. If `d` specifies that an implicit unit diagonal is to be assumed, then

(5.1) — `F` will not access the diagonal of `m`; and

(5.2) — the algorithm will interpret `m` as if it has a unit diagonal, that is, a diagonal each of whose elements behaves as a two-sided multiplicative identity (even if `m`'s value type does not have a two-sided multiplicative identity).

Otherwise, if `d` specifies that an explicit diagonal is to be assumed, then `F` will access the diagonal of `m`.

6 Within all the functions in 29.9, any calls to `abs`, `conj`, `imag`, and `real` are unqualified.

7 Two `mdspan` objects `x` and `y` *alias* each other, if they have the same extents `e`, and for every pack of integers `i` which is a multidimensional index in `e`, `x[i...]` and `y[i...]` refer to the same element.

[*Note 1*: This means that `x` and `y` view the same elements in the same order. — *end note*]

8 Two `mdspan` objects `x` and `y` *overlap* each other, if for some pack of integers `i` that is a multidimensional index in `x.extents()`, there exists a pack of integers `j` that is a multidimensional index in `y.extents()`, such that `x[i...]` and `y[j...]` refer to the same element.

[*Note 2*: Aliasing is a special case of overlapping. If `x` and `y` do not overlap, then they also do not alias each other. — *end note*]

29.9.4 Requirements [linalg.reqs]

29.9.4.1 Linear algebra value types [linalg.reqs.val]

1 Throughout 29.9, the following types are *linear algebra value types*:

(1.1) — the `value_type` type alias of any input or output `mdspan` parameter(s) of any function in 29.9; and

(1.2) — the `Scalar` template parameter (if any) of any function or class in 29.9.

2 Linear algebra value types shall model `semiregular`.

3 A value-initialized object of linear algebra value type shall act as the additive identity.

29.9.4.2 Algorithm and class requirements [linalg.reqs.alg]

1 29.9.4.2 lists common requirements for all algorithms and classes in 29.9.

2 All of the following statements presume that the algorithm's asymptotic complexity requirements, if any, are satisfied.

(2.1) — The function may make arbitrarily many objects of any linear algebra value type, value-initializing or direct-initializing them with any existing object of that type.

(2.2) — The *triangular solve algorithms* in 29.9.14.5, 29.9.15.3, 29.9.15.6, and 29.9.15.7 either have a `BinaryDivideOp` template parameter (see 29.9.12) and a binary function object parameter `divide` of that type, or they have effects equivalent to invoking such an algorithm. Triangular solve algorithms interpret `divide(a, b)` as `a` times the multiplicative inverse of `b`. Each triangular solve algorithm uses a sequence of evaluations of `*`, `*=`, `divide`, unary `+`, binary `+`, `+=`, unary `-`, binary `-`, `-=`, and `=` operators that would produce the result specified by the algorithm's *Effects* and *Remarks* when operating on elements of a field with noncommutative multiplication. It is a precondition of the algorithm that any addend, any subtrahend, any partial sum of addends in any order (treating any difference as a sum with the second term negated), any factor, any partial product of factors respecting their order, any numerator (first argument of `divide`), any denominator (second argument of `divide`), and any assignment is a well-formed expression.

(2.3) — Each function in 29.9.13, 29.9.14, and 29.9.15 that is not a triangular solve algorithm will use a sequence of evaluations of `*`, `*=`, `+`, `+=`, and `=` operators that would produce the result specified by the algorithm's *Effects* and *Remarks* when operating on elements of a semiring with noncommutative multiplication. It is a precondition of the algorithm that any addend, any partial sum of addends in any order, any factor, any partial product of factors respecting their order, and any assignment is a well-formed expression.

(2.4) — If the function has an output `mdspan`, then all addends, subtrahends (for the triangular solve algorithms), or results of the `divide` parameter on intermediate terms (if the function takes a `divide` parameter) are assignable and convertible to the output `mdspan`'s `value_type`.

(2.5) — The function may reorder addends and partial sums arbitrarily.

[*Note 1*: Factors in each product are not reordered; multiplication is not necessarily commutative. — *end note*]

[*Note 2*: The above requirements do not prohibit implementation approaches and optimization techniques which are not user-observable. In particular, if for all input and output arguments the `value_type` is a floating-point type, implementers are free to leverage approximations, use arithmetic operations not explicitly listed above, and compute floating point sums in any way that improves their accuracy. — *end note*]

3 [*Note 3*: For all functions in 29.9, suppose that all input and output `mdspan` have as `value_type` a floating-point type, and any `Scalar` template argument has a floating-point type. Then, functions can do all of the following:

(3.1) — compute floating-point sums in any way that improves their accuracy for arbitrary input;

(3.2) — perform additional arithmetic operations (other than those specified by the function's wording and 29.9.4.2) in order to improve performance or accuracy; and

(3.3) — use approximations (that might not be exact even if computing with real numbers), instead of computations that would be exact if it were possible to compute without rounding error;

as long as

(3.4) — the function satisfies the complexity requirements; and

(3.5) — the function is logarithmically stable, as defined in Demmel 2007[16]. Strassen's algorithm for matrix-matrix multiply is an example of a logarithmically stable algorithm.

— *end note*]

29.9.5 Tag classes [linalg.tags]

29.9.5.1 Storage order tags [linalg.tags.order]

1 The storage order tags describe the order of elements in an `mdspan` with `layout_blas_packed` (29.9.6) layout.

```
struct column_major_t {
  explicit column_major_t() = default;
};
inline constexpr column_major_t column_major{};

struct row_major_t {
  explicit row_major_t() = default;
};
inline constexpr row_major_t row_major{};
```

2 `column_major_t` indicates a column-major order, and `row_major_t` indicates a row-major order.

29.9.5.2 Triangle tags [linalg.tags.triangle]

```
struct upper_triangle_t {
  explicit upper_triangle_t() = default;
};
inline constexpr upper_triangle_t upper_triangle{};

struct lower_triangle_t {
  explicit lower_triangle_t() = default;
};
inline constexpr lower_triangle_t lower_triangle{};
```

1 These tag classes specify whether algorithms and other users of a matrix (represented as an `mdspan`) access the upper triangle (`upper_triangle_t`) or lower triangle (`lower_triangle_t`) of the matrix (see also 29.9.3). This is also subject to the restrictions of `implicit_unit_diagonal_t` if that tag is also used as a function argument; see below.

29.9.5.3 Diagonal tags [linalg.tags.diagonal]

```
struct implicit_unit_diagonal_t {
  explicit implicit_unit_diagonal_t() = default;
};
inline constexpr implicit_unit_diagonal_t implicit_unit_diagonal{};

struct explicit_diagonal_t {
  explicit explicit_diagonal_t() = default;
};
inline constexpr explicit_diagonal_t explicit_diagonal{};
```

1 These tag classes specify whether algorithms access the matrix's diagonal entries, and if not, then how algorithms interpret the matrix's implicitly represented diagonal values.

2 The `implicit_unit_diagonal_t` tag indicates that an implicit unit diagonal is to be assumed (29.9.3).

3 The `explicit_diagonal_t` tag indicates that an explicit diagonal is used (29.9.3).

29.9.6 Layouts for packed matrix types [linalg.layout.packed]

29.9.6.1 Overview [linalg.layout.packed.overview]

1 `layout_blas_packed` is an `mdspan` layout mapping policy that represents a square matrix that stores only the entries in one triangle, in a packed contiguous format. Its `Triangle` template parameter determines whether an `mdspan` with this layout stores the upper or lower triangle of the matrix. Its `StorageOrder` template parameter determines whether the layout packs the matrix's elements in column-major or row-major order.

2 A `StorageOrder` of `column_major_t` indicates column-major ordering. This packs matrix elements starting with the leftmost (least column index) column, and proceeding column by column, from the top entry (least row index).

3 A `StorageOrder` of `row_major_t` indicates row-major ordering. This packs matrix elements starting with the topmost (least row index) row, and proceeding row by row, from the leftmost (least column index) entry.

4 [*Note 1*: `layout_blas_packed` describes the data layout used by the BLAS' Symmetric Packed (SP), Hermitian Packed (HP), and Triangular Packed (TP) matrix types. — *end note*]

```
namespace std::linalg {
  template<class Triangle, class StorageOrder>
  class layout_blas_packed {
  public:
    using triangle_type = Triangle;
    using storage_order_type = StorageOrder;

    template<class Extents>
    struct mapping {
    public:
      using extents_type = Extents;
      using index_type = typename extents_type::index_type;
      using size_type = typename extents_type::size_type;
      using rank_type = typename extents_type::rank_type;
      using layout_type = layout_blas_packed;

      // 29.9.6.2, constructors
      constexpr mapping() noexcept = default;
      constexpr mapping(const mapping&) noexcept = default;
      constexpr mapping(const extents_type&) noexcept;
      template<class OtherExtents>
        constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
          mapping(const mapping<OtherExtents>& other) noexcept;

      constexpr mapping& operator=(const mapping&) noexcept = default;

      // 29.9.6.3, observers
      constexpr const extents_type& extents() const noexcept { return extents_; }

      constexpr index_type required_span_size() const noexcept;

      template<class Index0, class Index1>
        constexpr index_type operator() (Index0 ind0, Index1 ind1) const noexcept;

      static constexpr bool is_always_unique() noexcept {
        return (extents_type::static_extent(0) != dynamic_extent &&
                extents_type::static_extent(0) < 2) ||
               (extents_type::static_extent(1) != dynamic_extent &&
                extents_type::static_extent(1) < 2);
      }
      static constexpr bool is_always_exhaustive() noexcept { return true; }
      static constexpr bool is_always_strided() noexcept
        { return is_always_unique(); }

      constexpr bool is_unique() const noexcept {
        return extents_.extent(0) < 2;
      }
      constexpr bool is_exhaustive() const noexcept { return true; }
      constexpr bool is_strided() const noexcept {
        return extents_.extent(0) < 2;
      }

      constexpr index_type stride(rank_type) const noexcept;

      template<class OtherExtents>
        friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

    private:
      extents_type extents_{};      // exposition only
    };
  };
}
```

5 *Mandates*:

(5.1) — `Triangle` is either `upper_triangle_t` or `lower_triangle_t`,

(5.2) — `StorageOrder` is either `column_major_t` or `row_major_t`,

(5.3) — `Extents` is a specialization of `std::extents`,

(5.4) — `Extents::rank()` equals 2,

(5.5) — one of

```
extents_type::static_extent(0) == dynamic_extent,
extents_type::static_extent(1) == dynamic_extent, or
extents_type::static_extent(0) == extents_type::static_extent(1)
```

is `true`, and

(5.6) — if `Extents::rank_dynamic() == 0` is `true`, let N_s be equal to `Extents::static_extent(0)`; then, $N_s \times (N_s + 1)$ is representable as a value of type `index_type`.

6 `layout_blas_packed<T, SO>::mapping<E>` is a trivially copyable type that models `regular` for each `T`, `SO`, and `E`.

29.9.6.2 Constructors [linalg.layout.packed.cons]

```
constexpr mapping(const extents_type& e) noexcept;
```

1 *Preconditions*:

(1.1) — Let N be equal to `e.extent(0)`. Then, $N \times (N + 1)$ is representable as a value of type `index_type` (6.8.2).

(1.2) — `e.extent(0)` equals `e.extent(1)`.

2 *Effects*: Direct-non-list-initializes *`extents_`* with `e`.

```
template<class OtherExtents>
  explicit(!is_convertible_v<OtherExtents, extents_type>)
    constexpr mapping(const mapping<OtherExtents>& other) noexcept;
```

3 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

4 *Preconditions*: Let N be `other.extents().extent(0)`. Then, $N \times (N + 1)$ is representable as a value of type `index_type` (6.8.2).

5 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

29.9.6.3 Observers [linalg.layout.packed.obs]

```
constexpr index_type required_span_size() const noexcept;
```

1 *Returns*: *`extents_`*`.extent(0) * (`*`extents_`*`.extent(0) + 1)/2`.

[*Note 1*: For example, a 5 x 5 packed matrix only stores 15 matrix elements. — *end note*]

```
template<class Index0, class Index1>
  constexpr index_type operator() (Index0 ind0, Index1 ind1) const noexcept;
```

2 *Constraints*:

(2.1) — `is_convertible_v<Index0, index_type>` is `true`,

(2.2) — `is_convertible_v<Index1, index_type>` is `true`,

(2.3) — `is_nothrow_constructible_v<index_type, Index0>` is `true`, and

(2.4) — `is_nothrow_constructible_v<index_type, Index1>` is `true`.

3 Let `i` be `extents_type::`*`index-cast`*`(ind0)`, and let `j` be `extents_type::`*`index-cast`*`(ind1)`.

4 *Preconditions*: `i, j` is a multidimensional index in *`extents_`* (23.7.3.1).

5 *Returns*: Let `N` be *`extents_`*`.extent(0)`. Then

(5.1) — `(*this)(j, i)` if `i > j` is `true`; otherwise

(5.2) — `i + j * (j + 1)/2` if

```
  is_same_v<StorageOrder, column_major_t> && is_same_v<Triangle, upper_triangle_t>
```

is `true` or

```
  is_same_v<StorageOrder, row_major_t> && is_same_v<Triangle, lower_triangle_t>
```

is `true`; otherwise

(5.3) — `j + N * i - i * (i + 1)/2`.

```
constexpr index_type stride(rank_type r) const noexcept;
```

6 *Preconditions*:

(6.1) — `is_strided()` is `true`, and

(6.2) — `r < extents_type::rank()` is `true`.

7 *Returns*: `1`.

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
```

8 *Effects*: Equivalent to: `return x.extents() == y.extents();`

29.9.7 Exposition-only helpers [linalg.helpers]

29.9.7.1 *abs-if-needed* [linalg.helpers.abs]

1 The name *`abs-if-needed`* denotes an exposition-only function object. The expression *`abs-if-needed`*`(E)` for a subexpression `E` whose type is `T` is expression-equivalent to:

(1.1) — `E` if `T` is an unsigned integer;

(1.2) — otherwise, `std::abs(E)` if `T` is an arithmetic type,

(1.3) — otherwise, `abs(E)`, if that expression is valid, with overload resolution performed in a context that includes the declaration

```
  template<class U> U abs(U) = delete;
```

If the function selected by overload resolution does not return the absolute value of its input, the program is ill-formed, no diagnostic required.

29.9.7.2 *conj-if-needed* [linalg.helpers.conj]

1 The name *`conj-if-needed`* denotes an exposition-only function object. The expression *`conj-if-needed`*`(E)` for a subexpression `E` whose type is `T` is expression-equivalent to:

(1.1) — `conj(E)`, if `T` is not an arithmetic type and the expression `conj(E)` is valid, with overload resolution performed in a context that includes the declaration

```
  template<class U> U conj(const U&) = delete;
```

If the function selected by overload resolution does not return the complex conjugate of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, `E`.

29.9.7.3 *real-if-needed* [linalg.helpers.real]

1 The name *real-if-needed* denotes an exposition-only function object. The expression *real-if-needed*(E) for a subexpression E whose type is T is expression-equivalent to:

(1.1) — real(E), if T is not an arithmetic type and the expression real(E) is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U real(const U&) = delete;
```

If the function selected by overload resolution does not return the real part of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, E.

29.9.7.4 *imag-if-needed* [linalg.helpers.imag]

1 The name *imag-if-needed* denotes an exposition-only function object. The expression *imag-if-needed*(E) for a subexpression E whose type is T is expression-equivalent to:

(1.1) — imag(E), if T is not an arithmetic type and the expression imag(E) is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U imag(const U&) = delete;
```

If the function selected by overload resolution does not return the imaginary part of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, ((void)E, T{}).

29.9.7.5 Argument concepts [linalg.helpers.concepts]

1 The exposition-only concepts defined in this section constrain the algorithms in 29.9.

```
template<class T>
  constexpr bool is-mdspan = false;

template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr bool is-mdspan<mdspan<ElementType, Extents, Layout, Accessor>> = true;

template<class T>
  concept in-vector =
    is-mdspan<T> && T::rank() == 1;

template<class T>
  concept out-vector =
    is-mdspan<T> && T::rank() == 1 &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();

template<class T>
  concept inout-vector =
    is-mdspan<T> && T::rank() == 1 &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();

template<class T>
  concept in-matrix =
    is-mdspan<T> && T::rank() == 2;

template<class T>
  concept out-matrix =
    is-mdspan<T> && T::rank() == 2 &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();

template<class T>
  concept inout-matrix =
    is-mdspan<T> && T::rank() == 2 &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();

template<class T>
  constexpr bool is-layout-blas-packed = false;      // exposition only
```

```
template<class Triangle, class StorageOrder>
  constexpr bool is-layout-blas-packed<layout_blas_packed<Triangle, StorageOrder>> = true;

template<class T>
  concept possibly-packed-inout-matrix =
    is-mdspan<T> && T::rank() == 2 &&
    is_assignable_v<typename T::reference, typename T::element_type> &&
    (T::is_always_unique() || is-layout-blas-packed<typename T::layout_type>);

template<class T>
  concept in-object =
    is-mdspan<T> && (T::rank() == 1 || T::rank() == 2);

template<class T>
  concept out-object =
    is-mdspan<T> && (T::rank() == 1 || T::rank() == 2) &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();

template<class T>
  concept inout-object =
    is-mdspan<T> && (T::rank() == 1 || T::rank() == 2) &&
    is_assignable_v<typename T::reference, typename T::element_type> && T::is_always_unique();
```

2 If a function in 29.9 accesses the elements of a parameter constrained by *in-vector*, *in-matrix*, or *in-object*, those accesses will not modify the elements.

3 Unless explicitly permitted, any *inout-vector*, *inout-matrix*, *inout-object*, *out-vector*, *out-matrix*, *out-object*, or *possibly-packed-inout-matrix* parameter of a function in 29.9 shall not overlap any other mdspan parameter of the function.

29.9.7.6 Mandates [linalg.helpers.mandates]

1 [*Note 1*: These exposition-only helper functions use the less constraining input concepts even for the output arguments, because the additional constraint for assignability of elements is not necessary, and they are sometimes used in a context where the third argument is an input type too. — *end note*]

```
template<class MDS1, class MDS2>
  requires(is-mdspan<MDS1> && is-mdspan<MDS2>)
  constexpr
  bool compatible-static-extents(size_t r1, size_t r2) {          // exposition only
    return MDS1::static_extent(r1) == dynamic_extent ||
           MDS2::static_extent(r2) == dynamic_extent ||
           MDS1::static_extent(r1) == MDS2::static_extent(r2);
  }

template<in-vector In1, in-vector In2, in-vector Out>
  constexpr bool possibly-addable() {                             // exposition only
    return compatible-static-extents<Out, In1>(0, 0) &&
           compatible-static-extents<Out, In2>(0, 0) &&
           compatible-static-extents<In1, In2>(0, 0);
  }

template<in-matrix In1, in-matrix In2, in-matrix Out>
  constexpr bool possibly-addable() {                             // exposition only
    return compatible-static-extents<Out, In1>(0, 0) &&
           compatible-static-extents<Out, In1>(1, 1) &&
           compatible-static-extents<Out, In2>(0, 0) &&
           compatible-static-extents<Out, In2>(1, 1) &&
           compatible-static-extents<In1, In2>(0, 0) &&
           compatible-static-extents<In1, In2>(1, 1);
  }

template<in-matrix InMat, in-vector InVec, in-vector OutVec>
  constexpr bool possibly-multipliable() {                        // exposition only
    return compatible-static-extents<OutVec, InMat>(0, 0) &&
           compatible-static-extents<InMat, InVec>(1, 0);
  }

template<in-vector InVec, in-matrix InMat, in-vector OutVec>
  constexpr bool possibly-multipliable() {                        // exposition only
    return compatible-static-extents<OutVec, InMat>(0, 1) &&
           compatible-static-extents<InMat, InVec>(0, 0);
  }

template<in-matrix InMat1, in-matrix InMat2, in-matrix OutMat>
  constexpr bool possibly-multipliable() {                        // exposition only
    return compatible-static-extents<OutMat, InMat1>(0, 0) &&
           compatible-static-extents<OutMat, InMat2>(1, 1) &&
           compatible-static-extents<InMat1, InMat2>(1, 0);
  }
```

29.9.7.7 Preconditions [linalg.helpers.precond]

1 [*Note 1*: These exposition-only helper functions use the less constraining input concepts even for the output arguments, because the additional constraint for assignability of elements is not necessary, and they are sometimes used in a context where the third argument is an input type too. — *end note*]

```
constexpr bool addable(                                          // exposition only
  const in-vector auto& in1, const in-vector auto& in2, const in-vector auto& out) {
  return out.extent(0) == in1.extent(0) && out.extent(0) == in2.extent(0);
}

constexpr bool addable(                                          // exposition only
  const in-matrix auto& in1,  const in-matrix auto& in2, const in-matrix auto& out) {
  return out.extent(0) == in1.extent(0) && out.extent(1) == in1.extent(1) &&
         out.extent(0) == in2.extent(0) && out.extent(1) == in2.extent(1);
}

constexpr bool multipliable(                                     // exposition only
  const in-matrix auto& in_mat, const in-vector auto& in_vec, const in-vector auto& out_vec) {
  return out_vec.extent(0) == in_mat.extent(0) && in_mat.extent(1) == in_vec.extent(0);
}

constexpr bool multipliable( // exposition only
  const in-vector auto& in_vec, const in-matrix auto& in_mat, const in-vector auto& out_vec) {
  return out_vec.extent(0) == in_mat.extent(1) && in_mat.extent(0) == in_vec.extent(0);
}

constexpr bool multipliable(                                     // exposition only
  const in-matrix auto& in_mat1, const in-matrix auto& in_mat2, const in-matrix auto& out_mat) {
  return out_mat.extent(0) == in_mat1.extent(0) && out_mat.extent(1) == in_mat2.extent(1) &&
         in_mat1.extent(1) == in_mat2.extent(0);
}
```

29.9.8 Scaled in-place transformation [linalg.scaled]

29.9.8.1 Introduction [linalg.scaled.intro]

1 The `scaled` function takes a value `alpha` and an `mdspan` `x`, and returns a new read-only `mdspan` that represents the elementwise product of `alpha` with each element of `x`.

[*Example 1*:

```
using Vec = mdspan<double, dextents<size_t, 1>>;

// z = alpha * x + y
void z_equals_alpha_times_x_plus_y(double alpha, Vec x, Vec y, Vec z) {
  add(scaled(alpha, x), y, z);
}

// z = alpha * x + beta * y
void z_equals_alpha_times_x_plus_beta_times_y(double alpha, Vec x, double beta, Vec y, Vec z) {
  add(scaled(alpha, x), scaled(beta, y), z);
}
```

— *end example*]

29.9.8.2 Class template `scaled_accessor` [linalg.scaled.scaledaccessor]

1 The class template `scaled_accessor` is an `mdspan` accessor policy which upon access produces scaled elements. It is part of the implementation of `scaled` (29.9.8.3).

```
namespace std::linalg {
  template<class ScalingFactor, class NestedAccessor>
  class scaled_accessor {
  public:
    using element_type =
      add_const_t<decltype(declval<ScalingFactor>() * declval<NestedAccessor::element_type>())>;
    using reference = remove_const_t<element_type>;
    using data_handle_type = NestedAccessor::data_handle_type;
    using offset_policy = scaled_accessor<ScalingFactor, NestedAccessor::offset_policy>;

    constexpr scaled_accessor() = default;
    template<class OtherNestedAccessor>
      explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
        constexpr scaled_accessor(const scaled_accessor<ScalingFactor,
                                                        OtherNestedAccessor>& other);
    constexpr scaled_accessor(const ScalingFactor& s, const NestedAccessor& a);

    constexpr reference access(data_handle_type p, size_t i) const;
    constexpr offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;

    constexpr const ScalingFactor& scaling_factor() const noexcept { return scaling-factor; }
    constexpr const NestedAccessor& nested_accessor() const noexcept { return nested-accessor; }

  private:
    ScalingFactor scaling-factor{};                                   // exposition only
    NestedAccessor nested-accessor{};                                 // exposition only
  };
}
```

2 *Mandates*:

(2.1) — `element_type` is valid and denotes a type,

(2.2) — `is_copy_constructible_v<reference>` is `true`,

(2.3) — `is_reference_v<element_type>` is `false`,

(2.4) — `ScalingFactor` models `semiregular`, and

(2.5) — `NestedAccessor` meets the accessor policy requirements (23.7.3.5.2).

```
template<class OtherNestedAccessor>
  explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
    constexpr scaled_accessor(const scaled_accessor<ScalingFactor, OtherNestedAccessor>& other);
```

3 *Constraints*: `is_constructible_v<NestedAccessor, const OtherNestedAccessor&>` is `true`.

4 *Effects*:

(4.1) — Direct-non-list-initializes *`scaling-factor`* with `other.scaling_factor()`, and

(4.2) — direct-non-list-initializes *`nested-accessor`* with `other.nested_accessor()`.

```
constexpr scaled_accessor(const ScalingFactor& s, const NestedAccessor& a);
```

5 *Effects*:

(5.1) — Direct-non-list-initializes *`scaling-factor`* with `s`, and

(5.2) — direct-non-list-initializes *`nested-accessor`* with `a`.

```
constexpr reference access(data_handle_type p, size_t i) const;
```

6 *Returns*:

```
scaling_factor() * NestedAccessor::element_type(nested-accessor.access(p, i))
```

```
constexpr offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;
```

7 *Returns*: *nested-accessor*.offset(p, i)

29.9.8.3 Function template scaled [linalg.scaled.scaled]

1 The scaled function template takes a scaling factor alpha and an mdspan x, and returns a new read-only mdspan with the same domain as x, that represents the elementwise product of alpha with each element of x.

```
template<class ScalingFactor,
         class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto scaled(ScalingFactor alpha, mdspan<ElementType, Extents, Layout, Accessor> x);
```

2 Let SA be scaled_accessor<ScalingFactor, Accessor>.

3 *Returns*:

```
mdspan<typename SA::element_type, Extents, Layout, SA>(x.data_handle(), x.mapping(),
                                                       SA(alpha, x.accessor()))
```

4 [*Example 1*:

```
void test_scaled(mdspan<double, extents<int, 10>> x)
{
  auto x_scaled = scaled(5.0, x);
  for (int i = 0; i < x.extent(0); ++i) {
    assert(x_scaled[i] == 5.0 * x[i]);
  }
}
```

— *end example*]

29.9.9 Conjugated in-place transformation [linalg.conj]

29.9.9.1 Introduction [linalg.conj.intro]

1 The conjugated function takes an mdspan x, and returns a new read-only mdspan y with the same domain as x, whose elements are the complex conjugates of the corresponding elements of x.

29.9.9.2 Class template conjugated_accessor [linalg.conj.conjugatedaccessor]

1 The class template conjugated_accessor is an mdspan accessor policy which upon access produces conjugate elements. It is part of the implementation of conjugated (29.9.9.3).

```
namespace std::linalg {
  template<class NestedAccessor>
  class conjugated_accessor {
  public:
    using element_type =
      add_const_t<decltype(conj-if-needed(declval<NestedAccessor::element_type>()))>;
    using reference = remove_const_t<element_type>;
    using data_handle_type = typename NestedAccessor::data_handle_type;
    using offset_policy = conjugated_accessor<NestedAccessor::offset_policy>;

    constexpr conjugated_accessor() = default;
    template<class OtherNestedAccessor>
      explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>>)
      constexpr conjugated_accessor(const conjugated_accessor<OtherNestedAccessor>& other);

    constexpr reference access(data_handle_type p, size_t i) const;

    constexpr typename offset_policy::data_handle_type
      offset(data_handle_type p, size_t i) const;

    constexpr const Accessor& nested_accessor() const noexcept { return nested-accessor_; }

  private:
    NestedAccessor nested-accessor_{};                              // exposition only
  };
}
```

2 *Mandates*:

(2.1) — `element_type` is valid and denotes a type,

(2.2) — `is_copy_constructible_v<reference>` is `true`,

(2.3) — `is_reference_v<element_type>` is `false`, and

(2.4) — `NestedAccessor` meets the accessor policy requirements (23.7.3.5.2).

```
constexpr conjugated_accessor(const NestedAccessor& acc);
```

3 *Effects*: Direct-non-list-initializes *`nested-accessor_`* with `acc`.

```
template<class OtherNestedAccessor>
  explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>>)
    constexpr conjugated_accessor(const conjugated_accessor<OtherNestedAccessor>& other);
```

4 *Constraints*: `is_constructible_v<NestedAccessor, const OtherNestedAccessor&>` is `true`.

5 *Effects*: Direct-non-list-initializes *`nested-accessor_`* with `other.nested_accessor()`.

```
constexpr reference access(data_handle_type p, size_t i) const;
```

6 *Returns*: *`conj-if-needed`*`(NestedAccessor::element_type(`*`nested-accessor_`*`.access(p, i)))`

```
constexpr typename offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;
```

7 *Returns*: *`nested-accessor_`*`.offset(p, i)`

29.9.9.3 Function template `conjugated` [linalg.conj.conjugated]

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto conjugated(mdspan<ElementType, Extents, Layout, Accessor> a);
```

1 Let `A` be

(1.1) — `remove_cvref_t<decltype(a.accessor().nested_accessor())>` if `Accessor` is a specialization of `conjugated_accessor`;

(1.2) — otherwise, `Accessor` if `remove_cvref_t<ElementType>` is an arithmetic type;

(1.3) — otherwise, `conjugated_accessor<Accessor>` if the expression `conj(E)` is valid for any subexpression `E` whose type is `remove_cvref_t<ElementType>` with overload resolution performed in a context that includes the declaration `template<class U> U conj(const U&) = delete;`;

(1.4) — otherwise, `Accessor`.

2 *Returns*: Let `MD` be `mdspan<typename A::element_type, Extents, Layout, A>`.

(2.1) — `MD(a.data_handle(), a.mapping(), a.accessor().nested_accessor())` if `Accessor` is a specialization of `conjugated_accessor`;

(2.2) — otherwise, `a`, if `is_same_v<A, Accessor>` is `true`;

(2.3) — otherwise, `MD(a.data_handle(), a.mapping(), conjugated_accessor(a.accessor()))`.

3 [*Example 1*:

```
void test_conjugated_complex(mdspan<complex<double>, extents<int, 10>> a) {
  auto a_conj = conjugated(a);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj[i] == conj(a[i]);
  }
  auto a_conj_conj = conjugated(a_conj);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj_conj[i] == a[i]);
  }
}

void test_conjugated_real(mdspan<double, extents<int, 10>> a) {
  auto a_conj = conjugated(a);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj[i] == a[i]);
  }
  auto a_conj_conj = conjugated(a_conj);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj_conj[i] == a[i]);
  }
}
```

— *end example*]

29.9.10 Transpose in-place transformation [linalg.transp]

29.9.10.1 Introduction [linalg.transp.intro]

1 `layout_transpose` is an `mdspan` layout mapping policy that swaps the two indices, extents, and strides of any unique `mdspan` layout mapping policy.

2 The `transposed` function takes an `mdspan` representing a matrix, and returns a new `mdspan` representing the transpose of the input matrix.

29.9.10.2 Exposition-only helpers for `layout_transpose` and `transposed` [linalg.transp.helpers]

1 The exposition-only *`transpose-extents`* function takes an `extents` object representing the extents of a matrix, and returns a new `extents` object representing the extents of the transpose of the matrix.

2 The exposition-only alias template *`transpose-extents-t`*`<InputExtents>` gives the type of *`transpose-extents`*`(e)` for a given `extents` object `e` of type `InputExtents`.

```
template<class IndexType, size_t InputExtent0, size_t InputExtent1>
  constexpr extents<IndexType, InputExtent1, InputExtent0>
    transpose-extents(const extents<IndexType, InputExtent0, InputExtent1>& in);    // exposition only
```

3 *Returns*: `extents<IndexType, InputExtent1, InputExtent0>(in.extent(1), in.extent(0))`

```
template<class InputExtents>
  using transpose-extents-t =
    decltype(transpose-extents(declval<InputExtents>()));          // exposition only
```

29.9.10.3 Class template `layout_transpose` [linalg.transp.layout.transpose]

1 `layout_transpose` is an `mdspan` layout mapping policy that swaps the two indices, extents, and strides of any `mdspan` layout mapping policy.

```
namespace std::linalg {
  template<class Layout>
  class layout_transpose {
  public:
    using nested_layout_type = Layout;

    template<class Extents>
    struct mapping {
    private:
      using nested-mapping-type =
        typename Layout::template mapping<transpose-extents-t<Extents>>;    // exposition only

    public:
      using extents_type = Extents;
      using index_type = typename extents_type::index_type;
      using size_type = typename extents_type::size_type;
      using rank_type = typename extents_type::rank_type;
      using layout_type = layout_transpose;

      constexpr explicit mapping(const nested-mapping-type&);

      constexpr const extents_type& extents() const noexcept { return extents_; }

      constexpr index_type required_span_size() const
        { return nested-mapping_.required_span_size();

      template<class Index0, class Index1>
        constexpr index_type operator()(Index0 ind0, Index1 ind1) const
        { return nested-mapping_(ind1, ind0); }
      constexpr const nested-mapping-type& nested_mapping() const noexcept
        { return nested-mapping_; }

      static constexpr bool is_always_unique() noexcept
        { return nested-mapping-type::is_always_unique(); }
      static constexpr bool is_always_exhaustive() noexcept
        { return nested-mapping-type::is_always_exhaustive(); }
      static constexpr bool is_always_strided() noexcept
        { return nested-mapping-type::is_always_strided(); }

      constexpr bool is_unique() const { return nested-mapping_.is_unique(); }
      constexpr bool is_exhaustive() const { return nested-mapping_.is_exhaustive(); }
      constexpr bool is_strided() const { return nested-mapping_.is_strided(); }

      constexpr index_type stride(size_t r) const;

      template<class OtherExtents>
        friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y);
    };

    private:
      nested-mapping-type nested-mapping_;                         // exposition only
      extents_type extents_;                                       // exposition only
  };
}
```

2 Layout shall meet the layout mapping policy requirements (23.7.3.4.3).

3 *Mandates*:

(3.1) — Extents is a specialization of std::extents, and

(3.2) — Extents::rank() equals 2.

```
constexpr explicit mapping(const nested-mapping-type& map);
```

4 *Effects*:

(4.1) — Initializes *nested-mapping_* with map, and

(4.2) — initializes *extents_* with *transpose-extents*(map.extents()).

```
constexpr index_type stride(size_t r) const;
```

5 *Preconditions*:

(5.1) — is_strided() is true, and

(5.2) — r < 2 is true.

6 *Returns*: *nested-mapping_*.stride(r == 0 ? 1 : 0)

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y);
```

7 *Constraints*: The expression x.*nested-mapping_* == y.*nested-mapping_* is well-formed and its result is convertible to bool.

8 *Returns*: x.*nested-mapping_* == y.*nested-mapping_*.

29.9.10.4 Function template transposed [linalg.transp.transposed]

1 The transposed function takes a rank-2 mdspan representing a matrix, and returns a new mdspan representing the input matrix's transpose. The input matrix's data are not modified, and the returned mdspan accesses the input matrix's data in place.

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto transposed(mdspan<ElementType, Extents, Layout, Accessor> a);
```

2 *Mandates*: Extents::rank() == 2 is true.

3 Let ReturnExtents be *transpose-extents-t*<Extents>. Let R be mdspan<ElementType, ReturnExtents, ReturnLayout, Accessor>, where ReturnLayout is:

(3.1) — `layout_right` if `Layout` is `layout_left`;

(3.2) — otherwise, `layout_left` if `Layout` is `layout_right`;

(3.3) — otherwise, `layout_right_padded<PaddingValue>` if `Layout` is `layout_left_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(3.4) — otherwise, `layout_left_padded<PaddingValue>` if `Layout` is `layout_right_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(3.5) — otherwise, `layout_stride` if `Layout` is `layout_stride`;

(3.6) — otherwise, `layout_blas_packed<OppositeTriangle, OppositeStorageOrder>`, if `Layout` is `layout_blas_packed<Triangle, StorageOrder>` for some `Triangle` and `StorageOrder`, where

(3.6.1) — `OppositeTriangle` is

```
conditional_t<is_same_v<Triangle, upper_triangle_t>,
              lower_triangle_t, upper_triangle_t>
```

and

(3.6.2) — `OppositeStorageOrder` is

```
conditional_t<is_same_v<StorageOrder, column_major_t>, row_major_t, column_major_t>
```

(3.7) — otherwise, `NestedLayout` if `Layout` is `layout_transpose<NestedLayout>` for some `NestedLayout`;

(3.8) — otherwise, `layout_transpose<Layout>`.

4 *Returns*: With `ReturnMapping` being the type `typename ReturnLayout::template mapping<ReturnExtents>`:

(4.1) — if `Layout` is `layout_left`, `layout_right`, or a specialization of `layout_blas_packed`,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents())),
  a.accessor())
```

(4.2) — otherwise,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents()),
  a.mapping().stride(1)), a.accessor())
```

if `Layout` is `layout_left_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(4.3) — otherwise,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents()),
  a.mapping().stride(0)), a.accessor())
```

if `Layout` is `layout_right_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(4.4) — otherwise, if `Layout` is `layout_stride`,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents()),
  array{a.mapping().stride(1), a.mapping().stride(0)}), a.accessor())
```

(4.5) — otherwise, if `Layout` is a specialization of `layout_transpose`,

```
R(a.data_handle(), a.mapping().nested_mapping(), a.accessor())
```

(4.6) — otherwise,

```
R(a.data_handle(), ReturnMapping(a.mapping()), a.accessor())
```

5 [*Example 1*:

```
void test_transposed(mdspan<double, extents<size_t, 3, 4>> a) {
  const auto num_rows = a.extent(0);
  const auto num_cols = a.extent(1);

  auto a_t = transposed(a);
  assert(num_rows == a_t.extent(1));
  assert(num_cols == a_t.extent(0));
  assert(a.stride(0) == a_t.stride(1));
  assert(a.stride(1) == a_t.stride(0));
```

```
    for (size_t row = 0; row < num_rows; ++row) {
      for (size_t col = 0; col < num_rows; ++col) {
        assert(a[row, col] == a_t[col, row]);
      }
    }

    auto a_t_t = transposed(a_t);
    assert(num_rows == a_t_t.extent(0));
    assert(num_cols == a_t_t.extent(1));
    assert(a.stride(0) == a_t_t.stride(0));
    assert(a.stride(1) == a_t_t.stride(1));

    for (size_t row = 0; row < num_rows; ++row) {
      for (size_t col = 0; col < num_rows; ++col) {
        assert(a[row, col] == a_t_t[row, col]);
      }
    }
  }
```

— *end example*]

29.9.11 Conjugate transpose in-place transform [linalg.conjtransposed]

1 The `conjugate_transposed` function returns a conjugate transpose view of an object. This combines the effects of `transposed` and `conjugated`.

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto conjugate_transposed(mdspan<ElementType, Extents, Layout, Accessor> a);
```

2 *Effects*: Equivalent to: `return conjugated(transposed(a));`

3 [*Example 1*:

```
void test_conjugate_transposed(mdspan<complex<double>, extents<size_t, 3, 4>> a) {
  const auto num_rows = a.extent(0);
  const auto num_cols = a.extent(1);

  auto a_ct = conjugate_transposed(a);
  assert(num_rows == a_ct.extent(1));
  assert(num_cols == a_ct.extent(0));
  assert(a.stride(0) == a_ct.stride(1));
  assert(a.stride(1) == a_ct.stride(0));

  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == conj(a_ct[col, row]));
    }
  }

  auto a_ct_ct = conjugate_transposed(a_ct);
  assert(num_rows == a_ct_ct.extent(0));
  assert(num_cols == a_ct_ct.extent(1));
  assert(a.stride(0) == a_ct_ct.stride(0));
  assert(a.stride(1) == a_ct_ct.stride(1));

  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == a_ct_ct[row, col]);
      assert(conj(a_ct[col, row]) == a_ct_ct[row, col]);
    }
  }
}
```

— *end example*]

29.9.12 Algorithm requirements based on template parameter name[linalg.algs.reqs]

1 Throughout 29.9.13, 29.9.14, and 29.9.15, where the template parameters are not constrained, the names of template parameters are used to express the following constraints.

(1.1) — `is_execution_policy<ExecutionPolicy>::value` is `true` (26.3.6.2).

(1.2) — `Real` is any type such that `complex<Real>` is specified (29.4.1).

(1.3) — `Triangle` is either `upper_triangle_t` or `lower_triangle_t`.

(1.4) — `DiagonalStorage` is either `implicit_unit_diagonal_t` or `explicit_diagonal_t`.

[*Note 1*: Function templates that have a template parameter named `ExecutionPolicy` are parallel algorithms (26.3.1). — *end note*]

29.9.13 BLAS 1 algorithms [linalg.algs.blas1]

29.9.13.1 Complexity [linalg.algs.blas1.complexity]

1 *Complexity*: All algorithms in 29.9.13 with `mdspan` parameters perform a count of `mdspan` array accesses and arithmetic operations that is linear in the maximum product of extents of any `mdspan` parameter.

29.9.13.2 Givens rotations [linalg.algs.blas1.givens]

29.9.13.2.1 Compute Givens rotation [linalg.algs.blas1.givens.lartg]

```
template<class Real>
  setup_givens_rotation_result<Real> setup_givens_rotation(Real a, Real b) noexcept;

template<class Real>
  setup_givens_rotation_result<complex<Real>>
    setup_givens_rotation(complex<Real> a, complex<Real> b) noexcept;
```

1 These functions compute the Givens plane rotation represented by the two values c and s such that the 2 x 2 system of equations

$$\begin{bmatrix} c & s \\ -\overline{s} & c \end{bmatrix} \cdot \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

holds, where c is always a real scalar, and $c^2 + |s|^2 = 1$. That is, c and s represent a 2 x 2 matrix, that when multiplied by the right by the input vector whose components are a and b, produces a result vector whose first component r is the Euclidean norm of the input vector, and whose second component is zero.

[*Note 1*: These functions correspond to the LAPACK function `xLARTG`[20]. — *end note*]

2 *Returns*: `c, s, r`, where `c` and `s` form the Givens plane rotation corresponding to the input `a` and `b`, and `r` is the Euclidean norm of the two-component vector formed by `a` and `b`.

29.9.13.2.2 Apply a computed Givens rotation to vectors [linalg.algs.blas1.givens.rot]

```
template<inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(InOutVec1 x, InOutVec2 y, Real c, Real s);
template<class ExecutionPolicy, inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(ExecutionPolicy&& exec,
                             InOutVec1 x, InOutVec2 y, Real c, Real s);
template<inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(InOutVec1 x, InOutVec2 y, Real c, complex<Real> s);
template<class ExecutionPolicy, inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(ExecutionPolicy&& exec,
                             InOutVec1 x, InOutVec2 y, Real c, complex<Real> s);
```

1 [*Note 1*: These functions correspond to the BLAS function `xROT`[17]. — *end note*]

2 *Mandates*: `compatible-static-extents<InOutVec1, InOutVec2>(0, 0)` is `true`.

3 *Preconditions*: `x.extent(0)` equals `y.extent(0)`.

4 *Effects*: Applies the plane rotation specified by `c` and `s` to the input vectors `x` and `y`, as if the rotation were a 2 x 2 matrix and the input vectors were successive rows of a matrix with two rows.

29.9.13.3 Swap matrix or vector elements [linalg.algs.blas1.swap]

```
template<inout-object InOutObj1, inout-object InOutObj2>
  void swap_elements(InOutObj1 x, InOutObj2 y);
template<class ExecutionPolicy, inout-object InOutObj1, inout-object InOutObj2>
  void swap_elements(ExecutionPolicy&& exec, InOutObj1 x, InOutObj2 y);
```

1 [*Note 1*: These functions correspond to the BLAS function `xSWAP`[17]. — *end note*]

2 *Constraints*: `x.rank()` equals `y.rank()`.

3 *Mandates*: For all `r` in the range $[0, \texttt{x.rank()})$,

```
compatible-static-extents<InOutObj1, InOutObj2>(r, r)
```

is `true`.

4 *Preconditions*: `x.extents()` equals `y.extents()`.

5 *Effects*: Swaps all corresponding elements of `x` and `y`.

29.9.13.4 Multiply the elements of an object in place by a scalar [linalg.algs.blas1.scal]

```
template<class Scalar, inout-object InOutObj>
  void scale(Scalar alpha, InOutObj x);
template<class ExecutionPolicy, class Scalar, inout-object InOutObj>
  void scale(ExecutionPolicy&& exec, Scalar alpha, InOutObj x);
```

1 [*Note 1*: These functions correspond to the BLAS function `xSCAL`[17]. — *end note*]

2 *Effects*: Overwrites x with the result of computing the elementwise multiplication αx, where the scalar α is `alpha`.

29.9.13.5 Copy elements of one matrix or vector into another [linalg.algs.blas1.copy]

```
template<in-object InObj, out-object OutObj>
  void copy(InObj x, OutObj y);
template<class ExecutionPolicy, in-object InObj, out-object OutObj>
  void copy(ExecutionPolicy&& exec, InObj x, OutObj y);
```

1 [*Note 1*: These functions correspond to the BLAS function `xCOPY`[17]. — *end note*]

2 *Constraints*: `x.rank()` equals `y.rank()`.

3 *Mandates*: For all `r` in the range $[0, \texttt{x.rank()})$,

```
compatible-static-extents<InObj, OutObj>(r, r)
```

is `true`.

4 *Preconditions*: `x.extents()` equals `y.extents()`.

5 *Effects*: Assigns each element of x to the corresponding element of y.

29.9.13.6 Add vectors or matrices elementwise [linalg.algs.blas1.add]

```
template<in-object InObj1, in-object InObj2, out-object OutObj>
  void add(InObj1 x, InObj2 y, OutObj z);
template<class ExecutionPolicy, in-object InObj1, in-object InObj2, out-object OutObj>
  void add(ExecutionPolicy&& exec,
           InObj1 x, InObj2 y, OutObj z);
```

1 [*Note 1*: These functions correspond to the BLAS function `xAXPY`[17]. — *end note*]

2 *Constraints*: `x.rank()`, `y.rank()`, and `z.rank()` are all equal.

3 *Mandates*: `possibly-addable<InObj1, InObj2, OutObj>()` is `true`.

4 *Preconditions*: `addable(x,y,z)` is `true`.

5 *Effects*: Computes $z = x + y$.

6 *Remarks*: `z` may alias `x` or `y`.

29.9.13.7 Dot product of two vectors [linalg.algs.blas1.dot]

1 [*Note 1*: The functions in this section correspond to the BLAS functions `xDOT`, `xDOTU`, and `xDOTC`[17]. — *end note*]

2 The following elements apply to all functions in 29.9.13.7.

3 *Mandates*: `*compatible-static-extents*<InVec1, InVec2>(0, 0)` is `true`.

4 *Preconditions*: `v1.extent(0)` equals `v2.extent(0)`.

```
template<in-vector InVec1, in-vector InVec2, class Scalar>
  Scalar dot(InVec1 v1, InVec2 v2, Scalar init);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, class Scalar>
  Scalar dot(ExecutionPolicy&& exec,
             InVec1 v1, InVec2 v2, Scalar init);
```

5 These functions compute a non-conjugated dot product with an explicitly specified result type.

6 *Returns*: Let `N` be `v1.extent(0)`.

(6.1) — `init` if `N` is zero;

(6.2) — otherwise, `*GENERALIZED_SUM*(plus<>(), init, v1[0]*v2[0], ..., v1[N-1]*v2[N-1])`.

7 *Remarks*: If `InVec1::value_type`, `InVec2::value_type`, and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InVec1::value_type` or `InVec2::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-vector InVec1, in-vector InVec2>
  auto dot(InVec1 v1, InVec2 v2);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2>
  auto dot(ExecutionPolicy&& exec,
           InVec1 v1, InVec2 v2);
```

8 These functions compute a non-conjugated dot product with a default result type.

9 *Effects*: Let `T` be `decltype(declval<typename InVec1::value_type>() * declval<typename InVec2::value_type>())`. Then,

(9.1) — the two-parameter overload is equivalent to:

```
return dot(v1, v2, T{});
```

and

(9.2) — the three-parameter overload is equivalent to:

```
return dot(std::forward<ExecutionPolicy>(exec), v1, v2, T{});
```

```
template<in-vector InVec1, in-vector InVec2, class Scalar>
  Scalar dotc(InVec1 v1, InVec2 v2, Scalar init);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, class Scalar>
  Scalar dotc(ExecutionPolicy&& exec,
              InVec1 v1, InVec2 v2, Scalar init);
```

10 These functions compute a conjugated dot product with an explicitly specified result type.

11 *Effects*:

(11.1) — The three-parameter overload is equivalent to:

```
return dot(conjugated(v1), v2, init);
```

and

(11.2) — the four-parameter overload is equivalent to:

```
return dot(std::forward<ExecutionPolicy>(exec), conjugated(v1), v2, init);
```

```
template<in-vector InVec1, in-vector InVec2>
  auto dotc(InVec1 v1, InVec2 v2);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2>
  auto dotc(ExecutionPolicy&& exec,
            InVec1 v1, InVec2 v2);
```

12 These functions compute a conjugated dot product with a default result type.

13 *Effects*: Let `T` be `decltype(*conj-if-needed*(declval<typename InVec1::value_type>()) * declval<typename InVec2::value_type>())`. Then,

(13.1) — the two-parameter overload is equivalent to:

```
return dotc(v1, v2, T{});
```

and

(13.2) — the three-parameter overload is equivalent to

```
return dotc(std::forward<ExecutionPolicy>(exec), v1, v2, T{});
```

29.9.13.8 Scaled sum of squares of a vector's elements [linalg.algs.blas1.ssq]

```
template<in-vector InVec, class Scalar>
  sum_of_squares_result<Scalar> vector_sum_of_squares(InVec v, sum_of_squares_result<Scalar> init);
template<class ExecutionPolicy, in-vector InVec, class Scalar>
  sum_of_squares_result<Scalar> vector_sum_of_squares(ExecutionPolicy&& exec,
                                                      InVec v, sum_of_squares_result<Scalar> init);
```

1 [*Note 1*: These functions correspond to the LAPACK function xLASSQ[20]. — *end note*]

2 *Mandates*: `decltype(`*abs-if-needed*`(declval<typename InVec::value_type>()))` is convertible to `Scalar`.

3 *Effects*: Returns a value `result` such that

(3.1) — `result.scaling_factor` is the maximum of `init.scaling_factor` and *abs-if-needed*`(x[i])` for all `i` in the domain of `v`; and

(3.2) — let `s2init` be

```
init.scaling_factor * init.scaling_factor * init.scaled_sum_of_squares
```

then `result.scaling_factor * result.scaling_factor * result.scaled_sum_of_squares` equals the sum of `s2init` and the squares of *abs-if-needed*`(x[i])` for all `i` in the domain of `v`.

4 *Remarks*: If `InVec::value_type`, and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InVec::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

29.9.13.9 Euclidean norm of a vector [linalg.algs.blas1.nrm2]

```
template<in-vector InVec, class Scalar>
  Scalar vector_two_norm(InVec v, Scalar init);
template<class ExecutionPolicy, in-vector InVec, class Scalar>
  Scalar vector_two_norm(ExecutionPolicy&& exec, InVec v, Scalar init);
```

1 [*Note 1*: These functions correspond to the BLAS function xNRM2[17]. — *end note*]

2 *Mandates*: Let `a` be *abs-if-needed*`(declval<typename InVec::value_type>())`. Then, `decltype( init + a * a` is convertible to `Scalar`.

3 *Returns*: The square root of the sum of the square of `init` and the squares of the absolute values of the elements of `v`.

[*Note 2*: For `init` equal to zero, this is the Euclidean norm (also called 2-norm) of the vector `v`. — *end note*]

4 *Remarks*: If `InVec::value_type`, and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InVec::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

[*Note 3*: An implementation of this function for floating-point types `T` can use the `scaled_sum_of_squares` result from `vector_sum_of_squares(x, {.scaling_factor=1.0, .scaled_sum_of_squares=init})`. — *end note*]

```
template<in-vector InVec>
  auto vector_two_norm(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  auto vector_two_norm(ExecutionPolicy&& exec, InVec v);
```

5 *Effects*: Let `a` be *abs-if-needed*`(declval<typename InVec::value_type>())`. Let `T` be `decltype(a * a)`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return vector_two_norm(v, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return vector_two_norm(std::forward<ExecutionPolicy>(exec), v, T{});
```

29.9.13.10 Sum of absolute values of vector elements [linalg.algs.blas1.asum]

```
template<in-vector InVec, class Scalar>
  Scalar vector_abs_sum(InVec v, Scalar init);
template<class ExecutionPolicy, in-vector InVec, class Scalar>
  Scalar vector_abs_sum(ExecutionPolicy&& exec, InVec v, Scalar init);
```

1 [*Note 1*: These functions correspond to the BLAS functions SASUM, DASUM, SCASUM, and DZASUM[17]. — *end note*]

2 *Mandates*:

```
decltype(init + abs-if-needed(real-if-needed(declval<typename InVec::value_type>())) +
                abs-if-needed(imag-if-needed(declval<typename InVec::value_type>())))
```

is convertible to Scalar.

3 *Returns*: Let N be v.extent(0).

(3.1) — init if N is zero;

(3.2) — otherwise, if InVec::value_type is an arithmetic type,

```
GENERALIZED_SUM(plus<>(), init, abs-if-needed(v[0]), ..., abs-if-needed(v[N-1]))
```

(3.3) — otherwise,

```
GENERALIZED_SUM(plus<>(), init,
       abs-if-needed(real-if-needed(v[0])) + abs-if-needed(imag-if-needed(v[0])),
       ...,
       abs-if-needed(real-if-needed(v[N-1])) + abs-if-needed(imag-if-needed(v[N-1])))
```

4 *Remarks*: If InVec::value_type and Scalar are all floating-point types or specializations of complex, and if Scalar has higher precision than InVec::value_type, then intermediate terms in the sum use Scalar's precision or greater.

```
template<in-vector InVec>
  auto vector_abs_sum(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  auto vector_abs_sum(ExecutionPolicy&& exec, InVec v);
```

5 *Effects*: Let T be typename InVec::value_type. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return vector_abs_sum(v, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return vector_abs_sum(std::forward<ExecutionPolicy>(exec), v, T{});
```

29.9.13.11 Index of maximum absolute value of vector elements [linalg.algs.blas1.iamax]

```
template<in-vector InVec>
  typename InVec::extents_type vector_idx_abs_max(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  typename InVec::extents_type vector_idx_abs_max(ExecutionPolicy&& exec, InVec v);
```

1 [*Note 1*: These functions correspond to the BLAS function IxAMAX[17]. — *end note*]

2 Let T be

```
decltype(abs-if-needed(real-if-needed(declval<typename InVec::value_type>())) +
         abs-if-needed(imag-if-needed(declval<typename InVec::value_type>())))
```

3 *Mandates*: declval<T>() < declval<T>() is a valid expression.

4 *Returns*:

(4.1) — numeric_limits<typename InVec::size_type>::max() if v has zero elements;

(4.2) — otherwise, the index of the first element of v having largest absolute value, if InVec::value_type is an arithmetic type;

(4.3) — otherwise, the index of the first element v_e of `v` for which

```
abs-if-needed(real-if-needed(ve)) + abs-if-needed(imag-if-needed(ve))
```

has the largest value.

29.9.13.12 Frobenius norm of a matrix [linalg.algs.blas1.matfrobnorm]

1 [*Note 1*: These functions exist in the BLAS standard[21] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, class Scalar>
  Scalar matrix_frob_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, class Scalar>
  Scalar matrix_frob_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: Let `a` be *`abs-if-needed`*`(declval<typename InMat::value_type>())`. Then, `decltype(init + a * a)` is convertible to `Scalar`.

3 *Returns*: The square root of the sum of squares of `init` and the absolute values of the elements of `A`.

[*Note 2*: For `init` equal to zero, this is the Frobenius norm of the matrix `A`. — *end note*]

4 *Remarks*: If `InMat::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_frob_norm(InMat A);
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_frob_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `a` be *`abs-if-needed`*`(declval<typename InMat::value_type>())`. Let `T` be `decltype(a * a)`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_frob_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_frob_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.13.13 One norm of a matrix [linalg.algs.blas1.matonenorm]

1 [*Note 1*: These functions exist in the BLAS standard[21] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, class Scalar>
  Scalar matrix_one_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, class Scalar>
  Scalar matrix_one_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: `decltype(`*`abs-if-needed`*`(declval<typename InMat::value_type>()))` is convertible to `Scalar`.

3 *Returns*:

(3.1) — `init` if `A.extent(1)` is zero;

(3.2) — otherwise, the sum of `init` and the one norm of the matrix A.

[*Note 2*: The one norm of the matrix `A` is the maximum over all columns of `A`, of the sum of the absolute values of the elements of the column. — *end note*]

4 *Remarks*: If `InMat::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_one_norm(InMat A);
```

```
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_one_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `T` be `decltype(abs-if-needed(declval<typename InMat::value_type>())`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_one_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_one_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.13.14 Infinity norm of a matrix [linalg.algs.blas1.matinfnorm]

1 [*Note 1*: These functions exist in the BLAS standard[21] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, class Scalar>
  Scalar matrix_inf_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, class Scalar>
  Scalar matrix_inf_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: `decltype(abs-if-needed(declval<typename InMat::value_type>()))` is convertible to `Scalar`.

3 *Returns*:

(3.1) — `init` if `A.extent(0)` is zero;

(3.2) — otherwise, the sum of `init` and the infinity norm of the matrix `A`.

[*Note 2*: The infinity norm of the matrix `A` is the maximum over all rows of `A`, of the sum of the absolute values of the elements of the row. — *end note*]

4 *Remarks*: If `InMat::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_inf_norm(InMat A);
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_inf_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `T` be `decltype(abs-if-needed(declval<typename InMat::value_type>())`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_inf_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_inf_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.14 BLAS 2 algorithms [linalg.algs.blas2]

29.9.14.1 General matrix-vector product [linalg.algs.blas2.gemv]

1 [*Note 1*: These functions correspond to the BLAS function `xGEMV`. — *end note*]

2 The following elements apply to all functions in 29.9.14.1.

3 *Mandates*:

(3.1) — `possibly-multipliable<decltype(A), decltype(x), decltype(y)>()` is `true`, and

(3.2) — `possibly-addable<decltype(x), decltype(y), decltype(z)>()` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — `multipliable(A,x,y)` is `true`, and

(4.2) — `addable(x,y,z)` is `true` for those overloads that take a `z` parameter.

5 *Complexity*: $\mathcal{O}($`x.extent(0)` $\times$ `A.extent(1)`$)$.

```
template<in-matrix InMat, in-vector InVec, out-vector OutVec>
  void matrix_vector_product(InMat A, InVec x, OutVec y);
template<class ExecutionPolicy, in-matrix InMat, in-vector InVec, out-vector OutVec>
  void matrix_vector_product(ExecutionPolicy&& exec, InMat A, InVec x, OutVec y);
```

6 These functions perform an overwriting matrix-vector product.

7 *Effects*: Computes $y = Ax$.

[*Example 1*:

```
  constexpr size_t num_rows = 5;
  constexpr size_t num_cols = 6;

  // y = 3.0 * A * x
  void scaled_matvec_1(mdspan<double, extents<size_t, num_rows, num_cols>> A,
    mdspan<double, extents<size_t, num_cols>> x, mdspan<double, extents<size_t, num_rows>> y) {
    matrix_vector_product(scaled(3.0, A), x, y);
  }

  // z = 7.0 times the transpose of A, times y
  void scaled_transposed_matvec(mdspan<double, extents<size_t, num_rows, num_cols>> A,
    mdspan<double, extents<size_t, num_rows>> y, mdspan<double, extents<size_t, num_cols>> z) {
    matrix_vector_product(scaled(7.0, transposed(A)), y, z);
  }
```

— *end example*]

```
  template<in-matrix InMat, in-vector InVec1, in-vector InVec2, out-vector OutVec>
    void matrix_vector_product(InMat A, InVec1 x, InVec2 y, OutVec z);
  template<class ExecutionPolicy,
           in-matrix InMat, in-vector InVec1, in-vector InVec2, out-vector OutVec>
    void matrix_vector_product(ExecutionPolicy&& exec,
                               InMat A, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating matrix-vector product.

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: `z` may alias `y`.

[*Example 2*:

```
  // y = 3.0 * A * x + 2.0 * y
  void scaled_matvec_2(mdspan<double, extents<size_t, num_rows, num_cols>> A,
    mdspan<double, extents<size_t, num_cols>> x, mdspan<double, extents<size_t, num_rows>> y) {
    matrix_vector_product(scaled(3.0, A), x, scaled(2.0, y), y);
  }
```

— *end example*]

29.9.14.2 Symmetric matrix-vector product [linalg.algs.blas2.symv]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYMV` and `xSPMV`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.14.2.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — `compatible-static-extents<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — `possibly-multipliable<decltype(A), decltype(x), decltype(y)>()` is `true`; and

(3.4) — `possibly-addable<decltype(x), decltype(y), decltype(z)>()` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `multipliable(A,x,y)` is `true`, and

(4.3) — *addable*(x,y,z) is true for those overloads that take a z parameter.

5 *Complexity*: $\mathcal{O}$(x.extent(0) × A.extent(1)).

```
template<in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void symmetric_matrix_vector_product(InMat A, Triangle t, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void symmetric_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec x, OutVec y);
```

6 These functions perform an overwriting symmetric matrix-vector product, taking into account the Triangle parameter that applies to the symmetric matrix A (29.9.3).

7 *Effects*: Computes $y = Ax$.

```
template<in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void symmetric_matrix_vector_product(InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void symmetric_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating symmetric matrix-vector product, taking into account the Triangle parameter that applies to the symmetric matrix A (29.9.3).

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: z may alias y.

29.9.14.3 Hermitian matrix-vector product [linalg.algs.blas2.hemv]

1 [*Note 1*: These functions correspond to the BLAS functions xHEMV and xHPMV[18]. — *end note*]

2 The following elements apply to all functions in 29.9.14.3.

3 *Mandates*:

(3.1) — If InMat has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(3.2) — *compatible-static-extents*<decltype(A), decltype(A)>(0, 1) is true;

(3.3) — *possibly-multipliable*<decltype(A), decltype(x), decltype(y)>() is true; and

(3.4) — *possibly-addable*<decltype(x), decltype(y), decltype(z)>() is true for those overloads that take a z parameter.

4 *Preconditions*:

(4.1) — A.extent(0) equals A.extent(1),

(4.2) — *multipliable*(A, x, y) is true, and

(4.3) — *addable*(x, y, z) is true for those overloads that take a z parameter.

5 *Complexity*: $\mathcal{O}$(x.extent(0) × A.extent(1)).

```
template<in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void hermitian_matrix_vector_product(InMat A, Triangle t, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void hermitian_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec x, OutVec y);
```

6 These functions perform an overwriting Hermitian matrix-vector product, taking into account the Triangle parameter that applies to the Hermitian matrix A (29.9.3).

7 *Effects*: Computes $y = Ax$.

```
template<in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void hermitian_matrix_vector_product(InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void hermitian_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating Hermitian matrix-vector product, taking into account the `Triangle` parameter that applies to the Hermitian matrix `A` (29.9.3).

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: `z` may alias `y`.

29.9.14.4 Triangular matrix-vector product [linalg.algs.blas2.trmv]

1 [*Note 1*: These functions correspond to the BLAS functions `xTRMV` and `xTPMV`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.14.4.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *`compatible-static-extents`*`<decltype(A), decltype(y)>(0, 0)` is `true`;

(3.4) — *`compatible-static-extents`*`<decltype(A), decltype(x)>(0, 0)` is `true` for those overloads that take an `x` parameter; and

(3.5) — *`compatible-static-extents`*`<decltype(A), decltype(z)>(0, 0)` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `A.extent(0)` equals `y.extent(0)`,

(4.3) — `A.extent(0)` equals `x.extent(0)` for those overloads that take an `x` parameter, and

(4.4) — `A.extent(0)` equals `z.extent(0)` for those overloads that take a `z` parameter.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, in-vector InVec,
         out-vector OutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, in-vector InVec,
         out-vector OutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d, InVec x, OutVec y);
```

5 These functions perform an overwriting triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

6 *Effects*: Computes $y = Ax$.

7 *Complexity*: $\mathcal{O}($`x.extent(0)` $\times$ `A.extent(1)`$)$.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d, InOutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d, InOutVec y);
```

8 These functions perform an in-place triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: Performing this operation in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

9 *Effects*: Computes a vector y' such that $y' = Ay$, and assigns each element of y' to the corresponding element of y.

10 *Complexity*: $\mathcal{O}($`y.extent(0)` $\times$ `A.extent(1)`$)$.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d,
                                        InVec1 x, InVec2 y, OutVec z);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d,
                                        InVec1 x, InVec2 y, OutVec z);
```

11 These functions perform an updating triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

12 *Effects*: Computes $z = y + Ax$.

13 *Complexity*: $\mathscr{O}$(`x.extent(0)` × `A.extent(1)`).

14 *Remarks*: `z` may alias `y`.

29.9.14.5 Solve a triangular linear system [linalg.algs.blas2.trsv]

1 [*Note 1*: These functions correspond to the BLAS functions `xTRSV` and `xTPSV`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.14.5.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *`compatible-static-extents`*`<decltype(A), decltype(b)>(0, 0)` is `true`; and

(3.4) — *`compatible-static-extents`*`<decltype(A), decltype(x)>(0, 0)` is `true` for those overloads that take an `x` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `A.extent(0)` equals `b.extent(0)`, and

(4.3) — `A.extent(0)` equals `x.extent(0)` for those overloads that take an `x` parameter.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d,
                                      InVec b, OutVec x, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d,
                                      InVec b, OutVec x, BinaryDivideOp divide);
```

5 These functions perform a triangular solve, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

6 *Effects*: Computes a vector x' such that $b = Ax'$, and assigns each element of x' to the corresponding element of x. If no such x' exists, then the elements of `x` are valid but unspecified.

7 *Complexity*: $\mathscr{O}$(`A.extent(1)` × `b.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d, InVec b, OutVec x);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(A, t, d, b, x, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InVec b, OutVec x);
```

9 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(std::forward<ExecutionPolicy>(exec),
                               A, t, d, b, x, divides<void>{});
```

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-vector InOutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d,
                                      InOutVec b, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-vector InOutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d,
                                      InOutVec b, BinaryDivideOp divide);
```

10 These functions perform an in-place triangular solve, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

11 *Effects*: Computes a vector x' such that $b = Ax'$, and assigns each element of x' to the corresponding element of b. If no such x' exists, then the elements of `b` are valid but unspecified.

12 *Complexity*: $\mathcal{O}$(`A.extent(1)` $\times$ `b.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d, InOutVec b);
```

13 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(A, t, d, b, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InOutVec b);
```

14 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(std::forward<ExecutionPolicy>(exec),
                               A, t, d, b, divides<void>{});
```

29.9.14.6 Rank-1 (outer product) update of a matrix [linalg.algs.blas2.rank1]

```
template<in-vector InVec1, in-vector InVec2, inout-matrix InOutMat>
  void matrix_rank_1_update(InVec1 x, InVec2 y, InOutMat A);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, inout-matrix InOutMat>
  void matrix_rank_1_update(ExecutionPolicy&& exec, InVec1 x, InVec2 y, InOutMat A);
```

1 These functions perform a nonsymmetric nonconjugated rank-1 update.

[*Note 1*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERU` (for complex element types)[18]. — *end note*]

2 *Mandates*: *`possibly-multipliable`*`<InOutMat, InVec2, InVec1>()` is `true`.

3 *Preconditions*: *`multipliable`*`(A, y, x)` is `true`.

4 *Effects*: Computes a matrix A' such that $A' = A + xy^T$, and assigns each element of A' to the corresponding element of A.

5 *Complexity*: $\mathcal{O}$(`x.extent(0)` $\times$ `y.extent(0)`).

```
template<in-vector InVec1, in-vector InVec2, inout-matrix InOutMat>
  void matrix_rank_1_update_c(InVec1 x, InVec2 y, InOutMat A);
```

```
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, inout-matrix InOutMat>
  void matrix_rank_1_update_c(ExecutionPolicy&& exec, InVec1 x, InVec2 y, InOutMat A);
```

6 These functions perform a nonsymmetric conjugated rank-1 update.

[*Note 2*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERC` (for complex element types)[18]. — *end note*]

7 *Effects*:

(7.1) — For the overloads without an `ExecutionPolicy` argument, equivalent to:

```
matrix_rank_1_update(x, conjugated(y), A);
```

(7.2) — otherwise, equivalent to:

```
matrix_rank_1_update(std::forward<ExecutionPolicy>(exec), x, conjugated(y), A);
```

29.9.14.7 Symmetric or Hermitian Rank-1 (outer product) update of a matrix [linalg.algs.blas2.symherrank1]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYR`, `xSPR`, `xHER`, and `xHPR`[18]. They have overloads taking a scaling factor `alpha`, because it would be impossible to express the update $A = A - xx^T$ otherwise. — *end note*]

2 The following elements apply to all functions in 29.9.14.7.

3 *Mandates*:

(3.1) — If `InOutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`; and

(3.3) — *`compatible-static-extents`*`<decltype(A), decltype(x)>(0, 0)` is `true`.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`, and

(4.2) — `A.extent(0)` equals `x.extent(0)`.

5 *Complexity*: $\mathcal{O}($`x.extent(0)` $\times$ `x.extent(0)`$)$.

```
template<class Scalar, in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_1_update(Scalar alpha, InVec x, InOutMat A, Triangle t);
template<class ExecutionPolicy,
         class Scalar, in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, InOutMat A, Triangle t);
```

6 These functions perform a symmetric rank-1 update of the symmetric matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

7 *Effects*: Computes a matrix A' such that $A' = A + \alpha x x^T$, where the scalar α is `alpha`, and assigns each element of A' to the corresponding element of A.

```
template<in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_1_update(InVec x, InOutMat A, Triangle t);
template<class ExecutionPolicy,
         in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_1_update(ExecutionPolicy&& exec, InVec x, InOutMat A, Triangle t);
```

8 These functions perform a symmetric rank-1 update of the symmetric matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

9 *Effects*: Computes a matrix A' such that $A' = A + xx^T$ and assigns each element of A' to the corresponding element of A.

```
template<class Scalar, in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_1_update(Scalar alpha, InVec x, InOutMat A, Triangle t);
```

```
template<class ExecutionPolicy,
         class Scalar, in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, InOutMat A, Triangle t);
```

10 These functions perform a Hermitian rank-1 update of the Hermitian matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

11 *Effects*: Computes A' such that $A' = A + \alpha x x^H$, where the scalar α is `alpha`, and assigns each element of A' to the corresponding element of A.

```
template<in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_1_update(InVec x, InOutMat A, Triangle t);
template<class ExecutionPolicy,
         in-vector InVec, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_1_update(ExecutionPolicy&& exec, InVec x, InOutMat A, Triangle t);
```

12 These functions perform a Hermitian rank-1 update of the Hermitian matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

13 *Effects*: Computes a matrix A' such that $A' = A + x x^H$ and assigns each element of A' to the corresponding element of A.

29.9.14.8 Symmetric and Hermitian rank-2 matrix updates [linalg.algs.blas2.rank2]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYR2`,`xSPR2`, `xHER2` and `xHPR2`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.14.8.

3 *Mandates*:

(3.1) — If `InOutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`; and

(3.3) — *`possibly-multipliable`*`<decltype(A), decltype(x), decltype(y)>()` is `true`.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`, and

(4.2) — *`multipliable`*`(A, x, y)` is `true`.

5 *Complexity*: $\mathcal{O}$(`x.extent(0)` × `y.extent(0)`).

```
template<in-vector InVec1, in-vector InVec2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_2_update(InVec1 x, InVec2 y, InOutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, InOutMat A, Triangle t);
```

6 These functions perform a symmetric rank-2 update of the symmetric matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

7 *Effects*: Computes A' such that $A' = A + x y^T + y x^T$ and assigns each element of A' to the corresponding element of A.

```
template<in-vector InVec1, in-vector InVec2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_2_update(InVec1 x, InVec2 y, InOutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, InOutMat A, Triangle t);
```

8 These functions perform a Hermitian rank-2 update of the Hermitian matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

9 *Effects*: Computes A' such that $A' = A + x y^H + y x^H$ and assigns each element of A' to the corresponding element of A.

29.9.15 BLAS 3 algorithms [linalg.algs.blas3]

29.9.15.1 General matrix-matrix product [linalg.algs.blas3.gemm]

1 [*Note 1*: These functions correspond to the BLAS function `xGEMM`[19]. — *end note*]

2 The following elements apply to all functions in 29.9.15.1 in addition to function-specific elements.

3 *Mandates*: `possibly-multipliable<decltype(A), decltype(B), decltype(C)>()` is `true`.

4 *Preconditions*: `multipliable(A, B, C)` is `true`.

5 *Complexity*: $\mathcal{O}$(`A.extent(0)` × `A.extent(1)` × `B.extent(1)`).

```
template<in-matrix InMat1, in-matrix InMat2, out-matrix OutMat>
  void matrix_product(InMat1 A, InMat2 B, OutMat C);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2, out-matrix OutMat>
  void matrix_product(ExecutionPolicy&& exec, InMat1 A, InMat2 B, OutMat C);
```

6 *Effects*: Computes $C = AB$.

```
template<in-matrix InMat1, in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void matrix_product(InMat1 A, InMat2 B, InMat3 E, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void matrix_product(ExecutionPolicy&& exec, InMat1 A, InMat2 B, InMat3 E, OutMat C);
```

7 *Mandates*: `possibly-addable<InMat3, InMat3, OutMat>()` is `true`.

8 *Preconditions*: `addable(E, E, C)` is `true`.

9 *Effects*: Computes $C = E + AB$.

10 *Remarks*: `C` may alias `E`.

29.9.15.2 Symmetric, Hermitian, and triangular matrix-matrix product [linalg.algs.blas3.xxmm]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYMM`, `xHEMM`, and `xTRMM`[19]. — *end note*]

2 The following elements apply to all functions in 29.9.15.2 in addition to function-specific elements.

3 *Mandates*:

(3.1) — `possibly-multipliable<decltype(A), decltype(B), decltype(C)>()` is `true`, and

(3.2) — `possibly-addable<decltype(E), decltype(E), decltype(C)>()` is `true` for those overloads that take an `E` parameter.

4 *Preconditions*:

(4.1) — `multipliable(A, B, C)` is `true`, and

(4.2) — `addable(E, E, C)` is `true` for those overloads that take an `E` parameter.

5 *Complexity*: $\mathcal{O}$(`A.extent(0)` × `A.extent(1)` × `B.extent(1)`).

```
template<in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, Triangle t, InMat2 B, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec, InMat1 A, Triangle t, InMat2 B, OutMat C);

template<in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, Triangle t, InMat2 B, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec, InMat1 A, Triangle t, InMat2 B, OutMat C);

template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, OutMat C);
```

```
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_product(ExecutionPolicy&& exec,
                                 InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, OutMat C);
```

6 These functions perform a matrix-matrix multiply, taking into account the `Triangle` and `DiagonalStorage` (if applicable) parameters that apply to the symmetric, Hermitian, or triangular (respectively) matrix `A` (29.9.3).

7 *Mandates*:

(7.1) — If `InMat1` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument; and

(7.2) — *`compatible-static-extents`*`<InMat1, InMat1>(0, 1)` is `true`.

8 *Preconditions*: `A.extent(0) == A.extent(1)` is `true`.

9 *Effects*: Computes $C = AB$.

```
template<in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, InMat2 B, Triangle t, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, InMat2 B, Triangle t, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, class DiagonalStorage,
         out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, InMat2 B, Triangle t, DiagonalStorage d, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, class DiagonalStorage,
         out-matrix OutMat>
  void triangular_matrix_product(ExecutionPolicy&& exec,
                                 InMat1 A, InMat2 B, Triangle t, DiagonalStorage d, OutMat C);
```

10 These functions perform a matrix-matrix multiply, taking into account the `Triangle` and `DiagonalStorage` (if applicable) parameters that apply to the symmetric, Hermitian, or triangular (respectively) matrix `B` (29.9.3).

11 *Mandates*:

(11.1) — If `InMat2` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument; and

(11.2) — *`compatible-static-extents`*`<InMat2, InMat2>(0, 1)` is `true`.

12 *Preconditions*: `B.extent(0) == B.extent(1)` is `true`.

13 *Effects*: Computes $C = AB$.

```
template<in-matrix InMat1, class Triangle, in-matrix InMat2, in-matrix InMat3,
         out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, Triangle t, InMat2 B, InMat3 E, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, in-matrix InMat3,
         out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, Triangle t, InMat2 B, InMat3 E, OutMat C);

template<in-matrix InMat1, class Triangle, in-matrix InMat2, in-matrix InMat3,
         out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, Triangle t, InMat2 B, InMat3 E, OutMat C);
```

```
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, in-matrix InMat3,
         out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, Triangle t, InMat2 B, InMat3 E, OutMat C);

template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, InMat3 E,
                                 OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void triangular_matrix_product(ExecutionPolicy&& exec,
                                 InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, InMat3 E,
                                 OutMat C);
```

14 These functions perform a potentially overwriting matrix-matrix multiply-add, taking into account the `Triangle` and `DiagonalStorage` (if applicable) parameters that apply to the symmetric, Hermitian, or triangular (respectively) matrix `A` (29.9.3).

15 *Mandates*:

(15.1) — If `InMat1` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument; and

(15.2) — *`compatible-static-extents`*`<InMat1, InMat1>(0, 1)` is `true`.

16 *Preconditions*: `A.extent(0) == A.extent(1)` is `true`.

17 *Effects*: Computes $C = E + AB$.

18 *Remarks*: `C` may alias `E`.

```
template<in-matrix InMat1, in-matrix InMat2, class Triangle, in-matrix InMat3,
         out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, InMat2 B, Triangle t, InMat3 E, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, in-matrix InMat3,
         out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, InMat3 E, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, in-matrix InMat3,
         out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, InMat2 B, Triangle t, InMat3 E, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, in-matrix InMat3,
         out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, InMat3 E, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, class DiagonalStorage,
         in-matrix InMat3, out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, InMat2 B, Triangle t, DiagonalStorage d, InMat3 E,
                                 OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, class DiagonalStorage,
         in-matrix InMat3, out-matrix OutMat>
  void triangular_matrix_product(ExecutionPolicy&& exec,
                                 InMat1 A, InMat2 B, Triangle t, DiagonalStorage d, InMat3 E,
                                 OutMat C);
```

19 These functions perform a potentially overwriting matrix-matrix multiply-add, taking into account the `Triangle` and `DiagonalStorage` (if applicable) parameters that apply to the symmetric, Hermitian, or triangular (respectively) matrix `B` (29.9.3).

20 *Mandates*:

(20.1) — If `InMat2` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument; and

(20.2) — *`compatible-static-extents`*`<InMat2, InMat2>(0, 1)` is `true`.

21 *Preconditions*: `B.extent(0) == B.extent(1)` is `true`.

22 *Effects*: Computes $C = E + AB$.

23 *Remarks*: `C` may alias `E`.

29.9.15.3 In-place triangular matrix-matrix product [linalg.algs.blas3.trmm]

1 These functions perform an in-place matrix-matrix multiply, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 1*: These functions correspond to the BLAS function `xTRMM`[19]. — *end note*]

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_left_product(InMat A, Triangle t, DiagonalStorage d, InOutMat C);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_left_product(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InOutMat C);
```

2 *Mandates*:

(2.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(2.2) — *`possibly-multipliable`*`<InMat, InOutMat, InOutMat>()` is `true`; and

(2.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

3 *Preconditions*:

(3.1) — *`multipliable`*`(A, C, C)` is `true`, and

(3.2) — `A.extent(0) == A.extent(1)` is `true`.

4 *Effects*: Computes a matrix C' such that $C' = AC$ and assigns each element of C' to the corresponding element of C.

5 *Complexity*: $\mathcal{O}($`A.extent(0)` $\times$ `A.extent(1)` $\times$ `C.extent(0)`$)$.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_right_product(InMat A, Triangle t, DiagonalStorage d, InOutMat C);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_right_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, DiagonalStorage d, InOutMat C);
```

6 *Mandates*:

(6.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(6.2) — *`possibly-multipliable`*`<InOutMat, InMat, InOutMat>()` is `true`; and

(6.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

7 *Preconditions*:

(7.1) — *`multipliable`*`(C, A, C)` is `true`, and

(7.2) — `A.extent(0) == A.extent(1)` is `true`.

8 *Effects*: Computes a matrix C' such that $C' = CA$ and assigns each element of C' to the corresponding element of C.

9 *Complexity*: $\mathcal{O}($`A.extent(0)` $\times$ `A.extent(1)` $\times$ `C.extent(0)`$)$.

29.9.15.4 Rank-k update of a symmetric or Hermitian matrix [linalg.algs.blas3.rankk]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYRK` and `xHERK`[19]. — *end note*]

2 The following elements apply to all functions in 29.9.15.4.

3 *Mandates*:

(3.1) — If `InOutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *`compatible-static-extents`*`<decltype(C), decltype(C)>(0, 1)` is `true`; and

(3.4) — *`compatible-static-extents`*`<decltype(A), decltype(C)>(0, 0)` is `true`.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `C.extent(0)` equals `C.extent(1)`, and

(4.3) — `A.extent(0)` equals `C.extent(0)`.

5 *Complexity*: $\mathcal{O}($`A.extent(0)` $\times$ `A.extent(1)` $\times$ `C.extent(0)`$)$.

```
template<class Scalar, in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_k_update(Scalar alpha, InMat A, InOutMat C, Triangle t);
template<class ExecutionPolicy, class Scalar,
         in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_k_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InMat A, InOutMat C, Triangle t);
```

6 *Effects*: Computes a matrix C' such that $C' = C + \alpha AA^T$, where the scalar α is `alpha`, and assigns each element of C' to the corresponding element of C.

```
template<in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_k_update(InMat A, InOutMat C, Triangle t);
template<class ExecutionPolicy,
         in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_k_update(ExecutionPolicy&& exec,
                                      InMat A, InOutMat C, Triangle t);
```

7 *Effects*: Computes a matrix C' such that $C' = C + AA^T$, and assigns each element of C' to the corresponding element of C.

```
template<class Scalar, in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_k_update(Scalar alpha, InMat A, InOutMat C, Triangle t);
template<class ExecutionPolicy,
         class Scalar, in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_k_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InMat A, InOutMat C, Triangle t);
```

8 *Effects*: Computes a matrix C' such that $C' = C + \alpha AA^H$, where the scalar α is `alpha`, and assigns each element of C' to the corresponding element of C.

```
template<in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_k_update(InMat A, InOutMat C, Triangle t);
template<class ExecutionPolicy,
         in-matrix InMat, possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_k_update(ExecutionPolicy&& exec,
                                      InMat A, InOutMat C, Triangle t);
```

9 *Effects*: Computes a matrix C' such that $C' = C + AA^H$, and assigns each element of C' to the corresponding element of C.

29.9.15.5 Rank-2k update of a symmetric or Hermitian matrix [linalg.algs.blas3.rank2k]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYR2K` and `xHER2K`[19]. — *end note*]

2 The following elements apply to all functions in 29.9.15.5.

3 *Mandates*:

(3.1) — If `InOutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *possibly-addable*<decltype(A), decltype(B), decltype(C)>() is true; and

(3.3) — *compatible-static-extents*<decltype(A), decltype(A)>(0, 1) is true.

4 *Preconditions*:

(4.1) — *addable*(A, B, C) is true, and

(4.2) — A.extent(0) equals A.extent(1).

5 *Complexity*: $\mathcal{O}$(A.extent(0) × A.extent(1) × C.extent(0)).

```
template<in-matrix InMat1, in-matrix InMat2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_2k_update(InMat1 A, InMat2 B, InOutMat C, Triangle t);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void symmetric_matrix_rank_2k_update(ExecutionPolicy&& exec,
                                       InMat1 A, InMat2 B, InOutMat C, Triangle t);
```

6 *Effects*: Computes a matrix C' such that $C' = C + AB^T + BA^T$, and assigns each element of C' to the corresponding element of C.

```
template<in-matrix InMat1, in-matrix InMat2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_2k_update(InMat1 A, InMat2 B, InOutMat C, Triangle t);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2,
         possibly-packed-inout-matrix InOutMat, class Triangle>
  void hermitian_matrix_rank_2k_update(ExecutionPolicy&& exec,
                                       InMat1 A, InMat2 B, InOutMat C, Triangle t);
```

7 *Effects*: Computes a matrix C' such that $C' = C + AB^H + BA^H$, and assigns each element of C' to the corresponding element of C.

29.9.15.6 Solve multiple triangular linear systems [linalg.algs.blas3.trsm]

1 [*Note 1*: These functions correspond to the BLAS function xTRSM[19]. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X, BinaryDivideOp divide);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X, BinaryDivideOp divide);
```

2 These functions perform multiple matrix solves, taking into account the Triangle and DiagonalStorage parameters that apply to the triangular matrix A (29.9.3).

3 *Mandates*:

(3.1) — If InMat1 has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(3.2) — *possibly-multipliable*<InMat1, OutMat, InMat2>() is true; and

(3.3) — *compatible-static-extents*<InMat1, InMat1>(0, 1) is true.

4 *Preconditions*:

(4.1) — *multipliable*(A, X, B) is true, and

(4.2) — A.extent(0) == A.extent(1) is true.

5 *Effects*: Computes X' such that $AX' = B$, and assigns each element of X' to the corresponding element of X. If no such X' exists, then the elements of X are valid but unspecified.

6 *Complexity*: $\mathcal{O}$(A.extent(0) × X.extent(1) × X.extent(1)).

7 [*Note 2*: Since the triangular matrix is on the left, the desired `divide` implementation in the case of noncommutative multiplication is mathematically equivalent to $y^{-1}x$, where x is the first argument and y is the second argument, and y^{-1} denotes the multiplicative inverse of y. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_left_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(A, t, d, B, X, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X);
```

9 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(std::forward<ExecutionPolicy>(exec),
                                    A, t, d, B, X, divides<void>{});
```

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X, BinaryDivideOp divide);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X, BinaryDivideOp divide);
```

10 These functions perform multiple matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

11 *Mandates*:

(11.1) — If `InMat1` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(11.2) — *`possibly-multipliable`*`<OutMat, InMat1, InMat2>()` is `true`; and

(11.3) — *`compatible-static-extents`*`<InMat1, InMat1>(0,1)` is `true`.

12 *Preconditions*:

(12.1) — *`multipliable`*`(X, A, B)` is `true`, and

(12.2) — `A.extent(0) == A.extent(1)` is `true`.

13 *Effects*: Computes X' such that $X'A = B$, and assigns each element of X' to the corresponding element of X. If no such X' exists, then the elements of `X` are valid but unspecified.

14 *Complexity*: $O($ `B.extent(0)` $\cdot$ `B.extent(1)` $\cdot$ `A.extent(1)` $)$

[*Note 3*: Since the triangular matrix is on the right, the desired `divide` implementation in the case of noncommutative multiplication is mathematically equivalent to xy^{-1}, where x is the first argument and y is the second argument, and y^{-1} denotes the multiplicative inverse of y. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_right_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X);
```

15 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(A, t, d, B, X, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X);
```

16 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(std::forward<ExecutionPolicy>(exec),
                                     A, t, d, B, X, divides<void>{});
```

29.9.15.7 Solve multiple triangular linear systems in-place [linalg.algs.blas3.inplacetrsm]

1 [*Note 1*: These functions correspond to the BLAS function `xTRSM`[19]. — *end note*]

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B, BinaryDivideOp divide);
```

2 These functions perform multiple in-place matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: This algorithm makes it possible to compute factorizations like Cholesky and LU in place. Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`possibly-multipliable`*`<InMat, InOutMat, InOutMat>()` is `true`; and

(3.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

4 *Preconditions*:

(4.1) — *`multipliable`*`(A, B, B)` is `true`, and

(4.2) — `A.extent(0) == A.extent(1)` is `true`.

5 *Effects*: Computes X' such that $AX' = B$, and assigns each element of X' to the corresponding element of B. If so such X' exists, then the elements of `B` are valid but unspecified.

6 *Complexity*: $\mathcal{O}($`A.extent(0)` $\times$ `A.extent(1)` $\times$ `B.extent(1)`$)$.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_left_solve(InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B);
```

7 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(A, t, d, B, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(std::forward<ExecutionPolicy>(exec),
                                    A, t, d, B, divides<void>{});
```

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B, BinaryDivideOp divide);
```

9 These functions perform multiple in-place matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 3*: This algorithm makes it possible to compute factorizations like Cholesky and LU in place. Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

10 *Mandates*:

(10.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(10.2) — *`possibly-multipliable`*`<InOutMat, InMat, InOutMat>()` is `true`; and

(10.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

11 *Preconditions*:

(11.1) — *`multipliable`*`(B, A, B)` is `true`, and

(11.2) — `A.extent(0) == A.extent(1)` is `true`.

12 *Effects*: Computes X' such that $X'A = B$, and assigns each element of X' to the corresponding element of B. If so such X' exists, then the elements of `B` are valid but unspecified.

13 *Complexity*: $\mathcal{O}($`A.extent(0)` $\times$ `A.extent(1)` $\times$ `B.extent(1)`$)$.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_right_solve(InMat A, Triangle t, DiagonalStorage d, InOutMat B);
```

14 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(A, t, d, B, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B);
```

15 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(std::forward<ExecutionPolicy>(exec),
                                     A, t, d, B, divides<void>{});
```

29.10 Data-parallel types [simd]

29.10.1 General [simd.general]

1 Subclause 29.10 defines data-parallel types and operations on these types.

[*Note 1*: The intent is to support acceleration through data-parallel execution resources where available, such as SIMD registers and instructions or execution units driven by a common instruction decoder. SIMD stands for "Single Instruction Stream – Multiple Data Stream"; it is defined in Flynn 1966[22]. — *end note*]

2 The set of *vectorizable types* comprises

(2.1) — all standard integer types, character types, and the types `float` and `double` (6.8.2);

(2.2) — `std::float16_t`, `std::float32_t`, and `std::float64_t` if defined (6.8.3); and

(2.3) — `complex<T>` where `T` is a vectorizable floating-point type.

3 The term *data-parallel type* refers to all enabled specializations of the `basic_simd` and `basic_simd_mask` class templates. A *data-parallel object* is an object of data-parallel type.

4 Each specialization of `basic_simd` or `basic_simd_mask` is either enabled or disabled, as described in 29.10.6.1 and 29.10.8.1.

5 A data-parallel type consists of one or more elements of an underlying vectorizable type, called the *element type*. The number of elements is a constant for each data-parallel type and called the *width* of that type. The elements in a data-parallel type are indexed from 0 to width − 1.

6 An *element-wise operation* applies a specified operation to the elements of one or more data-parallel objects. Each such application is unsequenced with respect to the others. A *unary element-wise operation* is an element-wise operation that applies a unary operation to each element of a data-parallel object. A *binary element-wise operation* is an element-wise operation that applies a binary operation to corresponding elements of two data-parallel objects.

7 Given a `basic_simd_mask<Bytes, Abi>` object `mask`, the *selected indices* signify the integers i in the range [`0`, `mask.size()`) for which `mask[`i`]` is `true`. Given a data-parallel object `data`, the *selected elements* signify the elements `data[`i`]` for all selected indices i.

8 The conversion from an arithmetic type `U` to a vectorizable type `T` is *value-preserving* if all possible values of `U` can be represented with type `T`.

29.10.2 Exposition-only types, variables, and concepts [simd.expos]

```
using simd-size-type = see below;                                    // exposition only
template<size_t Bytes> using integer-from = see below;               // exposition only

template<size_t N> struct overaligned-flag;                          // exposition only
```

29.10.2.1 Exposition-only helpers [simd.expos.defn]

```
using simd-size-type = see below;
```

1 *`simd-size-type`* is an alias for a signed integer type.

```
template<size_t Bytes> using integer-from = see below;
```

2 *`integer-from`*`<Bytes>` is an alias for a signed integer type `T` such that `sizeof(T)` equals `Bytes`.

```
template<class T, class Abi>
  constexpr simd-size-type simd-size-v = see below;
```

3 *`simd-size-v`*`<T, Abi>` denotes the width of `basic_simd<T, Abi>` if the specialization `basic_simd<T, Abi>` is enabled, or `0` otherwise.

```
template<class T> constexpr size_t mask-element-size = see below;
```

4 *`mask-element-size`*`<basic_simd_mask<Bytes, Abi>>` has the value `Bytes`.

```
template<class T> using deduced-simd-t = see below;
```

5 Let `x` denote an lvalue of type `const T`.

6 *`deduced-simd-t`*`<T>` is an alias for

(6.1) — `decltype(x + x)`, if the type of `x + x` is an enabled specialization of `basic_simd`; otherwise

(6.2) — `void`.

```
template<class V, class T> using make-compatible-simd-t = see below;
```

7 Let `x` denote an lvalue of type `const T`. *`make-compatible-simd-t`*`<V, T>` is an alias for

(7.1) — *`deduced-simd-t`*`<T>`, if that type is not `void`, otherwise

(7.2) — `simd<decltype(x + x), V::size()>`.

```
template<class... Ts>
  requires math-floating-point<Ts...>
    using math-common-simd-t = see below;
```

8 Let `T0` denote `Ts...[0]`. Let `T1` denote `Ts...[1]`. Let `TRest` denote a pack such that `T0, T1, TRest...` is equivalent to `Ts...`.

9 Let *`math-common-simd-t`*`<Ts...>` be an alias for

(9.1) — *`deduced-simd-t`*`<T0>`, if `sizeof...(Ts)` equals 1; otherwise

(9.2) — `common_type_t<`*`deduced-simd-t`*`<T0>, `*`deduced-simd-t`*`<T1>>`, if `sizeof...(Ts)` equals 2 and *`math-floating-point`*`<T0> && `*`math-floating-point`*`<T1>` is `true`; otherwise

(9.3) — `common_type_t<`*`deduced-simd-t`*`<T0>, T1>`, if `sizeof...(Ts)` equals 2 and *`math-floating-point`*`<T0>` is `true`; otherwise

(9.4) — `common_type_t<T0, `*`deduced-simd-t`*`<T1>>`, if `sizeof...(Ts)` equals 2; otherwise

(9.5) — `common_type_t<`*`math-common-simd-t`*`<T0, T1>, TRest...>`, if *`math-common-simd-t`*`<T0, T1>` is valid and denotes a type; otherwise

(9.6) — `common_type_t<`*`math-common-simd-t`*`<TRest...>, T0, T1>`.

```
template<class BinaryOperation, class T>
  concept reduction-binary-operation =
    requires (const BinaryOperation binary_op, const simd<T, 1> v) {
      { binary_op(v, v) } -> same_as<simd<T, 1>>;
};
```

10 Types `BinaryOperation` and `T` model *`reduction-binary-operation`*`<BinaryOperation, T>` only if:

(10.1) — `BinaryOperation` is a binary element-wise operation and the operation is commutative.

(10.2) — An object of type `BinaryOperation` can be invoked with two arguments of type `basic_simd<T, Abi>`, with unspecified ABI tag `Abi`, returning a `basic_simd<T, Abi>`.

29.10.2.2 simd ABI tags [simd.expos.abi]

```
template<class T> using native-abi = see below;
template<class T, simd-size-type N> using deduce-abi-t = see below;
```

1 An *ABI tag* is a type that indicates a choice of size and binary representation for objects of data-parallel type.

[*Note 1*: The intent is for the size and binary representation to depend on the target architecture and compiler flags. The ABI tag, together with a given element type, implies the width. — *end note*]

2 [*Note 2*: The ABI tag is orthogonal to selecting the machine instruction set. The selected machine instruction set limits the usable ABI tag types, though (see 29.10.6.1). The ABI tags enable users to safely pass objects of data-parallel type between translation unit boundaries (e.g., function calls or I/O). — *end note*]

3 An implementation defines ABI tag types as necessary for the following aliases.

4 *`deduce-abi-t`*`<T, N>` is defined if

(4.1) — `T` is a vectorizable type,

(4.2) — `N` is greater than zero, and

(4.3) — `N` is not larger than an implementation-defined maximum.

The implementation-defined maximum for `N` is not smaller than 64 and can differ depending on `T`.

5 Where present, *`deduce-abi-t`*`<T, N>` names an ABI tag type such that

(5.1) — *`simd-size-v`*`<T,` *`deduce-abi-t`*`<T, N>>` equals `N`,

(5.2) — `basic_simd<T,` *`deduce-abi-t`*`<T, N>>` is enabled (29.10.6.1), and

(5.3) — `basic_simd_mask<sizeof(T),` *`deduce-abi-t`*`<`*`integer-from`*`<sizeof(T)>, N>>` is enabled.

6 *`native-abi`*`<T>` is an implementation-defined alias for an ABI tag. `basic_simd<T,` *`native-abi`*`<T>>` is an enabled specialization.

[*Note 3*: The intent is to use the ABI tag producing the most efficient data-parallel execution for the element type `T` on the currently targeted system. For target architectures with ISA extensions, compiler flags can change the type of the *`native-abi`*`<T>` alias. — *end note*]

[*Example 1*: Consider a target architecture supporting the ABI tags `__simd128` and `__simd256`, where hardware support for `__simd256` exists only for floating-point types. The implementation therefore defines *`native-abi`*`<T>` as an alias for

(6.1) — `__simd256` if `T` is a floating-point type, and

(6.2) — `__simd128` otherwise.

— *end example*]

29.10.3 Header <simd> synopsis [simd.syn]

```
namespace std::datapar {

29.10.4 simd type traits [simd.traits]

`template<class T, class U = typename T::value_type> struct alignment { see below };`

1 `alignment<T, U>` has a member `value` if and only if

(1.1) — `T` is a specialization of `basic_simd_mask` and `U` is `bool`, or

(1.2) — `T` is a specialization of `basic_simd` and `U` is a vectorizable type.

2 If `value` is present, the type `alignment<T, U>` is a `BinaryTypeTrait` with a base characteristic of `integral_constant<size_t, N>` for some unspecified `N` (29.10.6.2, 29.10.7.7).

[*Note 1*: `value` identifies the alignment restrictions on pointers used for (converting) loads and stores for the given type `T` on arrays of type `U`. — *end note*]

3 The behavior of a program that adds specializations for `alignment` is undefined.

`template<class T, class V> struct rebind { using type = see below; };`

4 The member `type` is present if and only if

(4.1) — `V` is a data-parallel type,

(4.2) — `T` is a vectorizable type, and

(4.3) — *`deduce-abi-t`*`<T, V::size()>` has a member type `type`.

5 If `V` is a specialization of `basic_simd`, let `Abi1` denote an ABI tag such that `basic_simd<T, Abi1>::size()` equals `V::size()`. If `V` is a specialization of `basic_simd_mask`, let `Abi1` denote an ABI tag such that `basic_simd_mask<sizeof(T), Abi1>::size()` equals `V::size()`.

6 Where present, the member typedef `type` names `basic_simd<T, Abi1>` if `V` is a specialization of `basic_simd` or `basic_simd_mask<sizeof(T), Abi1>` if `V` is a specialization of `basic_simd_mask`.

```
template<simd-size-type N, class V> struct resize { using type = see below; };
```

7 Let `T` denote

(7.1) — `typename V::value_type` if `V` is a specialization of `basic_simd`,

(7.2) — otherwise *`integer-from`*`<`*`mask-element-size`*`<V>>` if `V` is a specialization of `basic_simd_mask`.

8 The member `type` is present if and only if

(8.1) — `V` is a data-parallel type, and

(8.2) — *`deduce-abi-t`*`<T, N>` has a member type `type`.

9 If `V` is a specialization of `basic_simd`, let `Abi1` denote an ABI tag such that `basic_simd<T, Abi1>::size()` equals `V::size()`. If `V` is a specialization of `basic_simd_mask`, let `Abi1` denote an ABI tag such that `basic_simd_mask<sizeof(T), Abi1>::size()` equals `V::size()`.

10 Where present, the member typedef `type` names `basic_simd<T, Abi1>` if `V` is a specialization of `basic_simd` or `basic_simd_mask<sizeof(T), Abi1>` if `V` is a specialization of `basic_simd_mask`.

29.10.5 Load and store flags [simd.flags]

29.10.5.1 Class template `flags` overview [simd.flags.overview]

```
namespace std::datapar {
  template<class... Flags> struct flags {
    // 29.10.5.2, flags operators
    template<class... Other>
      friend consteval auto operator|(flags, flags<Other...>);
  };
}
```

1 [*Note 1*: The class template `flags` acts like an integer bit-flag for types. — *end note*]

2 *Constraints*: Every type in the parameter pack `Flags` is one of *`convert-flag`*, *`aligned-flag`*, or *`over-aligned-flag`*`<N>`.

29.10.5.2 `flags` operators [simd.flags.oper]

```
template<class... Other>
  friend consteval auto operator|(flags a, flags<Other...> b);
```

1 *Returns*: A default-initialized object of type `flags<Flags2...>` for some `Flags2` where every type in `Flags2` is present either in template parameter pack `Flags` or in template parameter pack `Other`, and every type in template parameter packs `Flags` and `Other` is present in `Flags2`. If the packs `Flags` and `Other` contain two different specializations *`overaligned-flag`*`<N1>` and *`overaligned-flag`*`<N2>`, `Flags2` is not required to contain the specialization *`overaligned-flag`*`<std::min(N1, N2)>`.

29.10.6 Class template `basic_simd` [simd.class]

29.10.6.1 Class template `basic_simd` overview [simd.overview]

```
namespace std::datapar {
  template<class T, class Abi> class basic_simd {
  public:
    using value_type = T;
    using mask_type = basic_simd_mask<sizeof(T), Abi>;
    using abi_type = Abi;

    static constexpr integral_constant<simd-size-type, simd-size-v<T, Abi>> size {};
```

```
constexpr basic_simd() noexcept = default;

// 29.10.6.2, basic_simd constructors
template<class U> constexpr explicit(see below) basic_simd(U&& value) noexcept;
template<class U, class UAbi>
  constexpr explicit(see below) basic_simd(const basic_simd<U, UAbi>&) noexcept;
template<class G> constexpr explicit basic_simd(G&& gen) noexcept;
template<class R, class... Flags>
  constexpr basic_simd(R&& range, flags<Flags...> = {});
template<class R, class... Flags>
  constexpr basic_simd(R&& range, const mask_type& mask, flags<Flags...> = {});
template<simd-floating-point V>
  constexpr explicit(see below) basic_simd(const V& reals, const V& imags = {}) noexcept;

// 29.10.6.3, basic_simd subscript operators
constexpr value_type operator[](simd-size-type) const;

// 29.10.6.4, basic_simd unary operators
constexpr basic_simd& operator++() noexcept;

friend constexpr mask_type operator>=(const basic_simd&, const basic_simd&) noexcept;
friend constexpr mask_type operator<=(const basic_simd&, const basic_simd&) noexcept;
friend constexpr mask_type operator>(const basic_simd&, const basic_simd&) noexcept;
friend constexpr mask_type operator<(const basic_simd&, const basic_simd&) noexcept;
```

```
    // 29.10.7.4, basic_simd complex-value accessors
    constexpr auto real() const noexcept;
    constexpr auto imag() const noexcept;
    template<simd-floating-point V>
      constexpr void real(const V& v) noexcept;
    template<simd-floating-point V>
      constexpr void imag(const V& v) noexcept;

    // 29.10.7.5, basic_simd exposition only conditional operators
    friend constexpr basic_simd simd-select-impl( // exposition only
      const mask_type&, const basic_simd&, const basic_simd&) noexcept;
  };

  template<class R, class... Ts>
    basic_simd(R&& r, Ts...) -> see below;
}
```

1 Every specialization of `basic_simd` is a complete type. The specialization of `basic_simd<T, Abi>` is

(1.1) — enabled, if `T` is a vectorizable type, and there exists value `N` in the range $[1, 64]$, such that `Abi` is *`deduce-abi-t`*`<T, N>`,

(1.2) — otherwise, disabled, if `T` is not a vectorizable type,

(1.3) — otherwise, it is implementation-defined if such a specialization is enabled.

If `basic_simd<T, Abi>` is disabled, then the specialization has a deleted default constructor, deleted destructor, deleted copy constructor, and deleted copy assignment. In addition only the `value_type`, `abi_type`, and `mask_type` members are present.

If `basic_simd<T, Abi>` is enabled, then `basic_simd<T, Abi>` is trivially copyable, default-initialization of an object of such a type default-initializes all elements, and value-initialization value-initializes all elements (9.5.1).

2 *Recommended practice*: Implementations should support implicit conversions between specializations of `basic_simd` and appropriate implementation-defined types.

[*Note 1*: Appropriate types are non-standard vector types which are available in the implementation. — *end note*]

29.10.6.2 basic_simd constructors [simd.ctor]

```
template<class U> constexpr explicit(see below) basic_simd(U&& value) noexcept;
```

1 Let `From` denote the type `remove_cvref_t<U>`.

2 *Constraints*: `value_type` satisfies `constructible_from<U>`.

3 *Effects*: Initializes each element to the value of the argument after conversion to `value_type`.

4 *Remarks*: The expression inside `explicit` evaluates to `false` if and only if `U` satisfies `convertible_to<value_type>`, and either

(4.1) — `From` is not an arithmetic type and does not satisfy *`constexpr-wrapper-like`*,

(4.2) — `From` is an arithmetic type and the conversion from `From` to `value_type` is value-preserving (29.10.1), or

(4.3) — `From` satisfies *`constexpr-wrapper-like`*, `remove_const_t<decltype(From::value)>` is an arithmetic type, and `From::value` is representable by `value_type`.

```
template<class U, class UAbi>
  constexpr explicit(see below) basic_simd(const basic_simd<U, UAbi>& x) noexcept;
```

5 *Constraints*: *`simd-size-v`*`<U, UAbi> == size()` is `true`.

6 *Effects*: Initializes the i^{th} element with `static_cast<T>(x[`i`])` for all i in the range of $[$`0`$,$ `size()`$)$.

7 *Remarks*: The expression inside `explicit` evaluates to `true` if either

(7.1) — the conversion from `U` to `value_type` is not value-preserving, or

(7.2) — both `U` and `value_type` are integral types and the integer conversion rank (6.8.6) of `U` is greater than the integer conversion rank of `value_type`, or

(7.3) — both `U` and `value_type` are floating-point types and the floating-point conversion rank (6.8.6) of `U` is greater than the floating-point conversion rank of `value_type`.

```
template<class G> constexpr explicit basic_simd(G&& gen);
```

8 Let $\texttt{From}_i$ denote the type `decltype(gen(integral_constant<`*`simd-size-type`*` , `*i*`>()))`.

9 *Constraints*: $\texttt{From}_i$ satisfies `convertible_to<value_type>` for all i in the range of $[$`0, size()`$)$. In addition, for all i in the range of $[$`0, size()`$)$, if $\texttt{From}_i$ is an arithmetic type, conversion from $\texttt{From}_i$ to `value_type` is value-preserving.

10 *Effects*: Initializes the i^{th} element with `static_cast<value_type>(gen(integral_constant<`*`simd-size-type`*` , i>()))` for all i in the range of $[$`0, size()`$)$.

11 *Remarks*: `gen` is invoked exactly once for each i, in increasing order of i.

```
template<class R, class... Flags>
  constexpr basic_simd(R&& r, flags<Flags...> = {});
template<class R, class... Flags>
  constexpr basic_simd(R&& r, const mask_type& mask, flags<Flags...> = {});
```

12 Let `mask` be `mask_type(true)` for the overload with no `mask` parameter.

13 *Constraints*:

(13.1) — `R` models `ranges::@contiguous_range@` and `ranges::@sized_range@`,

(13.2) — `ranges::size(r)` is a constant expression, and

(13.3) — `ranges::size(r)` is equal to `size()`.

14 *Mandates*:

(14.1) — `ranges::range_value_t<R>` is a vectorizable type, and

(14.2) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `ranges::range_value_t<R>` to `value_type` is value-preserving.

15 *Preconditions*:

(15.1) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(range)` points to storage aligned by `alignment_v<basic_simd, ranges::range_value_t<R>>`.

(15.2) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(range)` points to storage aligned by `N`.

16 *Effects*: Initializes the i^{th} element with `mask[`*i*`] ? static_cast<T>(ranges::data(range)[`*i*`]) : T()` for all i in the range of $[$`0, size()`$)$.

```
template<class R, class... Ts>
  basic_simd(R&& r, Ts...) -> see below;
```

17 *Constraints*:

(17.1) — `R` models `ranges::@contiguous_range@` and `ranges::@sized_range@`, and

(17.2) — `ranges::size(r)` is a constant expression.

18 *Remarks*: The deduced type is equivalent to `simd<ranges::range_value_t<R>, ranges::size(r)>`.

```
template<simd-floating-point V>
  constexpr explicit(see below)
    basic_simd(const V& reals, const V& imags = {}) noexcept;
```

19 *Constraints*:

(19.1) — *`simd-complex`*`<basic_simd>` is modeled, and

(19.2) — `V::size() == size()` is `true`.

20 *Effects*: Initializes the i^{th} element with `value_type(reals[`*i*`], imags[`*i*`])` for all i in the range $[$`0, size()`$)$.

21 *Remarks*: The expression inside `explicit` evaluates to `false` if and only if the floating-point conversion rank of `T::value_type` is greater than or equal to the floating-point conversion rank of `V::value_type`.

29.10.6.3 `basic_simd` subscript operator [simd.subscr]

```
constexpr value_type operator[](simd-size-type i) const;
```

1 *Preconditions*: `i >= 0 && i < size()` is `true`.

2 *Returns*: The value of the i^{th} element.

3 *Throws*: Nothing.

29.10.6.4 `basic_simd` unary operators [simd.unary]

1 Effects in [simd.unary] are applied as unary element-wise operations.

```
constexpr basic_simd& operator++() noexcept;
```

2 *Constraints*: `requires (value_type a) { ++a; }` is `true`.

3 *Effects*: Increments every element by one.

4 *Returns*: `*this`.

```
constexpr basic_simd operator++(int) noexcept;
```

5 *Constraints*: `requires (value_type a) { a++; }` is `true`.

6 *Effects*: Increments every element by one.

7 *Returns*: A copy of `*this` before incrementing.

```
constexpr basic_simd& operator--() noexcept;
```

8 *Constraints*: `requires (value_type a) { --a; }` is `true`.

9 *Effects*: Decrements every element by one.

10 *Returns*: `*this`.

```
constexpr basic_simd operator--(int) noexcept;
```

11 *Constraints*: `requires (value_type a) { a--; }` is `true`.

12 *Effects*: Decrements every element by one.

13 *Returns*: A copy of `*this` before decrementing.

```
constexpr mask_type operator!() const noexcept;
```

14 *Constraints*: `requires (const value_type a) { !a; }` is `true`.

15 *Returns*: A `basic_simd_mask` object with the i^{th} element set to `!operator[](`i`)` for all i in the range of $[0,$ `size()`$)$.

```
constexpr basic_simd operator~() const noexcept;
```

16 *Constraints*: `requires (const value_type a) { ~a; }` is `true`.

17 *Returns*: A `basic_simd` object with the i^{th} element set to `~operator[](`i`)` for all i in the range of $[0,$ `size()`$)$.

```
constexpr basic_simd operator+() const noexcept;
```

18 *Constraints*: `requires (const value_type a) { +a; }` is `true`.

19 *Returns*: `*this`.

```
constexpr basic_simd operator-() const noexcept;
```

20 *Constraints*: `requires (const value_type a) { -a; }` is `true`.

21 *Returns*: A `basic_simd` object where the i^{th} element is initialized to `-operator[](`i`)` for all i in the range of $[0,$ `size()`$)$.

29.10.7 `basic_simd` non-member operations [simd.nonmembers]

29.10.7.1 `basic_simd` binary operators [simd.binary]

```
friend constexpr basic_simd operator+(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator-(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator*(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator/(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator%(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator&(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator|(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator^(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator<<(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd operator>>(const basic_simd& lhs, const basic_simd& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a op b; }` is `true`.

3 *Returns*: A `basic_simd` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

```
friend constexpr basic_simd operator<<(const basic_simd& v, simd-size-type n) noexcept;
friend constexpr basic_simd operator>>(const basic_simd& v, simd-size-type n) noexcept;
```

4 Let *op* be the operator.

5 *Constraints*: `requires (value_type a, simd-size-type b) { a op b; }` is `true`.

6 *Returns*: A `basic_simd` object where the i^{th} element is initialized to the result of applying *op* to `v[`*i*`]` and `n` for all *i* in the range of $[0, \texttt{size()})$.

29.10.7.2 `basic_simd` compound assignment [simd.cassign]

```
friend constexpr basic_simd& operator+=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator-=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator*=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator/=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator%=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator&=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator|=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator^=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator<<=(basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr basic_simd& operator>>=(basic_simd& lhs, const basic_simd& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a op b; }` is `true`.

3 *Effects*: These operators apply the indicated operator to `lhs` and `rhs` as an element-wise operation.

4 *Returns*: `lhs`.

```
friend constexpr basic_simd& operator<<=(basic_simd& lhs, simd-size-type n) noexcept;
friend constexpr basic_simd& operator>>=(basic_simd& lhs, simd-size-type n) noexcept;
```

5 Let *op* be the operator.

6 *Constraints*: `requires (value_type a, simd-size-type b) { a op b; }` is `true`.

7 *Effects*: Equivalent to: `return operator op (lhs, basic_simd(n));`

29.10.7.3 `basic_simd` compare operators [simd.comparison]

```
friend constexpr mask_type operator==(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr mask_type operator!=(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr mask_type operator>=(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr mask_type operator<=(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr mask_type operator>(const basic_simd& lhs, const basic_simd& rhs) noexcept;
friend constexpr mask_type operator<(const basic_simd& lhs, const basic_simd& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a op b; }` is `true`.

3 *Returns*: A `basic_simd_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.7.4 simd complex accessors [simd.complex.access]

```
constexpr auto real() const noexcept;
constexpr auto imag() const noexcept;
```

1 *Constraints*: *simd-complex*<basic_simd> is modeled.

2 *Returns*: An object of type `rebind_t<typename T::value_type, basic_simd>` where the i^{th} element is initialized to the result of *cmplx-func*(`operator[](`*i*`)`) for all *i* in the range [0, `size()`), where *cmplx-func* is the corresponding function from `<complex>`.

```
template<simd-floating-point V>
  constexpr void real(const V& v) noexcept;
template<simd-floating-point V>
  constexpr void imag(const V& v) noexcept;
```

3 *Constraints*:

(3.1) — *simd-complex*<basic_simd> is modeled,

(3.2) — `same_as<typename V::value_type, typename T::value_type>` is modeled, and

(3.3) — `V::size() == size()` is `true`.

4 *Effects*: Replaces each element of the `basic_simd` object such that the i^{th} element is replaced with `value_type(v[`*i*`], operator[](`*i*`).imag())` or `value_type(operator[](`*i*`).real(), v[`*i*`])` for `real` and `imag` respectively, for all *i* in the range [0, `size()`).

29.10.7.5 basic_simd exposition only conditional operators [simd.cond]

```
friend constexpr basic_simd
simd-select-impl(const mask_type& mask, const basic_simd& a, const basic_simd& b) noexcept;
```

1 *Returns*: A `basic_simd` object where the i^{th} element equals `mask[`*i*`] ? a[`*i*`] : b[`*i*`]` for all *i* in the range of [0, `size()`).

29.10.7.6 basic_simd reductions [simd.reductions]

```
template<class T, class Abi, class BinaryOperation = plus<>>
  constexpr T reduce(const basic_simd<T, Abi>& x, BinaryOperation binary_op = {});
```

1 *Constraints*: `BinaryOperation` models *reduction-binary-operation*<T>.

2 *Preconditions*: `binary_op` does not modify `x`.

3 *Returns*: *GENERALIZED_SUM*(`binary_op, simd<T, 1>(x[0]), ..., simd<T, 1>(x[x.size() - 1])`)`[0]` (26.10.2).

4 *Throws*: Any exception thrown from `binary_op`.

```
template<class T, class Abi, class BinaryOperation = plus<>>
  constexpr T reduce(
    const basic_simd<T, Abi>& x, const typename basic_simd<T, Abi>::mask_type& mask,
    BinaryOperation binary_op = {}, type_identity_t<T> identity_element = see below);
```

5 *Constraints*:

(5.1) — `BinaryOperation` models *reduction-binary-operation*<T>.

(5.2) — An argument for `identity_element` is provided for the invocation, unless `BinaryOperation` is one of `plus<>`, `multiplies<>`, `bit_and<>`, `bit_or<>`, or `bit_xor<>`.

6 *Preconditions*:

(6.1) — `binary_op` does not modify `x`.

(6.2) — For all finite values `y` representable by `T`, the results of `y == binary_op(simd<T, 1>(identity_element), simd<T, 1>(y))[0]` and `y == binary_op(simd<T, 1>(y), simd<T, 1>(identity_element))[0]` are `true`.

7 *Returns*: If `none_of(mask)` is `true`, returns `identity_element`. Otherwise, returns *GENERALIZED_SUM*(`binary_op, simd<T, 1>(x[`k_0`]), ..., simd<T, 1>(x[`k_n`])`)`[0]` where $k_0, \ldots, k_n$ are the selected indices of `mask`.

8 *Throws*: Any exception thrown from `binary_op`.

9 *Remarks*: The default argument for `identity_element` is equal to

(9.1) — `T()` if `BinaryOperation` is `plus<>`,

(9.2) — `T(1)` if `BinaryOperation` is `multiplies<>`,

(9.3) — `T(~T())` if `BinaryOperation` is `bit_and<>`,

(9.4) — `T()` if `BinaryOperation` is `bit_or<>`, or

(9.5) — `T()` if `BinaryOperation` is `bit_xor<>`.

```
template<class T, class Abi> constexpr T reduce_min(const basic_simd<T, Abi>& x) noexcept;
```

10 *Constraints*: `T` models `totally_ordered`.

11 *Returns*: The value of an element `x[`*j*`]` for which `x[`*i*`] < x[`*j*`]` is `false` for all *i* in the range of $[0,$ `basic_simd<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr T reduce_min(
    const basic_simd<T, Abi>&, const typename basic_simd<T, Abi>::mask_type&) noexcept;
```

12 *Constraints*: `T` models `totally_ordered`.

13 *Returns*: If `none_of(mask)` is `true`, returns `numeric_limits<T>::max()`. Otherwise, returns the value of a selected element `x[`*j*`]` for which `x[`*i*`] < x[`*j*`]` is `false` for all selected indices *i* of `mask`.

```
template<class T, class Abi> constexpr T reduce_max(const basic_simd<T, Abi>& x) noexcept;
```

14 *Constraints*: `T` models `totally_ordered`.

15 *Returns*: The value of an element `x[`*j*`]` for which `x[`*j*`] < x[`*i*`]` is `false` for all *i* in the range of $[0,$ `basic_simd<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr T reduce_max(
    const basic_simd<T, Abi>&, const typename basic_simd<T, Abi>::mask_type&) noexcept;
```

16 *Constraints*: `T` models `totally_ordered`.

17 *Returns*: If `none_of(mask)` is `true`, returns `numeric_limits<V::value_type>::lowest()`. Otherwise, returns the value of a selected element `x[`*j*`]` for which `x[`*j*`] < x[`*i*`]` is `false` for all selected indices *i* of `mask`.

29.10.7.7 `basic_simd` load and store functions [simd.loadstore]

```
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_load(R&& r, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_load(R&& r, const typename V::mask_type& mask, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V unchecked_load(I first, iter_difference_t<I> n, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V unchecked_load(I first, iter_difference_t<I> n, const typename V::mask_type& mask,
                             flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V unchecked_load(I first, S last, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V unchecked_load(I first, S last, const typename V::mask_type& mask,
                             flags<Flags...> f = {});
```

1 Let

(1.1) — `mask` be `V::mask_type(true)` for the overloads with no `mask` parameter;

(1.2) — `R` be `span<const iter_value_t<I>>` for the overloads with no template parameter `R`;

(1.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

2 *Mandates*: If `ranges::size(r)` is a constant expression then `ranges::size(r)` $\geq$ `V::size()`.

3 *Preconditions*:

(3.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(3.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(3.3) — `ranges::size(r)` $\geq$ `V::size()`

4 *Effects*: Equivalent to: `return partial_load<V>(r, mask, f);`

5 *Remarks*: The default argument for template parameter `V` is `basic_simd<ranges::range_value_t<R>>`.

```
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_load(R&& r, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_load(R&& r, const typename V::mask_type& mask, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V partial_load(I first, iter_difference_t<I> n, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V partial_load(I first, iter_difference_t<I> n, const typename V::mask_type& mask,
                           flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V partial_load(I first, S last, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V partial_load(I first, S last, const typename V::mask_type& mask,
                           flags<Flags...> f = {});
```

6 Let

(6.1) — `mask` be `V::mask_type(true)` for the overloads with no `mask` parameter;

(6.2) — `R` be `span<const iter_value_t<I>>` for the overloads with no template parameter `R`;

(6.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

7 *Mandates*:

(7.1) — `ranges::range_value_t<R>` is a vectorizable type,

(7.2) — `same_as<remove_cvref_t<V>, V>` is `true`,

(7.3) — `V` is an enabled specialization of `basic_simd`, and

(7.4) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `ranges::range_value_t<R>` to `V::value_type` is value-preserving.

8 *Preconditions*:

(8.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(8.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(8.3) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(r)` points to storage aligned by `alignment_v<V, ranges::range_value_t<R>>`.

(8.4) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(r)` points to storage aligned by `N`.

9 *Effects*: Initializes the i^{th} element with `mask[`*i*`] && `*i*` < ranges::size(r) ? static_cast<T>(ranges::data(r)[`*i*`]) : T()` for all *i* in the range of [`0`, `V::size()`).

10 *Remarks*: The default argument for template parameter `V` is `basic_simd<ranges::range_value_t<R>>`.

```
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R> && indirectly_writable<ranges::iterator_t<R>, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, R&& r, flags<Flags...> f = {});
```

```
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R> && indirectly_writable<ranges::iterator_t<R>, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, R&& r,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, I first, iter_difference_t<I> n,
                                 flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, I first, iter_difference_t<I> n,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, I first, S last,
                                 flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void unchecked_store(const basic_simd<T, Abi>& v, I first, S last,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
```

11 Let

(11.1) — `mask` be `basic_simd<T, Abi>::mask_type(true)` for the overloads with no `mask` parameter;

(11.2) — `R` be `span<iter_value_t<I>>` for the overloads with no template parameter `R`;

(11.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

12 *Mandates*: If `ranges::size(r)` is a constant expression then `ranges::size(r)` ≥ *`simd-size-v`*`<T, Abi>`.

13 *Preconditions*:

(13.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(13.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(13.3) — `ranges::size(r)` ≥ *`simd-size-v`*`<T, Abi>`

14 *Effects*: Equivalent to: `partial_store(v, r, mask, f)`.

```
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R> && indirectly_writable<ranges::iterator_t<R>, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, R&& r, flags<Flags...> f = {});
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R> && indirectly_writable<ranges::iterator_t<R>, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, R&& r,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, I first, iter_difference_t<I> n,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, I first, iter_difference_t<I> n,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, I first, S last,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  requires indirectly_writable<I, T>
  constexpr void partial_store(const basic_simd<T, Abi>& v, I first, S last,
    const typename basic_simd<T, Abi>::mask_type& mask, flags<Flags...> f = {});
```

15 Let

(15.1) — `mask` be `basic_simd<T, Abi>::mask_type(true)` for the overloads with no `mask` parameter;

(15.2) — `R` be `span<iter_value_t<I>>` for the overloads with no template parameter `R`;

(15.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

16 *Mandates*:

(16.1) — `ranges::range_value_t<R>` is a vectorizable type, and

(16.2) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `T` to `ranges::range_value_t<R>` is value-preserving.

17 *Preconditions*:

(17.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(17.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(17.3) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(r)` points to storage aligned by `alignment_v<basic_simd<T, Abi>, ranges::range_value_t<R>>`.

(17.4) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(r)` points to storage aligned by `N`.

18 *Effects*: For all i in the range of [`0`, `basic_simd<T, Abi>::size()`), if `mask[`i`] && `i` < ranges::size(r)` is `true`, evaluates `ranges::data(r)[`i`] = v[`i`]`.

29.10.7.8 `basic_simd` and `basic_simd_mask` creation [simd.creation]

```
template<class T, class Abi>
  constexpr auto chunk(const basic_simd<typename T::value_type, Abi>& x) noexcept;
template<class T, class Abi>
  constexpr auto chunk(const basic_simd_mask<mask-element-size<T>, Abi>& x) noexcept;
```

1 *Constraints*:

(1.1) — For the first overload `T` is an enabled specialization of `basic_simd`. If `basic_simd<typename T::value_type, Abi>::size() % T::size()` is not `0` then `resize_t<basic_simd<typename T::value_type, Abi>::size() % T::size(), T>` is valid and denotes a type.

(1.2) — For the second overload `T` is an enabled specialization of `basic_simd_mask`. If `basic_simd_mask<`*`mask-element-size`*`<T>, Abi>::size() % T::size()` is not `0` then `resize_t<basic_simd_mask<`*`mask-element-size`*`<T>, Abi>::size() % T::size(), T>` is valid and denotes a type.

2 Let N be `x.size() / T::size()`.

3 *Returns*:

(3.1) — If `x.size() % T::size() == 0` is `true`, an `array<T, `N`>` with the i^{th} `basic_simd` or `basic_simd_mask` element of the j^{th} `array` element initialized to the value of the element in `x` with index i `+` j `* T::size()`.

(3.2) — Otherwise, a `tuple` of N objects of type `T` and one object of type `resize_t<x.size() % T::size(), T>`. The i^{th} `basic_simd` or `basic_simd_mask` element of the j^{th} `tuple` element of type `T` is initialized to the value of the element in `x` with index i `+` j `* T::size()`. The i^{th} `basic_simd` or `basic_simd_mask` element of the N^{th} `tuple` element is initialized to the value of the element in `x` with index i `+` N `* T::size()`.

```
template<size_t N, class T, class Abi>
  constexpr auto chunk(const basic_simd<T, Abi>& x) noexcept;
```

4 *Effects*: Equivalent to: `return chunk<resize_t<N, basic_simd<T, Abi>>>(x);`

```
template<size_t N, size_t Bytes, class Abi>
  constexpr auto chunk(const basic_simd_mask<Bytes, Abi>& x) noexcept;
```

5 *Effects*: Equivalent to: `return chunk<resize_t<N, basic_simd_mask<Bytes, Abi>>>(x);`

```
template<class T, class... Abis>
  constexpr simd<T, (basic_simd<T, Abis>::size() + ...)>
    cat(const basic_simd<T, Abis>&... xs) noexcept;
```

```
template<size_t Bytes, class... Abis>
  constexpr basic_simd_mask<Bytes, deduce-abi-t<integer-from<Bytes>,
                            (basic_simd_mask<Bytes, Abis>::size() + ...)>>
    cat(const basic_simd_mask<Bytes, Abis>&... xs) noexcept;
```

6 *Constraints*:

(6.1) — For the first overload `simd<T, (basic_simd<T, Abis>::size() + ...)>` is enabled.

(6.2) — For the second overload `basic_simd_mask<Bytes, deduce-abi-t<integer-from<Bytes>, (basic_simd_mask<Bytes, Abis>::size() + ...)>>` is enabled.

7 *Returns*: A data-parallel object initialized with the concatenated values in the `xs` pack of data-parallel objects: The i^{th} `basic_simd`/`basic_simd_mask` element of the j^{th} parameter in the `xs` pack is copied to the return value's element with index i + the sum of the width of the first j parameters in the `xs` pack.

29.10.7.9 Algorithms [simd.alg]

```
template<class T, class Abi>
  constexpr basic_simd<T, Abi> min(const basic_simd<T, Abi>& a,
                                   const basic_simd<T, Abi>& b) noexcept;
```

1 *Constraints*: `T` models `totally_ordered`.

2 *Returns*: The result of the element-wise application of `min(a[`i`], b[`i`])` for all i in the range of $[0,$ `basic_simd<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr basic_simd<T, Abi> max(const basic_simd<T, Abi>& a,
                                   const basic_simd<T, Abi>& b) noexcept;
```

3 *Constraints*: `T` models `totally_ordered`.

4 *Returns*: The result of the element-wise application of `max(a[`i`], b[`i`])` for all i in the range of $[0,$ `basic_simd<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr pair<basic_simd<T, Abi>, basic_simd<T, Abi>>
    minmax(const basic_simd<T, Abi>& a, const basic_simd<T, Abi>& b) noexcept;
```

5 *Effects*: Equivalent to: `return pair{min(a, b), max(a, b)};`

```
template<class T, class Abi>
  constexpr basic_simd<T, Abi> clamp(
    const basic_simd<T, Abi>& v, const basic_simd<T, Abi>& lo, const basic_simd<T, Abi>& hi);
```

6 *Constraints*: `T` models `totally_ordered`.

7 *Preconditions*: No element in `lo` shall be greater than the corresponding element in `hi`.

8 *Returns*: The result of element-wise application of `clamp(v[`i`], lo[`i`], hi[`i`])` for all i in the range of $[0,$ `basic_simd<T, Abi>::size()`$)$.

```
template<class T, class U>
  constexpr auto select(bool c, const T& a, const U& b)
  -> remove_cvref_t<decltype(c ? a : b)>;
```

9 *Effects*: Equivalent to: `return c ? a : b;`

```
template<size_t Bytes, class Abi, class T, class U>
  constexpr auto select(const basic_simd_mask<Bytes, Abi>& c, const T& a, const U& b)
  noexcept -> decltype(simd-select-impl(c, a, b));
```

10 *Effects*: Equivalent to:

```
  return simd-select-impl(c, a, b);
```

where *`simd-select-impl`* is found by argument-dependent lookup (6.5.4) contrary to 16.4.2.2.

29.10.7.10 Mathematical functions [simd.math]

template<class V0, class V1>
  constexpr typename math-common-simd-t<V0, V1>::mask_type islessgreater(const V0& x, const V1& y);
template<class V0, class V1>
  constexpr typename math-common-simd-t<V0, V1>::mask_type isunordered(const V0& x, const V1& y);
```

1 Let `Ret` denote the return type of the specialization of a function template with the name *math-func*. Let *math-func-simd* denote:

```
template<class... Args>
Ret math-func-simd(Args... args) {
  return Ret([&](simd-size-type i) {
      math-func(make-compatible-simd-t<Ret, Args>(args)[i]...);
  });
}
```

2 *Returns*: A value `ret` of type `Ret`, that is element-wise equal to the result of calling *math-func-simd* with the arguments of the above functions. If in an invocation of a scalar overload of *math-func* for index `i` in *math-func-simd* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

3 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<math-floating-point V> constexpr deduced-simd-t<V> acos(const V& x);
template<math-floating-point V> constexpr deduced-simd-t<V> asin(const V& x);
template<math-floating-point V> constexpr deduced-simd-t<V> atan(const V& x);

template<math-floating-point V> deduced-simd-t<V> sph_neumann(const rebind_t<unsigned,
deduced-simd-t<V>>& n, const V& x);
```

4 Let `Ret` denote the return type of the specialization of a function template with the name *math-func*. Let *math-func-simd* denote:

```
template<class... Args>
Ret math-func-simd(Args... args) {
  return Ret([&](simd-size-type i) {
      math-func(make-compatible-simd-t<Ret, Args>(args)[i]...);
  });
}
```

5 *Returns*: A value `ret` of type `Ret`, that is element-wise approximately equal to the result of calling *math-func-simd* with the arguments of the above functions. If in an invocation of a scalar overload of *math-func* for index `i` in *math-func-simd* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

6 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<math-floating-point V>
  constexpr deduced-simd-t<V> frexp(const V& value, rebind_t<int, deduced-simd-t<V>>* exp);
```

7 Let `Ret` be `deduced-simd-t<V>`. Let *frexp-simd* denote:

```
template<class V>
pair<Ret, rebind_t<int, Ret>> frexp-simd(const V& x) {
  int r1[Ret::size()];
  Ret r0([&](simd-size-type i) {
    frexp(make-compatible-simd-t<Ret, V>(x)[i], &r1[i]);
  });
  return {r0, rebind_t<int, Ret>(r1)};
}
```

Let `ret` be a value of type `pair<Ret, rebind_t<int, Ret>>` that is the same value as the result of calling *frexp-simd*`(x)`.

8 *Effects*: Sets `*exp` to `ret.second`.

9 *Returns*: `ret.first`.

```
template<class V0, class V1>
  constexpr math-common-simd-t<V0, V1> remquo(const V0& x, const V1& y,
                                              rebind_t<int, math-common-simd-t<V0, V1>>* quo);
```

10 Let `Ret` be *`math-common-simd-t`*`<V0, V1>`. Let *remquo-simd* denote:

```
template<class V0, class V1>
pair<Ret, rebind_t<int, Ret>> remquo-simd(const V0& x, const V1& y) {
  int r1[Ret::size()];
  Ret r0([&](simd-size-type i) {
    remquo(make-compatible-simd-t<Ret, V0>(x)[i],
           make-compatible-simd-t<Ret, V1>(y)[i], &r1[i]);
  });
  return {r0, rebind_t<int, Ret>(r1)};
}
```

Let `ret` be a value of type `pair<Ret, rebind_t<int, Ret>>` that is the same value as the result of calling *remquo-simd*`(x, y)`. If in an invocation of a scalar overload of `remquo` for index `i` in *remquo-simd* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

11 *Effects*: Sets `*quo` to `ret.second`.

12 *Returns*: `ret.first`.

13 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<class T, class Abi>
  constexpr basic_simd<T, Abi> modf(const type_identity_t<basic_simd<T, Abi>>& value,
                                    basic_simd<T, Abi>* iptr);
```

14 Let `V` be `basic_simd<T, Abi>`. Let *modf-simd* denote:

```
pair<V, V> modf-simd(const V& x) {
  T r1[Ret::size()];
  V r0([&](simd-size-type i) {
    modf(V(x)[i], &r1[i]);
  });
  return {r0, V(r1)};
}
```

Let `ret` be a value of type `pair<V, V>` that is the same value as the result of calling *modf-simd*`(value)`.

15 *Effects*: Sets `*iptr` to `ret.second`.

16 *Returns*: `ret.first`.

29.10.7.11 `basic_simd` bit library [simd.bit]

```
template<simd-type V> constexpr V byteswap(const V& v) noexcept;
```

1 *Constraints*: The type `V::value_type` models `integral`.

2 *Returns*: A `basic_simd` object where the i^{th} element is initialized to the result of `std::byteswap(v[`i`])` for all i in the range $[0,$ `V::size()`$)$.

```
template<simd-type V> constexpr V bit_ceil(const V& v) noexcept;
```

3 *Constraints*: The type `V::value_type` is an unsigned integer type (6.8.2).

4 *Preconditions*: For every i in the range $[0,$ `V::size()`$)$, the smallest power of 2 greater than or equal to `v[`i`]` is representable as a value of type `V::value_type`.

5 *Returns*: A `basic_simd` object where the ith element is initialized to the result of `std::bit_ceil(v[`i`])` for all i in the range $[0,$ `V::size()`$)$.

6 *Remarks*: A function call expression that violates the precondition in the *Preconditions*: element is not a core constant expression (7.7).

```
template<simd-type V> constexpr V bit_floor(const V& v) noexcept;
```

7 *Constraints*: The type `V::value_type` is an unsigned integer type (6.8.2).

8 *Returns*: A `basic_simd` object where the ith element is initialized to the result of `std::bit_floor(v[`i`])` for all i in the range $[0,$ `V::size()`$)$.

```
template<simd-type V>
  constexpr typename V::mask_type has_single_bit(const V& v) noexcept;
```

9 *Constraints*: The type `V::value_type` is an unsigned integer type (6.8.2).

10 *Returns*: A `basic_simd_mask` object where the ith element is initialized to the result of `std::has_-single_bit(v[`i`])` for all i in the range $[0,$ `V::size()`$)$.

```
template<simd-type V0, simd-type V1>
  constexpr V0 rotl(const V0& v0, const V1& v1) noexcept;
template<simd-type V0, simd-type V1>
  constexpr V0 rotr(const V0& v0, const V1& v1) noexcept;
```

11 *Constraints*:

(11.1) — The type `V0::value_type` is an unsigned integer type (6.8.2),

(11.2) — the type `V1::value_type` models `integral`,

(11.3) — `V0::size() == V1::size()` is `true`, and

(11.4) — `sizeof(typename V0::value_type) == sizeof(typename V1::value_type)` is `true`.

12 *Returns*: A `basic_simd` object where the ith element is initialized to the result of *`bit-func`*`(v0[`i`], static_cast<int>(v1[`i`]))` for all i in the range $[0,$ `V0::size()`$)$, where *bit-func* is the corresponding scalar function from `<bit>`.

```
template<simd-type V> constexpr V rotl(const V& v, int s) noexcept;
template<simd-type V> constexpr V rotr(const V& v, int s) noexcept;
```

13 *Constraints*: The type `V::value_type` is an unsigned integer type (6.8.2)

14 *Returns*: A `basic_simd` object where the ith element is initialized to the result of *`bit-func`*`(v[`i`], s)` for all i in the range $[0,$ `V::size()`$)$, where *bit-func* is the corresponding scalar function from `<bit>`.

```
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> bit_width(const V& v) noexcept;
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countl_zero(const V& v) noexcept;
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countl_one(const V& v) noexcept;
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countr_zero(const V& v) noexcept;
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countr_one(const V& v) noexcept;
template<simd-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> popcount(const V& v) noexcept;
```

15 *Constraints*: The type `V::value_type` is an unsigned integer type (6.8.2)

16 *Returns*: A `basic_simd` object where the ith element is initialized to the result of *`bit-func`*`(v[`i`])` for all i in the range $[0,$ `V::size()`$)$, where *bit-func* is the corresponding scalar function from `<bit>`.

29.10.7.12 simd complex math [simd.complex.math]

```
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> real(const V&) noexcept;
```

```
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> imag(const V&) noexcept;

template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> abs(const V&);
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> arg(const V&);
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> norm(const V&);
template<simd-complex V> constexpr V conj(const V&);
template<simd-complex V> constexpr V proj(const V&);

template<simd-complex V> constexpr V exp(const V& v);
template<simd-complex V> constexpr V log(const V& v);
template<simd-complex V> constexpr V log10(const V& v);

template<simd-complex V> constexpr V sqrt(const V& v);
template<simd-complex V> constexpr V sin(const V& v);
template<simd-complex V> constexpr V asin(const V& v);
template<simd-complex V> constexpr V cos(const V& v);
template<simd-complex V> constexpr V acos(const V& v);
template<simd-complex V> constexpr V tan(const V& v);
template<simd-complex V> constexpr V atan(const V& v);
template<simd-complex V> constexpr V sinh(const V& v);
template<simd-complex V> constexpr V asinh(const V& v);
template<simd-complex V> constexpr V cosh(const V& v);
template<simd-complex V> constexpr V acosh(const V& v);
template<simd-complex V> constexpr V tanh(const V& v);
template<simd-complex V> constexpr V atanh(const V& v);
```

1 *Returns*: A `basic_simd` object `ret` where the i^{th} element is initialized to the result of *`cmplx-func`*`(v[`*i*`])` for all i in the range $[$`0`$,$ `V::size()`$)$, where *cmplx-func* is the corresponding function from `<complex>`. If in an invocation of *cmplx-func* for index i a domain, pole, or range error would occur, the value of `ret[`*i*`]` is unspecified.

2 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<simd-floating-point V>
  rebind_t<complex<typename V::value_type>, V> polar(const V& x, const V& y = {});

template<simd-complex V> constexpr V pow(const V& x, const V& y);
```

3 *Returns*: A `basic_simd` object `ret` where the i^{th} element is initialized to the result of *`cmplx-func`*`(x[`*i*`], y[`*i*`])` for all i in the range $[$`0`$,$ `V::size()`$)$, where *cmplx-func* is the corresponding function from `<complex>`. If in an invocation of *cmplx-func* for index i a domain, pole, or range error would occur, the value of `ret[`*i*`]` is unspecified.

4 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

29.10.8 Class template `basic_simd_mask` [simd.mask.class]

29.10.8.1 Class template `basic_simd_mask` overview [simd.mask.overview]

```
namespace std::datapar {
  template<size_t Bytes, class Abi> class basic_simd_mask {
  public:
    using value_type = bool;
    using abi_type = Abi;

    static constexpr integral_constant<simd-size-type, simd-size-v<integer-from<Bytes>, Abi>>
      size {};

    template<class T0, class T1>
      friend constexpr simd<see below, size()>
        simd-select-impl(const basic_simd_mask&, const T0&, const T1&) noexcept; // exposition only
  };
}
```

1 Every specialization of `basic_simd_mask` is a complete type. The specialization of `basic_simd_mask<Bytes, Abi>` is:

(1.1) — disabled, if there is no vectorizable type `T` such that `Bytes` is equal to `sizeof(T)`,

(1.2) — otherwise, enabled, if there exists a vectorizable type `T` and a value `N` in the range [`1`, `64`] such that `Bytes` is equal to `sizeof(T)` and `Abi` is `*deduce-abi-t*<T, N>`,

(1.3) — otherwise, it is implementation-defined if such a specialization is enabled.

If `basic_simd_mask<Bytes, Abi>` is disabled, the specialization has a deleted default constructor, deleted destructor, deleted copy constructor, and deleted copy assignment. In addition only the `value_type` and `abi_type` members are present.

If `basic_simd_mask<Bytes, Abi>` is enabled, `basic_simd_mask<Bytes, Abi>` is trivially copyable.

2 *Recommended practice*: Implementations should support implicit conversions between specializations of `basic_simd_mask` and appropriate implementation-defined types.

[*Note 1*: Appropriate types are non-standard vector types which are available in the implementation. — *end note*]

29.10.8.2 `basic_simd_mask` constructors [simd.mask.ctor]

```
constexpr explicit basic_simd_mask(value_type x) noexcept;
```

1 *Effects*: Initializes each element with `x`.

```
template<size_t UBytes, class UAbi>
  constexpr explicit basic_simd_mask(const basic_simd_mask<UBytes, UAbi>& x) noexcept;
```

2 *Constraints*: `basic_simd_mask<UBytes, UAbi>::size() == size()` is `true`.

3 *Effects*: Initializes the i^{th} element with `x[`i`]` for all i in the range of [`0`, `size()`).

```
template<class G> constexpr explicit basic_simd_mask(G&& gen);
```

4 *Constraints*: The expression `gen(integral_constant<`*`simd-size-type`*`, i>())` is well-formed and its type is `bool` for all i in the range of [`0`, `size()`).

5 *Effects*: Initializes the i^{th} element with `gen(integral_constant<`*`simd-size-type`*`, i>())` for all i in the range of [`0`, `size()`).

6 *Remarks*: `gen` is invoked exactly once for each i, in increasing order of i.

29.10.8.3 `basic_simd_mask` subscript operator [simd.mask.subscr]

```
constexpr value_type operator[](simd-size-type i) const;
```

1 *Preconditions*: `i >= 0 && i < size()` is `true`.

2 *Returns*: The value of the i^{th} element.

3 *Throws*: Nothing.

29.10.8.4 `basic_simd_mask` unary operators [simd.mask.unary]

```
constexpr basic_simd_mask operator!() const noexcept;
constexpr basic_simd<integer-from<Bytes>, Abi> operator+() const noexcept;
constexpr basic_simd<integer-from<Bytes>, Abi> operator-() const noexcept;
constexpr basic_simd<integer-from<Bytes>, Abi> operator~() const noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A data-parallel object where the i^{th} element is initialized to the results of applying *op* to `operator[](`i`)` for all i in the range of [`0`, `size()`).

29.10.8.5 `basic_simd_mask` conversion operators [simd.mask.conv]

```
template<class U, class A>
  constexpr explicit(sizeof(U) != Bytes) operator basic_simd<U, A>() const noexcept;
```

1 *Constraints*: `*simd-size-v*<U, A> == *simd-size-v*<T, Abi>`.

2 *Returns*: A data-parallel object where the i^{th} element is initialized to `static_cast<U>(operator[](`i`))`.

29.10.9 Non-member operations [simd.mask.nonmembers]

29.10.9.1 `basic_simd_mask` binary operators [simd.mask.binary]

```
friend constexpr basic_simd_mask
  operator&&(const basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask
  operator||(const basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask
  operator& (const basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask
  operator| (const basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask
  operator^ (const basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A `basic_simd_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.9.2 `basic_simd_mask` compound assignment [simd.mask.cassign]

```
friend constexpr basic_simd_mask&
  operator&=(basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask&
  operator|=(basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
friend constexpr basic_simd_mask&
  operator^=(basic_simd_mask& lhs, const basic_simd_mask& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Effects*: These operators apply *op* to `lhs` and `rhs` as a binary element-wise operation.

3 *Returns*: `lhs`.

29.10.9.3 `basic_simd_mask` comparisons [simd.mask.comparison]

```
friend constexpr basic_simd_mask
  operator==(const basic_simd_mask&, const basic_simd_mask&) noexcept;
friend constexpr basic_simd_mask
  operator!=(const basic_simd_mask&, const basic_simd_mask&) noexcept;
friend constexpr basic_simd_mask
  operator>=(const basic_simd_mask&, const basic_simd_mask&) noexcept;
friend constexpr basic_simd_mask
  operator<=(const basic_simd_mask&, const basic_simd_mask&) noexcept;
friend constexpr basic_simd_mask
  operator>(const basic_simd_mask&, const basic_simd_mask&) noexcept;
friend constexpr basic_simd_mask
  operator<(const basic_simd_mask&, const basic_simd_mask&) noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A `basic_simd_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.9.4 `basic_simd_mask` exposition only conditional operators [simd.mask.cond]

```
friend constexpr basic_simd_mask simd-select-impl(
  const basic_simd_mask& mask, const basic_simd_mask& a, const basic_simd_mask& b) noexcept;
```

1 *Returns*: A `basic_simd_mask` object where the i^{th} element equals `mask[`*i*`] ? a[`*i*`] : b[`*i*`]` for all i in the range of `[0, size())`.

```
friend constexpr basic_simd_mask
simd-select-impl(const basic_simd_mask& mask, same_as<bool> auto a, same_as<bool> auto b) noexcept;
```

2 *Returns*: A `basic_simd_mask` object where the i^{th} element equals `mask[`*i*`] ? a : b` for all i in the range of `[0, size())`.

```
template<class T0, class T1>
  friend constexpr simd<see below, size()>
    simd-select-impl(const basic_simd_mask& mask, const T0& a, const T1& b) noexcept;
```

3 *Constraints*:

(3.1) — `same_as<T0, T1>` is `true`,

(3.2) — `T0` is a vectorizable type, and

(3.3) — `sizeof(T0) == Bytes`.

4 *Returns*: A `simd<T0, size()>` object where the i^{th} element equals `mask[`i`] ? a : b` for all i in the range of $[0,$ `size()`$)$.

29.10.9.5 `basic_simd_mask` reductions [simd.mask.reductions]

```
template<size_t Bytes, class Abi>
  constexpr bool all_of(const basic_simd_mask<Bytes, Abi>& k) noexcept;
```

1 *Returns*: `true` if all boolean elements in `k` are `true`, otherwise `false`.

```
template<size_t Bytes, class Abi>
  constexpr bool any_of(const basic_simd_mask<Bytes, Abi>& k) noexcept;
```

2 *Returns*: `true` if at least one boolean element in `k` is `true`, otherwise `false`.

```
template<size_t Bytes, class Abi>
  constexpr bool none_of(const basic_simd_mask<Bytes, Abi>& k) noexcept;
```

3 *Returns*: `!any_of(k)`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_count(const basic_simd_mask<Bytes, Abi>& k) noexcept;
```

4 *Returns*: The number of boolean elements in `k` that are `true`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_min_index(const basic_simd_mask<Bytes, Abi>& k);
```

5 *Preconditions*: `any_of(k)` is `true`.

6 *Returns*: The lowest element index i where `k[`i`]` is `true`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_max_index(const basic_simd_mask<Bytes, Abi>& k);
```

7 *Preconditions*: `any_of(k)` is `true`.

8 *Returns*: The greatest element index i where `k[`i`]` is `true`.

```
constexpr bool all_of(same_as<bool> auto x) noexcept;
constexpr bool any_of(same_as<bool> auto x) noexcept;
constexpr simd-size-type reduce_count(same_as<bool> auto x) noexcept;
```

9 *Returns*: `x`.

```
constexpr bool none_of(same_as<bool> auto x) noexcept;
```

10 *Returns*: `!x`.

```
constexpr simd-size-type reduce_min_index(same_as<bool> auto x);
constexpr simd-size-type reduce_max_index(same_as<bool> auto x);
```

11 *Preconditions*: `x` is `true`.

12 *Returns*: `0`.

29.11 C compatibility [numerics.c]

29.11.1 Header `<stdckdint.h>` synopsis [stdckdint.h.syn]

```
#define __STDC_VERSION_STDCKDINT_H__ 202311L
```

```
  template<class type1, class type2, class type3>
    bool ckd_add(type1* result, type2 a, type3 b);
  template<class type1, class type2, class type3>
    bool ckd_sub(type1* result, type2 a, type3 b);
  template<class type1, class type2, class type3>
    bool ckd_mul(type1* result, type2 a, type3 b);
```

1 See also: ISO/IEC 9899:2024, 7.20

29.11.2 Checked integer operations [numerics.c.ckdint]

```
template<class type1, class type2, class type3>
  bool ckd_add(type1* result, type2 a, type3 b);
template<class type1, class type2, class type3>
  bool ckd_sub(type1* result, type2 a, type3 b);
template<class type1, class type2, class type3>
  bool ckd_mul(type1* result, type2 a, type3 b);
```

1 *Mandates*: Each of the types `type1`, `type2`, and `type3` is a cv-unqualified signed or unsigned integer type.

2 *Remarks*: Each function template has the same semantics as the corresponding type-generic macro with the same name specified in ISO/IEC 9899:2024, 7.20.

30 Time library [time]

30.1 General [time.general]

1 This Clause describes the chrono library (30.2) and various C functions (30.15) that provide generally useful time utilities, as summarized in Table 128.

Table 128 — Time library summary [tab:time.summary]

	Subclause	Header
30.3	*Cpp17Clock* requirements	
30.4	Time-related traits	`<chrono>`
30.5	Class template `duration`	
30.6	Class template `time_point`	
30.7	Clocks	
30.8	Civil calendar	
30.9	Class template `hh_mm_ss`	
30.10	12/24 hour functions	
30.11	Time zones	
30.12	Formatting	
30.13	Parsing	
30.14	Hash support	
30.15	C library time utilities	`<ctime>`

2 Let *`STATICALLY-WIDEN`*`<charT>("...")` be `"..."` if `charT` is `char` and `L"..."` if `charT` is `wchar_t`.

30.2 Header `<chrono>` synopsis [time.syn]

```
#include <compare>              // see 17.12.1

namespace std::chrono {
  // 30.5, class template duration
  template<class Rep, class Period = ratio<1>> class duration;

  // 30.6, class template time_point
  template<class Clock, class Duration = typename Clock::duration> class time_point;
}

namespace std {
  // 30.4.3, common_type specializations
  template<class Rep1, class Period1, class Rep2, class Period2>
    struct common_type<chrono::duration<Rep1, Period1>,
                       chrono::duration<Rep2, Period2>>;

  template<class Clock, class Duration1, class Duration2>
    struct common_type<chrono::time_point<Clock, Duration1>,
                       chrono::time_point<Clock, Duration2>>;
}

namespace std::chrono {
  // 30.4, customization traits
  template<class Rep> struct treat_as_floating_point;
  template<class Rep>
    constexpr bool treat_as_floating_point_v = treat_as_floating_point<Rep>::value;

  template<class Rep> struct duration_values;
```

```
template<class T> struct is_clock;

30.3 *Cpp17Clock* requirements [time.clock.req]

1 A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall meet the requirements in Table 129.

2 In Table 129 `C1` and `C2` denote clock types. `t1` and `t2` are values returned by `C1::now()` where the call returning `t1` happens before (6.9.2) the call returning `t2` and both of these calls occur before `C1::time_point::max()`.

[*Note 1*: This means `C1` did not wrap around between `t1` and `t2`. — *end note*]

Table 129 — *Cpp17Clock* requirements [tab:time.clock]

Expression	Return type	Operational semantics
`C1::rep`	An arithmetic type or a class emulating an arithmetic type	The representation type of `C1::duration`.
`C1::period`	a specialization of `ratio`	The tick period of the clock in seconds.
`C1::duration`	`chrono::duration<C1::rep, C1::period>`	The `duration` type of the clock.
`C1::time_point`	`chrono::time_point<C1>` or `chrono::time_point<C2, C1::duration>`	The `time_point` type of the clock. `C1` and `C2` shall refer to the same epoch.
`C1::is_steady`	`const bool`	`true` if `t1 <= t2` is always `true` and the time between clock ticks is constant, otherwise `false`.
`C1::now()`	`C1::time_point`	Returns a `time_point` object representing the current point in time.

3 [*Note 2*: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — *end note*]

4 A type `TC` meets the *Cpp17TrivialClock* requirements if

(4.1) — `TC` meets the *Cpp17Clock* requirements,

(4.2) — the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) and *Cpp17Swappable* (16.4.4.3) requirements and the requirements of numeric types (29.2),

[*Note 3*: This means, in particular, that operations on these types will not throw exceptions. — *end note*]

(4.3) — the function `TC::now()` does not throw exceptions, and

(4.4) — the type `TC::time_point::clock` meets the *Cpp17TrivialClock* requirements, recursively.

30.4 Time-related traits [time.traits]

30.4.1 `treat_as_floating_point` [time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

1 The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick `period`. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among `duration`s. Otherwise, the implicit convertibility depends on the tick `period`s of the `duration`s.

[*Note 1*: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — *end note*]

30.4.2 `duration_values` [time.traits.duration.values]

```
template<class Rep>
  struct duration_values {
  public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
  };
```

1 The `duration` template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

2 *Returns*: `Rep(0)`.

[*Note 1*: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — *end note*]

3 *Remarks*: The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
```

4 *Returns*: `numeric_limits<Rep>::lowest()`.

5 *Remarks*: The value returned shall compare less than or equal to `zero()`.

```
static constexpr Rep max() noexcept;
```

6 *Returns*: `numeric_limits<Rep>::max()`.

7 *Remarks*: The value returned shall compare greater than `zero()`.

30.4.3 Specializations of `common_type` [time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
  struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
  };
```

1 The `period` of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[*Note 1*: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — *end note*]

2 [*Note 2*: The `typedef` name `type` is a synonym for the `duration` with the largest tick `period` possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — *end note*]

```
template<class Clock, class Duration1, class Duration2>
  struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
  };
```

3 The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two `durations`.

30.4.4 Class template `is_clock` [time.traits.is.clock]

```
template<class T> struct is_clock;
```

1 `is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (30.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

(1.1) — the *qualified-id*s `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),

(1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),

(1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.

2 The behavior of a program that adds specializations for `is_clock` is undefined.

30.5 Class template `duration` [time.duration]

30.5.1 General [time.duration.general]

1 A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
  template<class Rep, class Period = ratio<1>>
  class duration {
  public:
    using rep    = Rep;
    using period = typename Period::type;

  private:
    rep rep_;        // exposition only

  public:
    // 30.5.2, construct/copy/destroy
    constexpr duration() = default;
    template<class Rep2>
      constexpr explicit duration(const Rep2& r);
    template<class Rep2, class Period2>
      constexpr duration(const duration<Rep2, Period2>& d);
    ~duration() = default;
    duration(const duration&) = default;
    duration& operator=(const duration&) = default;

    // 30.5.3, observer
    constexpr rep count() const;

    // 30.5.4, arithmetic
    constexpr common_type_t<duration> operator+() const;
    constexpr common_type_t<duration> operator-() const;
    constexpr duration& operator++();
    constexpr duration  operator++(int);
    constexpr duration& operator--();
    constexpr duration  operator--(int);

    constexpr duration& operator+=(const duration& d);
    constexpr duration& operator-=(const duration& d);

    constexpr duration& operator*=(const rep& rhs);
    constexpr duration& operator/=(const rep& rhs);
    constexpr duration& operator%=(const rep& rhs);
    constexpr duration& operator%=(const duration& rhs);

    // 30.5.5, special values
    static constexpr duration zero() noexcept;
    static constexpr duration min() noexcept;
    static constexpr duration max() noexcept;
  };
}
```

2 `Rep` shall be an arithmetic type or a class emulating an arithmetic type. If `duration` is instantiated with a `duration` type as the argument for the template parameter `Rep`, the program is ill-formed.

3 If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.

4 Members of `duration` do not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of `duration` shall be a constexpr function if and only if the required initialization of the member `rep_` for copy and move, respectively, would be constexpr-suitable (9.2.6).

6 [*Example 1*:

```
duration<long, ratio<60>> d0;       // holds a count of minutes using a long
duration<long long, milli> d1;      // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>>  d2; // holds a count with a tick period of 1/30 of a second
                                    // (30 Hz) using a double
```

— *end example*]

30.5.2 Constructors [time.duration.cons]

```
template<class Rep2>
  constexpr explicit duration(const Rep2& r);
```

1 *Constraints*: `is_convertible_v<const Rep2&, rep>` is `true` and

(1.1) — `treat_as_floating_point_v<rep>` is `true` or

(1.2) — `treat_as_floating_point_v<Rep2>` is `false`.

[*Example 1*:

```
duration<int, milli> d(3);          // OK
duration<int, milli> d2(3.5);       // error
```

— end example]

2 *Effects*: Initializes `rep_` with `r`.

```
template<class Rep2, class Period2>
  constexpr duration(const duration<Rep2, Period2>& d);
```

3 *Constraints*: No overflow is induced in the conversion and `treat_as_floating_point_v<rep>` is `true` or both `ratio_divide<Period2, period>::den` is 1 and `treat_as_floating_point_v<Rep2>` is `false`.

[*Note 1*: This requirement prevents implicit truncation error when converting between integral-based `duration` types. Such a construction could easily lead to confusion about the value of the `duration`. *— end note*]

[*Example 2*:

```
duration<int, milli> ms(3);
duration<int, micro> us = ms;       // OK
duration<int, milli> ms2 = us;      // error
```

— end example]

4 *Effects*: Initializes `rep_` with `duration_cast<duration>(d).count()`.

30.5.3 Observer [time.duration.observer]

```
constexpr rep count() const;
```

1 *Returns*: `rep_`.

30.5.4 Arithmetic [time.duration.arithmetic]

```
constexpr common_type_t<duration> operator+() const;
```

1 *Returns*: `common_type_t<duration>(*this)`.

```
constexpr common_type_t<duration> operator-() const;
```

2 *Returns*: `common_type_t<duration>(-rep_)`.

```
constexpr duration& operator++();
```

3 *Effects*: Equivalent to: `++rep_`.

4 *Returns*: `*this`.

```
constexpr duration operator++(int);
```

5 *Effects*: Equivalent to: `return duration(rep_++);`

```
constexpr duration& operator--();
```

6 *Effects*: Equivalent to: `--rep_`.

7 *Returns*: `*this`.

```
constexpr duration operator--(int);
```

8 *Effects*: Equivalent to: `return duration(rep_--);`

```
constexpr duration& operator+=(const duration& d);
```

9 *Effects*: Equivalent to: `rep_ += d.count()`.

10 *Returns*: `*this`.

```
constexpr duration& operator-=(const duration& d);
```

11 *Effects*: Equivalent to: `rep_ -= d.count()`.

12 *Returns*: `*this`.

```
constexpr duration& operator*=(const rep& rhs);
```

13 *Effects*: Equivalent to: `rep_ *= rhs`.

14 *Returns*: `*this`.

```
constexpr duration& operator/=(const rep& rhs);
```

15 *Effects*: Equivalent to: `rep_ /= rhs`.

16 *Returns*: `*this`.

```
constexpr duration& operator%=(const rep& rhs);
```

17 *Effects*: Equivalent to: `rep_ %= rhs`.

18 *Returns*: `*this`.

```
constexpr duration& operator%=(const duration& rhs);
```

19 *Effects*: Equivalent to: `rep_ %= rhs.count()`.

20 *Returns*: `*this`.

30.5.5 Special values [time.duration.special]

```
static constexpr duration zero() noexcept;
```

1 *Returns*: `duration(duration_values<rep>::zero())`.

```
static constexpr duration min() noexcept;
```

2 *Returns*: `duration(duration_values<rep>::min())`.

```
static constexpr duration max() noexcept;
```

3 *Returns*: `duration(duration_values<rep>::max())`.

30.5.6 Non-member arithmetic [time.duration.nonmember]

1 In the function descriptions that follow, unless stated otherwise, let `CD` represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CD(CD(lhs).count() + CD(rhs).count())`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CD(CD(lhs).count() - CD(rhs).count())`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const duration<Rep1, Period>& d, const Rep2& s);
```

4 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true`.

5 *Returns*: `CD(CD(d).count() * s)`.

```
template<class Rep1, class Rep2, class Period>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const Rep1& s, const duration<Rep2, Period>& d);
```

6 *Constraints*: `is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>>` is `true`.

7 *Returns*: `d * s`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator/(const duration<Rep1, Period>& d, const Rep2& s);
```

8 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

9 *Returns*: `CD(CD(d).count() / s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<Rep1, Rep2>
    operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

10 Let `CD` be `common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>`.

11 *Returns*: `CD(lhs).count() / CD(rhs).count()`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator%(const duration<Rep1, Period>& d, const Rep2& s);
```

12 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

13 *Returns*: `CD(CD(d).count() % s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

14 *Returns*: `CD(CD(lhs).count() % CD(rhs).count())`.

30.5.7 Comparisons [time.duration.comparisons]

1 In the function descriptions that follow, `CT` represents `common_type_t<A, B>`, where `A` and `B` are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CT(lhs).count() == CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs).count() < CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

4 *Returns*: `rhs < lhs`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

5 *Returns*: `!(rhs < lhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

6 *Returns*: `!(lhs < rhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  requires three_way_comparable<typename CT::rep>
  constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                             const duration<Rep2, Period2>& rhs);
```

7 *Returns*: `CT(lhs).count() <=> CT(rhs).count()`.

30.5.8 Conversions [time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*: Let `CF` be `ratio_divide<Period, typename ToDuration::period>`, and `CR` be `common_type<typename ToDuration::rep, Rep, intmax_t>::type`.

(2.1) — If `CF::num == 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```

(2.2) — otherwise, if `CF::num != 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```

(2.3) — otherwise, if `CF::num == 1` and `CF::den != 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```

(2.4) — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

3 [*Note 1*: This function does not use any implicit conversions; all conversions are done with `static_cast`. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — *end note*]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration floor(const duration<Rep, Period>& d);
```

4 *Constraints*: `ToDuration` is a specialization of `duration`.

5 *Returns*: The greatest result `t` representable in `ToDuration` for which `t <= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

6 *Constraints*: `ToDuration` is a specialization of `duration`.

7 *Returns*: The least result `t` representable in `ToDuration` for which `t >= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration round(const duration<Rep, Period>& d);
```

8 *Constraints*: `ToDuration` is a specialization of `duration` and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

9 *Returns*: The value of `ToDuration` that is closest to `d`. If there are two closest values, then return the value `t` for which `t % 2 == 0`.

30.5.9 Suffixes for duration literals [time.duration.literals]

1 This subclause describes literal suffixes for constructing duration literals. The suffixes `h`, `min`, `s`, `ms`, `us`, `ns` denote duration values of the corresponding types `hours`, `minutes`, `seconds`, `milliseconds`, `microseconds`, and `nanoseconds` respectively if they are applied to *integer-literal*s.

2 If any of these suffixes are applied to a *floating-point-literal* the result is a `chrono::duration` literal with an unspecified floating-point representation.

3 If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.

4 [*Example 1*: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

— *end example*]

```
constexpr chrono::hours                                 operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

5 *Returns*: A `duration` literal representing `hours` hours.

```
constexpr chrono::minutes                             operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

6 *Returns*: A `duration` literal representing `minutes` minutes.

```
constexpr chrono::seconds               operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

7 *Returns*: A `duration` literal representing `sec` seconds.

8 [*Note 1*: The same suffix `s` is used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — *end note*]

```
constexpr chrono::milliseconds                 operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

9 *Returns*: A `duration` literal representing `msec` milliseconds.

```
constexpr chrono::microseconds                 operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

10 *Returns*: A `duration` literal representing `usec` microseconds.

```
constexpr chrono::nanoseconds                 operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

11 *Returns*: A `duration` literal representing `nsec` nanoseconds.

30.5.10 Algorithms [time.duration.alg]

```
template<class Rep, class Period>
  constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

1 *Constraints*: `numeric_limits<Rep>::is_signed` is `true`.

2 *Returns*: If `d >= d.zero()`, return `d`, otherwise return `-d`.

30.5.11 I/O [time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1 *Effects*: Inserts the duration `d` onto the stream `os` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where *`units-suffix`* depends on the type `Period::type` as follows:

(1.1) — If `Period::type` is `atto`, *`units-suffix`* is `"as"`.

(1.2) — Otherwise, if `Period::type` is `femto`, *`units-suffix`* is `"fs"`.

(1.3) — Otherwise, if `Period::type` is `pico`, *`units-suffix`* is `"ps"`.

(1.4) — Otherwise, if `Period::type` is `nano`, *`units-suffix`* is `"ns"`.

(1.5) — Otherwise, if `Period::type` is `micro`, it is implementation-defined whether *`units-suffix`* is `"µs"` (`"\u00b5\u0073"`) or `"us"`.

(1.6) — Otherwise, if `Period::type` is `milli`, *`units-suffix`* is `"ms"`.

(1.7) — Otherwise, if `Period::type` is `centi`, *`units-suffix`* is `"cs"`.

(1.8) — Otherwise, if `Period::type` is `deci`, *`units-suffix`* is `"ds"`.

(1.9) — Otherwise, if `Period::type` is `ratio<1>`, *`units-suffix`* is `"s"`.

(1.10) — Otherwise, if `Period::type` is `deca`, *`units-suffix`* is `"das"`.

(1.11) — Otherwise, if `Period::type` is `hecto`, *`units-suffix`* is `"hs"`.

(1.12) — Otherwise, if `Period::type` is `kilo`, *`units-suffix`* is `"ks"`.

(1.13) — Otherwise, if `Period::type` is `mega`, *`units-suffix`* is `"Ms"`.

(1.14) — Otherwise, if `Period::type` is `giga`, *`units-suffix`* is `"Gs"`.

(1.15) — Otherwise, if `Period::type` is `tera`, *`units-suffix`* is `"Ts"`.

(1.16) — Otherwise, if `Period::type` is `peta`, *`units-suffix`* is `"Ps"`.

(1.17) — Otherwise, if `Period::type` is `exa`, *`units-suffix`* is `"Es"`.

(1.18) — Otherwise, if `Period::type` is `ratio<60>`, *`units-suffix`* is `"min"`.

(1.19) — Otherwise, if `Period::type` is `ratio<3600>`, *`units-suffix`* is `"h"`.

(1.20) — Otherwise, if `Period::type` is `ratio<86400>`, *`units-suffix`* is `"d"`.

(1.21) — Otherwise, if `Period::type::den == 1`, *`units-suffix`* is `"[`*`num`*`]s"`.

(1.22) — Otherwise, *`units-suffix`* is `"[`*`num`*`/`*`den`*`]s"`.

In the list above, the use of *`num`* and *`den`* refers to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2 *Returns*: `os`.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                duration<Rep, Period>& d,
                basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the duration `d` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid duration, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

4 *Returns*: `is`.

30.6 Class template `time_point` [time.point]

30.6.1 General [time.point.general]

```
namespace std::chrono {
  template<class Clock, class Duration = typename Clock::duration>
  class time_point {
  public:
    using clock    = Clock;
    using duration = Duration;
    using rep      = typename duration::rep;
    using period   = typename duration::period;
  private:
    duration d_;                                              // exposition only

  public:
    // 30.6.2, construct
    constexpr time_point();                                   // has value epoch
    constexpr explicit time_point(const duration& d);         // same as time_point() + d
    template<class Duration2>
      constexpr time_point(const time_point<clock, Duration2>& t);

    // 30.6.3, observer
    constexpr duration time_since_epoch() const;

    // 30.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 30.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
  };
}
```

1 If `Duration` is not a specialization of `duration`, the program is ill-formed.

30.6.2 Constructors [time.point.cons]

```
constexpr time_point();
```

1 *Effects*: Initializes `d_` with `duration::zero()`. Such a `time_point` object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

2 *Effects*: Initializes `d_` with `d`. Such a `time_point` object represents the epoch `+ d`.

```
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);
```

3 *Constraints*: `is_convertible_v<Duration2, duration>` is `true`.

4 *Effects*: Initializes `d_` with `t.time_since_epoch()`.

30.6.3 Observer [time.point.observer]

```
constexpr duration time_since_epoch() const;
```

1 *Returns*: `d_`.

30.6.4 Arithmetic [time.point.arithmetic]

```
constexpr time_point& operator++();
```

1 *Effects*: Equivalent to: `++d_`.

2 *Returns*: `*this`.

```
constexpr time_point operator++(int);
```

3 *Effects*: Equivalent to: `return time_point{d_++};`

```
constexpr time_point& operator--();
```

4 *Effects*: Equivalent to: `--d_`.

5 *Returns*: `*this`.

```
constexpr time_point operator--(int);
```

6 *Effects*: Equivalent to: `return time_point{d_--};`

```
constexpr time_point& operator+=(const duration& d);
```

7 *Effects*: Equivalent to: `d_ += d`.

8 *Returns*: `*this`.

```
constexpr time_point& operator-=(const duration& d);
```

9 *Effects*: Equivalent to: `d_ -= d`.

10 *Returns*: `*this`.

30.6.5 Special values [time.point.special]

```
static constexpr time_point min() noexcept;
```

1 *Returns*: `time_point(duration::min())`.

```
static constexpr time_point max() noexcept;
```

2 *Returns*: `time_point(duration::max())`.

30.6.6 Non-member arithmetic [time.point.nonmember]

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

1 *Returns*: `CT(lhs.time_since_epoch() + rhs)`, where `CT` is the type of the return value.

```
template<class Rep1, class Period1, class Clock, class Duration2>
  constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
    operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `rhs + lhs`.

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs.time_since_epoch() - rhs)`, where `CT` is the type of the return value.

```
template<class Clock, class Duration1, class Duration2>
  constexpr common_type_t<Duration1, Duration2>
    operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `lhs.time_since_epoch() - rhs.time_since_epoch()`.

30.6.7 Comparisons [time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

1 *Returns*: `lhs.time_since_epoch() == rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `lhs.time_since_epoch() < rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

3 *Returns*: `rhs < lhs`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `!(rhs < lhs)`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

5 *Returns*: `!(lhs < rhs)`.

```
template<class Clock, class Duration1,
         three_way_comparable_with<Duration1> Duration2>
  constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                             const time_point<Clock, Duration2>& rhs);
```

6 *Returns*: `lhs.time_since_epoch() <=> rhs.time_since_epoch()`.

30.6.8 Conversions [time.point.cast]

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*:

```
time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))
```

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);
```

3 *Constraints*: `ToDuration` is a specialization of `duration`.

4 *Returns*: `time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);
```

5 *Constraints*: `ToDuration` is a specialization of `duration`.

6 *Returns*: `time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);
```

7 *Constraints*: `ToDuration` is a specialization of `duration`, and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

8 *Returns*: `time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))`.

30.7 Clocks [time.clock]

30.7.1 General [time.clock.general]

1 The types defined in 30.7 meet the *Cpp17TrivialClock* requirements (30.3) unless otherwise specified.

30.7.2 Class system_clock [time.clock.system]

30.7.2.1 Overview [time.clock.system.overview]

```
namespace std::chrono {
  class system_clock {
  public:
    using rep        = see below;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<system_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;
    // mapping to/from C type time_t
    static time_t      to_time_t  (const time_point& t) noexcept;
    static time_point  from_time_t(time_t t) noexcept;
  };
}
```

1 Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (30.8).

[*Example 1*:
`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is `0s`.
`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is `946’684’800s`, which is `10’957 * 86’400s`.
— *end example*]

30.7.2.2 Members [time.clock.system.members]

```
using system_clock::rep = unspecified;
```

1 *Constraints*: `system_clock::duration::min() < system_clock::duration::zero()` is `true`.

[*Note 1*: This implies that `rep` is a signed type. — *end note*]

```
static time_t to_time_t(const time_point& t) noexcept;
```

2 *Returns*: A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

```
static time_point from_time_t(time_t t) noexcept;
```

3 *Returns*: A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

30.7.2.3 Non-member functions [time.clock.system.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

1 *Constraints*: `treat_as_floating_point_v<typename Duration::rep>` is `false`, and `Duration{1} < days{1}` is `true`.

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);
```

3 [*Example 1*:

```
cout << sys_seconds{0s} << '\n';                 // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';       // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';       // 2000-01-01 01:02:03
```

— *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

4 *Effects*: `os << year_month_day{dp}`.

5 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

6 *Effects*: Attempts to parse the input stream `is` into the `sys_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_-`

base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

7 *Returns*: is.

30.7.3 Class utc_clock [time.clock.utc]

30.7.3.1 Overview [time.clock.utc.overview]

```
namespace std::chrono {
  class utc_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<utc_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static sys_time<common_type_t<Duration, seconds>>
        to_sys(const utc_time<Duration>& t);
    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
  };
}
```

1 In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[*Note 1*: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the utc_time. — *end note*]

[*Example 1*:
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s, which is 10'957 * 86'400s + 22s.
— *end example*]

2 utc_clock is not a *Cpp17TrivialClock* unless the implementation can guarantee that utc_clock::now() does not propagate an exception.

[*Note 2*: noexcept(from_sys(system_clock::now())) is false. — *end note*]

30.7.3.2 Member functions [time.clock.utc.members]

```
static time_point now();
```

1 *Returns*: from_sys(system_clock::now()), or a more accurate value of utc_time.

```
template<class Duration>
  static sys_time<common_type_t<Duration, seconds>>
    to_sys(const utc_time<Duration>& u);
```

2 *Returns*: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents a time_point during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of sys_time prior to the insertion of the leap second is returned.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    from_sys(const sys_time<Duration>& t);
```

3 *Returns*: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second

insertion, then the conversion counts that leap second as inserted.

[*Example 1*:

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

— *end example*]

30.7.3.3 Non-member functions [time.clock.utc.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
  cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `utc_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

```
struct leap_second_info {
  bool    is_leap_second;
  seconds elapsed;
};
```

5 The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```
template<class Duration>
  leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

6 *Returns*: A `leap_second_info lsi`, where `lsi.is_leap_second` is `true` if `ut` is during a positive leap second insertion, and otherwise `false`. `lsi.elapsed` is the sum of leap seconds between 1970-01-01 and `ut`. If `lsi.is_leap_second` is `true`, the leap second referred to by `ut` is included in the sum.

30.7.4 Class `tai_clock` [time.clock.tai]

30.7.4.1 Overview [time.clock.tai.overview]

```
namespace std::chrono {
  class tai_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<tai_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const tai_time<Duration>&) noexcept;
    template<class Duration>
      static tai_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

2 `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

30.7.4.2 Member functions [time.clock.tai.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const tai_time<Duration>& t) noexcept;
```

2 *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

[*Note 1*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

```
template<class Duration>
  static tai_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

[*Note 2*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

30.7.4.3 Non-member functions [time.clock.tai.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `tai_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

30.7.5 Class gps_clock [time.clock.gps]

30.7.5.1 Overview [time.clock.gps.overview]

```
namespace std::chrono {
  class gps_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
      static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from `1958y/January/1` to `1980y/January/Sunday[1]`, GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

30.7.5.2 Member functions [time.clock.gps.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;
```

2 *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

[*Note 1*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

```
template<class Duration>
  static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

[*Note 2*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

30.7.5.3 Non-member functions [time.clock.gps.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `gps_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

30.7.6 Type `file_clock` [time.clock.file]

30.7.6.1 Overview [time.clock.file.overview]

```
namespace std::chrono {
  using file_clock = see below;
}
```

1 `file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (30.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (31.12). Its epoch is unspecified, and `noexcept(file_clock::now())` is `true`.

[*Note 1*: The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`. — *end note*]

30.7.6.2 Member functions [time.clock.file.members]

1 The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
  static sys_time<see below>
    to_sys(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
  static utc_time<see below>
    to_utc(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

30.7.6.3 Non-member functions [time.clock.file.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

2 *Effects*: Attempts to parse the input stream `is` into the `file_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

3 *Returns*: `is`.

30.7.7 Class `steady_clock` [time.clock.steady]

```
namespace std::chrono {
  class steady_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = true;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

30.7.8 Class `high_resolution_clock` [time.clock.hires]

```
namespace std::chrono {
  class high_resolution_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

30.7.9 Local time [time.clock.local]

1 The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

2 *Effects*:

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

3 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

4 *Effects*: Attempts to parse the input stream `is` into the `local_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

5 *Returns*: `is`.

30.7.10 `time_point` conversions [time.clock.cast]

30.7.10.1 Class template `clock_time_conversion` [time.clock.conv]

```
namespace std::chrono {
  template<class DestClock, class SourceClock>
  struct clock_time_conversion {};
}
```

1 `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

2 Several specializations are provided by the implementation, as described in 30.7.10.2, 30.7.10.3, 30.7.10.4, and 30.7.10.5.

30.7.10.2 Identity conversions [time.clock.cast.id]

```
  template<class Clock>
  struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
      time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;
  };
```

```
template<class Duration>
  time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
```

1 *Returns*: `t`.

```
  template<>
  struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
      sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;
  };
```

```
template<class Duration>
  sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
```

2 *Returns*: `t`.

```
  template<>
  struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
      utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
  };
```

```
template<class Duration>
  utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
```

3 *Returns*: `t`.

30.7.10.3 Conversions between system_clock and utc_clock [time.clock.cast.sys.utc]

```
  template<>
  struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
      utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
  };
```

```
template<class Duration>
  utc_time<common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;
```

1 *Returns*: `utc_clock::from_sys(t)`.

```
  template<>
  struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        operator()(const utc_time<Duration>& t) const;
  };
```

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;
```

2 *Returns*: `utc_clock::to_sys(t)`.

30.7.10.4 Conversions between `system_clock` and other clocks [time.clock.cast.sys]

```
  template<class SourceClock>
  struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
      auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
  };
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));
```

1 *Constraints*: `SourceClock::to_sys(t)` is well-formed.

2 *Mandates*: `SourceClock::to_sys(t)` returns a `sys_time<Duration2>` for some type `Duration2` (30.6.1).

3 *Returns*: `SourceClock::to_sys(t)`.

```
  template<class DestClock>
  struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
      auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
  };
```

```
template<class Duration>
  auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));
```

4 *Constraints*: `DestClock::from_sys(t)` is well-formed.

5 *Mandates*: `DestClock::from_sys(t)` returns a `time_point<DestClock, Duration2>` for some type `Duration2` (30.6.1).

6 *Returns*: `DestClock::from_sys(t)`.

30.7.10.5 Conversions between `utc_clock` and other clocks [time.clock.cast.utc]

```
  template<class SourceClock>
  struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
      auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
  };
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));
```

1 *Constraints*: `SourceClock::to_utc(t)` is well-formed.

2 *Mandates*: `SourceClock::to_utc(t)` returns a `utc_time<Duration2>` for some type `Duration2` (30.6.1).

3 *Returns*: `SourceClock::to_utc(t)`.

```
  template<class DestClock>
  struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
      auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
  };
```

```
template<class Duration>
  auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
```

4 *Constraints*: `DestClock::from_utc(t)` is well-formed.

5 *Mandates*: `DestClock::from_utc(t)` returns a `time_point<DestClock, Duration2>` for some type `Duration2` (30.6.1).

6 *Returns*: `DestClock::from_utc(t)`.

30.7.10.6 Function template `clock_cast` [time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
  auto clock_cast(const time_point<SourceClock, Duration>& t);
```

1 *Constraints*: At least one of the following clock time conversion expressions is well-formed:

(1.1) — `clock_time_conversion<DestClock, SourceClock>{}(t)`

(1.2) —
```
clock_time_conversion<DestClock, system_clock>{}(
  clock_time_conversion<system_clock, SourceClock>{}(t))
```

(1.3) —
```
clock_time_conversion<DestClock, utc_clock>{}(
  clock_time_conversion<utc_clock, SourceClock>{}(t))
```

(1.4) —
```
clock_time_conversion<DestClock, utc_clock>{}(
  clock_time_conversion<utc_clock, system_clock>{}(
    clock_time_conversion<system_clock, SourceClock>{}(t)))
```

(1.5) —
```
clock_time_conversion<DestClock, system_clock>{}(
  clock_time_conversion<system_clock, utc_clock>{}(
    clock_time_conversion<utc_clock, SourceClock>{}(t)))
```

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

2 *Mandates*: Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

3 *Returns*: The best well-formed clock time conversion expression in the above list.

30.8 The civil calendar [time.cal]

30.8.1 General [time.cal.general]

1 The types in 30.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

30.8.2 Class `last_spec` [time.cal.last]

```
  namespace std::chrono {
    struct last_spec {
      explicit last_spec() = default;
    };
  }
```

1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

30.8.3 Class `day` [time.cal.day]

30.8.3.1 Overview [time.cal.day.overview]

```
  namespace std::chrono {
    class day {
      unsigned char d_;             // exposition only
    public:
      day() = default;
      constexpr explicit day(unsigned d) noexcept;

      constexpr day& operator++()    noexcept;
      constexpr day  operator++(int) noexcept;
      constexpr day& operator--()    noexcept;
      constexpr day  operator--(int) noexcept;

      constexpr day& operator+=(const days& d) noexcept;
      constexpr day& operator-=(const days& d) noexcept;

      constexpr explicit operator unsigned() const noexcept;
      constexpr bool ok() const noexcept;
    };
  }
```

1 `day` represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `day`'s unspecified internal storage. `day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `days` objects, which represent a difference between two `day` objects.

2 `day` is a trivially copyable and standard-layout class type.

30.8.3.2 Member functions [time.cal.day.members]

`constexpr explicit day(unsigned d) noexcept;`

1 *Effects*: Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range $[0, 255]$.

`constexpr day& operator++() noexcept;`

2 *Effects*: `++d_`.

3 *Returns*: `*this`.

`constexpr day operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr day& operator--() noexcept;`

6 *Effects*: Equivalent to: `--d_`.

7 *Returns*: `*this`.

`constexpr day operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr day& operator+=(const days& d) noexcept;`

10 *Effects*: `*this = *this + d`.

11 *Returns*: `*this`.

`constexpr day& operator-=(const days& d) noexcept;`

12 *Effects*: `*this = *this - d`.

13 *Returns*: `*this`.

`constexpr explicit operator unsigned() const noexcept;`

14 *Returns*: `d_`.

`constexpr bool ok() const noexcept;`

15 *Returns*: `1 <= d_ && d_ <= 31`.

30.8.3.3 Non-member functions [time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr day operator+(const day& x, const days& y) noexcept;
```

3 *Returns*: `day(unsigned{x} + y.count())`.

```
constexpr day operator+(const days& x, const day& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr day operator-(const day& x, const days& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr days operator-(const day& x, const day& y) noexcept;
```

6 *Returns*: `days{int(unsigned{x}) - int(unsigned{y})}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const day& d);
```

7 *Effects*: Equivalent to:

```
return os << (d.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
  format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `day d` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid day, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::day operator""d(unsigned long long d) noexcept;
```

10 *Returns*: `day{static_cast<unsigned>(d)}`.

30.8.4 Class `month` [time.cal.month]

30.8.4.1 Overview [time.cal.month.overview]

```
namespace std::chrono {
  class month {
    unsigned char m_;           // exposition only
  public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;

    constexpr month& operator++()    noexcept;
    constexpr month  operator++(int) noexcept;
    constexpr month& operator--()    noexcept;
    constexpr month  operator--(int) noexcept;

    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;
```

```
      constexpr explicit operator unsigned() const noexcept;
      constexpr bool ok() const noexcept;
    };
  }
```

1 `month` represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `month`'s unspecified internal storage. `month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `months` objects, which represent a difference between two `month` objects.

2 `month` is a trivially copyable and standard-layout class type.

30.8.4.2 Member functions [time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

1 *Effects*: Initializes `m_` with `m`. The value held is unspecified if `m` is not in the range $[0, 255]$.

```
constexpr month& operator++() noexcept;
```

2 *Effects*: `*this += months{1}`.

3 *Returns*: `*this`.

```
constexpr month operator++(int) noexcept;
```

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

6 *Effects*: `*this -= months{1}`.

7 *Returns*: `*this`.

```
constexpr month operator--(int) noexcept;
```

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

10 *Effects*: `*this = *this + m`.

11 *Returns*: `*this`.

```
constexpr month& operator-=(const months& m) noexcept;
```

12 *Effects*: `*this = *this - m`.

13 *Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

14 *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

15 *Returns*: `1 <= m_ && m_ <= 12`.

30.8.4.3 Non-member functions [time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

3 *Returns*:

```
  month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

[*Note 1*: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [`0`, `11`]. Assuming no overflow in the signed summation, this operation results in a `month` holding a value in the range [`1`, `12`] even if `!x.ok()`. — *end note*]

[*Example 1*: `February + months{11} == January`. — *end example*]

```
constexpr month operator+(const months& x, const month& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr month operator-(const month& x, const months& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr months operator-(const month& x, const month& y) noexcept;
```

6 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `m` in the range [`months{0}`, `months{11}`] satisfying `y + m == x`. Otherwise the value returned is unspecified.

[*Example 2*: `January - February == months{11}`. — *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month& m);
```

7 *Effects*: Equivalent to:

```
  return os << (m.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
           static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `month` `m` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

30.8.5 Class year [time.cal.year]

30.8.5.1 Overview [time.cal.year.overview]

```
namespace std::chrono {
  class year {
    short y_;                   // exposition only
  public:
    year() = default;
    constexpr explicit year(int y) noexcept;

    constexpr year& operator++()    noexcept;
    constexpr year  operator++(int) noexcept;
    constexpr year& operator--()    noexcept;
    constexpr year  operator--(int) noexcept;

    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;

    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;

    constexpr bool is_leap() const noexcept;
```

```
      constexpr explicit operator int() const noexcept;
      constexpr bool ok() const noexcept;

      static constexpr year min() noexcept;
      static constexpr year max() noexcept;
    };
  }
```

1 `year` represents a year in the civil calendar. It can represent values in the range [`min()`, `max()`]. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

2 `year` is a trivially copyable and standard-layout class type.

30.8.5.2 Member functions [time.cal.year.members]

```
constexpr explicit year(int y) noexcept;
```

1 *Effects*: Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range [`-32767`, `32767`].

```
constexpr year& operator++() noexcept;
```

2 *Effects*: `++y_`.

3 *Returns*: `*this`.

```
constexpr year operator++(int) noexcept;
```

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator--() noexcept;
```

6 *Effects*: `--y_`.

7 *Returns*: `*this`.

```
constexpr year operator--(int) noexcept;
```

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator+=(const years& y) noexcept;
```

10 *Effects*: `*this = *this + y`.

11 *Returns*: `*this`.

```
constexpr year& operator-=(const years& y) noexcept;
```

12 *Effects*: `*this = *this - y`.

13 *Returns*: `*this`.

```
constexpr year operator+() const noexcept;
```

14 *Returns*: `*this`.

```
constexpr year operator-() const noexcept;
```

15 *Returns*: `year{-y_}`.

```
constexpr bool is_leap() const noexcept;
```

16 *Returns*: `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.

```
constexpr explicit operator int() const noexcept;
```

17 *Returns*: `y_`.

```
constexpr bool ok() const noexcept;
```

18 *Returns*: `min().y_ <= y_ && y_ <= max().y_`.

```
static constexpr year min() noexcept;
```

19 *Returns*: `year{-32767}`.

```
static constexpr year max() noexcept;
```

20 *Returns*: `year{32767}`.

30.8.5.3 Non-member functions [time.cal.year.nonmembers]

```
constexpr bool operator==(const year& x, const year& y) noexcept;
```

1 *Returns*: `int{x} == int{y}`.

```
constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
```

2 *Returns*: `int{x} <=> int{y}`.

```
constexpr year operator+(const year& x, const years& y) noexcept;
```

3 *Returns*: `year{int{x} + static_cast<int>(y.count())}`.

```
constexpr year operator+(const years& x, const year& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr year operator-(const year& x, const years& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr years operator-(const year& x, const year& y) noexcept;
```

6 *Returns*: `years{int{x} - int{y}}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year& y);
```

7 *Effects*: Equivalent to:

```
return os << (y.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
  format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `year` `y` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid year, `is.setstate(ios_base::failbit)` is called and `y` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::year operator""y(unsigned long long y) noexcept;
```

10 *Returns*: `year{static_cast<int>(y)}`.

30.8.6 Class weekday [time.cal.wd]

30.8.6.1 Overview [time.cal.wd.overview]

```
namespace std::chrono {
  class weekday {
    unsigned char wd_;            // exposition only
  public:
    weekday() = default;
    constexpr explicit weekday(unsigned wd) noexcept;
    constexpr weekday(const sys_days& dp) noexcept;
    constexpr explicit weekday(const local_days& dp) noexcept;
    constexpr weekday& operator++()    noexcept;
    constexpr weekday  operator++(int) noexcept;
    constexpr weekday& operator--()    noexcept;
    constexpr weekday  operator--(int) noexcept;

    constexpr weekday& operator+=(const days& d) noexcept;
    constexpr weekday& operator-=(const days& d) noexcept;

    constexpr unsigned c_encoding() const noexcept;
    constexpr unsigned iso_encoding() const noexcept;
    constexpr bool ok() const noexcept;

    constexpr weekday_indexed operator[](unsigned index) const noexcept;
    constexpr weekday_last    operator[](last_spec) const noexcept;
  };
}
```

1 `weekday` represents a day of the week in the civil calendar. It normally holds values in the range `0` to `6`, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

[*Note 1*: `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — *end note*]

2 `weekday` is a trivially copyable and standard-layout class type.

30.8.6.2 Member functions [time.cal.wd.members]

`constexpr explicit weekday(unsigned wd) noexcept;`

1 *Effects*: Initializes `wd_` with `wd == 7 ? 0 : wd`. The value held is unspecified if `wd` is not in the range $[0, 255]$.

`constexpr weekday(const sys_days& dp) noexcept;`

2 *Effects*: Computes what day of the week corresponds to the `sys_days dp`, and initializes that day of the week in `wd_`.

3 [*Example 1*: If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing `4` in `wd_`. — *end example*]

`constexpr explicit weekday(const local_days& dp) noexcept;`

4 *Effects*: Computes what day of the week corresponds to the `local_days dp`, and initializes that day of the week in `wd_`.

5 *Postconditions*: The value is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

`constexpr weekday& operator++() noexcept;`

6 *Effects*: `*this += days{1}`.

7 *Returns*: `*this`.

`constexpr weekday operator++(int) noexcept;`

8 *Effects*: `++(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr weekday& operator--() noexcept;`

10 *Effects*: `*this -= days{1}`.

11 *Returns*: `*this`.

`constexpr weekday operator--(int) noexcept;`

12 *Effects*: `--(*this)`.

13 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator+=(const days& d) noexcept;
```

14 *Effects*: `*this = *this + d`.

15 *Returns*: `*this`.

```
constexpr weekday& operator-=(const days& d) noexcept;
```

16 *Effects*: `*this = *this - d`.

17 *Returns*: `*this`.

```
constexpr unsigned c_encoding() const noexcept;
```

18 *Returns*: `wd_`.

```
constexpr unsigned iso_encoding() const noexcept;
```

19 *Returns*: `wd_ == 0u ? 7u : wd_`.

```
constexpr bool ok() const noexcept;
```

20 *Returns*: `wd_ <= 6`.

```
constexpr weekday_indexed operator[](unsigned index) const noexcept;
```

21 *Returns*: `{*this, index}`.

```
constexpr weekday_last operator[](last_spec) const noexcept;
```

22 *Returns*: `weekday_last{*this}`.

30.8.6.3 Non-member functions [time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 *Returns*: `x.wd_ == y.wd_`.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 *Returns*:

```
weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}
```

where `modulo(n, 7)` computes the remainder of `n` divided by 7 using Euclidean division.

[*Note 1*: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of $[0, 6]$. Assuming no overflow in the signed summation, this operation results in a `weekday` holding a value in the range $[0, 6]$ even if `!x.ok()`. —*end note*]

[*Example 1*: `Monday + days{6} == Sunday`. —*end example*]

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 *Returns*: `y + x`.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 *Returns*: `x + -y`.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `d` in the range [`days{0}`, `days{6}`] satisfying `y + d == x`. Otherwise the value returned is unspecified.

[*Example 2*: `Sunday - Monday == days{6}`. —*end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

6 *Effects*: Equivalent to:

```
return os << (wd.ok() ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%a}"), wd) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
         static_cast<unsigned>(wd.wd_)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

7 *Effects*: Attempts to parse the input stream `is` into the `weekday` `wd` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid weekday, `is.setstate(ios_base::failbit)` is called and `wd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

8 *Returns*: `is`.

30.8.7 Class `weekday_indexed` [time.cal.wdidx]

30.8.7.1 Overview [time.cal.wdidx.overview]

```
namespace std::chrono {
  class weekday_indexed {
    chrono::weekday  wd_;       // exposition only
    unsigned char    index_;    // exposition only

  public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned        index()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_indexed` represents a `weekday` and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

2 [*Note 1*: A `weekday_indexed` object can be constructed by indexing a `weekday` with an `unsigned`. — *end note*]

[*Example 1*:

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
```

— *end example*]

3 `weekday_indexed` is a trivially copyable and standard-layout class type.

30.8.7.2 Member functions [time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

1 *Effects*: Initializes `wd_` with `wd` and `index_` with `index`. The values held are unspecified if `!wd.ok()` or `index` is not in the range $[0, 7]$.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: `wd_`.

```
constexpr unsigned index() const noexcept;
```

3 *Returns*: `index_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `wd_.ok() && 1 <= index_ && index_ <= 5`.

30.8.7.3 Non-member functions [time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday() && x.index() == y.index()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

2 *Effects*: Equivalent to:

```
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{}]"), wdi.weekday(), i) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{} is not a valid index]"),
         wdi.weekday(), i));
```

30.8.8 Class `weekday_last` [time.cal.wdlast]

30.8.8.1 Overview [time.cal.wdlast.overview]

```
namespace std::chrono {
  class weekday_last {
    chrono::weekday wd_;                // exposition only

  public:
    constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_last` represents the last weekday of a month.

2 [*Note 1*: A `weekday_last` object can be constructed by indexing a `weekday` with `last`. — *end note*]

[*Example 1*:

```
constexpr auto wdl = Sunday[last];      // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
```

— *end example*]

3 `weekday_last` is a trivially copyable and standard-layout class type.

30.8.8.2 Member functions [time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 *Effects*: Initializes `wd_` with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: `wd_`.

```
constexpr bool ok() const noexcept;
```

3 *Returns*: `wd_.ok()`.

30.8.8.3 Non-member functions [time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]"), wdl.weekday());
```

30.8.9 Class `month_day` [time.cal.md]

30.8.9.1 Overview [time.cal.md.overview]

```
namespace std::chrono {
  class month_day {
    chrono::month m_;           // exposition only
    chrono::day   d_;              // exposition only

  public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `month_day` is a trivially copyable and standard-layout class type.

30.8.9.2 Member functions [time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::day day() const noexcept;
```

3 *Returns*: `d_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `true` if `m_.ok()` is `true`, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns `false`. When `m_ == February`, the number of days is considered to be 29.

30.8.9.3 Non-member functions [time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

3 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{}"),
                    md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

4 *Effects*: Attempts to parse the input stream `is` into the `month_day` `md` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` is called and `md` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

5 *Returns*: `is`.

30.8.10 Class month_day_last [time.cal.mdlast]

```
namespace std::chrono {
  class month_day_last {
    chrono::month m_;                    // exposition only

  public:
    constexpr explicit month_day_last(const chrono::month& m) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day_last` represents the last day of a month.

2 [*Note 1*: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`. — *end note*]

[*Example 1*:

```
constexpr auto mdl = February/last;      // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

— *end example*]

3 `month_day_last` is a trivially copyable and standard-layout class type.

```
constexpr explicit month_day_last(const chrono::month& m) noexcept;
```

4 *Effects*: Initializes `m_` with `m`.

```
constexpr month month() const noexcept;
```

5 *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

6 *Returns*: `m_.ok()`.

```
constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
```

7 *Returns*: `x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;
```

8 *Returns*: `x.month() <=> y.month()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

9 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/last"), mdl.month());
```

30.8.11 Class month_weekday [time.cal.mwd]

30.8.11.1 Overview [time.cal.mwd.overview]

```
namespace std::chrono {
  class month_weekday {
    chrono::month           m_;          // exposition only
    chrono::weekday_indexed wdi_;        // exposition only
  public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr chrono::month           month()           const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday` represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a `month` and a `weekday_indexed`.

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[3];              // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

— *end example*]

3 `month_weekday` is a trivially copyable and standard-layout class type.

30.8.11.2 Member functions [time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

3 *Returns*: `wdi_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `m_.ok() && wdi_.ok()`.

30.8.11.3 Non-member functions [time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                    mwd.month(), mwd.weekday_indexed());
```

30.8.12 Class `month_weekday_last` [time.cal.mwdlast]

30.8.12.1 Overview [time.cal.mwdlast.overview]

```
namespace std::chrono {
  class month_weekday_last {
    chrono::month        m_;     // exposition only
    chrono::weekday_last wdl_;   // exposition only
  public:
    constexpr month_weekday_last(const chrono::month& m,
                                 const chrono::weekday_last& wdl) noexcept;

    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday_last` represents the last weekday of a month, of an as yet unspecified year. To do this the `month_weekday_last` stores a `month` and a `weekday_last`.

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[last];    // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
```

— *end example*]

3 `month_weekday_last` is a trivially copyable and standard-layout class type.

30.8.12.2 Member functions [time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                             const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

3 *Returns*: `wdl_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `m_.ok() && wdl_.ok()`.

30.8.12.3 Non-member functions [time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.weekday_last() == y.weekday_last()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                    mwdl.month(), mwdl.weekday_last());
```

30.8.13 Class year_month [time.cal.ym]

30.8.13.1 Overview [time.cal.ym.overview]

```
namespace std::chrono {
  class year_month {
    chrono::year  y_;           // exposition only
    chrono::month m_;           // exposition only

  public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy)  noexcept;
    constexpr year_month& operator-=(const years& dy)  noexcept;

    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `year_month` is a trivially copyable and standard-layout class type.

30.8.13.2 Member functions [time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, and `m_` with `m`.

```
constexpr chrono::year year() const noexcept;
```

2 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

3 *Returns*: `m_`.

```
constexpr year_month& operator+=(const months& dm) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Effects*: `*this = *this + dm`.

6 *Returns*: `*this`.

```
constexpr year_month& operator-=(const months& dm) noexcept;
```

7 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

8 *Effects*: `*this = *this - dm`.

9 *Returns*: `*this`.

```
constexpr year_month& operator+=(const years& dy) noexcept;
```

10 *Effects*: `*this = *this + dy`.

11 *Returns*: `*this`.

```
constexpr year_month& operator-=(const years& dy) noexcept;
```

12 *Effects*: `*this = *this - dy`.

13 *Returns*: `*this`.

```
constexpr bool ok() const noexcept;
```

14 *Returns*: `y_.ok() && m_.ok()`.

30.8.13.3 Non-member functions [time.cal.ym.nonmembers]

```
constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();
```

```
constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

4 *Returns*: A `year_month` value `z` such that `z.ok() && z - ym == dm` is `true`.

5 *Complexity*: $\mathcal{O}(1)$ with respect to the value of `dm`.

```
constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ym + dm`.

```
constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Returns*: `ym + -dm`.

```
constexpr months operator-(const year_month& x, const year_month& y) noexcept;
```

10 *Returns*:

```
x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
                             static_cast<int>(unsigned{y.month()})}
```

```
constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
```

11 *Returns*: `(ym.year() + dy) / ym.month()`.

```
constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
```

12 *Returns*: `ym + dy`.

```
constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
```

13 *Returns*: `ym + -dy`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month& ym);
```

14 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
                    ym.year(), ym.month());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month` `ym` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `year_month`, `is.setstate(ios_base::failbit)` is called and `ym` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns*: `is`.

30.8.14 Class year_month_day [time.cal.ymd]

30.8.14.1 Overview [time.cal.ymd.overview]

```
namespace std::chrono {
  class year_month_day {
    chrono::year  y_;           // exposition only
    chrono::month m_;           // exposition only
    chrono::day   d_;           // exposition only

  public:
    year_month_day() = default;
    constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                             const chrono::day& d) noexcept;
    constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
    constexpr year_month_day(const sys_days& dp) noexcept;
    constexpr explicit year_month_day(const local_days& dp) noexcept;

    constexpr year_month_day& operator+=(const months& m) noexcept;
    constexpr year_month_day& operator-=(const months& m) noexcept;
    constexpr year_month_day& operator+=(const years& y)  noexcept;
    constexpr year_month_day& operator-=(const years& y)  noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
```

```
      constexpr bool ok() const noexcept;
    };
  }
```

1 `year_month_day` represents a specific year, month, and day. `year_month_day` is a field-based time point with a resolution of `days`.

[*Note 1*: `year_month_day` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `year_month_day` is a trivially copyable and standard-layout class type.

30.8.14.2 Member functions [time.cal.ymd.members]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `d_` with `d`.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

2 *Effects*: Initializes `y_` with `ymdl.year()`, `m_` with `ymdl.month()`, and `d_` with `ymdl.day()`.

[*Note 1*: This conversion from `year_month_day_last` to `year_month_day` can be more efficient than converting a `year_month_day_last` to a `sys_days`, and then converting that `sys_days` to a `year_month_day`. — *end note*]

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

3 *Effects*: Constructs an object of type `year_month_day` that corresponds to the date represented by `dp`.

4 *Remarks*: For any value `ymd` of type `year_month_day` for which `ymd.ok()` is `true`, `ymd == year_-month_day{sys_days{ymd}}` is `true`.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

5 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Effects*: `*this = *this + m`.

8 *Returns*: `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

9 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

10 *Effects*: `*this = *this - m`.

11 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

12 *Effects*: `*this = *this + y`.

13 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

14 *Effects*: `*this = *this - y`.

15 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

16 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

17 *Returns*: `m_`.

```
constexpr chrono::day day() const noexcept;
```

18 *Returns*: `d_`.

```
constexpr operator sys_days() const noexcept;
```

19 *Returns*: If `ok()`, returns a `sys_days` holding a count of days from the `sys_days` epoch to `*this` (a negative value if `*this` represents a date prior to the `sys_days` epoch). Otherwise, if `y_.ok() && m_.ok()` is `true`, returns `sys_days{y_/m_/1d} + (d_ - 1d)`. Otherwise the value returned is unspecified.

20 *Remarks*: A `sys_days` in the range [`days{-12687428}`, `days{11248737}`] which is converted to a `year_month_day` has the same value when converted back to a `sys_days`.

21 [*Example 1*:

```
static_assert(year_month_day{sys_days{2017y/January/0}}  == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
```

— *end example*]

```
constexpr explicit operator local_days() const noexcept;
```

22 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

23 *Returns*: If `y_.ok()` is `true`, and `m_.ok()` is `true`, and `d_` is in the range [`1d`, `(y_/m_/last).day()`], then returns `true`; otherwise returns `false`.

30.8.14.3 Non-member functions [time.cal.ymd.nonmembers]

```
constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

4 *Returns*: `(ymd.year() / ymd.month() + dm) / ymd.day()`.

5 [*Note 1*: If `ymd.day()` is in the range [`1d`, `28d`], `ok()` will return `true` for the resultant `year_month_day`. — *end note*]

```
constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymd + dm`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Returns*: `ymd + (-dm)`.

```
constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
```

10 *Returns*: `(ymd.year() + dy) / ymd.month() / ymd.day()`.

11 [*Note 2*: If `ymd.month()` is February and `ymd.day()` is not in the range [`1d`, `28d`], `ok()` can return `false` for the resultant `year_month_day`. — *end note*]

```
constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
```

12 *Returns*: `ymd + dy`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
```

13 *Returns*: `ymd + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
```

14 *Effects*: Equivalent to:

```
return os << (ymd.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%F}"), ymd) :
  format(STATICALLY-WIDEN<charT>("{:%F} is not a valid date"), ymd));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month_day ymd` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `year_month_day`, `is.setstate(ios_base::failbit)` is called and `ymd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns*: `is`.

30.8.15 Class `year_month_day_last` [time.cal.ymdlast]

30.8.15.1 Overview [time.cal.ymdlast.overview]

```
namespace std::chrono {
  class year_month_day_last {
    chrono::year           y_;          // exposition only
    chrono::month_day_last mdl_;        // exposition only

  public:
    constexpr year_month_day_last(const chrono::year& y,
                                  const chrono::month_day_last& mdl) noexcept;

    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y)  noexcept;
    constexpr year_month_day_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year           year()           const noexcept;
    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day            day()            const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last day of a year and month.

[*Note 1*: `year_month_day_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day_last` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `year_month_day_last` is a trivially copyable and standard-layout class type.

30.8.15.2 Member functions [time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                              const chrono::month_day_last& mdl) noexcept;
```

1 *Effects*: Initializes `y_` with `y` and `mdl_` with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Effects*: `*this = *this + m`.

4 *Returns*: `*this`.

```
constexpr year_month_day_last& operator-=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects*: `*this = *this - m`.

7 *Returns*: `*this`.

```
constexpr year_month_day_last& operator+=(const years& y) noexcept;
```

8 *Effects*: `*this = *this + y`.

9 *Returns*: `*this`.

```
constexpr year_month_day_last& operator-=(const years& y) noexcept;
```

10 *Effects*: `*this = *this - y`.

11 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns*: `mdl_.month()`.

```
constexpr chrono::month_day_last month_day_last() const noexcept;
```

14 *Returns*: `mdl_`.

```
constexpr chrono::day day() const noexcept;
```

15 *Returns*: If `ok()` is `true`, returns a `day` representing the last day of the (`year`, `month`) pair represented by `*this`. Otherwise, the returned value is unspecified.

16 [*Note 1*: This value might be computed on demand. — *end note*]

```
constexpr operator sys_days() const noexcept;
```

17 *Returns*: `sys_days{year()/month()/day()}`.

```
constexpr explicit operator local_days() const noexcept;
```

18 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

19 *Returns*: `y_.ok() && mdl_.ok()`.

30.8.15.3 Non-member functions [time.cal.ymdlast.nonmembers]

```
constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month_day_last() == y.month_day_last()`.

```
constexpr strong_ordering operator<=>(const year_month_day_last& x,
                                      const year_month_day_last& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month_day_last() <=> y.month_day_last();
```

```
constexpr year_month_day_last
  operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

4 *Returns*: `(ymdl.year() / ymdl.month() + dm) / last`.

```
constexpr year_month_day_last
  operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Returns*: `ymdl + dm`.

```
constexpr year_month_day_last
  operator-(const year_month_day_last& ymdl, const months& dm) noexcept;
```

7 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

8 *Returns*: `ymdl + (-dm)`.

```
constexpr year_month_day_last
  operator+(const year_month_day_last& ymdl, const years& dy) noexcept;
```

9 *Returns*: `{ymdl.year()+dy, ymdl.month_day_last()}`.

```
constexpr year_month_day_last
  operator+(const years& dy, const year_month_day_last& ymdl) noexcept;
```

10 *Returns*: `ymdl + dy`.

```
constexpr year_month_day_last
  operator-(const year_month_day_last& ymdl, const years& dy) noexcept;
```

11 *Returns*: `ymdl + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);
```

12 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
                    ymdl.year(), ymdl.month_day_last());
```

30.8.16 Class year_month_weekday [time.cal.ymwd]

30.8.16.1 Overview [time.cal.ymwd.overview]

```
namespace std::chrono {
  class year_month_weekday {
    chrono::year            y_;         // exposition only
    chrono::month           m_;         // exposition only
    chrono::weekday_indexed wdi_;       // exposition only

  public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                 const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

```
      constexpr year_month_weekday& operator+=(const months& m) noexcept;
      constexpr year_month_weekday& operator-=(const months& m) noexcept;
      constexpr year_month_weekday& operator+=(const years& y)  noexcept;
      constexpr year_month_weekday& operator-=(const years& y)  noexcept;

      constexpr chrono::year            year()            const noexcept;
      constexpr chrono::month           month()           const noexcept;
      constexpr chrono::weekday         weekday()         const noexcept;
      constexpr unsigned                index()           const noexcept;
      constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

      constexpr          operator sys_days()   const noexcept;
      constexpr explicit operator local_days() const noexcept;
      constexpr bool ok() const noexcept;
    };
  }
```

1 `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`.

[*Note 1*: `year_month_weekday` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

2 `year_month_weekday` is a trivially copyable and standard-layout class type.

30.8.16.2 Member functions [time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

2 *Effects*: Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

3 *Remarks*: For any value `ymwd` of type `year_month_weekday` for which `ymwd.ok()` is `true`, `ymwd == year_month_weekday{sys_days{ymwd}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

4 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects*: `*this = *this + m`.

7 *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Effects*: `*this = *this - m`.

10 *Returns*: `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

11 *Effects*: `*this = *this + y`.

12 *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

13 *Effects*: `*this = *this - y`.

14 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

15 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

16 *Returns*: `m_`.

```
constexpr chrono::weekday weekday() const noexcept;
```

17 *Returns*: `wdi_.weekday()`.

```
constexpr unsigned index() const noexcept;
```

18 *Returns*: `wdi_.index()`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

19 *Returns*: `wdi_`.

```
constexpr operator sys_days() const noexcept;
```

20 *Returns*: If `y_.ok() && m_.ok() && wdi_.weekday().ok()`, returns a `sys_days` that represents the date `(index() - 1) * 7` days after the first `weekday()` of `year()/month()`. If `index()` is 0 the returned `sys_days` represents the date 7 days prior to the first `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

21 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

22 *Returns*: If any of `y_.ok()`, `m_.ok()`, or `wdi_.ok()` is `false`, returns `false`. Otherwise, if `*this` represents a valid date, returns `true`. Otherwise, returns `false`.

30.8.16.3 Non-member functions [time.cal.ymwd.nonmembers]

```
constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
```

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()
```

```
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Returns*: `(ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed()`.

```
constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Returns*: `ymwd + dm`.

```
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymwd + (-dm)`.

```
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;
```

8 *Returns*: `{ymwd.year()+dy, ymwd.month(), ymwd.weekday_indexed()}`.

```
constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
```

9 *Returns*: `ymwd + dy`.

```
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
```

10 *Returns*: `ymwd + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                    ymwd.year(), ymwd.month(), ymwd.weekday_indexed());
```

30.8.17 Class year_month_weekday_last [time.cal.ymwdlast]

30.8.17.1 Overview [time.cal.ymwdlast.overview]

```
namespace std::chrono {
  class year_month_weekday_last {
    chrono::year         y_;    // exposition only
    chrono::month        m_;    // exposition only
    chrono::weekday_last wdl_;  // exposition only

  public:
    constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                      const chrono::weekday_last& wdl) noexcept;

    constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator+=(const years& y)  noexcept;
    constexpr year_month_weekday_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year         year()         const noexcept;
    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday      weekday()      const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_weekday_last` represents a specific year, month, and last weekday of the month. `year_month_weekday_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last weekday of a year and month.

[*Note 1*: `year_month_weekday_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday_last` meets the *Cpp17EqualityComparable* (Table 28) requirements.

2 `year_month_weekday_last` is a trivially copyable and standard-layout class type.

30.8.17.2 Member functions [time.cal.ymwdlast.members]

```
constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                  const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Effects*: `*this = *this + m`.

4 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects*: `*this = *this - m`.

7 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
```

8 *Effects*: `*this = *this + y`.

9 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
```

10 *Effects*: `*this = *this - y`.

11 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns*: `m_`.

```
constexpr chrono::weekday weekday() const noexcept;
```

14 *Returns*: `wdl_.weekday()`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

15 *Returns*: `wdl_`.

```
constexpr operator sys_days() const noexcept;
```

16 *Returns*: If `ok() == true`, returns a `sys_days` that represents the last `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

17 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

18 *Returns*: `y_.ok() && m_.ok() && wdl_.ok()`.

30.8.17.3 Non-member functions [time.cal.ymwdlast.nonmembers]

```
constexpr bool operator==(const year_month_weekday_last& x,
                          const year_month_weekday_last& y) noexcept;
```

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()
```

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Returns*: `(ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last()`.

```
constexpr year_month_weekday_last
  operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Returns*: `ymwdl + dm`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymwdl + (-dm)`.

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

8 *Returns*: `{ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
```

9 *Returns*: `ymwdl + dy`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

10 *Returns*: `ymwdl + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                    ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
```

30.8.18 Conventional syntax operators [time.cal.operators]

1 A set of overloaded `operator/` functions provides a conventional syntax for the creation of civil calendar dates.

2 [*Note 1*: The year, month, and day are accepted in any of the following 3 orders:

year / *month* / *day*
month / *day* / *year*
day / *month* / *year*

Anywhere a *day* is needed, any of the following can also be specified:

`last`
weekday `[`*i*`]`
weekday `[last]`

— *end note*]

3 [*Note 2*: Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```
year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
```

— *end note*]

4 [*Example 1*:

```
auto a = 2015/4/4;          // a == int(125)
auto b = 2015y/4/4;         // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /
```

— *end example*]

```
constexpr year_month
  operator/(const year& y, const month& m) noexcept;
```

5 *Returns*: `{y, m}`.

```
constexpr year_month
  operator/(const year& y, int   m) noexcept;
```

6 *Returns*: `y / month(m)`.

```
constexpr month_day
  operator/(const month& m, const day& d) noexcept;
```

7 *Returns*: `{m, d}`.

```
constexpr month_day
  operator/(const month& m, int d) noexcept;
```

8 *Returns*: `m / day(d)`.

```
constexpr month_day
  operator/(int m, const day& d) noexcept;
```

9 *Returns*: `month(m) / d`.

```
constexpr month_day
  operator/(const day& d, const month& m) noexcept;
```

10 *Returns*: `m / d`.

```
constexpr month_day
  operator/(const day& d, int m) noexcept;
```

11 *Returns*: `month(m) / d`.

```
constexpr month_day_last
  operator/(const month& m, last_spec) noexcept;
```

12 *Returns*: `month_day_last{m}`.

```
constexpr month_day_last
  operator/(int m, last_spec) noexcept;
```

13 *Returns*: `month(m) / last`.

```
constexpr month_day_last
  operator/(last_spec, const month& m) noexcept;
```

14 *Returns*: `m / last`.

```
constexpr month_day_last
  operator/(last_spec, int m) noexcept;
```

15 *Returns*: `month(m) / last`.

```
constexpr month_weekday
  operator/(const month& m, const weekday_indexed& wdi) noexcept;
```

16 *Returns*: `{m, wdi}`.

```
constexpr month_weekday
  operator/(int m, const weekday_indexed& wdi) noexcept;
```

17 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, const month& m) noexcept;
```

18 *Returns*: `m / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, int m) noexcept;
```

19 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday_last
  operator/(const month& m, const weekday_last& wdl) noexcept;
```

20 *Returns*: `{m, wdl}`.

```
constexpr month_weekday_last
  operator/(int m, const weekday_last& wdl) noexcept;
```

21 *Returns*: `month(m) / wdl`.

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, const month& m) noexcept;
```

22 *Returns*: `m / wdl`.

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, int m) noexcept;
```

23 *Returns*: `month(m) / wdl`.

```
constexpr year_month_day
  operator/(const year_month& ym, const day& d) noexcept;
```

24 *Returns*: `{ym.year(), ym.month(), d}`.

```
constexpr year_month_day
  operator/(const year_month& ym, int d) noexcept;
```

25 *Returns*: `ym / day(d)`.

```
constexpr year_month_day
  operator/(const year& y, const month_day& md) noexcept;
```

26 *Returns*: `y / md.month() / md.day()`.

```
constexpr year_month_day
  operator/(int y, const month_day& md) noexcept;
```

27 *Returns*: `year(y) / md`.

```
constexpr year_month_day
  operator/(const month_day& md, const year& y) noexcept;
```

28 *Returns*: `y / md`.

```
constexpr year_month_day
  operator/(const month_day& md, int y) noexcept;
```

29 *Returns*: `year(y) / md`.

```
constexpr year_month_day_last
  operator/(const year_month& ym, last_spec) noexcept;
```

30 *Returns*: `{ym.year(), month_day_last{ym.month()}}`.

```
constexpr year_month_day_last
  operator/(const year& y, const month_day_last& mdl) noexcept;
```

31 *Returns*: `{y, mdl}`.

```
constexpr year_month_day_last
  operator/(int y, const month_day_last& mdl) noexcept;
```

32 *Returns*: `year(y) / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, const year& y) noexcept;
```

33 *Returns*: `y / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, int y) noexcept;
```

34 *Returns*: `year(y) / mdl`.

```
constexpr year_month_weekday
  operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
```

35 *Returns*: `{ym.year(), ym.month(), wdi}`.

```
constexpr year_month_weekday
  operator/(const year& y, const month_weekday& mwd) noexcept;
```

36 *Returns*: `{y, mwd.month(), mwd.weekday_indexed()}`.

```
constexpr year_month_weekday
  operator/(int y, const month_weekday& mwd) noexcept;
```

37 *Returns*: `year(y) / mwd`.

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, const year& y) noexcept;
```

38 *Returns*: `y / mwd`.

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, int y) noexcept;
```

39 *Returns*: `year(y) / mwd`.

```
constexpr year_month_weekday_last
  operator/(const year_month& ym, const weekday_last& wdl) noexcept;
```

40 *Returns*: `{ym.year(), ym.month(), wdl}`.

```
constexpr year_month_weekday_last
  operator/(const year& y, const month_weekday_last& mwdl) noexcept;
```

41 *Returns*: `{y, mwdl.month(), mwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator/(int y, const month_weekday_last& mwdl) noexcept;
```

42 *Returns*: `year(y) / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, const year& y) noexcept;
```

43 *Returns*: `y / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, int y) noexcept;
```

44 *Returns*: `year(y) / mwdl`.

30.9 Class template `hh_mm_ss` [time.hms]

30.9.1 Overview [time.hms.overview]

```
namespace std::chrono {
  template<class Duration> class hh_mm_ss {
  public:
    static constexpr unsigned fractional_width = see below;
    using precision                            = see below;

    constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
    constexpr explicit hh_mm_ss(Duration d);

    constexpr bool is_negative() const noexcept;
    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr precision subseconds() const noexcept;

    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;

  private:
    bool            is_neg;      // exposition only
    chrono::hours   h;           // exposition only
    chrono::minutes m;           // exposition only
    chrono::seconds s;           // exposition only
    precision       ss;          // exposition only
  };
}
```

1 The `hh_mm_ss` class template splits a `duration` into a multi-field time structure *hours*:*minutes*:*seconds* and possibly *subseconds*, where *subseconds* will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The

individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

2 If `Duration` is not a specialization of `duration`, the program is ill-formed.

30.9.2 Members [time.hms.members]

```
static constexpr unsigned fractional_width = see below;
```

1 `fractional_width` is the number of fractional decimal digits represented by `precision`. `fractional_width` has the value of the smallest possible integer in the range $[0, 18]$ such that `precision` will exactly represent all values of `Duration`. If no such value of `fractional_width` exists, then `fractional_width` is 6.

[*Example 1*: See Table 130 for some durations, the resulting `fractional_width`, and the formatted fractional second output of `Duration{1}`.

Table 130 — Examples for `fractional_width` [tab:time.hms.width]

Duration	`fractional_width`	Formatted fractional second output
`hours`, `minutes`, and `seconds`	0	
`milliseconds`	3	0.001
`microseconds`	6	0.000001
`nanoseconds`	9	0.000000001
`duration<int, ratio<1, 2>>`	1	0.5
`duration<int, ratio<1, 3>>`	6	0.333333
`duration<int, ratio<1, 4>>`	2	0.25
`duration<int, ratio<1, 5>>`	1	0.2
`duration<int, ratio<1, 6>>`	6	0.166666
`duration<int, ratio<1, 7>>`	6	0.142857
`duration<int, ratio<1, 8>>`	3	0.125
`duration<int, ratio<1, 9>>`	6	0.111111
`duration<int, ratio<1, 10>>`	1	0.1
`duration<int, ratio<756, 625>>`	4	0.2096

— *end example*]

```
using precision = see below;
```

2 `precision` is

`duration<common_type_t<Duration::rep, seconds::rep>, ratio<1,` $10^{\texttt{fractional\_width}}$`>>`

```
constexpr explicit hh_mm_ss(Duration d);
```

3 *Effects*: Constructs an object of type `hh_mm_ss` which represents the `Duration d` with precision `precision`.

(3.1) — Initializes `is_neg` with `d < Duration::zero()`.

(3.2) — Initializes `h` with `duration_cast<chrono::hours>(abs(d))`.

(3.3) — Initializes `m` with `duration_cast<chrono::minutes>(abs(d) - hours())`.

(3.4) — Initializes `s` with `duration_cast<chrono::seconds>(abs(d) - hours() - minutes())`.

(3.5) — If `treat_as_floating_point_v<precision::rep>` is `true`, initializes `ss` with `abs(d) - hours() - minutes() - seconds()`. Otherwise, initializes `ss` with `duration_cast<precision>(abs(d) - hours() - minutes() - seconds())`.

[*Note 1*: When `precision::rep` is integral and `precision::period` is `ratio<1>`, `subseconds()` always returns a value equal to `0s`. — *end note*]

4 *Postconditions*: If `treat_as_floating_point_v<precision::rep>` is `true`, `to_duration()` returns `d`, otherwise `to_duration()` returns `duration_cast<precision>(d)`.

```
constexpr bool is_negative() const noexcept;
```

5 *Returns*: `is_neg`.

```
constexpr chrono::hours hours() const noexcept;
```

6 *Returns*: `h`.

```
constexpr chrono::minutes minutes() const noexcept;
```

7 *Returns*: `m`.

```
constexpr chrono::seconds seconds() const noexcept;
```

8 *Returns*: `s`.

```
constexpr precision subseconds() const noexcept;
```

9 *Returns*: `ss`.

```
constexpr precision to_duration() const noexcept;
```

10 *Returns*: If `is_neg`, returns `-(h + m + s + ss)`, otherwise returns `h + m + s + ss`.

```
constexpr explicit operator precision() const noexcept;
```

11 *Returns*: `to_duration()`.

30.9.3 Non-members [time.hms.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

2 [*Example 1*:

```
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
  hh_mm_ss hms{ms};
  cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';
```

Produces the output (assuming the "C" locale):

```
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
```

— *end example*]

30.10 12/24 hours functions [time.12]

1 These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

2 *Returns*: `0h <= h && h <= 11h`.

```
constexpr bool is_pm(const hours& h) noexcept;
```

3 *Returns*: `12h <= h && h <= 23h`.

```
constexpr hours make12(const hours& h) noexcept;
```

4 *Returns*: The 12-hour equivalent of `h` in the range [`1h`, `12h`]. If `h` is not in the range [`0h`, `23h`], the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

5 *Returns*: If `is_pm` is `false`, returns the 24-hour equivalent of `h` in the range [`0h`, `11h`], assuming `h` represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of `h` in the range [`12h`, `23h`], assuming `h` represents a post meridiem hour. If `h` is not in the range [`1h`, `12h`], the value returned is unspecified.

30.11 Time zones [time.zone]

30.11.1 General [time.zone.general]

1 30.11 describes an interface for accessing the IANA Time Zone Database[11] that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (30.8) and to user-defined calendars.

30.11.2 Time zone database [time.zone.db]

30.11.2.1 Class `tzdb` [time.zone.db.tzdb]

```
namespace std::chrono {
  struct tzdb {
    string                 version;
    vector<time_zone>      zones;
    vector<time_zone_link> links;
    vector<leap_second>    leap_seconds;

    const time_zone* locate_zone(string_view tz_name) const;
    const time_zone* current_zone() const;
  };
}
```

1 Each `vector` in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

2 *Returns*:

(2.1) — If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;

(2.2) — otherwise, if `links` contains an element `tz_l` for which `tz_l.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_l.target()`.

[*Note 1*: A `time_zone_link` specifies an alternative name for a `time_zone`. — *end note*]

3 *Throws*: If a `const time_zone*` cannot be found as described in the *Returns*: element, throws a `runtime_error`.

[*Note 2*: On non-exceptional return, the return value is always a pointer to a valid `time_zone`. — *end note*]

```
const time_zone* current_zone() const;
```

4 *Returns*: A pointer to the time zone which the computer has set as its local time zone.

30.11.2.2 Class `tzdb_list` [time.zone.db.list]

```
namespace std::chrono {
  class tzdb_list {
  public:
    tzdb_list(const tzdb_list&) = delete;
    tzdb_list& operator=(const tzdb_list&) = delete;

    // unspecified additional constructors

    class const_iterator;

    const tzdb& front() const noexcept;

    const_iterator erase_after(const_iterator p);

    const_iterator begin() const noexcept;
    const_iterator end()   const noexcept;

    const_iterator cbegin() const noexcept;
    const_iterator cend()   const noexcept;
  };
}
```

1 The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

[*Note 1*: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`. — *end note*]

The `tzdb_list` object contains a list of `tzdb` objects.

2 `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

```
const tzdb& front() const noexcept;
```

3 *Synchronization*: This operation is thread-safe with respect to `reload_tzdb()`.

[*Note 2*: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. — *end note*]

4 *Returns*: A reference to the first `tzdb` in the container.

```
const_iterator erase_after(const_iterator p);
```

5 *Preconditions*: The iterator following `p` is dereferenceable.

6 *Effects*: Erases the `tzdb` referred to by the iterator following `p`.

7 *Postconditions*: No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

[*Note 3*: It is not possible to erase the `tzdb` referred to by `begin()`. — *end note*]

8 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

9 *Throws*: Nothing.

```
const_iterator begin() const noexcept;
```

10 *Returns*: An iterator referring to the first `tzdb` in the container.

```
const_iterator end() const noexcept;
```

11 *Returns*: An iterator referring to the position one past the last `tzdb` in the container.

```
const_iterator cbegin() const noexcept;
```

12 *Returns*: `begin()`.

```
const_iterator cend() const noexcept;
```

13 *Returns*: `end()`.

30.11.2.3 Time zone database access [time.zone.db.access]

```
tzdb_list& get_tzdb_list();
```

1 *Effects*: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

2 *Synchronization*: It is safe to call this function from multiple threads at one time.

3 *Returns*: A reference to the database.

4 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdbs`.

```
const tzdb& get_tzdb();
```

5 *Returns*: `get_tzdb_list().front()`.

```
const time_zone* locate_zone(string_view tz_name);
```

6 *Returns*: `get_tzdb().locate_zone(tz_name)`.

7 [*Note 1*: The time zone database will be initialized if this is the first reference to the database. — *end note*]

```
const time_zone* current_zone();
```

8 *Returns*: `get_tzdb().current_zone()`.

30.11.2.4 Remote time zone database support [time.zone.db.remote]

1 The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

2 *Effects*: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

3 *Synchronization*: This function is thread-safe with respect to `get_tzdb_list().front()` and `get_-tzdb_list().erase_after()`.

4 *Postconditions*: No pointers, references, or iterators are invalidated.

5 *Returns*: `get_tzdb_list().front()`.

6 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

7 *Returns*: The latest remote database version.

[*Note 1*: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — *end note*]

30.11.3 Exception classes [time.zone.exception]

30.11.3.1 Class `nonexistent_local_time` [time.zone.exception.nonexist]

```
namespace std::chrono {
  class nonexistent_local_time : public runtime_error {
  public:
    template<class Duration>
      nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::nonexistent` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is in a gap between\n"
   << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
   << i.first.abbrev << " and\n"
   << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
   << i.second.abbrev
   << " which are both equivalent to\n"
   << i.first.end << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[2]/March/2016} + 2h + 30min};
  } catch (const nonexistent_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC
```

— *end example*]

30.11.3.2 Class `ambiguous_local_time` [time.zone.exception.ambig]

```
namespace std::chrono {
  class ambiguous_local_time : public runtime_error {
  public:
    template<class Duration>
      ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::ambiguous` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is ambiguous.  It could be\n"
   << tp << ' ' << i.first.abbrev << " == "
   << tp - i.first.offset << " UTC or\n"
   << tp << ' ' << i.second.abbrev  << " == "
   << tp - i.second.offset  << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[1]/November/2016} + 1h + 30min};
  } catch (const ambiguous_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous.  It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

— *end example*]

30.11.4 Information classes [time.zone.info]

30.11.4.1 Class `sys_info` [time.zone.info.sys]

```
namespace std::chrono {
  struct sys_info {
    sys_seconds   begin;
    sys_seconds   end;
    seconds       offset;
    minutes       save;
    string        abbrev;
  };
}
```

1 A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

2 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. — *end note*]

3 The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range [`begin`, `end`). This information can be used to efficiently iterate the transitions of a `time_zone`.

4 The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

5 The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on "daylight saving" time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range [`begin`, `end`) (if `save != 0min` for this `sys_info`).

6 The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

7 *Effects*: Streams out the `sys_info` object `r` in an unspecified format.

8 *Returns*: `os`.

30.11.4.2 Class `local_info` [time.zone.info.local]

```
namespace std::chrono {
  struct local_info {
    static constexpr int unique      = 0;
    static constexpr int nonexistent = 1;
    static constexpr int ambiguous   = 2;

    int result;
    sys_info first;
    sys_info second;
  };
}
```

1 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — *end note*]

2 Describes the result of converting a `local_time` to a `sys_time` as follows:

(2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

(2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.

(2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

3 *Effects*: Streams out the `local_info` object `r` in an unspecified format.

4 *Returns*: `os`.

30.11.5 Class `time_zone` [time.zone.timezone]

30.11.5.1 Overview [time.zone.overview]

```
  namespace std::chrono {
    class time_zone {
    public:
      time_zone(time_zone&&) = default;
      time_zone& operator=(time_zone&&) = default;

      // unspecified additional constructors

      string_view name() const noexcept;

      template<class Duration> sys_info   get_info(const sys_time<Duration>& st)   const;
      template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

      template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
          to_sys(const local_time<Duration>& tp) const;

      template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
          to_sys(const local_time<Duration>& tp, choose z) const;

      template<class Duration>
        local_time<common_type_t<Duration, seconds>>
          to_local(const sys_time<Duration>& tp) const;
    };
  }
```

1 A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization.

[*Note 1*: `const time_zone` objects can be accessed via functions such as `locate_zone`. — *end note*]

30.11.5.2 Member functions [time.zone.members]

```
string_view name() const noexcept;
```

1 *Returns*: The name of the `time_zone`.

2 [*Example 1*: `"America/New_York"`. — *end example*]

```
template<class Duration>
  sys_info get_info(const sys_time<Duration>& st) const;
```

3 *Returns*: A `sys_info` `i` for which `st` is in the range [`i.begin`, `i.end`).

```
template<class Duration>
  local_info get_info(const local_time<Duration>& tp) const;
```

4 *Returns*: A `local_info` for `tp`.

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp) const;
```

5 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`.

6 *Throws*: If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC `time_points`, throws `nonexistent_local_time`.

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;
```

7 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_-zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```
template<class Duration>
  local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;
```

8 *Returns*: The `local_time` associated with `tp` and this `time_zone`.

30.11.5.3 Non-member functions [time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

30.11.6 Class template zoned_traits [time.zone.zonedtraits]

```
namespace std::chrono {
  template<class T> struct zoned_traits {};
}
```

1 `zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
  template<> struct zoned_traits<const time_zone*> {
    static const time_zone* default_zone();
    static const time_zone* locate_zone(string_view name);
  };
}
```

```
static const time_zone* default_zone();
```

2 *Returns*: `std::chrono::locate_zone("UTC")`.

```
static const time_zone* locate_zone(string_view name);
```

3 *Returns*: `std::chrono::locate_zone(name)`.

30.11.7 Class template zoned_time [time.zone.zonedtime]

30.11.7.1 Overview [time.zone.zonedtime.overview]

```
namespace std::chrono {
  template<class Duration, class TimeZonePtr = const time_zone*>
  class zoned_time {
  public:
    using duration = common_type_t<Duration, seconds>;

  private:
    TimeZonePtr        zone_;                    // exposition only
    sys_time<duration> tp_;                      // exposition only

    using traits = zoned_traits<TimeZonePtr>;    // exposition only

  public:
    zoned_time();
    zoned_time(const zoned_time&) = default;
    zoned_time& operator=(const zoned_time&) = default;

    zoned_time(const sys_time<Duration>& st);
    explicit zoned_time(TimeZonePtr z);
    explicit zoned_time(string_view name);

    template<class Duration2>
      zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

    zoned_time(TimeZonePtr z,    const sys_time<Duration>& st);
    zoned_time(string_view name, const sys_time<Duration>& st);

    zoned_time(TimeZonePtr z,    const local_time<Duration>& tp);
    zoned_time(string_view name, const local_time<Duration>& tp);
    zoned_time(TimeZonePtr z,    const local_time<Duration>& tp, choose c);
    zoned_time(string_view name, const local_time<Duration>& tp, choose c);

    template<class Duration2, class TimeZonePtr2>
      zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
    template<class Duration2, class TimeZonePtr2>
      zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

    template<class Duration2, class TimeZonePtr2>
      zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
    template<class Duration2, class TimeZonePtr2>
      zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

    zoned_time& operator=(const sys_time<Duration>& st);
    zoned_time& operator=(const local_time<Duration>& lt);

    operator sys_time<duration>() const;
    explicit operator local_time<duration>() const;

    TimeZonePtr          get_time_zone()  const;
    local_time<duration> get_local_time() const;
    sys_time<duration>   get_sys_time()   const;
    sys_info             get_info()       const;
  };

  zoned_time() -> zoned_time<seconds>;

  template<class Duration>
    zoned_time(sys_time<Duration>)
      -> zoned_time<common_type_t<Duration, seconds>>;

  template<class TimeZonePtrOrName>
    using time-zone-representation =        // exposition only
      conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
                    const time_zone*,
                    remove_cvref_t<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName>
    zoned_time(TimeZonePtrOrName&&)
      -> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
      -> zoned_time<common_type_t<Duration, seconds>,
                    time-zone-representation<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
               choose = choose::earliest)
      -> zoned_time<common_type_t<Duration, seconds>,
                        time-zone-representation<TimeZonePtrOrName>>;

    template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
      zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
                 choose = choose::earliest)
        -> zoned_time<common_type_t<Duration, seconds>,
                        time-zone-representation<TimeZonePtrOrName>>;
}
```

1 `zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2 If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.

3 Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction (12.2.2.9).

30.11.7.2 Constructors [time.zone.zonedtime.ctor]

```
zoned_time();
```

1 *Constraints*: `traits::default_zone()` is a well-formed expression.

2 *Effects*: Initializes `zone_` with `traits::default_zone()` and default constructs `tp_`.

```
zoned_time(const sys_time<Duration>& st);
```

3 *Constraints*: `traits::default_zone()` is a well-formed expression.

4 *Effects*: Initializes `zone_` with `traits::default_zone()` and `tp_` with `st`.

```
explicit zoned_time(TimeZonePtr z);
```

5 *Preconditions*: `z` refers to a time zone.

6 *Effects*: Initializes `zone_` with `std::move(z)` and default constructs `tp_`.

```
explicit zoned_time(string_view name);
```

7 *Constraints*: `traits::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of `traits::locate_zone(string_view{})`.

8 *Effects*: Initializes `zone_` with `traits::locate_zone(name)` and default constructs `tp_`.

```
template<class Duration2>
  zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

9 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

10 *Effects*: Initializes `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

11 *Preconditions*: `z` refers to a time zone.

12 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `st`.

```
zoned_time(string_view name, const sys_time<Duration>& st);
```

13 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.

14 *Effects*: Equivalent to construction with `{traits::locate_zone(name), st}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

15 *Constraints*:

```
  is_convertible_v<
    decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{})),
    sys_time<duration>>
```

is `true`.

16 *Preconditions*: `z` refers to a time zone.

17 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

18 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `tp`.

19 *Effects*: Equivalent to construction with `{traits::locate_zone(name), tp}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

20 *Constraints*:

```
is_convertible_v<
  decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest)),
  sys_time<duration>>
```

is `true`.

21 *Preconditions*: `z` refers to a time zone.

22 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

23 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.

24 *Effects*: Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

25 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

26 *Preconditions*: `z` refers to a valid time zone.

27 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

28 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

29 *Preconditions*: `z` refers to a valid time zone.

30 *Effects*: Equivalent to construction with `{z, y}`.

31 [*Note 1*: The `choose` parameter has no effect. — *end note*]

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

32 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

33 *Effects*: Equivalent to construction with `{traits::locate_zone(name), y}`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);
```

34 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, the type `zoned_time<Duration2, TimeZonePtr2>`, and the type `choose`.

35 *Effects*: Equivalent to construction with `{traits::locate_zone(name), y, c}`.

36 [*Note 2*: The `choose` parameter has no effect. — *end note*]

30.11.7.3 Member functions [time.zone.zonedtime.members]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

1 *Effects*: After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

2 *Returns*: `*this`.

```
zoned_time& operator=(const local_time<Duration>& lt);
```

3 *Effects*: After assignment, `get_local_time() == lt`. This assignment has no effect on the return value of `get_time_zone()`.

4 *Returns*: `*this`.

```
operator sys_time<duration>() const;
```

5 *Returns*: `get_sys_time()`.

```
explicit operator local_time<duration>() const;
```

6 *Returns*: `get_local_time()`.

```
TimeZonePtr get_time_zone() const;
```

7 *Returns*: `zone_`.

```
local_time<duration> get_local_time() const;
```

8 *Returns*: `zone_->to_local(tp_)`.

```
sys_time<duration> get_sys_time() const;
```

9 *Returns*: `tp_`.

```
sys_info get_info() const;
```

10 *Returns*: `zone_->get_info(tp_)`.

30.11.7.4 Non-member functions [time.zone.zonedtime.nonmembers]

```
template<class Duration1, class Duration2, class TimeZonePtr>
  bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);
```

1 *Returns*: `x.zone_ == y.zone_ && x.tp_ == y.tp_`.

```
template<class charT, class traits, class Duration, class TimeZonePtr>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const zoned_time<Duration, TimeZonePtr>& t);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T %Z}"), t);
```

30.11.8 Class `leap_second` [time.zone.leap]

30.11.8.1 Overview [time.zone.leap.overview]

```
namespace std::chrono {
  class leap_second {
  public:
    leap_second(const leap_second&)            = default;
    leap_second& operator=(const leap_second&) = default;

    // unspecified additional constructors

    constexpr sys_seconds date() const noexcept;
    constexpr seconds value() const noexcept;
  };
}
```

1 Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

2 [*Example 1*:

```
for (auto& l : get_tzdb().leap_seconds)
  if (l <= sys_days{2018y/March/17d})
    cout << l.date() << ": " << l.value() << '\n';
```

Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

— *end example*]

30.11.8.2 Member functions [time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

1 *Returns*: The date and time at which the leap second was inserted.

```
constexpr seconds value() const noexcept;
```

2 *Returns*: `+1s` to indicate a positive leap second or `-1s` to indicate a negative leap second.

[*Note 1*: All leap seconds inserted up through 2022 were positive leap seconds. — *end note*]

30.11.8.3 Non-member functions [time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

1 *Returns*: `x.date() == y.date()`.

```
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

2 *Returns*: `x.date() <=> y.date()`.

```
template<class Duration>
  constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

3 *Returns*: `x.date() == y`.

```
template<class Duration>
  constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

4 *Returns*: `x.date() < y`.

```
template<class Duration>
  constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

5 *Returns*: `x < y.date()`.

```
template<class Duration>
  constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

6 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

7 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

8 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

9 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

10 *Returns*: `!(x < y)`.

```
template<class Duration>
  constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

11 *Returns*: `!(x < y)`.

```
template<class Duration>
  requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
  constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

12 *Returns*: `x.date() <=> y`.

30.11.9 Class `time_zone_link` [time.zone.link]

30.11.9.1 Overview [time.zone.link.overview]

```
namespace std::chrono {
  class time_zone_link {
  public:
    time_zone_link(time_zone_link&&)            = default;
    time_zone_link& operator=(time_zone_link&&) = default;

    // unspecified additional constructors

    string_view name()   const noexcept;
    string_view target() const noexcept;
  };
}
```

1 A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_link`s are constructed when the time zone database is initialized.

30.11.9.2 Member functions [time.zone.link.members]

```
string_view name() const noexcept;
```

1 *Returns*: The alternative name for the time zone.

```
string_view target() const noexcept;
```

2 *Returns*: The name of the `time_zone` for which this `time_zone_link` provides an alternative name.

30.11.9.3 Non-member functions [time.zone.link.nonmembers]

```
bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

30.12 Formatting [time.format]

1 Each `formatter` (28.5.6) specialization in the chrono library (30.2) meets the *Formatter* requirements (28.5.6.1). The `parse` member functions of these formatters interpret the format specification as a *chrono-format-spec* according to the following syntax:

chrono-format-spec:
    fill-and-align$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ `L`$_{opt}$ *chrono-specs*$_{opt}$

chrono-specs:
    conversion-spec
    chrono-specs conversion-spec
    chrono-specs literal-char

literal-char:
    any character other than `{`, `}`, or `%`

conversion-spec:
    `%` *modifier*$_{opt}$ *type*

modifier: one of
    `E O`

type: one of
    `a A b B c C d D e F g G h H I j m M n`
    `p q Q r R S t T u U V w W x X y Y z Z %`

The productions *fill-and-align*, *width*, and *precision* are described in 28.5.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for types that are specializations of `std::chrono::duration` for which the nested *typedef-name* `rep` denotes a floating-point type. For all other types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

2 A *formatting locale* is an instance of `locale` used by a formatting function, defined as

(2.1) — the `"C"` locale if the `L` option is not present in *chrono-format-spec*, otherwise

(2.2) — the locale passed to the formatting function if any, otherwise

(2.3) — the global locale.

3 Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 131; the formats specified in ISO 8601-1:2019 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.

4 The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a *`STATICALLY-WIDEN`*`<charT>("-")` character sequence placed before the replacement of the initial conversion specifier.

[*Example 1*:

```
cout << format("{:%T}", -10'000s);          // prints: -02:46:40
cout << format("{:%H:%M:%S}", -10'000s);    // prints: -02:46:40
cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s);
                                            // prints: minutes -46, hours 02, seconds 40
```

— *end example*]

5 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

[*Note 1*: If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type `format_error` is thrown, as described above. — *end note*]

6 If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

[*Example 2*: A `duration` does not contain enough information to format as a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 131 — Meaning of conversion specifiers [tab:time.format.spec]

Specifier	Replacement
`%a`	The locale's abbreviated weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%A`	The locale's full weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%b`	The locale's abbreviated month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%B`	The locale's full month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%c`	The locale's date and time representation. The modified command `%Ec` produces the locale's alternate date and time representation.
`%C`	The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%EC` produces the locale's alternative representation of the century.
`%d`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%Od` produces the locale's alternative representation.
`%D`	Equivalent to `%m/%d/%y`.
`%e`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command `%Oe` produces the locale's alternative representation.
`%F`	Equivalent to `%Y-%m-%d`.
`%g`	The last two decimal digits of the calendar year as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit it is prefixed by `0`.
`%G`	The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is less than four digits it is left-padded with `0` to four digits.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OH` produces the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OI` produces the locale's alternative representation.
`%j`	If the type being formatted is a specialization of `duration`, the decimal number of `days` without padding. Otherwise, the day of the year as a decimal number. January 1 is `001`. If the result is less than three digits, it is left-padded with `0` to three digits.
`%m`	The month as a decimal number. Jan is `01`. If the result is a single digit, it is prefixed with `0`. The modified command `%Om` produces the locale's alternative representation.
`%M`	The minute as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OM` produces the locale's alternative representation.
`%n`	A new-line character.
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%q`	The duration's unit suffix as specified in 30.5.11.
`%Q`	The duration's numeric value (as if extracted via `.count()`).
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.

Table 131 — Meaning of conversion specifiers (continued)

Specifier	Replacement
`%S`	Seconds as a decimal number. If the number of seconds is less than `10`, the result is prefixed with `0`. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command `%OS` produces the locale's alternative representation.
`%t`	A horizontal-tab character.
`%T`	Equivalent to `%H:%M:%S`.
`%u`	The calendar day of week as a decimal number (`1`-`7`), as specified in ISO 8601-1:2019, where Monday is `1`. The modified command `%Ou` produces the locale's alternative representation.
`%U`	The week number of the year as a decimal number. The first Sunday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. If the result is a single digit, it is prefixed with `0`. The modified command `%OU` produces the locale's alternative representation.
`%V`	The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit, it is prefixed with `0`. The modified command `%OV` produces the locale's alternative representation.
`%w`	The weekday as a decimal number (`0`-`6`), where Sunday is `0`. The modified command `%Ow` produces the locale's alternative representation.
`%W`	The week number of the year as a decimal number. The first Monday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. If the result is a single digit, it is prefixed with `0`. The modified command `%OW` produces the locale's alternative representation.
`%x`	The locale's date representation. The modified command `%Ex` produces the locale's alternate date representation.
`%X`	The locale's time representation. The modified command `%EX` produces the locale's alternate time representation.
`%y`	The last two decimal digits of the year. If the result is a single digit it is prefixed by `0`. The modified command `%Oy` produces the locale's alternative representation. The modified command `%Ey` produces the locale's alternative representation of offset from `%EC` (year only).
`%Y`	The year as a decimal number. If the result is less than four digits it is left-padded with `0` to four digits. The modified command `%EY` produces the locale's alternative full year representation.
`%z`	The offset from UTC as specified in ISO 8601-1:2019, 5.3.4.1. For example `-0430` refers to 4 hours 30 minutes behind UTC. If the offset is zero, `+0000` is used. The modified commands `%Ez` and `%Oz` insert a `:` between the hours and minutes: `-04:30`. If the offset information is not available, an exception of type `format_error` is thrown.
`%Z`	The time zone abbreviation. If the time zone abbreviation is not available, an exception of type `format_error` is thrown.
`%%`	A `%` character.

7 If the *chrono-specs* is omitted, the chrono object is formatted as if by streaming it to `basic_ostringstream<charT> os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[*Example 3*:

```
string s = format("{:=>8}", 42ms);        // value of s is "====42ms"
```

— *end example*]

8 For `chrono::duration` the library only provides the following specialization of `enable_nonlocking_formatter_optimization`:

```
template<class Rep, class Period>
  constexpr bool enable_nonlocking_formatter_optimization<
    chrono::duration<Rep, Period>> =
      enable_nonlocking_formatter_optimization<Rep>;
```

9 For `chrono::zoned_time` the library only provides the following specialization of `enable_nonlocking_-formatter_optimization`:

```
template<class Duration>
  constexpr bool enable_nonlocking_formatter_optimization<
    chrono::zoned_time<Duration, const std::chrono::time_zone*>> = true;
```

```
template<class Duration, class charT>
  struct formatter<chrono::sys_time<Duration>, charT>;
```

10 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted.

```
template<class Duration, class charT>
  struct formatter<chrono::utc_time<Duration>, charT>;
```

11 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is *`STATICALLY-WIDEN`*`<charT>("60")`.

```
template<class Duration, class charT>
  struct formatter<chrono::tai_time<Duration>, charT>;
```

12 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("TAI")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} -
  (sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::gps_time<Duration>, charT>;
```

13 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("GPS")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
  (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::file_time<Duration>, charT>;
```

14 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `clock_cast<system_clock>(t)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(t)`, where `t` is the first argument to `format`.

```
template<class Duration, class charT>
  struct formatter<chrono::local_time<Duration>, charT>;
```

15 *Remarks*: If `%Z`, `%z`, or a modified version of `%z` is used, an exception of type `format_error` is thrown.

```
template<class Duration> struct local-time-format-t {           // exposition only
  local_time<Duration> time;                                     // exposition only
  const string* abbrev;                                          // exposition only
  const seconds* offset_sec;                                     // exposition only
};
```

```
template<class Duration>
  local-time-format-t<Duration>
    local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                      const seconds* offset_sec = nullptr);
```

16 *Returns*: `{time, abbrev, offset_sec}`.

```
template<class Duration, class charT>
  struct formatter<chrono::local-time-format-t<Duration>, charT>;
```

17 Let `f` be a *`local-time-format-t`*`<Duration>` object passed to `formatter::format`.

18 *Remarks*: If the *chrono-specs* is omitted, the result is equivalent to using `%F %T %Z` as the *chrono-specs*. If `%Z` is used, it is replaced with `*f.abbrev` if `f.abbrev` is not a null pointer value. If `%Z` is used and `f.abbrev` is a null pointer value, an exception of type `format_error` is thrown. If `%z` (or a modified variant of `%z`) is used, it is formatted with the value of `*f.offset_sec` if `f.offset_sec` is not a null pointer value. If `%z` (or a modified variant of `%z`) is used and `f.offset_sec` is a null pointer value, then an exception of type `format_error` is thrown.

```
template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
    : formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT> {
  template<class FormatContext>
    typename FormatContext::iterator
      format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
};
```

```
template<class FormatContext>
  typename FormatContext::iterator
    format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
```

19 *Effects*: Equivalent to:

```
sys_info info = tp.get_info();
return formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT>::
         format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);
```

30.13 Parsing [time.parse]

1 Each `parse` overload specified in this subclause calls `from_stream` unqualified, so as to enable argument-dependent lookup (6.5.4). In the following paragraphs, let `is` denote an object of type `basic_istream<charT, traits>` and let `I` be `basic_istream<charT, traits>&`, where `charT` and `traits` are template parameters in that context.

2 *Recommended practice*: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by `parse` immovable and preventing stream extraction into an lvalue of such a manipulator type.

```
template<class charT, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

3 Let *F* be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_-traits<charT>` for the first overload.

4 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

is well-formed when treated as an unevaluated operand (7.2.3).

5 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp)` has type `I`, has value `is`, and calls `from_stream(is, F, tp)`.

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
```

6 Let *F* be `fmt` for the first overload and `fmt.c_str()` for the second overload.

7 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand (7.2.3).

8 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev))`.

```
template<class charT, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          minutes& offset);
```

9 Let F be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

10 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp,
            declval<basic_string<charT, traits, Alloc>*>(),
            &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

11 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
            F, tp,
            static_cast<basic_string<charT, traits, Alloc>*>(nullptr),
            &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

12 Let F be `fmt` for the first overload and `fmt.c_str()` for the second overload.

13 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

14 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev), &offset)`.

15 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to Table 132. Some flags can be modified by a width parameter given as a positive decimal integer called out as *`N`* below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 132, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

16 If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

[*Example 1*: A `duration` cannot represent a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

17 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 132 — Meaning of parse flags [tab:time.parse.spec]

Flag	Parsed value
`%a`	The locale's full or abbreviated case-insensitive weekday name.
`%A`	Equivalent to `%a`.
`%b`	The locale's full or abbreviated case-insensitive month name.
`%B`	Equivalent to `%b`.
`%c`	The locale's date and time representation. The modified command `%Ec` interprets the locale's alternate date and time representation.
`%C`	The century as a decimal number. The modified command `%NC` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%EC` interprets the locale's alternative representation of the century.
`%d`	The day of the month as a decimal number. The modified command `%Nd` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Od` interprets the locale's alternative representation of the day of the month.
`%D`	Equivalent to `%m/%d/%y`.
`%e`	Equivalent to `%d` and can be modified like `%d`.
`%F`	Equivalent to `%Y-%m-%d`. If modified with a width *N*, the width is applied to only `%Y`.
`%g`	The last two decimal digits of the calendar year, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%Ng` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required.
`%G`	The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%NG` specifies the maximum number of characters to read. If *N* is not specified, the default is 4. Leading zeroes are permitted but not required.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. The modified command `%NH` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OH` interprets the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. The modified command `%NI` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OI` interprets the locale's alternative representation.
`%j`	If the type being parsed is a specialization of `duration`, a decimal number of `days`. Otherwise, the day of the year as a decimal number. January 1 is `1`. In either case, the modified command `%Nj` specifies the maximum number of characters to read. If *N* is not specified, the default is 3. Leading zeroes are permitted but not required.
`%m`	The month as a decimal number. January is `1`. The modified command `%Nm` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Om` interprets the locale's alternative representation.
`%M`	The minutes as a decimal number. The modified command `%NM` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OM` interprets the locale's alternative representation.

Table 132 — Meaning of `parse` flags (continued)

Flag	Parsed value
`%n`	Matches one whitespace character. [*Note 1*: `%n`, `%t`, and a space can be combined to match a wide range of whitespace patterns. For example, `"%n "` matches one or more whitespace characters, and `"%n%t%t"` matches one to three whitespace characters. — *end note*]
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.
`%S`	The seconds as a decimal number. The modified command `%`*`N`*`S` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a `long double` in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command `%OS` interprets the locale's alternative representation.
`%t`	Matches zero or one whitespace characters.
`%T`	Equivalent to `%H:%M:%S`.
`%u`	The calendar day of week as a decimal number (`1`-`7`), as specified in ISO 8601-1:2019, where Monday is `1`. The modified command `%`*`N`*`u` specifies the maximum number of characters to read. If *`N`* is not specified, the default is `1`. Leading zeroes are permitted but not required.
`%U`	The week number of the year as a decimal number. The first Sunday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%`*`N`*`U` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OU` interprets the locale's alternative representation.
`%V`	The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%`*`N`*`V` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2. Leading zeroes are permitted but not required.
`%w`	The weekday as a decimal number (`0`-`6`), where Sunday is `0`. The modified command `%`*`N`*`w` specifies the maximum number of characters to read. If *`N`* is not specified, the default is `1`. Leading zeroes are permitted but not required. The modified command `%Ow` interprets the locale's alternative representation.
`%W`	The week number of the year as a decimal number. The first Monday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%`*`N`*`W` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OW` interprets the locale's alternative representation.
`%x`	The locale's date representation. The modified command `%Ex` interprets the locale's alternate date representation.
`%X`	The locale's time representation. The modified command `%EX` interprets the locale's alternate time representation.
`%y`	The last two decimal digits of the year. If the century is not otherwise specified (e.g., with `%C`), values in the range [`69`, `99`] are presumed to refer to the years 1969 to 1999, and values in the range [`00`, `68`] are presumed to refer to the years 2000 to 2068. The modified command `%`*`N`*`y` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands `%Ey` and `%Oy` interpret the locale's alternative representation.
`%Y`	The year as a decimal number. The modified command `%`*`N`*`Y` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command `%EY` interprets the locale's alternative representation.

Table 132 — Meaning of `parse` flags (continued)

Flag	Parsed value
`%z`	The offset from UTC in the format `[+|-]hh[mm]`. For example `-0430` refers to 4 hours 30 minutes behind UTC, and `04` refers to 4 hours ahead of UTC. The modified commands `%Ez` and `%Oz` parse a `:` between the hours and minutes and render leading zeroes on the hour field optional: `[+|-]h[h][:mm]`. For example `-04:30` refers to 4 hours 30 minutes behind UTC, and `4` refers to 4 hours ahead of UTC.
`%Z`	The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3.1) that are alphanumeric, or one of `'_'`, `'/'`, `'-'`, or `'+'`.
`%%`	A `%` character is extracted.

30.14 Hash support [time.hash]

```
template<class Rep, class Period> struct hash<chrono::duration<Rep, Period>>;
```

1 The specialization `hash<chrono::duration<Rep, Period>>` is enabled (22.10.19) if and only if `hash<Rep>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<class Clock, class Duration> struct hash<chrono::time_point<Clock, Duration>>;
```

2 The specialization `hash<chrono::time_point<Clock, Duration>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::day>;
template<> struct hash<chrono::month>;
template<> struct hash<chrono::year>;
template<> struct hash<chrono::weekday>;
template<> struct hash<chrono::weekday_indexed>;
template<> struct hash<chrono::weekday_last>;
template<> struct hash<chrono::month_day>;
template<> struct hash<chrono::month_day_last>;
template<> struct hash<chrono::month_weekday>;
template<> struct hash<chrono::month_weekday_last>;
template<> struct hash<chrono::year_month>;
template<> struct hash<chrono::year_month_day>;
template<> struct hash<chrono::year_month_day_last>;
template<> struct hash<chrono::year_month_weekday>;
template<> struct hash<chrono::year_month_weekday_last>;
```

3 The specializations are enabled (22.10.19).

[*Note 1*: All the `hash<Key>` specializations listed above meet the *Cpp17Hash* requirements, even when called on objects `k` of type `Key` such that `k.ok()` is `false`. — *end note*]

```
template<class Duration, class TimeZonePtr>
  struct hash<chrono::zoned_time<Duration, TimeZonePtr>>;
```

4 The specialization `hash<chrono::zoned_time<Duration, TimeZonePtr>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled and `hash<TimeZonePtr>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::leap_second>;
```

5 The specialization is enabled (22.10.19).

30.15 Header <ctime> synopsis [ctime.syn]

```
#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
  using size_t = see 17.2.4;
  using clock_t = see below;
  using time_t = see below;
```

```
    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const tm* timeptr);
    char* ctime(const time_t* timer);
    tm* gmtime(const time_t* timer);
    tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
  }
```

1 The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.[255]

2 The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

See also: ISO/IEC 9899:2018, 7.27

255) `strftime` supports the C conversion specifiers `C`, `D`, `e`, `F`, `g`, `G`, `h`, `r`, `R`, `t`, `T`, `u`, `V`, and `z`, and the modifiers `E` and `O`.

31 Input/output library [input.output]

31.1 General [input.output.general]

1 This Clause describes components that C++ programs may use to perform input/output operations.

2 The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 133.

Table 133 — Input/output library summary [tab:iostreams.summary]

	Subclause	Header
31.2	Requirements	
31.3	Forward declarations	`<iosfwd>`
31.4	Standard iostream objects	`<iostream>`
31.5	Iostreams base classes	`<ios>`
31.6	Stream buffers	`<streambuf>`
31.7	Formatting and manipulators	`<istream>`, `<ostream>`, `<iomanip>`, `<print>`
31.8	String streams	`<sstream>`
31.9	Span-based streams	`<spanstream>`
31.10	File streams	`<fstream>`
31.11	Synchronized output streams	`<syncstream>`
31.12	File systems	`<filesystem>`
31.13	C library files	`<cstdio>`, `<cinttypes>`

31.2 Iostreams requirements [iostreams.requirements]

31.2.1 Imbue limitations [iostream.limits.imbue]

1 No function described in Clause 31 except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in Clause 31 or as an overriding virtual function of any class declared in Clause 31 calls `imbue`, the behavior is undefined.

31.2.2 Types [stream.types]

```
using streamoff = implementation-defined;
```

1 The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.[256]

```
using streamsize = implementation-defined;
```

2 The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.[257]

31.2.3 Positioning type limitations [iostreams.limits.pos]

1 The classes of Clause 31 with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.

2 [*Note 1*: For each of the specializations of `char_traits` defined in 27.2.4, `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`. — *end note*]

3 In the classes of Clause 31, a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character container types (3.10) that meet the requirements for a character on which any of the iostream components can be instantiated.

256) Typically `long long`.
257) Most places where `streamsize` is used would use `size_t` in C, or `ssize_t` in POSIX.

31.2.4 Thread safety [iostreams.threadsafety]

1 Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

[*Note 1*: Data races result in undefined behavior (6.9.2). — *end note*]

2 If one thread makes a library call a that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call b such that this does not result in a data race, then a's write synchronizes with b's read.

31.3 Forward declarations [iostream.forward]

31.3.1 Header `<iosfwd>` synopsis [iosfwd.syn]

```
namespace std {
  template<class charT> struct char_traits;
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;

  template<class T> class allocator;

  template<class charT, class traits = char_traits<charT>>
    class basic_ios;
  template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
  template<class charT, class traits = char_traits<charT>>
    class basic_istream;
  template<class charT, class traits = char_traits<charT>>
    class basic_ostream;
  template<class charT, class traits = char_traits<charT>>
    class basic_iostream;

using wstringbuf     = basic_stringbuf<wchar_t>;
using wistringstream = basic_istringstream<wchar_t>;
using wostringstream = basic_ostringstream<wchar_t>;
using wstringstream  = basic_stringstream<wchar_t>;

using wspanbuf     = basic_spanbuf<wchar_t>;
using wispanstream = basic_ispanstream<wchar_t>;
using wospanstream = basic_ospanstream<wchar_t>;
using wspanstream  = basic_spanstream<wchar_t>;

using wfilebuf  = basic_filebuf<wchar_t>;
using wifstream = basic_ifstream<wchar_t>;
using wofstream = basic_ofstream<wchar_t>;
using wfstream  = basic_fstream<wchar_t>;

using wsyncbuf = basic_syncbuf<wchar_t>;
using wosyncstream = basic_osyncstream<wchar_t>;

template<class state> class fpos;
using streampos  = fpos<char_traits<char>::state_type>;
using wstreampos = fpos<char_traits<wchar_t>::state_type>;
```

```
    using u8streampos = fpos<char_traits<char8_t>::state_type>;
    using u16streampos = fpos<char_traits<char16_t>::state_type>;
    using u32streampos = fpos<char_traits<char32_t>::state_type>;
  }
```

1 Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.[258]

31.3.2 Overview [iostream.forward.overview]

1 The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

2 The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.

3 The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream` and `basic_ifstream`.

4 The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.

5 The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.

6 [*Note 1*: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (27.2). — *end note*]

7 Other *typedef-name*s define instances of class templates specialized for `char` or `wchar_t` types.

8 Specializations of the class template `fpos` are used for specifying file position information.

[*Example 1*: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — *end example*]

9 [*Note 2*: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — *end note*]

31.4 Standard iostream objects [iostream.objects]

31.4.1 Header `<iostream>` synopsis [iostream.syn]

```
  #include <ios>          // see 31.5.1
  #include <streambuf>    // see 31.6.1
  #include <istream>      // see 31.7.1
  #include <ostream>      // see 31.7.2

  namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
  }
```

31.4.2 Overview [iostream.objects.overview]

1 In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).

2 The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects. The dynamic types of the stream buffers initially associated with these objects are unspecified, but they have the behavior specified for `std::basic_filebuf<char>` or `std::basic_filebuf<wchar_t>`.

258) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

3 The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.[259]

4 *Recommended practice*: If it is possible for them to do so, implementations should initialize the objects earlier than required.

5 The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.9.3.3).

[*Note 1*: As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects. — *end note*]

6 Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILE`s, as specified in the C standard library.

7 Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

[*Note 2*: Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — *end note*]

SEE ALSO: ISO/IEC 9899:2018, 7.21.2

31.4.3 Narrow stream objects [narrow.stream.objects]

`istream cin;`

1 The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2 After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

3 The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

4 The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

5 After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

6 The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

31.4.4 Wide stream objects [wide.stream.objects]

`wistream wcin;`

1 The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2 After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

3 The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

259) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

`wostream wcerr;`

4 The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

5 After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wclog;`

6 The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

31.5 Iostreams base classes [iostreams.base]

31.5.1 Header `<ios>` synopsis [ios.syn]

```
#include <iosfwd>    // see 31.3.1

namespace std {
  // 31.2.2, types
  using streamoff  = implementation-defined;
  using streamsize = implementation-defined;
  // 31.5.3, class template fpos
  template<class stateT> class fpos;

  // 31.5.2, class ios_base
  class ios_base;
  // 31.5.4, class template basic_ios
  template<class charT, class traits = char_traits<charT>>
    class basic_ios;

  // 31.5.5, manipulators
  ios_base& boolalpha  (ios_base& str);
  ios_base& noboolalpha(ios_base& str);

  ios_base& showbase   (ios_base& str);
  ios_base& noshowbase (ios_base& str);

  ios_base& showpoint  (ios_base& str);
  ios_base& noshowpoint(ios_base& str);

  ios_base& showpos    (ios_base& str);
  ios_base& noshowpos  (ios_base& str);

  ios_base& skipws     (ios_base& str);
  ios_base& noskipws   (ios_base& str);

  ios_base& uppercase  (ios_base& str);
  ios_base& nouppercase(ios_base& str);

  ios_base& unitbuf    (ios_base& str);
  ios_base& nounitbuf  (ios_base& str);

  // 31.5.5.2, adjustfield
  ios_base& internal   (ios_base& str);
  ios_base& left       (ios_base& str);
  ios_base& right      (ios_base& str);

  // 31.5.5.3, basefield
  ios_base& dec        (ios_base& str);
  ios_base& hex        (ios_base& str);
  ios_base& oct        (ios_base& str);

  // 31.5.5.4, floatfield
  ios_base& fixed      (ios_base& str);
```

```
    ios_base& scientific (ios_base& str);
    ios_base& hexfloat   (ios_base& str);
    ios_base& defaultfloat(ios_base& str);

    // 31.5.6, error reporting
    enum class io_errc {
      stream = 1
    };

    template<> struct is_error_code_enum<io_errc> : public true_type { };
    error_code make_error_code(io_errc e) noexcept;
    error_condition make_error_condition(io_errc e) noexcept;
    const error_category& iostream_category() noexcept;
  }
```

31.5.2 Class ios_base [ios.base]

31.5.2.1 General [ios.base.general]

```
  namespace std {
    class ios_base {
    public:
      class failure;                    // see below

      // 31.5.2.2.2, fmtflags
      using fmtflags = T1;
      static constexpr fmtflags boolalpha = unspecified;
      static constexpr fmtflags dec = unspecified;
      static constexpr fmtflags fixed = unspecified;
      static constexpr fmtflags hex = unspecified;
      static constexpr fmtflags internal = unspecified;
      static constexpr fmtflags left = unspecified;
      static constexpr fmtflags oct = unspecified;
      static constexpr fmtflags right = unspecified;
      static constexpr fmtflags scientific = unspecified;
      static constexpr fmtflags showbase = unspecified;
      static constexpr fmtflags showpoint = unspecified;
      static constexpr fmtflags showpos = unspecified;
      static constexpr fmtflags skipws = unspecified;
      static constexpr fmtflags unitbuf = unspecified;
      static constexpr fmtflags uppercase = unspecified;
      static constexpr fmtflags adjustfield = see below;
      static constexpr fmtflags basefield = see below;
      static constexpr fmtflags floatfield = see below;

      // 31.5.2.2.3, iostate
      using iostate = T2;
      static constexpr iostate badbit = unspecified;
      static constexpr iostate eofbit = unspecified;
      static constexpr iostate failbit = unspecified;
      static constexpr iostate goodbit = see below;

      fmtflags flags() const;
      fmtflags flags(fmtflags fmtfl);
      fmtflags setf(fmtflags fmtfl);
      fmtflags setf(fmtflags fmtfl, fmtflags mask);
      void unsetf(fmtflags mask);

      streamsize precision() const;
      streamsize precision(streamsize prec);
      streamsize width() const;
      streamsize width(streamsize wide);

      // 31.5.2.4, locales
      locale imbue(const locale& loc);
      locale getloc() const;

      // 31.5.2.6, storage
      static int xalloc();
      long&  iword(int idx);
      void*& pword(int idx);

      // destructor
      virtual ~ios_base();

      // 31.5.2.7, callbacks
      enum event { erase_event, imbue_event, copyfmt_event };
      using event_callback = void (*)(event, ios_base&, int idx);
      void register_callback(event_callback fn, int idx);

      ios_base(const ios_base&) = delete;
      ios_base& operator=(const ios_base&) = delete;

      static bool sync_with_stdio(bool sync = true);

    protected:
      ios_base();

    private:
      static int index;              // exposition only
      long*  iarray;                 // exposition only
      void** parray;                 // exposition only
    };
  }
```

1 `ios_base` defines several member types:

(1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;

(1.2) — a class `Init`;

(1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;

(1.4) — an enumerated type, `seekdir`.

2 It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

3 [*Note 1*: For the sake of exposition, the maintained data is presented here as:

(3.1) — `static int` *`index`*, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

(3.2) — `long*` *`iarray`*, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;

(3.3) — `void**` *`parray`*, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

— *end note*]

31.5.2.2 Types [ios.types]

31.5.2.2.1 Class `ios_base::failure` [ios.failure]

```
namespace std {
  class ios_base::failure : public system_error {
  public:
    explicit failure(const string& msg, const error_code& ec = io_errc::stream);
    explicit failure(const char* msg, const error_code& ec = io_errc::stream);
  };
}
```

1 An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

[*Note 1*: When `ios_base::failure` is a synonym for another type, that type needs to provide a nested type `failure` to emulate the injected-class-name. — *end note*]

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

2 When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

[*Note 2*: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`. — *end note*]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

3 *Effects*: Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

4 *Effects*: Constructs the base class with `msg` and `ec`.

31.5.2.2.2 Type `ios_base::fmtflags` [ios.fmtflags]

```
using fmtflags = T1;
```

1 The type `fmtflags` is a bitmask type (16.3.3.3.3). Setting its elements has the effects indicated in Table 134.

2 Type `fmtflags` also defines the constants indicated in Table 135.

31.5.2.2.3 Type `ios_base::iostate` [ios.iostate]

```
using iostate = T2;
```

1 The type `iostate` is a bitmask type (16.3.3.3.3) that contains the elements indicated in Table 136.

2 Type `iostate` also defines the constant:

(2.1) — `goodbit`, the value zero.

31.5.2.2.4 Type `ios_base::openmode` [ios.openmode]

```
using openmode = T3;
```

1 The type `openmode` is a bitmask type (16.3.3.3.3). It contains the elements indicated in Table 137.

Table 134 — `fmtflags` effects [tab:ios.fmtflags]

Element	Effect(s) if set
`boolalpha`	insert and extract `bool` type in alphabetic format
`dec`	converts integer input or generates integer output in decimal base
`fixed`	generate floating-point output in fixed-point notation
`hex`	converts integer input or generates integer output in hexadecimal base
`internal`	adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated
`left`	adds fill characters on the right (final positions) of certain generated output
`oct`	converts integer input or generates integer output in octal base
`right`	adds fill characters on the left (initial positions) of certain generated output
`scientific`	generates floating-point output in scientific notation
`showbase`	generates a prefix indicating the numeric base of generated integer output
`showpoint`	generates a decimal-point character unconditionally in generated floating-point output
`showpos`	generates a `+` sign in non-negative generated numeric output
`skipws`	skips leading whitespace before certain input operations
`unitbuf`	flushes output after each output operation
`uppercase`	replaces certain lowercase letters with their uppercase equivalents in generated output

Table 135 — `fmtflags` constants [tab:ios.fmtflags.const]

Constant	Allowable values
`adjustfield`	`left | right | internal`
`basefield`	`dec | oct | hex`
`floatfield`	`scientific | fixed`

Table 136 — `iostate` effects [tab:ios.iostate]

Element	Effect(s) if set
`badbit`	indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);
`eofbit`	indicates that an input operation reached the end of an input sequence;
`failbit`	indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Table 137 — `openmode` effects [tab:ios.openmode]

Element	Effect(s) if set
`app`	seek to end before each write
`ate`	open and seek to end immediately after opening
`binary`	perform input and output in binary mode (as opposed to text mode)
`in`	open for input
`noreplace`	open in exclusive mode
`out`	open for output
`trunc`	truncate an existing stream when opening

31.5.2.2.5 Type `ios_base::seekdir` [ios.seekdir]

```
using seekdir = T4;
```

1 The type `seekdir` is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 138.

Table 138 — `seekdir` effects [tab:ios.seekdir]

Element	Meaning
`beg`	request a seek (for subsequent input or output) relative to the beginning of the stream
`cur`	request a seek relative to the current position within the sequence
`end`	request a seek relative to the current end of the sequence

31.5.2.2.6 Class `ios_base::Init` [ios.init]

```
namespace std {
  class ios_base::Init {
  public:
    Init();
    Init(const Init&) = default;
    ~Init();
    Init& operator=(const Init&) = default;
  };
}
```

1 The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

```
Init();
```

2 *Effects*: Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

```
~Init();
```

3 *Effects*: If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

31.5.2.3 State functions [fmtflags.state]

```
fmtflags flags() const;
```

1 *Returns*: The format control information for both input and output.

```
fmtflags flags(fmtflags fmtfl);
```

2 *Postconditions*: `fmtfl == flags()`.

3 *Returns*: The previous value of `flags()`.

```
fmtflags setf(fmtflags fmtfl);
```

4 *Effects*: Sets `fmtfl` in `flags()`.

5 *Returns*: The previous value of `flags()`.

```
fmtflags setf(fmtflags fmtfl, fmtflags mask);
```

6 *Effects*: Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

7 *Returns*: The previous value of `flags()`.

```
void unsetf(fmtflags mask);
```

8 *Effects*: Clears `mask` in `flags()`.

```
streamsize precision() const;
```

9 *Returns*: The precision to generate on certain output conversions.

`streamsize precision(streamsize prec);`

10 *Postconditions*: `prec == precision()`.

11 *Returns*: The previous value of `precision()`.

`streamsize width() const;`

12 *Returns*: The minimum field width (number of characters) to generate on certain output conversions.

`streamsize width(streamsize wide);`

13 *Postconditions*: `wide == width()`.

14 *Returns*: The previous value of `width()`.

31.5.2.4 Functions [ios.base.locales]

`locale imbue(const locale& loc);`

1 *Effects*: Calls each registered callback pair `(fn, idx)` (31.5.2.7) as `(*fn)(imbue_event, *this, idx)` at such a time that a call to `ios_base::getloc()` from within `fn` returns the new locale value `loc`.

2 *Postconditions*: `loc == getloc()`.

3 *Returns*: The previous value of `getloc()`.

`locale getloc() const;`

4 *Returns*: If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

31.5.2.5 Static members [ios.members.static]

`static bool sync_with_stdio(bool sync = true);`

1 *Effects*: If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

2 *Returns*: `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

3 *Remarks*: When a standard iostream object `str` is *synchronized* with a standard stdio stream `f`, the effect of inserting a character `c` by

```
fputc(f, c);
```

is the same as the effect of

```
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character `c` by

```
c = fgetc(f);
```

is the same as the effect of

```
c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character `c` by

```
ungetc(c, f);
```

is the same as the effect of

```
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.[260]

260) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

31.5.2.6 Storage functions [ios.base.storage]

`static int xalloc();`

1 *Returns*: *`index`* `++`.

2 *Remarks*: Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

`long& iword(int idx);`

3 *Preconditions*: `idx` is a value obtained by a call to `xalloc`.

4 *Effects*: If *`iarray`* is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in *`iarray`*. The function then extends the array pointed at by *`iarray`* as necessary to include the element *`iarray`*`[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.[261] However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails[262] and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

5 *Returns*: On success *`iarray`*`[idx]`. On failure, a valid `long&` initialized to 0.

`void*& pword(int idx);`

6 *Preconditions*: `idx` is a value obtained by a call to `xalloc`.

7 *Effects*: If *`parray`* is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in *`parray`*. The function then extends the array pointed at by *`parray`* as necessary to include the element *`parray`*`[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails[263] and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

8 *Returns*: On success `parray[idx]`. On failure a valid `void*&` initialized to 0.

9 *Remarks*: After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

31.5.2.7 Callbacks [ios.base.callback]

`void register_callback(event_callback fn, int idx);`

1 *Preconditions*: The function `fn` does not throw exceptions.

2 *Effects*: Registers the pair `(fn, idx)` such that during calls to `imbue()` (31.5.2.4), `copyfmt()`, or `~ios_base()` (31.5.2.8), the function `fn` is called with argument `idx`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

3 *Remarks*: Identical pairs are not merged. A function registered twice will be called twice.

31.5.2.8 Constructors and destructor [ios.base.cons]

`ios_base();`

1 *Effects*: Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

`~ios_base();`

2 *Effects*: Calls each registered callback pair `(fn, idx)` (31.5.2.7) as `(*fn)(erase_event, *this, idx)` at such time that any `ios_base` member function called from within `fn` has well-defined results. Then, any memory obtained is deallocated.

261) An implementation is free to implement both the integer array pointed at by *`iarray`* and the pointer array pointed at by *`parray`* as sparse data structures, possibly with a one-element cache for each.
262) For example, because it cannot allocate space.
263) For example, because it cannot allocate space.

31.5.3 Class template fpos [fpos]

31.5.3.1 General [fpos.general]

```
namespace std {
  template<class stateT> class fpos {
  public:
    // 31.5.3.2, members
    stateT state() const;
    void state(stateT);

  private:
    stateT st;                    // exposition only
  };
}
```

31.5.3.2 Members [fpos.members]

`void state(stateT s);`

1 *Effects*: Assigns `s` to *`st`*.

`stateT state() const;`

2 *Returns*: Current value of *`st`*.

31.5.3.3 Requirements [fpos.operations]

1 An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the *Cpp17DefaultConstructible* (Table 30), *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17Destructible* (Table 35) requirements. If `is_trivially_copy_constructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copy_assignable_v<stateT>` is `true`, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* (Table 28) requirements. In addition, the expressions shown in Table 139 are valid and have the indicated semantics. In that table,

(1.1) — `P` refers to a specialization of `fpos`,

(1.2) — `p` and `q` refer to values of type `P` or `const P`,

(1.3) — `pl` and `ql` refer to modifiable lvalues of type `P`,

(1.4) — `O` refers to type `streamoff`, and

(1.5) — `o` and `o2` refer to values of type `streamoff` or `const streamoff`.

Table 139 — Position type requirements [tab:fpos.operations]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`P(o)`	`P`	converts from `offset`	*Effects*: Value-initializes the state object.

`P p(o);`
`P p = o;`
			Effects: Value-initializes the state object.
			Postconditions: `p == P(o)` is `true`.

`P()`	`P`	`P(0)`	
`P p;`		`P p(0);`	
`O(p)`	`streamoff`	converts to `offset`	`P(O(p)) == p`

Table 139 — Position type requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`p == q`	`bool`		*Remarks*: For any two values `o` and `o2`, if `p` is obtained from `o` converted to `P` or from a copy of such `P` value and if `q` is obtained from `o2` converted to `P` or from a copy of such `P` value, then `p == q` is `true` only if `o == o2` is `true`.
`p != q`	`bool`	`!(p == q)`	
`p + o`	`P`	+ offset	*Remarks*: With `ql = p + o;`, then: `ql - o == p`
`pl += o`	`P&`	+= offset	*Remarks*: With `ql = pl;` before the `+=`, then: `pl - o == ql`
`p - o`	`P`	- offset	*Remarks*: With `ql = p - o;`, then: `ql + o == p`
`pl -= o`	`P&`	-= offset	*Remarks*: With `ql = pl;` before the `-=`, then: `pl + o == ql`
`o + p`	convertible to `P`	`p + o`	`P(o + p) == p + o`
`p - q`	`streamoff`	distance	`p == q + (p - q)`

2 Stream operations that return a value of type `traits::pos_type` return `P(O(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

31.5.4 Class template `basic_ios` [ios]

31.5.4.1 Overview [ios.overview]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ios : public ios_base {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.5.4.4, flags functions
    explicit operator bool() const;
    bool operator!() const;
    iostate rdstate() const;
    void clear(iostate state = goodbit);
    void setstate(iostate state);
    bool good() const;
    bool eof()  const;
    bool fail() const;
    bool bad()  const;

    iostate exceptions() const;
    void exceptions(iostate except);

    // 31.5.4.2, constructor/destructor
    explicit basic_ios(basic_streambuf<charT, traits>* sb);
    virtual ~basic_ios();

    // 31.5.4.3, members
    basic_ostream<charT, traits>* tie() const;
    basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

```
      basic_streambuf<charT, traits>* rdbuf() const;
      basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

      basic_ios& copyfmt(const basic_ios& rhs);

      char_type fill() const;
      char_type fill(char_type ch);

      locale imbue(const locale& loc);

      char      narrow(char_type c, char dfault) const;
      char_type widen(char c) const;

      basic_ios(const basic_ios&) = delete;
      basic_ios& operator=(const basic_ios&) = delete;

    protected:
      basic_ios();
      void init(basic_streambuf<charT, traits>* sb);
      void move(basic_ios& rhs);
      void move(basic_ios&& rhs);
      void swap(basic_ios& rhs) noexcept;
      void set_rdbuf(basic_streambuf<charT, traits>* sb);
    };
  }
```

31.5.4.2 Constructors [basic.ios.cons]

`explicit basic_ios(basic_streambuf<charT, traits>* sb);`

1 *Effects*: Assigns initial values to its member objects by calling `init(sb)`.

`basic_ios();`

2 *Effects*: Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

`~basic_ios();`

3 *Remarks*: The destructor does not destroy `rdbuf()`.

`void init(basic_streambuf<charT, traits>* sb);`

4 *Postconditions*: The postconditions of this function are indicated in Table 140.

Table 140 — `basic_ios::init()` effects [tab:basic.ios.cons]

Element	Value
`rdbuf()`	`sb`
`tie()`	`0`
`rdstate()`	`goodbit` if `sb` is not a null pointer, otherwise `badbit`.
`exceptions()`	`goodbit`
`flags()`	`skipws | dec`
`width()`	`0`
`precision()`	`6`
`fill()`	`widen(' ')`
`getloc()`	a copy of the value returned by `locale()`
`iarray`	a null pointer
`parray`	a null pointer

31.5.4.3 Member functions [basic.ios.members]

`basic_ostream<charT, traits>* tie() const;`

1 *Returns*: An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

`basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);`

2 *Preconditions*: If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

3 *Postconditions*: `tiestr == tie()`.

4 *Returns*: The previous value of `tie()`.

`basic_streambuf<charT, traits>* rdbuf() const;`

5 *Returns*: A pointer to the `streambuf` associated with the stream.

`basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);`

6 *Effects*: Calls `clear()`.

7 *Postconditions*: `sb == rdbuf()`.

8 *Returns*: The previous value of `rdbuf()`.

`locale imbue(const locale& loc);`

9 *Effects*: Calls `ios_base::imbue(loc)` (31.5.2.4) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (31.6.3.3.1).

10 *Returns*: The prior value of `ios_base::imbue()`.

`char narrow(char_type c, char dfault) const;`

11 *Returns*: `use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)`

`char_type widen(char c) const;`

12 *Returns*: `use_facet<ctype<char_type>>(getloc()).widen(c)`

`char_type fill() const;`

13 *Returns*: The character used to pad (fill) an output conversion to the specified field width.

`char_type fill(char_type fillch);`

14 *Postconditions*: `traits::eq(fillch, fill())`.

15 *Returns*: The previous value of `fill()`.

`basic_ios& copyfmt(const basic_ios& rhs);`

16 *Effects*: If `(this == addressof(rhs))` is `true` does nothing. Otherwise assigns to the member objects of `*this` the corresponding member objects of `rhs` as follows:

- (16.1) — calls each registered callback pair `(fn, idx)` as `(*fn)(erase_event, *this, idx)`;
- (16.2) — then, assigns to the member objects of `*this` the corresponding member objects of `rhs`, except that
  - (16.2.1) — `rdstate()`, `rdbuf()`, and `exceptions()` are left unchanged;
  - (16.2.2) — the contents of arrays pointed at by `pword` and `iword` are copied, not the pointers themselves;[264] and
  - (16.2.3) — if any newly stored pointer values in `*this` point at objects stored outside the object `rhs` and those objects are destroyed when `rhs` is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
- (16.3) — then, calls each callback pair that was copied from `rhs` as `(*fn)(copyfmt_event, *this, idx)`;
- (16.4) — then, calls `exceptions(rhs.exceptions())`.

264) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

17 [*Note 1*: The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — *end note*]

18 *Postconditions*: The postconditions of this function are indicated in Table 141.

Table 141 — `basic_ios::copyfmt()` effects [tab:basic.ios.copyfmt]

Element	Value
`rdbuf()`	*unchanged*
`tie()`	`rhs.tie()`
`rdstate()`	*unchanged*
`exceptions()`	`rhs.exceptions()`
`flags()`	`rhs.flags()`
`width()`	`rhs.width()`
`precision()`	`rhs.precision()`
`fill()`	`rhs.fill()`
`getloc()`	`rhs.getloc()`

19 *Returns*: `*this`.

```
void move(basic_ios& rhs);
void move(basic_ios&& rhs);
```

20 *Postconditions*: `*this` has the state that `rhs` had before the function call, except that `rdbuf()` returns `nullptr`. `rhs` is in a valid but unspecified state, except that `rhs.rdbuf()` returns the same value as it returned before the function call, and `rhs.tie()` returns `nullptr`.

```
void swap(basic_ios& rhs) noexcept;
```

21 *Effects*: The states of `*this` and `rhs` are exchanged, except that `rdbuf()` returns the same value as it returned before the function call, and `rhs.rdbuf()` returns the same value as it returned before the function call.

```
void set_rdbuf(basic_streambuf<charT, traits>* sb);
```

22 *Preconditions*: `sb != nullptr` is `true`.

23 *Effects*: Associates the `basic_streambuf` object pointed to by `sb` with this stream without calling `clear()`.

24 *Postconditions*: `rdbuf() == sb` is `true`.

25 *Throws*: Nothing.

31.5.4.4 Flags functions [iostate.flags]

```
explicit operator bool() const;
```

1 *Returns*: `!fail()`.

```
bool operator!() const;
```

2 *Returns*: `fail()`.

```
iostate rdstate() const;
```

3 *Returns*: The error state of the stream buffer.

```
void clear(iostate state = goodbit);
```

4 *Effects*: If `((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0`, returns. Otherwise, the function throws an object of class `ios_base::failure` (31.5.2.2.1), constructed with implementation-defined argument values.

5 *Postconditions*: If `rdbuf() != 0` then `state == rdstate()`; otherwise `rdstate() == (state | ios_base::badbit)`.

```
void setstate(iostate state);
```

6 *Effects*: Calls `clear(rdstate() | state)` (which may throw `ios_base::failure` (31.5.2.2.1)).

`bool good() const;`

7 *Returns*: `rdstate() == 0`

`bool eof() const;`

8 *Returns*: `true` if `eofbit` is set in `rdstate()`.

`bool fail() const;`

9 *Returns*: `true` if `failbit` or `badbit` is set in `rdstate()`.[265]

`bool bad() const;`

10 *Returns*: `true` if `badbit` is set in `rdstate()`.

`iostate exceptions() const;`

11 *Returns*: A mask that determines what elements set in `rdstate()` cause exceptions to be thrown.

`void exceptions(iostate except);`

12 *Effects*: Calls `clear(rdstate())`.

13 *Postconditions*: `except == exceptions()`.

31.5.5 `ios_base` manipulators [std.ios.manip]

31.5.5.1 `fmtflags` manipulators [fmtflags.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& boolalpha(ios_base& str);`

2 *Effects*: Calls `str.setf(ios_base::boolalpha)`.

3 *Returns*: `str`.

`ios_base& noboolalpha(ios_base& str);`

4 *Effects*: Calls `str.unsetf(ios_base::boolalpha)`.

5 *Returns*: `str`.

`ios_base& showbase(ios_base& str);`

6 *Effects*: Calls `str.setf(ios_base::showbase)`.

7 *Returns*: `str`.

`ios_base& noshowbase(ios_base& str);`

8 *Effects*: Calls `str.unsetf(ios_base::showbase)`.

9 *Returns*: `str`.

`ios_base& showpoint(ios_base& str);`

10 *Effects*: Calls `str.setf(ios_base::showpoint)`.

11 *Returns*: `str`.

`ios_base& noshowpoint(ios_base& str);`

12 *Effects*: Calls `str.unsetf(ios_base::showpoint)`.

13 *Returns*: `str`.

`ios_base& showpos(ios_base& str);`

14 *Effects*: Calls `str.setf(ios_base::showpos)`.

15 *Returns*: `str`.

`ios_base& noshowpos(ios_base& str);`

16 *Effects*: Calls `str.unsetf(ios_base::showpos)`.

265) Checking `badbit` also for `fail()` is historical practice.

17 *Returns*: `str`.

`ios_base& skipws(ios_base& str);`

18 *Effects*: Calls `str.setf(ios_base::skipws)`.

19 *Returns*: `str`.

`ios_base& noskipws(ios_base& str);`

20 *Effects*: Calls `str.unsetf(ios_base::skipws)`.

21 *Returns*: `str`.

`ios_base& uppercase(ios_base& str);`

22 *Effects*: Calls `str.setf(ios_base::uppercase)`.

23 *Returns*: `str`.

`ios_base& nouppercase(ios_base& str);`

24 *Effects*: Calls `str.unsetf(ios_base::uppercase)`.

25 *Returns*: `str`.

`ios_base& unitbuf(ios_base& str);`

26 *Effects*: Calls `str.setf(ios_base::unitbuf)`.

27 *Returns*: `str`.

`ios_base& nounitbuf(ios_base& str);`

28 *Effects*: Calls `str.unsetf(ios_base::unitbuf)`.

29 *Returns*: `str`.

31.5.5.2 `adjustfield` manipulators [adjustfield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& internal(ios_base& str);`

2 *Effects*: Calls `str.setf(ios_base::internal, ios_base::adjustfield)`.

3 *Returns*: `str`.

`ios_base& left(ios_base& str);`

4 *Effects*: Calls `str.setf(ios_base::left, ios_base::adjustfield)`.

5 *Returns*: `str`.

`ios_base& right(ios_base& str);`

6 *Effects*: Calls `str.setf(ios_base::right, ios_base::adjustfield)`.

7 *Returns*: `str`.

31.5.5.3 `basefield` manipulators [basefield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& dec(ios_base& str);`

2 *Effects*: Calls `str.setf(ios_base::dec, ios_base::basefield)`.

3 *Returns*: `str`.[266]

`ios_base& hex(ios_base& str);`

4 *Effects*: Calls `str.setf(ios_base::hex, ios_base::basefield)`.

5 *Returns*: `str`.

266) The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

```
ios_base& oct(ios_base& str);
```

6 *Effects*: Calls `str.setf(ios_base::oct, ios_base::basefield)`.

7 *Returns*: `str`.

31.5.5.4 `floatfield` manipulators [floatfield.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```
ios_base& fixed(ios_base& str);
```

2 *Effects*: Calls `str.setf(ios_base::fixed, ios_base::floatfield)`.

3 *Returns*: `str`.

```
ios_base& scientific(ios_base& str);
```

4 *Effects*: Calls `str.setf(ios_base::scientific, ios_base::floatfield)`.

5 *Returns*: `str`.

```
ios_base& hexfloat(ios_base& str);
```

6 *Effects*: Calls `str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield)`.

7 *Returns*: `str`.

8 [*Note 1*: `ios_base::hex` cannot be used to specify a hexadecimal floating-point format, because it is not part of `ios_base::floatfield` (Table 135). — *end note*]

```
ios_base& defaultfloat(ios_base& str);
```

9 *Effects*: Calls `str.unsetf(ios_base::floatfield)`.

10 *Returns*: `str`.

31.5.6 Error reporting [error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
```

1 *Returns*: `error_code(static_cast<int>(e), iostream_category())`.

```
error_condition make_error_condition(io_errc e) noexcept;
```

2 *Returns*: `error_condition(static_cast<int>(e), iostream_category())`.

```
const error_category& iostream_category() noexcept;
```

3 *Returns*: A reference to an object of a type derived from class `error_category`.

4 The object's `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function shall return a pointer to the string `"iostream"`.

31.6 Stream buffers [stream.buffers]

31.6.1 Header `<streambuf>` synopsis [streambuf.syn]

```
namespace std {
  // 31.6.3, class template basic_streambuf
  template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
  using streambuf  = basic_streambuf<char>;
  using wstreambuf = basic_streambuf<wchar_t>;
}
```

1 The header `<streambuf>` defines types that control input from and output to *character* sequences.

31.6.2 Stream buffer requirements [streambuf.reqts]

1 Stream buffers can impose various constraints on the sequences they control. Some constraints are:

(1.1) — The controlled input sequence can be not readable.

(1.2) — The controlled output sequence can be not writable.

(1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.

(1.4) — The controlled sequences can support operations *directly* to or from associated sequences.

(1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

2 Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter "the stream position" and conversion state as needed to maintain this subsequence relationship. The three pointers are:

(2.1) — the *beginning pointer*, or lowest element address in the array (called `xbeg` here);

(2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);

(2.3) — the *end pointer*, or first element address beyond the end of the array (called `xend` here).

3 The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

(3.1) — If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.

(3.2) — If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).

(3.3) — If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.

(3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

31.6.3 Class template basic_streambuf [streambuf]

31.6.3.1 General [streambuf.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_streambuf {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    virtual ~basic_streambuf();

    // 31.6.3.3.1, locales
    locale   pubimbue(const locale& loc);
    locale   getloc() const;

    // 31.6.3.3.2, buffer and positioning
    basic_streambuf* pubsetbuf(char_type* s, streamsize n);
    pos_type pubseekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which
                          = ios_base::in | ios_base::out);
    pos_type pubseekpos(pos_type sp,
                        ios_base::openmode which
                          = ios_base::in | ios_base::out);
    int      pubsync();
    // get and put areas
    // 31.6.3.3.3, get area
    streamsize in_avail();
    int_type snextc();
    int_type sbumpc();
    int_type sgetc();
    streamsize sgetn(char_type* s, streamsize n);

    // 31.6.3.3.4, putback
    int_type sputbackc(char_type c);
    int_type sungetc();

    // 31.6.3.3.5, put area
    int_type   sputc(char_type c);
    streamsize sputn(const char_type* s, streamsize n);

  protected:
    basic_streambuf();
    basic_streambuf(const basic_streambuf& rhs);
    basic_streambuf& operator=(const basic_streambuf& rhs);

    void swap(basic_streambuf& rhs);

    // 31.6.3.4.2, get area access
    char_type* eback() const;
    char_type* gptr()  const;
    char_type* egptr() const;
    void       gbump(int n);
    void       setg(char_type* gbeg, char_type* gnext, char_type* gend);

    // 31.6.3.4.3, put area access
    char_type* pbase() const;
    char_type* pptr() const;
    char_type* epptr() const;
    void       pbump(int n);
    void       setp(char_type* pbeg, char_type* pend);

    // 31.6.3.5, virtual functions
    // 31.6.3.5.1, locales
    virtual void imbue(const locale& loc);

    // 31.6.3.5.2, buffer management and positioning
    virtual basic_streambuf* setbuf(char_type* s, streamsize n);
    virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                             ios_base::openmode which
                               = ios_base::in | ios_base::out);
    virtual pos_type seekpos(pos_type sp,
                             ios_base::openmode which
                               = ios_base::in | ios_base::out);
    virtual int      sync();

    // 31.6.3.5.3, get area
    virtual streamsize showmanyc();
    virtual streamsize xsgetn(char_type* s, streamsize n);
    virtual int_type   underflow();
    virtual int_type   uflow();

    // 31.6.3.5.4, putback
    virtual int_type   pbackfail(int_type c = traits::eof());

    // 31.6.3.5.5, put area
    virtual streamsize xsputn(const char_type* s, streamsize n);
    virtual int_type   overflow(int_type c = traits::eof());
```

```
    };
  }
```

1 The class template `basic_streambuf` serves as a base class for deriving various *stream buffers* whose objects each control two *character sequences*:

(1.1) — a character *input sequence*;

(1.2) — a character *output sequence*.

31.6.3.2 Constructors [streambuf.cons]

`basic_streambuf();`

1 *Effects*: Initializes:[267]

(1.1) — all pointer member objects to null pointers,

(1.2) — the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.

2 *Remarks*: Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

`basic_streambuf(const basic_streambuf& rhs);`

3 *Postconditions*:

(3.1) — `eback() == rhs.eback()`

(3.2) — `gptr() == rhs.gptr()`

(3.3) — `egptr() == rhs.egptr()`

(3.4) — `pbase() == rhs.pbase()`

(3.5) — `pptr() == rhs.pptr()`

(3.6) — `epptr() == rhs.epptr()`

(3.7) — `getloc() == rhs.getloc()`

`~basic_streambuf();`

4 *Effects*: None.

31.6.3.3 Public member functions [streambuf.members]

31.6.3.3.1 Locales [streambuf.locales]

`locale pubimbue(const locale& loc);`

1 *Effects*: Calls `imbue(loc)`.

2 *Postconditions*: `loc == getloc()`.

3 *Returns*: Previous value of `getloc()`.

`locale getloc() const;`

4 *Returns*: If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

31.6.3.3.2 Buffer management and positioning [streambuf.buffer]

`basic_streambuf* pubsetbuf(char_type* s, streamsize n);`

1 *Returns*: `setbuf(s, n)`.

```
pos_type pubseekoff(off_type off, ios_base::seekdir way,
                    ios_base::openmode which
                      = ios_base::in | ios_base::out);
```

2 *Returns*: `seekoff(off, way, which)`.

267) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

```
pos_type pubseekpos(pos_type sp,
                    ios_base::openmode which
                      = ios_base::in | ios_base::out);
```

3 *Returns*: `seekpos(sp, which)`.

```
int pubsync();
```

4 *Returns*: `sync()`.

31.6.3.3.3 Get area [streambuf.pub.get]

```
streamsize in_avail();
```

1 *Returns*: If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmanyc()` (31.6.3.5.3).

```
int_type snextc();
```

2 *Effects*: Calls `sbumpc()`.

3 *Returns*: If that function returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns `sgetc()`.

```
int_type sbumpc();
```

4 *Effects*: If the input sequence read position is not available, returns `uflow()`. Otherwise, returns `traits::to_int_type(*gptr())` and increments the next pointer for the input sequence.

```
int_type sgetc();
```

5 *Returns*: If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())`.

```
streamsize sgetn(char_type* s, streamsize n);
```

6 *Returns*: `xsgetn(s, n)`.

31.6.3.3.4 Putback [streambuf.pub.pback]

```
int_type sputbackc(char_type c);
```

1 *Effects*: If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is `false`, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

```
int_type sungetc();
```

2 *Effects*: If the input sequence putback position is not available, returns `pbackfail()`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

31.6.3.3.5 Put area [streambuf.pub.put]

```
int_type sputc(char_type c);
```

1 *Effects*: If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

```
streamsize sputn(const char_type* s, streamsize n);
```

2 *Returns*: `xsputn(s, n)`.

31.6.3.4 Protected member functions [streambuf.protected]

31.6.3.4.1 Assignment [streambuf.assign]

```
basic_streambuf& operator=(const basic_streambuf& rhs);
```

1 *Postconditions*:

(1.1) — `eback() == rhs.eback()`

(1.2) — `gptr() == rhs.gptr()`

(1.3) — `egptr() == rhs.egptr()`

(1.4) — `pbase() == rhs.pbase()`

(1.5) — `pptr() == rhs.pptr()`

(1.6) — `epptr() == rhs.epptr()`

(1.7) — `getloc() == rhs.getloc()`

2 *Returns*: `*this`.

```
void swap(basic_streambuf& rhs);
```

3 *Effects*: Swaps the data members of `rhs` and `*this`.

31.6.3.4.2 Get area access [streambuf.get.area]

```
char_type* eback() const;
```

1 *Returns*: The beginning pointer for the input sequence.

```
char_type* gptr() const;
```

2 *Returns*: The next pointer for the input sequence.

```
char_type* egptr() const;
```

3 *Returns*: The end pointer for the input sequence.

```
void gbump(int n);
```

4 *Effects*: Adds `n` to the next pointer for the input sequence.

```
void setg(char_type* gbeg, char_type* gnext, char_type* gend);
```

5 *Preconditions*: [`gbeg`, `gnext`), [`gbeg`, `gend`), and [`gnext`, `gend`) are all valid ranges.

6 *Postconditions*: `gbeg == eback()`, `gnext == gptr()`, and `gend == egptr()` are all `true`.

31.6.3.4.3 Put area access [streambuf.put.area]

```
char_type* pbase() const;
```

1 *Returns*: The beginning pointer for the output sequence.

```
char_type* pptr() const;
```

2 *Returns*: The next pointer for the output sequence.

```
char_type* epptr() const;
```

3 *Returns*: The end pointer for the output sequence.

```
void pbump(int n);
```

4 *Effects*: Adds `n` to the next pointer for the output sequence.

```
void setp(char_type* pbeg, char_type* pend);
```

5 *Preconditions*: [`pbeg`, `pend`) is a valid range.

6 *Postconditions*: `pbeg == pbase()`, `pbeg == pptr()`, and `pend == epptr()` are all `true`.

31.6.3.5 Virtual functions [streambuf.virtuals]

31.6.3.5.1 Locales [streambuf.virt.locales]

```
void imbue(const locale&);
```

1 *Effects*: Change any translations based on locale.

2 *Remarks*: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

3 *Default behavior*: Does nothing.

31.6.3.5.2 Buffer management and positioning [streambuf.virt.buffer]

```
basic_streambuf* setbuf(char_type* s, streamsize n);
```

1 *Effects*: Influences stream buffering in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.3.5).

2 *Default behavior*: Does nothing. Returns `this`.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out);
```

3 *Effects*: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.3.5).

4 *Default behavior*: Returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out);
```

5 *Effects*: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2, 31.10.3).

6 *Default behavior*: Returns `pos_type(off_type(-1))`.

```
int sync();
```

7 *Effects*: Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8 *Returns*: `-1` on failure. What constitutes failure is determined by each derived class (31.10.3.5).

9 *Default behavior*: Returns zero.

31.6.3.5.3 Get area [streambuf.virt.get]

`streamsize showmanyc();`[268]

1 *Returns*: An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.[269]

2 *Default behavior*: Returns zero.

3 *Remarks*: Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4 *Effects*: Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5 *Returns*: The number of characters assigned.[270]

6 *Remarks*: Uses `traits::eof()`.

```
int_type underflow();
```

7 The *pending sequence* of characters is defined as the concatenation of

(7.1) — the empty sequence if `gptr()` is null, otherwise the characters in [`gptr()`, `egptr()`), followed by

(7.2) — some (possibly empty) sequence of characters read from the input sequence.

268) The morphemes of `showmanyc` are “es-how-many-see”, not “show-manic”.

269) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

270) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xsputn()` by overriding these definitions from the base class.

8 The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

9 The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in [`eback()`, `gptr()`).

10 *Effects*: The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in [`gptr()`, `egptr()`) are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

11 If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the "usual backup condition" is that either

(11.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in [`eback()`, `gptr()`) agree with the last `gptr() - eback()` characters of the backup sequence, or

(11.2) — the characters in [`gptr() - n`, `gptr()`) agree with the backup sequence (where `n` is the length of the backup sequence).

12 *Returns*: `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

13 *Default behavior*: Returns `traits::eof()`.

14 *Remarks*: The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

```
int_type uflow();
```

15 *Preconditions*: The constraints are the same as for `underflow()`, except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

16 *Default behavior*: Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increments the value of the next pointer for the input sequence.

17 *Returns*: `traits::eof()` to indicate failure.

31.6.3.5.4 Putback [streambuf.virt.pback]

```
int_type pbackfail(int_type c = traits::eof());
```

1 The *pending sequence* is defined as for `underflow()`, with the modifications that

(1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.

(1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2 *Postconditions*: On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

3 *Returns*: `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4 Returns some value other than `traits::eof()` to indicate success.

5 *Default behavior*: Returns `traits::eof()`.

6 *Remarks*: The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area [streambuf.virt.put]

```
streamsize xsputn(const char_type* s, streamsize n);
```

1 *Effects*: Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated

by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes `true` or whether it achieves the same effects by other means.

2 *Returns*: The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

3 *Effects*: Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

(3.1) — the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by

(3.2) — the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.

4 *Preconditions*: Every overriding definition of this virtual function obeys the following constraints:

(4.1) — The effect of consuming a character on the associated output sequence is specified.[271]

(4.2) — Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.

(4.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.

5 *Returns*: `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.[272]

6 *Default behavior*: Returns `traits::eof()`.

7 *Remarks*: The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

31.7 Formatting and manipulators [iostream.format]

31.7.1 Header `<istream>` synopsis [istream.syn]

```
namespace std {
  // 31.7.5.2, class template basic_istream
  template<class charT, class traits = char_traits<charT>>
    class basic_istream;

  using istream  = basic_istream<char>;
  using wistream = basic_istream<wchar_t>;

  // 31.7.5.7, class template basic_iostream
  template<class charT, class traits = char_traits<charT>>
    class basic_iostream;

  using iostream  = basic_iostream<char>;
  using wiostream = basic_iostream<wchar_t>;

  // 31.7.5.5, standard basic_istream manipulators
  template<class charT, class traits>
    basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

  // 31.7.5.6, rvalue stream extraction
  template<class Istream, class T>
    Istream&& operator>>(Istream&& is, T&& x);
}
```

271) That is, for each class derived from a specialization of `basic_streambuf` in this Clause (31.8.2, 31.10.3), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.
272) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

31.7.2 Header <ostream> synopsis [ostream.syn]

```
namespace std {
  // 31.7.6.2, class template basic_ostream
  template<class charT, class traits = char_traits<charT>>
    class basic_ostream;

  using ostream  = basic_ostream<char>;
  using wostream = basic_ostream<wchar_t>;

  // 31.7.6.5, standard basic_ostream manipulators
  template<class charT, class traits>
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
  template<class charT, class traits>
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
  template<class charT, class traits>
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

  template<class charT, class traits>
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
  template<class charT, class traits>
    basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
  template<class charT, class traits>
    basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

  // 31.7.6.6, rvalue stream insertion
  template<class Ostream, class T>
    Ostream&& operator<<(Ostream&& os, const T& x);

  // 31.7.6.3.5, print functions
  template<class... Args>
    void print(ostream& os, format_string<Args...> fmt, Args&&... args);
  template<class... Args>
    void println(ostream& os, format_string<Args...> fmt, Args&&... args);
  void println(ostream& os);

  void vprint_unicode(ostream& os, string_view fmt, format_args args);
  void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
}
```

31.7.3 Header <iomanip> synopsis [iomanip.syn]

```
namespace std {
  // 31.7.7, standard manipulators
  unspecified resetiosflags(ios_base::fmtflags mask);
  unspecified setiosflags  (ios_base::fmtflags mask);
  unspecified setbase(int base);
  template<class charT> unspecified setfill(charT c);
  unspecified setprecision(int n);
  unspecified setw(int n);

  // 31.7.8, extended manipulators
  template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
  template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
  template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
  template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);

  // 31.7.9, quoted manipulators
  template<class charT>
    unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));

  template<class charT, class traits, class Allocator>
    unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                       charT delim = charT('"'), charT escape = charT('\\'));
  template<class charT, class traits, class Allocator>
    unspecified quoted(basic_string<charT, traits, Allocator>& s,
                       charT delim = charT('"'), charT escape = charT('\\'));

  template<class charT, class traits>
    unspecified quoted(basic_string_view<charT, traits> s,
                       charT delim = charT('"'), charT escape = charT('\\'));
}
```

31.7.4 Header `<print>` synopsis [print.syn]

```
namespace std {
  // 31.7.10, print functions
  template<class... Args>
    void print(format_string<Args...> fmt, Args&&... args);
  template<class... Args>
    void print(FILE* stream, format_string<Args...> fmt, Args&&... args);

  template<class... Args>
    void println(format_string<Args...> fmt, Args&&... args);
  void println();
  template<class... Args>
    void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
  void println(FILE* stream);

  void vprint_unicode(string_view fmt, format_args args);
  void vprint_unicode(FILE* stream, string_view fmt, format_args args);
  void vprint_unicode_buffered(FILE* stream, string_view fmt, format_args args);

  void vprint_nonunicode(string_view fmt, format_args args);
  void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
  void vprint_nonunicode_buffered(FILE* stream, string_view fmt, format_args args);
}
```

31.7.5 Input streams [input.streams]

31.7.5.1 General [input.streams.general]

1 The header `<istream>` defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

31.7.5.2 Class template `basic_istream` [istream]

31.7.5.2.1 General [istream.general]

1 When a function is specified with a type placeholder of *`extended-floating-point-type`*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of *`extended-floating-point-type`*.

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_istream : virtual public basic_ios<charT, traits> {
  public:
    // types (inherited from basic_ios (31.5.4))
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.7.5.2.2, constructor/destructor
    explicit basic_istream(basic_streambuf<charT, traits>* sb);
    virtual ~basic_istream();

    // 31.7.5.2.4, prefix/suffix
    class sentry;
    // 31.7.5.3, formatted input
    basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
    basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
    basic_istream& operator>>(ios_base& (*pf)(ios_base&));

    basic_istream& operator>>(bool& n);
    basic_istream& operator>>(short& n);
    basic_istream& operator>>(unsigned short& n);
    basic_istream& operator>>(int& n);
    basic_istream& operator>>(unsigned int& n);
    basic_istream& operator>>(long& n);
    basic_istream& operator>>(unsigned long& n);
    basic_istream& operator>>(long long& n);
    basic_istream& operator>>(unsigned long long& n);
    basic_istream& operator>>(float& f);
    basic_istream& operator>>(double& f);
    basic_istream& operator>>(long double& f);
    basic_istream& operator>>(extended-floating-point-type& f);

    basic_istream& operator>>(void*& p);
    basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);

    // 31.7.5.4, unformatted input
    streamsize gcount() const;
    int_type get();
    basic_istream& get(char_type& c);
    basic_istream& get(char_type* s, streamsize n);
    basic_istream& get(char_type* s, streamsize n, char_type delim);
    basic_istream& get(basic_streambuf<char_type, traits>& sb);
    basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

    basic_istream& getline(char_type* s, streamsize n);
    basic_istream& getline(char_type* s, streamsize n, char_type delim);

    basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
    int_type       peek();
    basic_istream& read    (char_type* s, streamsize n);
    streamsize     readsome(char_type* s, streamsize n);

    basic_istream& putback(char_type c);
    basic_istream& unget();
    int sync();

    pos_type tellg();
    basic_istream& seekg(pos_type);
    basic_istream& seekg(off_type, ios_base::seekdir);

  protected:
    // 31.7.5.2.2, copy/move constructor
    basic_istream(const basic_istream&) = delete;
    basic_istream(basic_istream&& rhs);

    // 31.7.5.2.3, assignment and swap
    basic_istream& operator=(const basic_istream&) = delete;
    basic_istream& operator=(basic_istream&& rhs);
    void swap(basic_istream& rhs);
  };

  // 31.7.5.3.3, character extraction templates
  template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
  template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
  template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

  template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
  template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
  template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}
```

2 The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.

3 Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions.* Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()->sbumpc()` or `rdbuf()->sgetc()`. They may use other public members of `istream`.

31.7.5.2.2 Constructors [istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

1 *Effects*: Initializes the base class subobject with `basic_ios::init(sb)` (31.5.4.2).

2 *Postconditions*: `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

3 *Effects*: Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

4 *Remarks*: Does not perform any operations of `rdbuf()`.

31.7.5.2.3 Assignment and swap [istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

1 *Effects*: Equivalent to `swap(rhs)`.

2 *Returns*: `*this`.

```
void swap(basic_istream& rhs);
```

3 *Effects*: Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

31.7.5.2.4 Class `basic_istream::sentry` [istream.sentry]

```
  namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
      bool ok_;                   // exposition only

    public:
      explicit sentry(basic_istream& is, bool noskipws = false);
      ~sentry();
      explicit operator bool() const { return ok_; }
      sentry(const sentry&) = delete;
      sentry& operator=(const sentry&) = delete;
    };
  }
```

1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream& is, bool noskipws = false);
```

2 *Effects*: If `is.good()` is `false`, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()`

to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.[273] If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

3 *Remarks*: The constructor

```
explicit sentry(basic_istream& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

4 To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
  // c is a whitespace character.
```

5 If, after any preparation is completed, `is.good()` is `true`, *`ok_`* `!= false` otherwise, *`ok_`* `== false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).[274]

```
~sentry();
```

6 *Effects*: None.

```
explicit operator bool() const;
```

7 *Returns*: *`ok_`*.

31.7.5.3 Formatted input functions [istream.formatted]

31.7.5.3.1 Common requirements [istream.formatted.reqmts]

1 Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.5.3.2 Arithmetic extractors [istream.formatted.arithmetic]

```
basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
```

273) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

274) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```
basic_istream& operator>>(void*& val);
```

1 As in the case of the inserters, these extractors depend on the locale's `num_get<>` (28.3.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[*Note 1*: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — *end note*]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
basic_istream& operator>>(short& val);
```

2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<short>::min()) {
  state |= ios_base::failbit;
  val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
  state |= ios_base::failbit;
  val = numeric_limits<short>::max();
}  else
  val = static_cast<short>(lval);
```

```
basic_istream& operator>>(int& val);
```

3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<int>::min()) {
  state |= ios_base::failbit;
  val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
  state |= ios_base::failbit;
  val = numeric_limits<int>::max();
}  else
  val = static_cast<int>(lval);
```

```
basic_istream& operator>>(extended-floating-point-type& val);
```

4 If the floating-point conversion rank of *`extended-floating-point-type`* is not less than or equal to that of `long double`, then an invocation of the operator function is conditionally supported with implementation-defined semantics.

5 Otherwise, let `FP` be a standard floating-point type:

(5.1) — if the floating-point conversion rank of *`extended-floating-point-type`* is less than or equal to that of `float`, then `FP` is `float`,

(5.2) — otherwise, if the floating-point conversion rank of *`extended-floating-point-type`* is less than or equal to that of `double`, then `FP` is `double`,

(5.3) — otherwise, `FP` is `long double`.

6 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
```

```
FP fval;
use_facet<numget>(loc).get(*this, 0, *this, state, fval);
if (fval < -numeric_limits<extended-floating-point-type>::max()) {
  state |= ios_base::failbit;
  val = -numeric_limits<extended-floating-point-type>::max();
} else if (numeric_limits<extended-floating-point-type>::max() < fval) {
  state |= ios_base::failbit;
  val = numeric_limits<extended-floating-point-type>::max();
} else {
  val = static_cast<extended-floating-point-type>(fval);
}
```

[*Note 2*: When the extended floating-point type has a floating-point conversion rank that is not equal to the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate results. `from_chars` can be used in situations where maximum accuracy is important. — *end note*]

31.7.5.3.3 `basic_istream::operator>>` [istream.extractors]

```
basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
```

1 *Effects*: None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

2 *Returns*: `pf(*this)`.[275]

```
basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3 *Effects*: Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

4 *Returns*: `*this`.

```
basic_istream& operator>>(ios_base& (*pf)(ios_base&));
```

5 *Effects*: Calls `pf(*this)`.[276] This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

6 *Returns*: `*this`.

```
template<class charT, class traits, size_t N>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
```

7 *Effects*: Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

8 Characters are extracted and stored until any of the following occurs:

(8.1) — `n-1` characters are stored;

(8.2) — end of file occurs on the input sequence;

(8.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is `true`.

9 `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10 If the function extracted no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

11 *Returns*: `in`.

```
template<class charT, class traits>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
```

275) See, for example, the function signature `ws(basic_istream&)` (31.7.5.5).
276) See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

```
template<class traits>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
```

12 *Effects*: Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

13 *Returns*: `in`.

```
basic_istream& operator>>(basic_streambuf<charT, traits>* sb);
```

14 *Effects*: Behaves as an unformatted input function (31.7.5.4). If `sb` is null, calls `setstate(failbit)`, which may throw `ios_base::failure` (31.5.4.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

(14.1) — end-of-file occurs on the input sequence;

(14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(14.3) — an exception occurs (in which case the exception is caught).

15 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

16 *Returns*: `*this`.

31.7.5.4 Unformatted input functions [istream.unformatted]

1 Each unformatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any event the `sentry` object is destroyed before leaving the unformatted input function.

```
streamsize gcount() const;
```

2 *Effects*: None. This member function does not behave as an unformatted input function (as described above).

3 *Returns*: The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns `numeric_limits<streamsize>::max()`.

```
int_type get();
```

4 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

5 *Returns*: `c` if available, otherwise `traits::eof()`.

```
basic_istream& get(char_type& c);
```

6 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.[277] Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

7 *Returns*: `*this`.

277) Note that this function is not overloaded on types `signed char` and `unsigned char`.

`basic_istream& get(char_type* s, streamsize n, char_type delim);`

8 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.[278] Characters are extracted and stored until any of the following occurs:

(8.1) — `n` is less than one or `n - 1` characters are stored;

(8.2) — end-of-file occurs on the input sequence;

(8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

9 If the function stores no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called. In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

10 *Returns*: `*this`.

`basic_istream& get(char_type* s, streamsize n);`

11 *Effects*: Calls `get(s, n, widen('\n'))`.

12 *Returns*: Value returned by the call.

`basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);`

13 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

(13.1) — end-of-file occurs on the input sequence;

(13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(13.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted);

(13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

15 *Returns*: `*this`.

`basic_istream& get(basic_streambuf<char_type, traits>& sb);`

16 *Effects*: Calls `get(sb, widen('\n'))`.

17 *Returns*: Value returned by the call.

`basic_istream& getline(char_type* s, streamsize n, char_type delim);`

18 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.[279] Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);[280]
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

19 These conditions are tested in the order shown.[281]

20 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.[282]

21 In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

278) Note that this function is not overloaded on types `signed char` and `unsigned char`.
279) Note that this function is not overloaded on types `signed char` and `unsigned char`.
280) Since the final input character is "extracted", it is counted in the `gcount()`, even though it is not stored.
281) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.
282) This implies an empty input line will not cause `failbit` to be set.

22 *Returns*: `*this`.

23 [*Example 1*:

```
#include <iostream>

int main() {
  using namespace std;
  const int line_buffer_size = 100;

  char buffer[line_buffer_size];
  int line_number = 0;
  while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
    int count = cin.gcount();
    if (cin.eof())
      cout << "Partial final line";     // cin.fail() is false
    else if (cin.fail()) {
      cout << "Partial long line";
      cin.clear(cin.rdstate() & ~ios_base::failbit);
    } else {
      count--;                          // Don't include newline in count
      cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
  }
}
```

— *end example*]

`basic_istream& getline(char_type* s, streamsize n);`

24 *Returns*: `getline(s, n, widen('\n'))`

`basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());`

25 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and discards them. Characters are extracted until any of the following occurs:

(25.1) — `n != numeric_limits<streamsize>::max()` (17.3.5) and `n` characters have been extracted so far;

(25.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`, which may throw `ios_base::failure` (31.5.4.4));

(25.3) — `traits::eq_int_type(traits::to_int_type(c), delim)` for the next available input character `c` (in which case `c` is extracted).

[*Note 1*: The last condition will never occur if `traits::eq_int_type(delim, traits::eof())`. — *end note*]

26 *Returns*: `*this`.

`int_type peek();`

27 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, reads but does not extract the current input character.

28 *Returns*: `traits::eof()` if `good()` is `false`. Otherwise, returns `rdbuf()->sgetc()`.

`basic_istream& read(char_type* s, streamsize n);`

29 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`.[283] Characters are extracted and stored until either of the following occurs:

(29.1) — `n` characters are stored;

(29.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(failbit | eofbit)`, which may throw `ios_base::failure` (31.5.4.4)).

283) Note that this function is not overloaded on types `signed char` and `unsigned char`.

30 *Returns*: `*this`.

`streamsize readsome(char_type* s, streamsize n);`

31 *Effects*: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`. If `rdbuf()->in_avail() == -1`, calls `setstate(eofbit)` (which may throw `ios_base::failure` (31.5.4.4)), and extracts no characters;

(31.1) — If `rdbuf()->in_avail() == 0`, extracts no characters

(31.2) — If `rdbuf()->in_avail() > 0`, extracts `min(rdbuf()->in_avail(), n))`.

32 *Returns*: The number of characters extracted.

`basic_istream& putback(char_type c);`

33 *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sputbackc(c)`. If `rdbuf()` is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[*Note 2*: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — *end note*]

34 *Returns*: `*this`.

`basic_istream& unget();`

35 *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sungetc()`. If `rdbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[*Note 3*: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — *end note*]

36 *Returns*: `*this`.

`int sync();`

37 *Effects*: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rdbuf()` is a null pointer, returns `-1`. Otherwise, calls `rdbuf()->pubsync()` and, if that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4), and returns `-1`. Otherwise, returns zero.

`pos_type tellg();`

38 *Effects*: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

39 *Returns*: After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, in)`.

`basic_istream& seekg(pos_type pos);`

40 *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

41 *Returns*: `*this`.

```
basic_istream& seekg(off_type off, ios_base::seekdir dir);
```

42 *Effects*: Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

43 *Returns*: `*this`.

31.7.5.5 Standard `basic_istream` manipulators [istream.manip]

1 Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
  basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

2 *Effects*: Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (31.7.5.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

3 *Returns*: `is`.

31.7.5.6 Rvalue stream extraction [istream.rvalue]

```
template<class Istream, class T>
  Istream&& operator>>(Istream&& is, T&& x);
```

1 *Constraints*: The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

2 *Effects*: Equivalent to:

```
is >> std::forward<T>(x);
return std::move(is);
```

31.7.5.7 Class template `basic_iostream` [iostreamclass]

31.7.5.7.1 General [iostreamclass.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_iostream
    : public basic_istream<charT, traits>,
      public basic_ostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.7.5.7.2, constructor
    explicit basic_iostream(basic_streambuf<charT, traits>* sb);

    // 31.7.5.7.3, destructor
    virtual ~basic_iostream();

  protected:
    // 31.7.5.7.2, constructor
    basic_iostream(const basic_iostream&) = delete;
    basic_iostream(basic_iostream&& rhs);
    // 31.7.5.7.4, assignment and swap
    basic_iostream& operator=(const basic_iostream&) = delete;
    basic_iostream& operator=(basic_iostream&& rhs);
    void swap(basic_iostream& rhs);
  };
}
```

1 The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors [iostream.cons]

`explicit basic_iostream(basic_streambuf<charT, traits>* sb);`

1 *Effects*: Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (31.7.5.2) and `basic_ostream<charT, traits>(sb)` (31.7.6.2).

2 *Postconditions*: `rdbuf() == sb` and `gcount() == 0`.

`basic_iostream(basic_iostream&& rhs);`

3 *Effects*: Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `std::move(rhs)`.

31.7.5.7.3 Destructor [iostream.dest]

`virtual ~basic_iostream();`

1 *Remarks*: Does not perform any operations on `rdbuf()`.

31.7.5.7.4 Assignment and swap [iostream.assign]

`basic_iostream& operator=(basic_iostream&& rhs);`

1 *Effects*: Equivalent to `swap(rhs)`.

`void swap(basic_iostream& rhs);`

2 *Effects*: Calls `basic_istream<charT, traits>::swap(rhs)`.

31.7.6 Output streams [output.streams]

31.7.6.1 General [output.streams.general]

1 The header `<ostream>` defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template `basic_ostream` [ostream]

31.7.6.2.1 General [ostream.general]

1 When a function has a parameter type *`extended-floating-point-type`*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2).

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ostream : virtual public basic_ios<charT, traits> {
  public:
    // types (inherited from basic_ios (31.5.4))
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.7.6.2.2, constructor/destructor
    explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
    virtual ~basic_ostream();

    // 31.7.6.2.4, prefix/suffix
    class sentry;
    // 31.7.6.3, formatted output
    basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
    basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
    basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

    basic_ostream& operator<<(bool n);
    basic_ostream& operator<<(short n);
    basic_ostream& operator<<(unsigned short n);
    basic_ostream& operator<<(int n);
    basic_ostream& operator<<(unsigned int n);
    basic_ostream& operator<<(long n);
    basic_ostream& operator<<(unsigned long n);
    basic_ostream& operator<<(long long n);
    basic_ostream& operator<<(unsigned long long n);
    basic_ostream& operator<<(float f);
    basic_ostream& operator<<(double f);
    basic_ostream& operator<<(long double f);
    basic_ostream& operator<<(extended-floating-point-type f);

    basic_ostream& operator<<(const void* p);
    basic_ostream& operator<<(const volatile void* p);
    basic_ostream& operator<<(nullptr_t);
    basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

    // 31.7.6.4, unformatted output
    basic_ostream& put(char_type c);
    basic_ostream& write(const char_type* s, streamsize n);

    basic_ostream& flush();

    // 31.7.6.2.5, seeks
    pos_type tellp();
    basic_ostream& seekp(pos_type);
    basic_ostream& seekp(off_type, ios_base::seekdir);

  protected:
    // 31.7.6.2.2, copy/move constructor
    basic_ostream(const basic_ostream&) = delete;
    basic_ostream(basic_ostream&& rhs);

    // 31.7.6.2.3, assignment and swap
    basic_ostream& operator=(const basic_ostream&) = delete;
    basic_ostream& operator=(basic_ostream&& rhs);
    void swap(basic_ostream& rhs);
  };

    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const char*);
  template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const char*);

  template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const signed char*);
  template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const unsigned char*);

  template<class traits>
    basic_ostream<char, traits>&
      operator<<(basic_ostream<char, traits>&, const wchar_t*) = delete;
  template<class traits>
    basic_ostream<char, traits>&
      operator<<(basic_ostream<char, traits>&, const char8_t*) = delete;
  template<class traits>
    basic_ostream<char, traits>&
      operator<<(basic_ostream<char, traits>&, const char16_t*) = delete;
  template<class traits>
    basic_ostream<char, traits>&
      operator<<(basic_ostream<char, traits>&, const char32_t*) = delete;
  template<class traits>
    basic_ostream<wchar_t, traits>&
      operator<<(basic_ostream<wchar_t, traits>&, const char8_t*) = delete;
  template<class traits>
    basic_ostream<wchar_t, traits>&
      operator<<(basic_ostream<wchar_t, traits>&, const char16_t*) = delete;
  template<class traits>
    basic_ostream<wchar_t, traits>&
      operator<<(basic_ostream<wchar_t, traits>&, const char32_t*) = delete;
}
```

2 The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

3 Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions.* Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xsputn()`, and `sync()`.

4 If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

5 [*Note 1*: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers. — *end note*]

31.7.6.2.2 Constructors [ostream.cons]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

1 *Effects*: Initializes the base class subobject with `basic_ios<charT, traits>::init(sb)` (31.5.4.2).

2 *Postconditions*: `rdbuf() == sb`.

```
basic_ostream(basic_ostream&& rhs);
```

3 *Effects*: Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

```
virtual ~basic_ostream();
```

4 *Remarks*: Does not perform any operations on `rdbuf()`.

31.7.6.2.3 Assignment and swap [ostream.assign]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

1 *Effects*: Equivalent to `swap(rhs)`.

2 *Returns*: `*this`.

```
void swap(basic_ostream& rhs);
```

3 *Effects*: Calls `basic_ios<charT, traits>::swap(rhs)`.

31.7.6.2.4 Class `basic_ostream::sentry` [ostream.sentry]

```
namespace std {
  template<class charT, class traits>
  class basic_ostream<charT, traits>::sentry {
    bool ok_;          // exposition only

  public:
    explicit sentry(basic_ostream& os);
    ~sentry();
    explicit operator bool() const { return ok_; }

    sentry(const sentry&) = delete;
    sentry& operator=(const sentry&) = delete;
  };
}
```

1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream& os);
```

2 If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.[284]

3 If, after any preparation is completed, `os.good()` is `true`, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).[285]

```
~sentry();
```

4 If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good()` is `true`, calls `os.rdbuf()->pubsync()`. If that function returns −1, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

5 *Effects*: Returns `ok_`.

284) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.
285) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

31.7.6.2.5 Seek members [ostream.seeks]

1 Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```
pos_type tellp();
```

2 *Returns*: If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```
basic_ostream& seekp(pos_type pos);
```

3 *Effects*: If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

4 *Returns*: `*this`.

```
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

5 *Effects*: If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

6 *Returns*: `*this`.

31.7.6.3 Formatted output functions [ostream.formatted]

31.7.6.3.1 Common requirements [ostream.formatted.reqmts]

1 Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is set[286] in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.

2 The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.

3 If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character container type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.6.3.2 Arithmetic inserters [ostream.inserters.arithmetic]

```
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
```

1 *Effects*: The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

286) This is done without causing an `ios_base::failure` to be thrown.

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(),
    baseflags == ios_base::oct || baseflags == ios_base::hex
      ? static_cast<long>(static_cast<unsigned short>(val))
      : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(),
    baseflags == ios_base::oct || baseflags == ios_base::hex
      ? static_cast<long>(static_cast<unsigned int>(val))
      : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(), static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(), static_cast<double>(val)).failed();
```

2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostream`s and uses `streambuf`s directly. Class `locale` relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

3 *Returns*: `*this`.

```
basic_ostream& operator<<(const volatile void* p);
```

4 *Effects*: Equivalent to: `return operator<<(const_cast<const void*>(p));`

```
basic_ostream& operator<<(extended-floating-point-type val);
```

5 *Effects*: If the floating-point conversion rank of *`extended-floating-point-type`* is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(), static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of *`extended-floating-point-type`* is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
  getloc()).put(*this, *this, fill(), static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

6 *Returns*: `*this`.

31.7.6.3.3 `basic_ostream::operator<<` [ostream.inserters]

```
basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
```

1 *Effects*: None. Does not behave as a formatted output function (as described in 31.7.6.3.1).

2 *Returns*: `pf(*this)`.[287]

```
basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3 *Effects*: Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

4 *Returns*: `*this`.[288]

```
basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
```

5 *Effects*: Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

6 *Returns*: `*this`.

```
basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);
```

7 *Effects*: Behaves as an unformatted output function (31.7.6.4). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8 Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

- (8.1) — end-of-file occurs on the input sequence;
- (8.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (8.3) — an exception occurs while getting a character from `sb`.

9 If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

10 *Returns*: `*this`.

```
basic_ostream& operator<<(nullptr_t);
```

11 *Effects*: Equivalent to:

```
return *this << s;
```

where `s` is an implementation-defined NTCTS (3.36).

31.7.6.3.4 Character inserter function templates [ostream.inserters.character]

```
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
```

1 *Effects*: Behaves as a formatted output function (31.7.6.3.1) of `out`. Constructs a character sequence `seq`. If `c` has type `char` and the character container type of the stream is not `char`, then `seq` consists of `out.widen(c)`; otherwise `seq` consists of `c`. Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `os.width(0)`.

2 *Returns*: `out`.

287) See, for example, the function signature `endl(basic_ostream&)` (31.7.6.5).
288) See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

```
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                          const unsigned char* s);
```

3 *Preconditions*: `s` is not a null pointer.

4 *Effects*: Behaves like a formatted inserter (as described in 31.7.6.3.1) of `out`. Creates a character sequence `seq` of `n` characters starting at `s`, each widened using `out.widen()` (31.5.4.3), where `n` is the number that would be computed as if by:

(4.1) — `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,

(4.2) — `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,

(4.3) — `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `width(0)`.

5 *Returns*: `out`.

31.7.6.3.5 Print [ostream.formatted.print]

```
template<class... Args>
  void print(ostream& os, format_string<Args...> fmt, Args&&... args);
```

1 *Effects*: If the ordinary literal encoding (5.3.1) is UTF-8, equivalent to:

```
vprint_unicode(os, fmt.str, make_format_args(args...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(os, fmt.str, make_format_args(args...));
```

```
template<class... Args>
  void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

2 *Effects*: Equivalent to:

```
print(os, "{}\n", format(os.getloc(), fmt, std::forward<Args>(args)...));
```

```
void println(ostream& os);
```

3 *Effects*: Equivalent to:

```
print(os, "\n");
```

```
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
```

4 *Effects*: Behaves as a formatted output function (31.7.6.3.1) of `os`, except that:

(4.1) — failure to generate output is reported as specified below, and

(4.2) — any exception thrown by the call to `vformat` is propagated without regard to the value of `os.exceptions()` and without turning on `ios_base::badbit` in the error state of `os`.

After constructing a `sentry` object, the function initializes a variable with automatic storage duration via

```
string out = vformat(os.getloc(), fmt, args);
```

(4.3) — If the function is `vprint_unicode` and `os` is a stream that refers to a terminal that is capable of displaying Unicode only via a native Unicode API, which is determined in an implementation-defined manner, flushes `os` and then writes `out` to the terminal using the native Unicode API;

if `out` contains invalid code units, the behavior is undefined. Then establishes an observable checkpoint (4.1.2).

(4.4) — Otherwise inserts the character sequence [`out.begin()`,`out.end()`) into `os`.

If writing to the terminal or inserting into `os` fails, calls `os.setstate(ios_base::badbit)` (which may throw `ios_base::failure`).

5 *Recommended practice*: For `vprint_unicode`, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

31.7.6.4 Unformatted output functions [ostream.unformatted]

1 Each unformatted output function begins execution by constructing an object of class `sentry`. If that object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios_base::badbit` is set[289] in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the `sentry` object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```
basic_ostream& put(char_type c);
```

2 *Effects*: Behaves as an unformatted output function (as described above). After constructing a `sentry` object, inserts the character `c`, if possible.[290]

3 Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

4 *Returns*: `*this`.

```
basic_ostream& write(const char_type* s, streamsize n);
```

5 *Effects*: Behaves as an unformatted output function (as described above). After constructing a `sentry` object, obtains characters to insert from successive locations of an array whose first element is designated by `s`.[291] Characters are inserted until either of the following occurs:

(5.1) — `n` characters are inserted;

(5.2) — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (31.5.4.4)).

6 *Returns*: `*this`.

```
basic_ostream& flush();
```

7 *Effects*: Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)). Otherwise, if the `sentry` object returns `false`, does nothing.

8 *Returns*: `*this`.

31.7.6.5 Standard `basic_ostream` manipulators [ostream.manip]

1 Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
  basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

2 *Effects*: Calls `os.put(os.widen('\n'))`, then `os.flush()`.

3 *Returns*: `os`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

4 *Effects*: Inserts a null character into the output sequence: calls `os.put(charT())`.

289) This is done without causing an `ios_base::failure` to be thrown.
290) Note that this function is not overloaded on types `signed char` and `unsigned char`.
291) Note that this function is not overloaded on types `signed char` and `unsigned char`.

5 *Returns*: `os`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

6 *Effects*: Calls `os.flush()`.

7 *Returns*: `os`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

8 *Effects*: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

[*Note 1*: To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its *`emit-on-sync`* flag. — *end note*]

9 *Returns*: `os`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
```

10 *Effects*: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11 *Returns*: `os`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

12 *Effects*: Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, behaves as an unformatted output function (31.7.6.4) of `os`. After constructing a `sentry` object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.

13 *Returns*: `os`.

31.7.6.6 Rvalue stream insertion [ostream.rvalue]

```
template<class Ostream, class T>
  Ostream&& operator<<(Ostream&& os, const T& x);
```

1 *Constraints*: The expression `os << x` is well-formed when treated as an unevaluated operand and `Ostream` is publicly and unambiguously derived from `ios_base`.

2 *Effects*: As if by: `os << x;`

3 *Returns*: `std::move(os)`.

31.7.7 Standard manipulators [std.manip]

1 The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```
unspecified resetiosflags(ios_base::fmtflags mask);
```

2 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:[292]

```
void f(ios_base& str, ios_base::fmtflags mask) {
  // reset specified flags
  str.setf(ios_base::fmtflags(0), mask);
}
```

292) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

`unspecified` `setiosflags(ios_base::fmtflags mask);`

3 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
  // set specified flags
  str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

`unspecified` `setbase(int base);`

4 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
  // set basefield
  str.setf(base ==  8 ? ios_base::oct :
      base == 10 ? ios_base::dec :
      base == 16 ? ios_base::hex :
      ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

`unspecified` `setfill(char_type c);`

5 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
  // set fill character
  str.fill(c);
}
```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

`unspecified` `setprecision(int n);`

6 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
  // set precision
  str.precision(n);
}
```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

unspecified `setw(int n);`

7 *Returns*: An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
  // set width
  str.width(n);
}
```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

31.7.8 Extended manipulators [ext.manip]

1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

`template<class moneyT>` *unspecified* `get_money(moneyT& mon, bool intl = false);`

2 *Mandates*: The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 27).

3 *Effects*: The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function (31.7.5.3.1).

4 *Returns*: An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
  using Iter     = istreambuf_iterator<charT, traits>;
  using MoneyGet = money_get<charT, Iter>;

  ios_base::iostate err = ios_base::goodbit;
  const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

  mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

  if (ios_base::goodbit != err)
    str.setstate(err);
}
```

The expression `in >> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value `in`.

`template<class moneyT>` *unspecified* `put_money(const moneyT& mon, bool intl = false);`

5 *Mandates*: The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 27).

6 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function (31.7.6.3.1) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
  using Iter     = ostreambuf_iterator<charT, traits>;
  using MoneyPut = money_put<charT, Iter>;

  const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
  const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

  if (end.failed())
    str.setstate(ios_base::badbit);
}
```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

`template<class charT> *unspecified* get_time(tm* tmb, const charT* fmt);`

7 *Preconditions*: The argument `tmb` is a valid pointer to an object of type `tm`, and [`fmt`, `fmt + char_traits<charT>::length(fmt)`) is a valid range.

8 *Returns*: An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
  using Iter    = istreambuf_iterator<charT, traits>;
  using TimeGet = time_get<charT, Iter>;

  ios_base::iostate err = ios_base::goodbit;
  const TimeGet& tg = use_facet<TimeGet>(str.getloc());

  tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
    fmt, fmt + traits::length(fmt));

  if (err != ios_base::goodbit)
    str.setstate(err);
}
```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value `in`.

`template<class charT> *unspecified* put_time(const tm* tmb, const charT* fmt);`

9 *Preconditions*: The argument `tmb` is a valid pointer to an object of type `tm`, and [`fmt`, `fmt + char_traits<charT>::length(fmt)`) is a valid range.

10 *Returns*: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
  using Iter    = ostreambuf_iterator<charT, traits>;
  using TimePut = time_put<charT, Iter>;

  const TimePut& tp = use_facet<TimePut>(str.getloc());
  const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
    fmt, fmt + traits::length(fmt));

  if (end.failed())
    str.setstate(ios_base::badbit);
}
```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.9 Quoted manipulators [quoted.manip]

1 [*Note 1*: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — *end note*]

```
template<class charT>
  unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
  unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                     charT delim = charT('"'), charT escape = charT('\\'));
```

```
template<class charT, class traits>
  unspecified quoted(basic_string_view<charT, traits> s,
                     charT delim = charT('"'), charT escape = charT('\\'));
```

2 *Returns*: An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (31.7.6.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

(2.1) — `delim`.

(2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.

(2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 31.7.6.3.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT, class traits, class Allocator>
  unspecified quoted(basic_string<charT, traits, Allocator>& s,
                     charT delim = charT('"'), charT escape = charT('\\'));
```

3 *Returns*: An object of unspecified type such that:

(3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, charT&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.2.1):

(3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:

(3.1.1.1) — Turn off the `skipws` flag.

(3.1.1.2) — `s.clear()`

(3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.

(3.1.1.4) — Discard the final `delim` character.

(3.1.1.5) — Restore the `skipws` flag to its original value.

(3.1.2) — Otherwise, `in >> s`.

(3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.

(3.3) — The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.

(3.4) — The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.10 Print functions [print.fun]

```
template<class... Args>
  void print(format_string<Args...> fmt, Args&&... args);
```

1 *Effects*: Equivalent to:

```
print(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
  void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

2 *Effects*: Let `locksafe` be `(enable_nonlocking_formatter_optimization<remove_cvref_t<Args>> && ...)`. If the ordinary literal encoding (5.3.1) is UTF-8, equivalent to:

```
locksafe
  ? vprint_unicode(stream, fmt.str, make_format_args(args...))
  : vprint_unicode_buffered(stream, fmt.str, make_format_args(args...));
```

Otherwise, equivalent to:

```
locksafe
  ? vprint_nonunicode(stream, fmt.str, make_format_args(args...))
  : vprint_nonunicode_buffered(stream, fmt.str, make_format_args(args...));
```

```
template<class... Args>
  void println(format_string<Args...> fmt, Args&&... args);
```

3 *Effects*: Equivalent to:

```
println(stdout, fmt, std::forward<Args>(args)...);
```

```
void println();
```

4 *Effects*: Equivalent to:

```
println(stdout);
```

```
template<class... Args>
  void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

5 *Effects*: Equivalent to:

```
print(stream, runtime_format(string(fmt.get()) + '\n'), std::forward<Args>(args)...);
```

```
void println(FILE* stream);
```

6 *Effects*: Equivalent to:

```
print(stream, "\n");
```

```
void vprint_unicode(string_view fmt, format_args args);
```

7 *Effects*: Equivalent to:

```
vprint_unicode(stdout, fmt, args);
```

```
void vprint_unicode_buffered(FILE* stream, string_view fmt, format_args args);
```

8 *Effects*: Equivalent to:

```
string out = vformat(fmt, args);
vprint_unicode(stream, "{}", make_format_args(out));
```

```
void vprint_unicode(FILE* stream, string_view fmt, format_args args);
```

9 *Preconditions*: `stream` is a valid pointer to an output C stream.

10 *Effects*: Locks `stream`. Let `out` denote the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`.

(10.1) — If `stream` refers to a terminal that is capable of displaying Unicode only via a native Unicode API, flushes `stream` and then writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined. Then establishes an observable checkpoint (4.1.2).

(10.2) — Otherwise writes `out` to `stream` unchanged.

Unconditionally unlocks `stream` on function exit.

See also: ISO/IEC 9899:2018, 7.21.2.

[*Note 1*: On Windows the native Unicode API is `WriteConsoleW` and `stream` referring to a terminal means that `GetConsoleMode(_get_osfhandle(_fileno(stream)), ...)` returns nonzero. — *end note*]

11 *Throws*: Any exception thrown by the call to `vformat` (28.5.3). `system_error` if writing to the terminal or `stream` fails. May throw `bad_alloc`.

12 *Recommended practice*: If invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

```
void vprint_nonunicode(string_view fmt, format_args args);
```

13 *Effects*: Equivalent to:

```
  vprint_nonunicode(stdout, fmt, args);
```

```
void vprint_nonunicode_buffered(FILE* stream, string_view fmt, format_args args);
```

14 *Effects*: Equivalent to:

```
  string out = vformat(fmt, args);
  vprint_nonunicode("{}", make_format_args(out));
```

```
void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
```

15 *Preconditions*: `stream` is a valid pointer to an output C stream.

16 *Effects*: While holding the lock on `stream`, writes the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt` to `stream`.

17 *Throws*: Any exception thrown by the call to `vformat` (28.5.3). `system_error` if writing to `stream` fails. May throw `bad_alloc`.

31.8 String-based streams [string.streams]

31.8.1 Header <sstream> synopsis [sstream.syn]

```
namespace std {
  // 31.8.2, class template basic_stringbuf
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
    class basic_stringbuf;

  template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

  using stringbuf  = basic_stringbuf<char>;
  using wstringbuf = basic_stringbuf<wchar_t>;

  // 31.8.3, class template basic_istringstream
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
    class basic_istringstream;

  template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,
              basic_istringstream<charT, traits, Allocator>& y);

  using istringstream  = basic_istringstream<char>;
  using wistringstream = basic_istringstream<wchar_t>;

  // 31.8.4, class template basic_ostringstream
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
    class basic_ostringstream;

  template<class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);

  using ostringstream  = basic_ostringstream<char>;
  using wostringstream = basic_ostringstream<wchar_t>;
```

```
    // 31.8.5, class template basic_stringstream
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
      class basic_stringstream;

    template<class charT, class traits, class Allocator>
      void swap(basic_stringstream<charT, traits, Allocator>& x,
                basic_stringstream<charT, traits, Allocator>& y);

    using stringstream  = basic_stringstream<char>;
    using wstringstream = basic_stringstream<wchar_t>;
  }
```

1 The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 27.4.

31.8.2 Class template `basic_stringbuf` [stringbuf]

31.8.2.1 General [stringbuf.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_stringbuf : public basic_streambuf<charT, traits> {
  public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type       = typename traits::pos_type;
    using off_type       = typename traits::off_type;
    using traits_type    = traits;
    using allocator_type = Allocator;

    // 31.8.2.2, constructors
    basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
    explicit basic_stringbuf(ios_base::openmode which);
    explicit basic_stringbuf(
      const basic_string<charT, traits, Allocator>& s,
      ios_base::openmode which = ios_base::in | ios_base::out);
    explicit basic_stringbuf(const Allocator& a)
      : basic_stringbuf(ios_base::in | ios_base::out, a) {}
    basic_stringbuf(ios_base::openmode which, const Allocator& a);
    explicit basic_stringbuf(
      basic_string<charT, traits, Allocator>&& s,
      ios_base::openmode which = ios_base::in | ios_base::out);
    template<class SAlloc>
      basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_stringbuf(s, ios_base::in | ios_base::out, a) {}
    template<class SAlloc>
      basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
      explicit basic_stringbuf(

    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
      void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);
    template<class T>
      void str(const T& t);

  protected:
    // 31.8.2.5, overridden virtual functions
    int_type underflow() override;
    int_type pbackfail(int_type c = traits::eof()) override;
    int_type overflow (int_type c = traits::eof()) override;
    basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

    pos_type seekoff(off_type off, ios_base::seekdir way,
                     ios_base::openmode which
                       = ios_base::in | ios_base::out) override;
    pos_type seekpos(pos_type sp,
                     ios_base::openmode which
                       = ios_base::in | ios_base::out) override;

  private:
    ios_base::openmode mode;                        // exposition only
    basic_string<charT, traits, Allocator> buf;     // exposition only
    void init-buf-ptrs();                           // exposition only
  };
}
```

1 The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.

2 For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

(2.1) — `ios_base::openmode` *`mode`*, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

(2.2) — `basic_string<charT, traits, Allocator>` *`buf`* contains the underlying character sequence.

(2.3) — *`init-buf-ptrs`*`()` sets the base class' get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to *`buf`* accordingly.

31.8.2.2 Constructors [stringbuf.cons]

`explicit basic_stringbuf(ios_base::openmode which);`

1 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), and *`mode`* with `which`. It is implementation-defined whether the sequence pointers (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) are initialized to null pointers.

2 *Postconditions*: `str().empty()` is `true`.

```
explicit basic_stringbuf(
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::in | ios_base::out);
```

3 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), ***`mode`*** with `which`, and ***`buf`*** with `s`, then calls ***`init-buf-ptrs`***`()`.

```
basic_stringbuf(ios_base::openmode which, const Allocator& a);
```

4 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), ***`mode`*** with `which`, and ***`buf`*** with `a`, then calls ***`init-buf-ptrs`***`()`.

5 *Postconditions*: `str().empty()` is `true`.

```
explicit basic_stringbuf(
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::in | ios_base::out);
```

6 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), ***`mode`*** with `which`, and ***`buf`*** with `std::move(s)`, then calls ***`init-buf-ptrs`***`()`.

```
template<class SAlloc>
  basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

7 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), ***`mode`*** with `which`, and ***`buf`*** with `{s,a}`, then calls ***`init-buf-ptrs`***`()`.

```
template<class SAlloc>
  explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

8 *Constraints*: `is_same_v<SAlloc, Allocator>` is `false`.

9 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), ***`mode`*** with `which`, and ***`buf`*** with `s`, then calls ***`init-buf-ptrs`***`()`.

```
template<class T>
  explicit basic_stringbuf(const T& t, ios_base::openmode which = ios_base::in | ios_base::out);
template<class T>
  basic_stringbuf(const T& t, const Allocator& a);
template<class T>
  basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);
```

10 Let `which` be `ios_base::in | ios_base::out` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

11 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

12 *Effects*: Creates a variable `sv` as if by `basic_string_view<charT, traits> sv = t`, then value-initializes the base class, initializes ***`mode`*** with `which`, and direct-non-list-initializes ***`buf`*** with `sv, a`, then calls ***`init-buf-ptrs`***`()`.

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

13 *Effects*: Copy constructs the base class from `rhs` and initializes ***`mode`*** with `rhs.mode`. In the first form `buf` is initialized from `std::move(rhs).str()`. In the second form ***`buf`*** is initialized from `{std::move(rhs).str(), a}`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had.

14 *Postconditions*: Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

(14.1) — `str() == rhs_p.str()`

(14.2) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`

(14.3) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`

(14.4) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`

(14.5) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`

(14.6) — `if (eback()) eback() != rhs_a.eback()`

(14.7) — `if (gptr()) gptr() != rhs_a.gptr()`

(14.8) — `if (egptr()) egptr() != rhs_a.egptr()`

(14.9) — `if (pbase()) pbase() != rhs_a.pbase()`

(14.10) — `if (pptr()) pptr() != rhs_a.pptr()`

(14.11) — `if (epptr()) epptr() != rhs_a.epptr()`

(14.12) — `getloc() == rhs_p.getloc()`

(14.13) — `rhs` is empty but usable, as if `std::move(rhs).str()` was called.

31.8.2.3 Assignment and swap [stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects*: After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.8.2.2).

2 *Returns*: `*this`.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

3 *Preconditions*: `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true` or `get_allocator() == rhs.get_allocator()` is `true`.

4 *Effects*: Exchanges the state of `*this` and `rhs`.

5 *Remarks*: The exception specification is equivalent to:
`allocator_traits<Allocator>::propagate_on_container_swap::value ||`
`allocator_traits<Allocator>::is_always_equal::value`

```
template<class charT, class traits, class Allocator>
  void swap(basic_stringbuf<charT, traits, Allocator>& x,
            basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

6 *Effects*: Equivalent to `x.swap(y)`.

31.8.2.4 Member functions [stringbuf.members]

1 The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init-buf-ptrs(); // exposition only
```

2 *Effects*: Initializes the input and output sequences from *`buf`* according to *`mode`*.

3 *Postconditions*:

(3.1) — If `ios_base::out` is set in *`mode`*, `pbase()` points to *`buf`*`.front()` and `epptr() >= pbase() + `*`buf`*`.size()` is true;

(3.1.1) — in addition, if `ios_base::ate` is set in *`mode`*, `pptr() == pbase() + `*`buf`*`.size()` is `true`,

(3.1.2) — otherwise `pptr() == pbase()` is `true`.

(3.2) — If `ios_base::in` is set in *`mode`*, `eback()` points to *`buf`*`.front()`, and `(gptr() == eback() && egptr() == eback() + `*`buf`*`.size())` is `true`.

4 [*Note 1*: For efficiency reasons, stream buffer operations can violate invariants of *`buf`* while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range [*`buf`*`.data() + `*`buf`*`.size()`, *`buf`*`.data() + `*`buf`*`.capacity()`). All operations retrieving a `basic_string` from `buf` ensure that the `basic_string` invariants hold on the returned value. — *end note*]

```
allocator_type get_allocator() const noexcept;
```

5 *Returns*: `*buf*.get_allocator()`.

```
basic_string<charT, traits, Allocator> str() const &;
```

6 *Effects*: Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

```
template<class SAlloc>
  basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

7 *Constraints*: `SAlloc` is a type that qualifies as an allocator (23.2.2.2).

8 *Effects*: Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

```
basic_string<charT, traits, Allocator> str() &&;
```

9 *Postconditions*: The underlying character sequence `buf` is empty and `pbase()`, `pptr()`, `epptr()`, `eback()`, `gptr()`, and `egptr()` are initialized as if by calling `*init-buf-ptrs*()` with an empty `buf`.

10 *Returns*: A `basic_string<charT, traits, Allocator>` object move constructed from the `basic_stringbuf`'s underlying character sequence in `buf`. This can be achieved by first adjusting `buf` to have the same content as `view()`.

```
basic_string_view<charT, traits> view() const noexcept;
```

11 Let `sv` be `basic_string_view<charT, traits>`.

12 *Returns*: A `sv` object referring to the `basic_stringbuf`'s underlying character sequence in `buf`:

(12.1) — If `ios_base::out` is set in `*mode*`, then `sv(pbase(), high_mark-pbase())` is returned.

(12.2) — Otherwise, if `ios_base::in` is set in `*mode*`, then `sv(eback(), egptr()-eback())` is returned.

(12.3) — Otherwise, `sv()` is returned.

13 [*Note 2*: Using the returned `sv` object after destruction or invalidation of the character sequence underlying `*this` is undefined behavior, unless `sv.empty()` is `true`. — *end note*]

```
void str(const basic_string<charT, traits, Allocator>& s);
```

14 *Effects*: Equivalent to:

```
buf = s;
init-buf-ptrs();
```

```
template<class SAlloc>
  void str(const basic_string<charT, traits, SAlloc>& s);
```

15 *Constraints*: `is_same_v<SAlloc,Allocator>` is `false`.

16 *Effects*: Equivalent to:

```
buf = s;
init-buf-ptrs();
```

```
void str(basic_string<charT, traits, Allocator>&& s);
```

17 *Effects*: Equivalent to:

```
buf = std::move(s);
init-buf-ptrs();
```

```
template<class T>
  void str(const T& t);
```

18 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

19 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
buf = sv;
init-buf-ptrs();
```

31.8.2.5 Overridden virtual functions [stringbuf.virtuals]

`int_type underflow() override;`

1 *Returns*: If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

`int_type pbackfail(int_type c = traits::eof()) override;`

2 *Effects*: Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(2.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

(2.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if *`mode`* `& ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

(2.3) — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

3 *Returns*: As specified above, or `traits::eof()` to indicate failure.

4 *Remarks*: If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

`int_type overflow(int_type c = traits::eof()) override;`

5 *Effects*: Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

Signals success by returning `c`.

(5.2) — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

Signals success by returning a value other than `traits::eof()`.

6 *Returns*: As specified above, or `traits::eof()` to indicate failure.

7 *Remarks*: The function can alter the number of write positions available as a result of any call.

8 The function can make a write position available only if `ios_base::out` is set in *`mode`*. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in *`mode`*, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out) override;
```

9 *Effects*: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 142.

10 For a sequence to be positioned, the function determines `newoff` as indicated in Table 143. If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

11 If `(newoff + off) < 0`, or if `newoff + off` refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

Table 142 — `seekoff` positioning [tab:stringbuf.seekoff.pos]

Conditions	Result
`ios_base::in` is set in `which`	positions the input sequence
`ios_base::out` is set in `which`	positions the output sequence
both `ios_base::in` and `ios_base::out` are set in `which` and either `way == ios_base::beg` or `way == ios_base::end`	positions both the input and the output sequences
Otherwise	the positioning operation fails.

Table 143 — `newoff` values [tab:stringbuf.seekoff.newoff]

Condition	`newoff` Value
`way == ios_base::beg`	0
`way == ios_base::cur`	the next pointer minus the beginning pointer (`xnext - xbeg`).
`way == ios_base::end`	the high mark pointer minus the beginning pointer (`high_mark - xbeg`).

12 *Returns*: `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out) override;
```

13 *Effects*: Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.

14 *Returns*: `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

15 *Effects*: implementation-defined, except that `setbuf(0, 0)` has no effect.

16 *Returns*: `this`.

31.8.3 Class template `basic_istringstream` [istringstream]

31.8.3.1 General [istringstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_istringstream : public basic_istream<charT, traits> {
  public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type       = typename traits::pos_type;
    using off_type       = typename traits::off_type;
    using traits_type    = traits;
    using allocator_type = Allocator;

    // 31.8.3.2, constructors
    basic_istringstream() : basic_istringstream(ios_base::in) {}
    explicit basic_istringstream(ios_base::openmode which);
    explicit basic_istringstream(
      const basic_string<charT, traits, Allocator>& s,
      ios_base::openmode which = ios_base::in);
    basic_istringstream(ios_base::openmode which, const Allocator& a);
    explicit basic_istringstream(
      basic_string<charT, traits, Allocator>&& s,
      ios_base::openmode which = ios_base::in);
    template<class SAlloc>
      basic_istringstream(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_istringstream(s, ios_base::in, a) {}
    template<class SAlloc>
      basic_istringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
      explicit basic_istringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::in);
    template<class T>
      explicit basic_istringstream(const T& t, ios_base::openmode which = ios_base::in);
    template<class T>
      basic_istringstream(const T& t, const Allocator& a);
    template<class T>
      basic_istringstream(const T& t, ios_base::openmode which, const Allocator& a);
    basic_istringstream(const basic_istringstream&) = delete;
    basic_istringstream(basic_istringstream&& rhs);

    basic_istringstream& operator=(const basic_istringstream&) = delete;
    basic_istringstream& operator=(basic_istringstream&& rhs);

    // 31.8.3.3, swap
    void swap(basic_istringstream& rhs);

    // 31.8.3.4, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
    basic_string<charT, traits, Allocator> str() const &;
    template<class SAlloc>
      basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
      void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);
    template<class T>
      void str(const T& t);

  private:
    basic_stringbuf<charT, traits, Allocator> sb;    // exposition only
  };
}
```

1 The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — *`sb`*, the `stringbuf` object.

31.8.3.2 Constructors [istringstream.cons]

```
explicit basic_istringstream(ios_base::openmode which);
```

1 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (31.8.2.2).

```
explicit basic_istringstream(
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::in);
```

2 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and *sb* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
basic_istringstream(ios_base::openmode which, const Allocator& a);
```

3 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and *sb* with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a)` (31.8.2.2).

```
explicit basic_istringstream(
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::in);
```

4 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and *sb* with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in)` (31.8.2.2).

```
template<class SAlloc>
  basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

5 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and *sb* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a)` (31.8.2.2).

```
template<class SAlloc>
  explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);
```

6 *Constraints*: `is_same_v<SAlloc, Allocator>` is `false`.

7 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and *sb* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
template<class T>
  explicit basic_istringstream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
  basic_istringstream(const T& t, const Allocator& a);
template<class T>
  basic_istringstream(const T& t, ios_base::openmode which, const Allocator& a);
```

8 Let `which` be `ios_base::in` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Initializes the base class with `addressof(sb)`, and direct-non-list-initializes *sb* with `t, which | ios_base::in, a`.

```
basic_istringstream(basic_istringstream&& rhs);
```

11 *Effects*: Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

31.8.3.3 Swap [istringstream.swap]

```
void swap(basic_istringstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
  void swap(basic_istringstream<charT, traits, Allocator>& x,
            basic_istringstream<charT, traits, Allocator>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.8.3.4 Member functions [istringstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(`*`sb`*`))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects*: Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
  basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
```

3 *Effects*: Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT,traits,Allocator> str() &&;
```

4 *Effects*: Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects*: Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
  void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects*: Equivalent to: `rdbuf()->str(std::move(s));`

```
template<class T>
  void str(const T& t);
```

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Equivalent to: `rdbuf()->str(t);`

31.8.4 Class template basic_ostringstream [ostringstream]

31.8.4.1 General [ostringstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_ostringstream : public basic_ostream<charT, traits> {
  public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type       = typename traits::pos_type;
    using off_type       = typename traits::off_type;
    using traits_type    = traits;
    using allocator_type = Allocator;

    // 31.8.4.2, constructors
    basic_ostringstream() : basic_ostringstream(ios_base::out) {}
    explicit basic_ostringstream(ios_base::openmode which);
    explicit basic_ostringstream(
      const basic_string<charT, traits, Allocator>& s,
      ios_base::openmode which = ios_base::out);
    basic_ostringstream(ios_base::openmode which, const Allocator& a);
    explicit basic_ostringstream(
      basic_string<charT, traits, Allocator>&& s,
      ios_base::openmode which = ios_base::out);
    template<class SAlloc>
      basic_ostringstream(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_ostringstream(s, ios_base::out, a) {}
    template<class SAlloc>
      basic_ostringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
      explicit basic_ostringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::out);
    template<class T>
      explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
    template<class T>
      basic_ostringstream(const T& t, const Allocator& a);
    template<class T>
      basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
    basic_ostringstream(const basic_ostringstream&) = delete;
    basic_ostringstream(basic_ostringstream&& rhs);

    basic_ostringstream& operator=(const basic_ostringstream&) = delete;
    basic_ostringstream& operator=(basic_ostringstream&& rhs);

    // 31.8.4.3, swap
    void swap(basic_ostringstream& rhs);

    // 31.8.4.4, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

    basic_string<charT, traits, Allocator> str() const &;
    template<class SAlloc>
      basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
      void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);
    template<class T>
      void str(const T& t);

   private:
    basic_stringbuf<charT, traits, Allocator> sb;    // exposition only
  };
}
```

1 The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — *`sb`*, the `stringbuf` object.

31.8.4.2 Constructors [ostringstream.cons]

```
explicit basic_ostringstream(ios_base::openmode which);
```

1 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (31.8.2.2).

```
explicit basic_ostringstream(
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::out);
```

2 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

3 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a)` (31.8.2.2).

```
explicit basic_ostringstream(
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::out);
```

4 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (31.8.2.2).

```
template<class SAlloc>
  basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

5 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a)` (31.8.2.2).

```
template<class SAlloc>
  explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);
```

6 *Constraints*: `is_same_v<SAlloc,Allocator>` is `false`.

7 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))` (31.7.6.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
template<class T>
  explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
  basic_ostringstream(const T& t, const Allocator& a);
template<class T>
  basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
```

8 Let `which` be `ios_base::out` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Initializes the base class with `addressof(`*`sb`*`)`, and direct-non-list-initializes *`sb`* with `t, which | ios_base::out, a`.

```
basic_ostringstream(basic_ostringstream&& rhs);
```

11 *Effects*: Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(`*`sb`*`))` to install the contained `basic_stringbuf`.

31.8.4.3 Swap [ostringstream.swap]

```
void swap(basic_ostringstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
  void swap(basic_ostringstream<charT, traits, Allocator>& x,
            basic_ostringstream<charT, traits, Allocator>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.8.4.4 Member functions [ostringstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(`*`sb`*`))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects*: Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
  basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
```

3 *Effects*: Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT,traits,Allocator> str() &&;
```

4 *Effects*: Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects*: Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
  void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects*: Equivalent to: `rdbuf()->str(std::move(s));`

```
template<class T>
  void str(const T& t);
```

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Equivalent to: `rdbuf()->str(t);`

31.8.5 Class template basic_stringstream [stringstream]

31.8.5.1 General [stringstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_stringstream : public basic_iostream<charT, traits> {
  public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type       = typename traits::pos_type;
    using off_type       = typename traits::off_type;
    using traits_type    = traits;
    using allocator_type = Allocator;

    // 31.8.5.2, constructors
    basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}
    explicit basic_stringstream(ios_base::openmode which);
    explicit basic_stringstream(
      const basic_string<charT, traits, Allocator>& s,
      ios_base::openmode which = ios_base::out | ios_base::in);
    basic_stringstream(ios_base::openmode which, const Allocator& a);
    explicit basic_stringstream(
      basic_string<charT, traits, Allocator>&& s,
      ios_base::openmode which = ios_base::out | ios_base::in);
    template<class SAlloc>
      basic_stringstream(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_stringstream(s, ios_base::out | ios_base::in, a) {}
    template<class SAlloc>
      basic_stringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
      explicit basic_stringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::out | ios_base::in);
    template<class T>
      explicit basic_stringstream(const T& t,
                                  ios_base::openmode which = ios_base::out | ios_base::in);
    template<class T>
      basic_stringstream(const T& t, const Allocator& a);
    template<class T>
      basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
    basic_stringstream(const basic_stringstream&) = delete;
    basic_stringstream(basic_stringstream&& rhs);

    basic_stringstream& operator=(const basic_stringstream&) = delete;
    basic_stringstream& operator=(basic_stringstream&& rhs);

    // 31.8.5.3, swap
    void swap(basic_stringstream& rhs);

    // 31.8.5.4, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

    basic_string<charT, traits, Allocator> str() const &;
    template<class SAlloc>
      basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
    basic_string<charT, traits, Allocator> str() &&;
    basic_string_view<charT, traits> view() const noexcept;

    void str(const basic_string<charT, traits, Allocator>& s);
    template<class SAlloc>
      void str(const basic_string<charT, traits, SAlloc>& s);
    void str(basic_string<charT, traits, Allocator>&& s);
    template<class T>
      void str(const T& t);

  private:
    basic_stringbuf<charT, traits, Allocator> sb;    // exposition only
  };
}
```

1 The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

(1.1) — *`sb`*, the `stringbuf` object.

31.8.5.2 Constructors [stringstream.cons]

`explicit basic_stringstream(ios_base::openmode which);`

1 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(which)`.

```
explicit basic_stringstream(
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::out | ios_base::in);
```

2 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

```
basic_stringstream(ios_base::openmode which, const Allocator& a);
```

3 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(which, a)` (31.8.2.2).

```
explicit basic_stringstream(
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::out | ios_base::in);
```

4 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` (31.8.2.2).

```
template<class SAlloc>
  basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

5 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```
template<class SAlloc>
  explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

6 *Constraints*: `is_same_v<SAlloc,Allocator>` is `false`.

7 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_stringbuf<charT, traits, Allocator>(s, which)` (31.8.2.2).

```
template<class T>
  explicit basic_stringstream(const T& t, ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
  basic_stringstream(const T& t, const Allocator& a);
template<class T>
  basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
```

8 Let `which` be `ios_base::out | ios_base::in` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Initializes the base class with `addressof(`*`sb`*`)`, and direct-non-list-initializes *`sb`* with `t, which, a`.

```
basic_stringstream(basic_stringstream&& rhs);
```

11 *Effects*: Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(`*`sb`*`))` to install the contained `basic_stringbuf`.

31.8.5.3 Swap [stringstream.swap]

```
void swap(basic_stringstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_iostream<charT,traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
  void swap(basic_stringstream<charT, traits, Allocator>& x,
            basic_stringstream<charT, traits, Allocator>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.8.5.4 Member functions [stringstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(`*`sb`*`))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects*: Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
  basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
```

3 *Effects*: Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT,traits,Allocator> str() &&;
```

4 *Effects*: Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects*: Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
  void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects*: Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects*: Equivalent to: `rdbuf()->str(std::move(s));`

```
template<class T>
  void str(const T&);
```

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Equivalent to: `rdbuf()->str(t);`

31.9 Span-based streams [span.streams]

31.9.1 Overview [span.streams.overview]

1 The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span` as described in 23.7.2.2.

[*Note 1*: A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in 31.9. Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race. — *end note*]

31.9.2 Header `<spanstream>` synopsis [spanstream.syn]

```
namespace std {
  // 31.9.3, class template basic_spanbuf
  template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf;

  template<class charT, class traits>
    void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

  using spanbuf = basic_spanbuf<char>;
  using wspanbuf = basic_spanbuf<wchar_t>;

  // 31.9.4, class template basic_ispanstream
  template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream;
  template<class charT, class traits>
    void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

  using ispanstream = basic_ispanstream<char>;
  using wispanstream = basic_ispanstream<wchar_t>;

  // 31.9.5, class template basic_ospanstream
  template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream;

  template<class charT, class traits>
    void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

  using ospanstream = basic_ospanstream<char>;
  using wospanstream = basic_ospanstream<wchar_t>;

  // 31.9.6, class template basic_spanstream
  template<class charT, class traits = char_traits<charT>>
    class basic_spanstream;

  template<class charT, class traits>
    void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

  using spanstream = basic_spanstream<char>;
  using wspanstream = basic_spanstream<wchar_t>;
}
```

31.9.3 Class template basic_spanbuf [spanbuf]

31.9.3.1 General [spanbuf.general]

```
  namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf
      : public basic_streambuf<charT, traits> {
    public:
      using char_type   = charT;
      using int_type    = typename traits::int_type;
      using pos_type    = typename traits::pos_type;
      using off_type    = typename traits::off_type;
      using traits_type = traits;

      // 31.9.3.2, constructors
      basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
      explicit basic_spanbuf(ios_base::openmode which)
        : basic_spanbuf(std::span<charT>(), which) {}
      explicit basic_spanbuf(std::span<charT> s,
                             ios_base::openmode which = ios_base::in | ios_base::out);
      basic_spanbuf(const basic_spanbuf&) = delete;
      basic_spanbuf(basic_spanbuf&& rhs);

      // 31.9.3.3, assignment and swap
      basic_spanbuf& operator=(const basic_spanbuf&) = delete;
      basic_spanbuf& operator=(basic_spanbuf&& rhs);
      void swap(basic_spanbuf& rhs);

      // 31.9.3.4, member functions
      std::span<charT> span() const noexcept;
      void span(std::span<charT> s) noexcept;

    protected:
      // 31.9.3.5, overridden virtual functions
      basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
      pos_type seekoff(off_type off, ios_base::seekdir way,
                       ios_base::openmode which = ios_base::in | ios_base::out) override;
      pos_type seekpos(pos_type sp,
                       ios_base::openmode which = ios_base::in | ios_base::out) override;

    private:
      ios_base::openmode mode;            // exposition only
      std::span<charT> buf;               // exposition only
    };
  }
```

1 The class template `basic_spanbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class `span<charT>`.

2 For the sake of exposition, the maintained data is presented here as:

(2.1) — `ios_base::openmode` *`mode`*, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

(2.2) — `std::span<charT>` *`buf`* is the view to the underlying character sequence.

31.9.3.2 Constructors [spanbuf.cons]

```
explicit basic_spanbuf(std::span<charT> s,
                       ios_base::openmode which = ios_base::in | ios_base::out);
```

1 *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), and *`mode`* with `which`. Initializes the internal pointers as if calling `span(s)`.

```
basic_spanbuf(basic_spanbuf&& rhs);
```

2 *Effects*: Initializes the base class with `std::move(rhs)` and *`mode`* with `std::move(rhs.`*`mode`*`)` and *`buf`* with `std::move(rhs.`*`buf`*`)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.`*`buf`*`.empty()` returns `true` after the move.

3 *Postconditions*: Let `rhs_p` refer to the state of `rhs` just prior to this construction.

(3.1) — `span().data() == rhs_p.span().data()`

(3.2) — `span().size() == rhs_p.span().size()`

(3.3) — `eback() == rhs_p.eback()`

(3.4) — `gptr() == rhs_p.gptr()`

(3.5) — `egptr() == rhs_p.egptr()`

(3.6) — `pbase() == rhs_p.pbase()`

(3.7) — `pptr() == rhs_p.pptr()`

(3.8) — `epptr() == rhs_p.epptr()`

(3.9) — `getloc() == rhs_p.getloc()`

31.9.3.3 Assignment and swap [spanbuf.assign]

```
basic_spanbuf& operator=(basic_spanbuf&& rhs);
```

1 *Effects*: Equivalent to:

```
basic_spanbuf tmp{std::move(rhs)};
this->swap(tmp);
return *this;
```

```
void swap(basic_spanbuf& rhs);
```

2 *Effects*: Equivalent to:

```
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

```
template<class charT, class traits>
  void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
```

3 *Effects*: Equivalent to `x.swap(y)`.

31.9.3.4 Member functions [spanbuf.members]

```
std::span<charT> span() const noexcept;
```

1 *Returns*: If `ios_base::out` is set in *`mode`*, returns `std::span<charT>(pbase(), pptr())`, otherwise returns *`buf`*.

[*Note 1*: In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`. — *end note*]

```
void span(std::span<charT> s) noexcept;
```

2 *Effects*: *`buf`* `= s`. Initializes the input and output sequences according to *`mode`*.

3 *Postconditions*:

(3.1) — If `ios_base::out` is set in *`mode`*, `pbase() == s.data() && epptr() == pbase() + s.size()` is `true`;

(3.1.1) — in addition, if `ios_base::ate` is set in *`mode`*, `pptr() == pbase() + s.size()` is `true`,

(3.1.2) — otherwise `pptr() == pbase()` is `true`.

(3.2) — If `ios_base::in` is set in *`mode`*, `eback() == s.data() && gptr() == eback() && egptr() == eback() + s.size()` is `true`.

31.9.3.5 Overridden virtual functions [spanbuf.virtuals]

1 [*Note 1*: Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `pbackfail` can provide useful behavior. — *end note*]

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;
```

2 *Effects*: Alters the stream position within one or both of the controlled sequences, if possible, as follows:

(2.1) — If `ios_base::in` is set in `which`, positions the input sequence; `xnext` is `gptr()`, `xbeg` is `eback()`.

(2.2) — If `ios_base::out` is set in `which`, positions the output sequence; `xnext` is `pptr()`, `xbeg` is `pbase()`.

3 If both `ios_base::in` and `ios_base::out` are set in `which` and `way` is `ios_base::cur`, the positioning operation fails.

4 For a sequence to be positioned, if its next pointer `xnext` (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` as computed below is nonzero, the positioning operation fails. Otherwise, the function determines `baseoff` as a value of type `off_type` as follows:

(4.1) — `0` when `way` is `ios_base::beg`;

(4.2) — `(pptr() - pbase())` for the output sequence, or `(gptr() - eback())` for the input sequence when `way` is `ios_base::cur`;

(4.3) — when `way` is `ios_base::end` :

(4.3.1) — `(pptr() - pbase())` if `ios_base::out` is set in *`mode`* and `ios_base::in` is not set in *`mode`*,

(4.3.2) — *`buf`*`.size()` otherwise.

5 If `baseoff` + `off` would overflow, or if `baseoff` + `off` is less than zero, or if `baseoff` + `off` is greater than *`buf`*`.size()`, the positioning operation fails. Otherwise, the function computes

```
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

6 *Returns*: `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

7 *Effects*: Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

8 *Effects*: Equivalent to:

```
  this->span(std::span<charT>(s, n));
  return this;
```

31.9.4 Class template basic_ispanstream [ispanstream]

31.9.4.1 General [ispanstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ispanstream
    : public basic_istream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.9.4.2, constructors
    explicit basic_ispanstream(std::span<charT> s,
                               ios_base::openmode which = ios_base::in);
    basic_ispanstream(const basic_ispanstream&) = delete;
    basic_ispanstream(basic_ispanstream&& rhs);
    template<class ROS> explicit basic_ispanstream(ROS&& s);

    basic_ispanstream& operator=(const basic_ispanstream&) = delete;
    basic_ispanstream& operator=(basic_ispanstream&& rhs);

    // 31.9.4.3, swap
    void swap(basic_ispanstream& rhs);

    // 31.9.4.4, member functions
    basic_spanbuf<charT, traits>* rdbuf() const noexcept;

    std::span<const charT> span() const noexcept;
    void span(std::span<charT> s) noexcept;
    template<class ROS> void span(ROS&& s) noexcept;

  private:
    basic_spanbuf<charT, traits> sb;     // exposition only
  };
}
```

1 [*Note 1*: Constructing an `ispanstream` from a *string-literal* includes the termination character `'\0'` in the underlying `spanbuf`. — *end note*]

31.9.4.2 Constructors [ispanstream.cons]

```
explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);
```

1 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` and *`sb`* with `basic_spanbuf<charT, traits>(s, which | ios_base::in)` (31.9.3.2).

```
basic_ispanstream(basic_ispanstream&& rhs);
```

2 *Effects*: Initializes the base class with `std::move(rhs)` and *`sb`* with `std::move(rhs.sb)`. Next, `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

```
template<class ROS> explicit basic_ispanstream(ROS&& s)
```

3 *Constraints*: `ROS` models `ranges::borrowed_range`. `!convertible_to<ROS, std::span<charT>> && convertible_to<ROS, std::span<charT const>>` is `true`.

4 *Effects*: Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:

```
basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))
```

31.9.4.3 Swap [ispanstream.swap]

```
void swap(basic_ispanstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
  void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.9.4.4 Member functions [ispanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 *Effects*: Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<const charT> span() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

3 *Effects*: Equivalent to `rdbuf()->span(s)`.

```
template<class ROS> void span(ROS&& s) noexcept;
```

4 *Constraints*: `ROS` models `ranges::borrowed_range`. `(!convertible_to<ROS, std::span<charT>>) && convertible_to<ROS, std::span<const charT>>` is `true`.

5 *Effects*: Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:

```
this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()));
```

31.9.5 Class template basic_ospanstream [ospanstream]

31.9.5.1 General [ospanstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ospanstream
    : public basic_ostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.9.5.2, constructors
    explicit basic_ospanstream(std::span<charT> s,
                               ios_base::openmode which = ios_base::out);
    basic_ospanstream(const basic_ospanstream&) = delete;
    basic_ospanstream(basic_ospanstream&& rhs);

    basic_ospanstream& operator=(const basic_ospanstream&) = delete;
    basic_ospanstream& operator=(basic_ospanstream&& rhs);

    // 31.9.5.3, swap
    void swap(basic_ospanstream& rhs);

    // 31.9.5.4, member functions
    basic_spanbuf<charT, traits>* rdbuf() const noexcept;
    std::span<charT> span() const noexcept;
    void span(std::span<charT> s) noexcept;

  private:
    basic_spanbuf<charT, traits> sb;     // exposition only
  };
}
```

31.9.5.2 Constructors [ospanstream.cons]

```
explicit basic_ospanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out);
```

1 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` and *sb* with `basic_spanbuf<charT, traits>(s, which | ios_base::out)` (31.9.3.2).

```
basic_ospanstream(basic_ospanstream&& rhs) noexcept;
```

2 *Effects*: Initializes the base class with `std::move(rhs)` and *sb* with `std::move(rhs.sb)`. Next, `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.5.3 Swap [ospanstream.swap]

```
void swap(basic_ospanstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
  void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.9.5.4 Member functions [ospanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 *Effects*: Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

3 *Effects*: Equivalent to `rdbuf()->span(s)`.

31.9.6 Class template basic_spanstream [spanstream]

31.9.6.1 General [spanstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_spanstream
    : public basic_iostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    // 31.9.6.2, constructors
    explicit basic_spanstream(std::span<charT> s,
                              ios_base::openmode which = ios_base::out | ios_base::in);
    basic_spanstream(const basic_spanstream&) = delete;
    basic_spanstream(basic_spanstream&& rhs);
    basic_spanstream& operator=(const basic_spanstream&) = delete;
    basic_spanstream& operator=(basic_spanstream&& rhs);

    // 31.9.6.3, swap
    void swap(basic_spanstream& rhs);

    // 31.9.6.4, members
    basic_spanbuf<charT, traits>* rdbuf() const noexcept;

    std::span<charT> span() const noexcept;
    void span(std::span<charT> s) noexcept;

  private:
    basic_spanbuf<charT, traits> sb;      // exposition only
  };
}
```

31.9.6.2 Constructors [spanstream.cons]

```
explicit basic_spanstream(std::span<charT> s,
                          ios_base::openmode which = ios_base::out | ios_bas::in);
```

1 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and *sb* with `basic_spanbuf<charT, traits>(s, which)` (31.9.3.2).

```
basic_spanstream(basic_spanstream&& rhs);
```

2 *Effects*: Initializes the base class with `std::move(rhs)` and *sb* with `std::move(rhs.sb)`. Next, `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.6.3 Swap [spanstream.swap]

```
void swap(basic_spanstream& rhs);
```

1 *Effects*: Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
  void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.9.6.4 Member functions [spanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 *Effects*: Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

3 *Effects*: Equivalent to `rdbuf()->span(s)`.

31.10 File-based streams [file.streams]

31.10.1 Header <fstream> synopsis [fstream.syn]

```
namespace std {
  // 31.10.3, class template basic_filebuf
  template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;

  template<class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
  using filebuf  = basic_filebuf<char>;
  using wfilebuf = basic_filebuf<wchar_t>;

  // 31.10.4, class template basic_ifstream
  template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;

  template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

  using ifstream  = basic_ifstream<char>;
  using wifstream = basic_ifstream<wchar_t>;

  // 31.10.5, class template basic_ofstream
  template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;

  template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

  using ofstream  = basic_ofstream<char>;
  using wofstream = basic_ofstream<wchar_t>;

  // 31.10.6, class template basic_fstream
  template<class charT, class traits = char_traits<charT>>
    class basic_fstream;

  template<class charT, class traits>
    void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

  using fstream  = basic_fstream<char>;
  using wfstream = basic_fstream<wchar_t>;
}
```

1 The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

2 [*Note 1*: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — *end note*]

3 In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (31.12.6) is not `char`.

[*Note 2*: These functions enable class `path` support for systems with a wide native path character type, such as `wchar_t`. — *end note*]

31.10.2 Native handles [file.native]

1 Several classes described in 31.10 have a member `native_handle_type`.

2 The type `native_handle_type` represents a platform-specific *native handle* to a file. It is trivially copyable and models `semiregular`.

[*Note 1*: For operating systems based on POSIX, `native_handle_type` is `int`. For Windows-based operating systems, `native_handle_type` is `HANDLE`. — *end note*]

31.10.3 Class template `basic_filebuf` [filebuf]

31.10.3.1 General [filebuf.general]

```
  namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
    public:
      using char_type   = charT;
      using int_type    = typename traits::int_type;
      using pos_type    = typename traits::pos_type;
      using off_type    = typename traits::off_type;
      using traits_type = traits;
      using native_handle_type = implementation-defined;   // see 31.10.2

      // 31.10.3.2, constructors/destructor
      basic_filebuf();
      basic_filebuf(const basic_filebuf&) = delete;
      basic_filebuf(basic_filebuf&& rhs);
      virtual ~basic_filebuf();

      // 31.10.3.3, assignment and swap
      basic_filebuf& operator=(const basic_filebuf&) = delete;
      basic_filebuf& operator=(basic_filebuf&& rhs);
      void swap(basic_filebuf& rhs);

      // 31.10.3.4, members
      bool is_open() const;
      basic_filebuf* open(const char* s, ios_base::openmode mode);
      basic_filebuf* open(const filesystem::path::value_type* s,
                          ios_base::openmode mode);   // wide systems only; see 31.10.1
      basic_filebuf* open(const string& s, ios_base::openmode mode);
      basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
      basic_filebuf* close();
      native_handle_type native_handle() const noexcept;

    protected:
      // 31.10.3.5, overridden virtual functions
      streamsize showmanyc() override;
      int_type underflow() override;
      int_type uflow() override;
      int_type pbackfail(int_type c = traits::eof()) override;
      int_type overflow (int_type c = traits::eof()) override;

      basic_streambuf<charT, traits>* setbuf(char_type* s, streamsize n) override;

      pos_type seekoff(off_type off, ios_base::seekdir way,
                       ios_base::openmode which = ios_base::in | ios_base::out) override;
      pos_type seekpos(pos_type sp,
                       ios_base::openmode which = ios_base::in | ios_base::out) override;

      int sync() override;
      void imbue(const locale& loc) override;
    };
  }
```

1 The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.

2 The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILE`s.

3 In particular:

(3.1) — If the file is not open for reading the input sequence cannot be read.

(3.2) — If the file is not open for writing the output sequence cannot be written.

(3.3) — A joint file position is maintained for both the input sequence and the output sequence.

4 An instance of `basic_filebuf` behaves as described in 31.10.3 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.

5 The file associated with a `basic_filebuf` has an associated value of type `native_handle_type`, called the native handle (31.10.2) of that file. This native handle can be obtained by calling the member function `native_handle`.

6 For any opened `basic_filebuf f`, the native handle returned by `f.native_handle()` is invalidated when `f.close()` is called, or `f` is destroyed.

7 In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
  use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

31.10.3.2 Constructors [filebuf.cons]

```
basic_filebuf();
```

1 *Effects*: Initializes the base class with `basic_streambuf<charT, traits>()` (31.6.3.2).

2 *Postconditions*: `is_open() == false`.

```
basic_filebuf(basic_filebuf&& rhs);
```

3 *Effects*: It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.

4 *Postconditions*: Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

(4.1) — `is_open() == rhs_p.is_open()`

(4.2) — `rhs_a.is_open() == false`

(4.3) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`

(4.4) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`

(4.5) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`

(4.6) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`

(4.7) — `if (eback()) eback() != rhs_a.eback()`

(4.8) — `if (gptr()) gptr() != rhs_a.gptr()`

(4.9) — `if (egptr()) egptr() != rhs_a.egptr()`

(4.10) — `if (pbase()) pbase() != rhs_a.pbase()`

(4.11) — `if (pptr()) pptr() != rhs_a.pptr()`

(4.12) — `if (epptr()) epptr() != rhs_a.epptr()`

```
virtual ~basic_filebuf();
```

5 *Effects*: Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see 16.4.6.14).

31.10.3.3 Assignment and swap [filebuf.assign]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

1 *Effects*: Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.10.3.2).

2 *Returns*: `*this`.

```
void swap(basic_filebuf& rhs);
```

3 *Effects*: Exchanges the state of `*this` and `rhs`.

```
template<class charT, class traits>
  void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
```

4 *Effects*: Equivalent to `x.swap(y)`.

31.10.3.4 Member functions [filebuf.members]

```
bool is_open() const;
```

1 *Returns*: `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to close.

```
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
                    ios_base::openmode mode);  // wide systems only; see 31.10.1
```

2 *Preconditions*: `s` points to an NTCTS (3.36).

3 *Effects*: If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens the file to which `s` resolves, if possible, as if by a call to `fopen` with the second argument determined from `mode & ~ios_base::ate` as indicated in Table 144. If `mode` is not some combination of flags shown in the table then the open fails.

Table 144 — File open modes [tab:filebuf.open.modes]

`ios_base` flag combination						`stdio` equivalent
`binary`	`in`	`out`	`trunc`	`app`	`noreplace`	
		+				`"w"`
		+			+	`"wx"`
		+	+			`"w"`
		+	+		+	`"wx"`
		+		+		`"a"`
				+		`"a"`
	+					`"r"`
	+	+				`"r+"`
	+	+	+			`"w+"`
	+	+	+		+	`"w+x"`
	+	+		+		`"a+"`
	+			+		`"a+"`
+		+				`"wb"`
+		+			+	`"wbx"`
+		+	+			`"wb"`
+		+	+		+	`"wbx"`
+		+		+		`"ab"`
+				+		`"ab"`
+	+					`"rb"`
+	+	+				`"r+b"`
+	+	+	+			`"w+b"`
+	+	+	+		+	`"w+bx"`
+	+	+		+		`"a+b"`
+	+			+		`"a+b"`

4 If the open operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).[293]

5 If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.

6 *Returns*: `this` if successful, a null pointer otherwise.

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
```

7 *Returns*: `open(s.c_str(), mode);`

293) The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` (31.13.1).

`basic_filebuf* close();`

8 *Effects*: If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(traits::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(traits::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

9 *Postconditions*: `is_open() == false`.

10 *Returns*: `this` on success, a null pointer otherwise.

`native_handle_type native_handle() const noexcept;`

11 *Preconditions*: `is_open()` is `true`.

12 *Returns*: The native handle associated with `*this`.

31.10.3.5 Overridden virtual functions [filebuf.virtuals]

`streamsize showmanyc() override;`

1 *Effects*: Behaves the same as `basic_streambuf::showmanyc()` (31.6.3.5).

2 *Remarks*: An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

`int_type underflow() override;`

3 *Effects*: Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char   extern_buf[XSIZE];
char*  extern_end;
charT  intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
  a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
               intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

`int_type uflow() override;`

4 *Effects*: Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

`int_type pbackfail(int_type c = traits::eof()) override;`

5 *Effects*: Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.

Returns: `c`.

(5.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

Returns: `c`.

(5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

Returns: `traits::not_eof(c)`.

6 *Returns*: As specified above, or `traits::eof()` to indicate failure.

7 *Remarks*: If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type overflow(int_type c = traits::eof()) override;
```

10 *Effects*: Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of "consuming characters" is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
charT* end;
char   xbuf[XSIZE];
char*  xbuf_end;
codecvt_base::result r =
  a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

(10.1) — If `r == codecvt_base::error` then fail.

(10.2) — If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.

(10.3) — If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).

(10.4) — Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn't large enough) then increase `XSIZE` and repeat from the beginning.

Then establishes an observable checkpoint (4.1.2).

11 *Returns*: `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_-open() == false`, the function always fails.

```
basic_streambuf* setbuf(char_type* s, streamsize n) override;
```

12 *Effects*: If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. "Unbuffered" means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out) override;
```

13 *Effects*: Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `fseek(file, width * off, whence)`, otherwise call `fseek(file, 0, whence)`.

14 *Returns*: A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

15 *Remarks*: "The last operation was output" means either the last virtual operation was overflow or the put buffer is non-empty. "Write any unshift sequence" means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in Table 145.

Table 145 — `seekoff` effects [tab:filebuf.seekoff]

`way` Value	`stdio` Equivalent
`basic_ios::beg`	`SEEK_SET`
`basic_ios::cur`	`SEEK_CUR`
`basic_ios::end`	`SEEK_END`

```
pos_type seekpos(pos_type sp,
                 ios_base::openmode which
                   = ios_base::in | ios_base::out) override;
```

16 Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if `(om & ios_base::in) != 0`, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.

17 If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

18 *Returns*: `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

```
int sync() override;
```

19 *Effects*: If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc) override;
```

20 *Preconditions*: If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent (28.3.4.2.5.3) then that facet is the same as the corresponding facet of `loc`.

21 *Effects*: Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

22 *Remarks*: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

31.10.4 Class template `basic_ifstream` [ifstream]

31.10.4.1 General [ifstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ifstream : public basic_istream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;
    using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

    // 31.10.4.2, constructors
    basic_ifstream();
    explicit basic_ifstream(const char* s,
                            ios_base::openmode mode = ios_base::in);
    explicit basic_ifstream(const filesystem::path::value_type* s,
                            ios_base::openmode mode = ios_base::in);// wide systems only; see 31.10.1
    explicit basic_ifstream(const string& s,
                            ios_base::openmode mode = ios_base::in);
    template<class T>
      explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
    basic_ifstream(const basic_ifstream&) = delete;
    basic_ifstream(basic_ifstream&& rhs);

    basic_ifstream& operator=(const basic_ifstream&) = delete;
    basic_ifstream& operator=(basic_ifstream&& rhs);

    // 31.10.4.3, swap
    void swap(basic_ifstream& rhs);

    // 31.10.4.4, members
    basic_filebuf<charT, traits>* rdbuf() const;
    native_handle_type native_handle() const noexcept;

    bool is_open() const;
    void open(const char* s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path::value_type* s,
              ios_base::openmode mode = ios_base::in);  // wide systems only; see 31.10.1
    void open(const string& s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
    void close();

  private:
    basic_filebuf<charT, traits> sb;      // exposition only
  };
}
```

1 The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — *`sb`*, the `filebuf` object.

31.10.4.2 Constructors [ifstream.cons]

```
basic_ifstream();
```

1 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.2.2) and *`sb`* with `basic_filebuf<charT, traits>()` (31.10.3.2).

```
explicit basic_ifstream(const char* s,
                        ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
                        ios_base::openmode mode = ios_base::in);  // wide systems only; see 31.10.1
```

2 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.2.2) and *`sb`* with `basic_filebuf<charT, traits>()` (31.10.3.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ifstream(const string& s,
                        ios_base::openmode mode = ios_base::in);
```

3 *Effects*: Equivalent to `basic_ifstream(s.c_str(), mode)`.

```
template<class T>
  explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
```

4 *Constraints*: `is_same_v<T, filesystem::path>` is `true`.

5 *Effects*: Equivalent to `basic_ifstream(s.c_str(), mode)`.

```
basic_ifstream(basic_ifstream&& rhs);
```

6 *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(`*`sb`*`))` to install the contained `basic_filebuf`.

31.10.4.3 Swap [ifstream.swap]

```
void swap(basic_ifstream& rhs);
```

1 *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
  void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.10.4.4 Member functions [ifstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->native_handle();`

```
bool is_open() const;
```

3 *Returns*: `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::in);   // wide systems only; see 31.10.1
```

4 *Effects*: Calls `rdbuf()->open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
```

5 *Effects*: Calls `open(s.c_str(), mode)`.

```
void close();
```

6 *Effects*: Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

31.10.5 Class template `basic_ofstream` [ofstream]

31.10.5.1 General [ofstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ofstream : public basic_ostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;
    using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

    // 31.10.5.2, constructors
    basic_ofstream();
    explicit basic_ofstream(const char* s,
                            ios_base::openmode mode = ios_base::out);
    explicit basic_ofstream(const filesystem::path::value_type* s,  // wide systems only; see 31.10.1
                            ios_base::openmode mode = ios_base::out);
    explicit basic_ofstream(const string& s,
                            ios_base::openmode mode = ios_base::out);
    template<class T>
      explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
    basic_ofstream(const basic_ofstream&) = delete;
    basic_ofstream(basic_ofstream&& rhs);
    basic_ofstream& operator=(const basic_ofstream&) = delete;
    basic_ofstream& operator=(basic_ofstream&& rhs);

    // 31.10.5.3, swap
    void swap(basic_ofstream& rhs);

    // 31.10.5.4, members
    basic_filebuf<charT, traits>* rdbuf() const;
    native_handle_type native_handle() const noexcept;

    bool is_open() const;
    void open(const char* s, ios_base::openmode mode = ios_base::out);
    void open(const filesystem::path::value_type* s,
              ios_base::openmode mode = ios_base::out);      // wide systems only; see 31.10.1
    void open(const string& s, ios_base::openmode mode = ios_base::out);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
    void close();

  private:
    basic_filebuf<charT, traits> sb;      // exposition only
  };
}
```

1 The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — *`sb`*, the `filebuf` object.

31.10.5.2 Constructors [ofstream.cons]

```
basic_ofstream();
```

1 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and *`sb`* with `basic_filebuf<charT, traits>()` (31.10.3.2).

```
explicit basic_ofstream(const char* s,
                        ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
                        ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

2 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and *`sb`* with `basic_filebuf<charT, traits>()` (31.10.3.2), then calls `rdbuf()->open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
                        ios_base::openmode mode = ios_base::out);
```

3 *Effects*: Equivalent to `basic_ofstream(s.c_str(), mode)`.

```
template<class T>
  explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
```

4 *Constraints*: `is_same_v<T, filesystem::path>` is `true`.

5 *Effects*: Equivalent to `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

6 *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.5.3 Swap [ofstream.swap]

```
void swap(basic_ofstream& rhs);
```

1 *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and *`sb`*`.swap(rhs.`*`sb`*`)`.

```
template<class charT, class traits>
  void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.10.5.4 Member functions [ofstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_filebuf<charT, traits>*>(addressof(`*sb*`))`.

```
native_handle_type native_handle() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->native_handle();`

```
bool is_open() const;
```

3 *Returns*: `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::out);              // wide systems only; see 31.10.1
```

4 *Effects*: Calls `rdbuf()->open(s, mode | ios_base::out)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void close();
```

5 *Effects*: Calls `rdbuf()->close()` and, if that function fails (returns a null pointer), calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
```

6 *Effects*: Calls `open(s.c_str(), mode)`.

31.10.6 Class template `basic_fstream` [fstream]

31.10.6.1 General [fstream.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_fstream : public basic_iostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;
    using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

    // 31.10.6.2, constructors
    basic_fstream();
    explicit basic_fstream(
      const char* s,
      ios_base::openmode mode = ios_base::in | ios_base::out);
    explicit basic_fstream(
      const filesystem::path::value_type* s,
      ios_base::openmode mode = ios_base::in | ios_base::out);   // wide systems only; see 31.10.1
    explicit basic_fstream(
      const string& s,
      ios_base::openmode mode = ios_base::in | ios_base::out);
    template<class T>
      explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
    basic_fstream(const basic_fstream&) = delete;
    basic_fstream(basic_fstream&& rhs);

    basic_fstream& operator=(const basic_fstream&) = delete;
    basic_fstream& operator=(basic_fstream&& rhs);
    // 31.10.6.3, swap
    void swap(basic_fstream& rhs);

    // 31.10.6.4, members
    basic_filebuf<charT, traits>* rdbuf() const;
    native_handle_type native_handle() const noexcept;

    bool is_open() const;
    void open(
      const char* s,
      ios_base::openmode mode = ios_base::in | ios_base::out);
    void open(
      const filesystem::path::value_type* s,
      ios_base::openmode mode = ios_base::in | ios_base::out);   // wide systems only; see 31.10.1
    void open(
      const string& s,
      ios_base::openmode mode = ios_base::in | ios_base::out);
    void open(
      const filesystem::path& s,
      ios_base::openmode mode = ios_base::in | ios_base::out);
    void close();

  private:
    basic_filebuf<charT, traits> sb;     // exposition only
  };
}
```

1 The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

(1.1) — *`sb`*, the `basic_filebuf` object.

31.10.6.2 Constructors [fstream.cons]

```
basic_fstream();
```

1 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_filebuf<charT, traits>()`.

```
explicit basic_fstream(
  const char* s,
  ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
  const filesystem::path::value_type* s,
  ios_base::openmode mode = ios_base::in | ios_base::out);   // wide systems only; see 31.10.1
```

2 *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(`*`sb`*`))` (31.7.5.7.2) and *`sb`* with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_fstream(
  const string& s,
  ios_base::openmode mode = ios_base::in | ios_base::out);
```

3 *Effects*: Equivalent to `basic_fstream(s.c_str(), mode)`.

```
template<class T>
  explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
```

4 *Constraints*: `is_same_v<T, filesystem::path>` is `true`.

5 *Effects*: Equivalent to `basic_fstream(s.c_str(), mode)`.

```
basic_fstream(basic_fstream&& rhs);
```

6 *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(`*`sb`*`))` to install the contained `basic_filebuf`.

31.10.6.3 Swap [fstream.swap]

```
void swap(basic_fstream& rhs);
```

1 *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT,traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
  void swap(basic_fstream<charT, traits>& x,
            basic_fstream<charT, traits>& y);
```

2 *Effects*: Equivalent to `x.swap(y)`.

31.10.6.4 Member functions [fstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1 *Returns*: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

2 *Effects*: Equivalent to: `return rdbuf()->native_handle();`

```
bool is_open() const;
```

3 *Returns*: `rdbuf()->is_open()`.

```
void open(
  const char* s,
  ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
  const filesystem::path::value_type* s,
  ios_base::openmode mode = ios_base::in | ios_base::out);   // wide systems only; see 31.10.1
```

4 *Effects*: Calls `rdbuf()->open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(
  const string& s,
  ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
  const filesystem::path& s,
  ios_base::openmode mode = ios_base::in | ios_base::out);
```

5 *Effects*: Calls `open(s.c_str(), mode)`.

```
void close();
```

6 *Effects*: Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

31.11 Synchronized output streams [syncstream]

31.11.1 Header <syncstream> synopsis [syncstream.syn]

```
#include <ostream>   // see 31.7.2

namespace std {
  // 31.11.2, class template basic_syncbuf
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf;

  // 31.11.2.6, specialized algorithms
  template<class charT, class traits, class Allocator>
    void swap(basic_syncbuf<charT, traits, Allocator>&,
              basic_syncbuf<charT, traits, Allocator>&);

  using syncbuf = basic_syncbuf<char>;
  using wsyncbuf = basic_syncbuf<wchar_t>;
```

```
    // 31.11.3, class template basic_osyncstream
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
      class basic_osyncstream;

    using osyncstream = basic_osyncstream<char>;
    using wosyncstream = basic_osyncstream<wchar_t>;
  }
```

1 The header `<syncstream>` provides a mechanism to synchronize execution agents writing to the same stream.

31.11.2 Class template `basic_syncbuf` [syncstream.syncbuf]

31.11.2.1 Overview [syncstream.syncbuf.overview]

```
  namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf : public basic_streambuf<charT, traits> {
    public:
      using char_type      = charT;
      using int_type       = typename traits::int_type;
      using pos_type       = typename traits::pos_type;
      using off_type       = typename traits::off_type;
      using traits_type    = traits;
      using allocator_type = Allocator;

      using streambuf_type = basic_streambuf<charT, traits>;

      // 31.11.2.2, construction and destruction
      basic_syncbuf()
        : basic_syncbuf(nullptr) {}
      explicit basic_syncbuf(streambuf_type* obuf)
        : basic_syncbuf(obuf, Allocator()) {}
      basic_syncbuf(streambuf_type*, const Allocator&);
      basic_syncbuf(basic_syncbuf&&);
      ~basic_syncbuf();

      // 31.11.2.3, assignment and swap
      basic_syncbuf& operator=(basic_syncbuf&&);
      void swap(basic_syncbuf&);

      // 31.11.2.4, member functions
      bool emit();
      streambuf_type* get_wrapped() const noexcept;
      allocator_type get_allocator() const noexcept;
      void set_emit_on_sync(bool) noexcept;

    protected:
      // 31.11.2.5, overridden virtual functions
      int sync() override;

    private:
      streambuf_type* wrapped;      // exposition only
      bool emit-on-sync{};          // exposition only
    };
  }
```

1 Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped stream buffer object `*`*`wrapped`* when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

31.11.2.2 Construction and destruction [syncstream.syncbuf.cons]

```
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

1 *Effects*: Sets *`wrapped`* to `obuf`.

2 *Postconditions*: `get_wrapped() == obuf` and `get_allocator() == allocator` are `true`.

3 *Throws*: Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

4 *Remarks*: A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```
basic_syncbuf(basic_syncbuf&& other);
```

5 *Postconditions*: The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are `true`.

6 *Remarks*: This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```
~basic_syncbuf();
```

7 *Effects*: Calls `emit()`.

8 *Throws*: Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

31.11.2.3 Assignment and swap [syncstream.syncbuf.assign]

```
basic_syncbuf& operator=(basic_syncbuf&& rhs);
```

1 *Effects*: Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

2 *Postconditions*:

(2.1) — `rhs.get_wrapped() == nullptr` is `true`.

(2.2) — `this->get_allocator() == rhs.get_allocator()` is `true` when

```
allocator_traits<Allocator>::propagate_on_container_move_assignment::value
```

is `true`; otherwise, the allocator is unchanged.

3 *Returns*: `*this`.

4 *Remarks*: This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

```
void swap(basic_syncbuf& other);
```

5 *Preconditions*: Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true` or `this->get_allocator() == other.get_allocator()` is `true`.

6 *Effects*: Exchanges the state of `*this` and `other`.

31.11.2.4 Member functions [syncstream.syncbuf.members]

```
bool emit();
```

1 *Effects*: Atomically transfers the associated output of `*this` to the stream buffer `*`*`wrapped`*, so that it appears in the output stream as a contiguous sequence of characters. *`wrapped`*`->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

2 *Synchronization*: All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the "happens before" relation (6.9.2.2), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

3 *Postconditions*: On success, the associated output is empty.

4 *Returns*: `true` if all of the following conditions hold; otherwise `false`:

(4.1) — *`wrapped`* `== nullptr` is `false`.

(4.2) — All of the characters in the associated output were successfully transferred.

(4.3) — The call to *`wrapped`*`->pubsync()` (if any) succeeded.

5 *Remarks*: May call member functions of *`wrapped`* while holding a lock uniquely associated with *`wrapped`*.

```
streambuf_type* get_wrapped() const noexcept;
```

6 *Returns*: *`wrapped`*.

```
allocator_type get_allocator() const noexcept;
```

7 *Returns*: A copy of the allocator that was set in the constructor or assignment operator.

```
void set_emit_on_sync(bool b) noexcept;
```

8 *Effects*: *`emit-on-sync`* `= b`.

31.11.2.5 Overridden virtual functions [syncstream.syncbuf.virtuals]

```
int sync() override;
```

1 *Effects*: Records that the wrapped stream buffer is to be flushed. Then, if *`emit-on-sync`* is `true`, calls `emit()`.

[*Note 1*: If *`emit-on-sync`* is `false`, the actual flush is delayed until a call to `emit()`. — *end note*]

2 *Returns*: If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

31.11.2.6 Specialized algorithms [syncstream.syncbuf.special]

```
template<class charT, class traits, class Allocator>
  void swap(basic_syncbuf<charT, traits, Allocator>& a,
            basic_syncbuf<charT, traits, Allocator>& b);
```

1 *Effects*: Equivalent to `a.swap(b)`.

31.11.3 Class template `basic_osyncstream` [syncstream.osyncstream]

31.11.3.1 Overview [syncstream.osyncstream.overview]

```
namespace std {
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
  class basic_osyncstream : public basic_ostream<charT, traits> {
  public:
    using char_type   = charT;
    using int_type    = typename traits::int_type;
    using pos_type    = typename traits::pos_type;
    using off_type    = typename traits::off_type;
    using traits_type = traits;

    using allocator_type = Allocator;
    using streambuf_type = basic_streambuf<charT, traits>;
    using syncbuf_type   = basic_syncbuf<charT, traits, Allocator>;

    // 31.11.3.2, construction and destruction
    basic_osyncstream(streambuf_type*, const Allocator&);
    explicit basic_osyncstream(streambuf_type* obuf)
      : basic_osyncstream(obuf, Allocator()) {}
    basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
      : basic_osyncstream(os.rdbuf(), allocator) {}
    explicit basic_osyncstream(basic_ostream<charT, traits>& os)
      : basic_osyncstream(os, Allocator()) {}
    basic_osyncstream(basic_osyncstream&&) noexcept;
    ~basic_osyncstream();

    // assignment
    basic_osyncstream& operator=(basic_osyncstream&&);

    // 31.11.3.3, member functions
    void emit();
    streambuf_type* get_wrapped() const noexcept;
    syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }
  private:
    syncbuf_type sb;      // exposition only
  };
}
```

1 `Allocator` shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

2 [*Example 1*: A named variable can be used within a block statement for streaming.

```
{
  osyncstream bout(cout);
  bout << "Hello, ";
  bout << "World!";
  bout << endl; // flush is noted
  bout << "and more!\n";
}   // characters are transferred and cout is flushed
```

— *end example*]

3 [*Example 2*: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, `cout` is not flushed. — *end example*]

31.11.3.2 Construction and destruction [syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

1 *Effects*: Initializes *`sb`* from `buf` and `allocator`. Initializes the base class with `basic_ostream<charT, traits>(addressof(`*`sb`*`))`.

2 [*Note 1*: The member functions of the provided stream buffer can be called from `emit()` while a lock is held, which might result in a deadlock if used incautiously. — *end note*]

3 *Postconditions*: `get_wrapped() == buf` is `true`.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

4 *Effects*: Move constructs the base class and *`sb`* from the corresponding subobjects of `other`, and calls `basic_ostream<charT, traits>::set_rdbuf(addressof(`*`sb`*`))`.

5 *Postconditions*: The value returned by `get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. `nullptr == other.get_wrapped()` is `true`.

31.11.3.3 Member functions [syncstream.osyncstream.members]

```
void emit();
```

1 *Effects*: Behaves as an unformatted output function (31.7.6.4). After constructing a `sentry` object, calls *`sb`*`.emit()`. If that call returns `false`, calls `setstate(ios_base::badbit)`.

2 [*Example 1*: A flush on a `basic_osyncstream` does not flush immediately:

```
{
  osyncstream bout(cout);
  bout << "Hello," << '\n';      // no flush
  bout.emit();                   // characters transferred; cout not flushed
  bout << "World!" << endl;      // flush noted; cout not flushed
  bout.emit();                   // characters transferred; cout flushed
  bout << "Greetings." << '\n';  // no flush
}   // characters transferred; cout not flushed
```

— *end example*]

3 [*Example 2*: The function `emit()` can be used to handle exceptions from operations on the underlying stream.

```
{
  osyncstream bout(cout);
  bout << "Hello, " << "World!" << '\n';
  try {
    bout.emit();
  } catch (...) {
    // handle exception
  }
}
```

— *end example*]

`streambuf_type* get_wrapped() const noexcept;`

4 *Returns*: *sb*.get_wrapped().

5 [*Example 3*: Obtaining the wrapped stream buffer with `get_wrapped()` allows wrapping it again with an `osyncstream`. For example,

```
{
  osyncstream bout1(cout);
  bout1 << "Hello, ";
  {
    osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
  }
  bout1 << "World!" << '\n';
}
```

produces the *uninterleaved* output

```
Goodbye, Planet!
Hello, World!
```

— *end example*]

31.12 File systems [filesystems]

31.12.1 General [fs.general]

1 Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.

2 A *file system* is a collection of files and their attributes.

3 A *file* is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.

4 A *directory* is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The *parent directory* of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The *parent directory* of other types of files is a directory containing a directory entry for the file under discussion.

5 A *link* is an object that associates a filename with a file. Several links can associate names with the same file. A *hard link* is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[*Note 1*: A hard link can be thought of as a shared-ownership smart pointer to a file. — *end note*]

A *symbolic link* is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[*Note 2*: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a "dangling" symbolic link. — *end note*]

31.12.2 Conformance [fs.conformance]

31.12.2.1 General [fs.conformance.general]

1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

31.12.2.2 POSIX conformance [fs.conform.9945]

1 Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.

[*Note 1*: This constitutes an "as if" rule allowing implementations to call native operating system or other APIs. — *end note*]

2 Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

[*Note 2*: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — *end note*]

3 Implementations are not required to provide behavior that is not supported by a particular file system.

[*Example 1*: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — *end example*]

31.12.2.3 Operating system dependent behavior conformance [fs.conform.os]

1 Behavior that is specified as being *operating system dependent* is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

2 It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

31.12.2.4 File system race behavior [fs.race.behavior]

1 A *file system race* is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.

2 If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Preconditions*: is not specified for the function.

[*Note 1*: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — *end note*]

31.12.3 Requirements [fs.req]

1 Throughout subclause 31.12, `char`, `wchar_t`, `char8_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.

2 Functions with template parameters named `EcharT` shall not participate in overload resolution unless `EcharT` is one of the encoded character types.

3 Template parameters named `InputIterator` shall meet the *Cpp17InputIterator* requirements (24.3.5.3) and shall have a value type that is one of the encoded character types.

4 [*Note 1*: Use of an encoded character type implies an associated character set and encoding. Since `signed char` and `unsigned char` have no implied character set and encoding, they are not included as permitted types. — *end note*]

5 Template parameters named `Allocator` shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

31.12.4 Header `<filesystem>` synopsis [fs.filesystem.syn]

```
#include <compare>              // see 17.12.1

namespace std::filesystem {
  // 31.12.6, paths
  class path;

  // 31.12.6.8, path non-member functions

  template<>
    inline constexpr bool enable_view<filesystem::recursive_directory_iterator> = true;
}
```

1 Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

31.12.5 Error reporting [fs.err.report]

1 Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`.

[*Note 1*: This supports two common use cases:

(1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.

(1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

— *end note*]

2 Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

(2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.

(2.2) — Failure to allocate storage is reported by throwing an exception as described in 16.4.6.14.

(2.3) — Destructors throw nothing.

3 Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

(3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

31.12.6 Class path [fs.class.path]

31.12.6.1 General [fs.class.path.general]

1 An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

2 [*Note 1*: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — *end note*]

3 A *path* is a sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name*$_{opt}$, *root-directory*$_{opt}$, and an optional sequence of *filenames* (31.12.6.2). The maximum number of elements in the sequence is operating system dependent (31.12.2.3).

4 An *absolute path* is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A *relative path* is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[*Note 2*: Pathnames "." and ".." are relative paths. — *end note*]

5 A *pathname* is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (31.12.6.2) or according to an operating system dependent *native pathname format* accepted by the host operating system.

6 *Pathname resolution* is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[*Example 1*: For POSIX-based operating systems, this mechanism is specified in POSIX, section 4.12, Pathname resolution. — *end example*]

```
namespace std::filesystem {
  class path {
  public:
    using value_type  = see below;
    using string_type = basic_string<value_type>;
    static constexpr value_type preferred_separator = see below;

    // 31.12.8.1, enumeration format
    enum format;

    // 31.12.6.5.1, constructors and destructor
    path() noexcept;
    path(const path& p);
    path(path&& p) noexcept;
    path(string_type&& source, format fmt = auto_format);
    template<class Source>
      path(const Source& source, format fmt = auto_format);
    template<class InputIterator>
      path(InputIterator first, InputIterator last, format fmt = auto_format);
    template<class Source>
      path(const Source& source, const locale& loc, format fmt = auto_format);
    template<class InputIterator>
      path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
    ~path();

    // 31.12.6.5.2, assignments
    path& operator=(const path& p);
    path& operator=(path&& p) noexcept;
    path& operator=(string_type&& source);
    path& assign(string_type&& source);

      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, path& p);
    };
  }
```

7 `value_type` is a `typedef` for the operating system dependent encoded character type used to represent pathnames.

8 The value of the `preferred_separator` member is the operating system dependent *preferred-separator* character (31.12.6.2).

9 [*Example 2*: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character (`'/'`). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (`L'\\'`). — *end example*]

31.12.6.2 Generic pathname format [fs.path.generic]

pathname:
  root-name$_{opt}$ *root-directory*$_{opt}$ *relative-path*

root-name:
  operating system dependent sequences of characters
  implementation-defined sequences of characters

root-directory:
  directory-separator

relative-path:
  filename
  filename directory-separator relative-path
  an empty path

filename:
  non-empty sequence of characters other than *directory-separator* characters

directory-separator:
  preferred-separator directory-separator$_{opt}$
  fallback-separator directory-separator$_{opt}$

preferred-separator:
  operating system dependent directory separator character

fallback-separator:
  `/`, if *preferred-separator* is not `/`

1 A *filename* is the name of a file. The *dot* and *dot-dot* filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

(1.1) — The permitted characters.

[*Example 1*: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — *end example*]

[*Note 1*: Wider portability can be achieved by limiting *filename* characters to the POSIX Portable Filename Character Set:
`A B C D E F G H I J K L M N O P Q R S T U V W X Y Z`
`a b c d e f g h i j k l m n o p q r s t u v w x y z`
`0 1 2 3 4 5 6 7 8 9 . _ -` — *end note*]

(1.2) — The maximum permitted length.

(1.3) — Filenames that are not permitted.

(1.4) — Filenames that have special meaning.

(1.5) — Case awareness and sensitivity during path resolution.

(1.6) — Special rules that may apply to file types other than regular files, such as directories.

2 Except in a *root-name*, multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.

3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.

4 A *root-name* identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent *root-name*s, at least one implementation-defined *root-name* is required.

[*Note 2*: Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a *root-name* identifying a specific device such as a disk drive. — *end note*]

5 If a *root-name* is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[*Note 3*: On a POSIX-like operating system, it is impossible to have a *root-name* and a *relative-path* without an intervening *root-directory* element. — *end note*]

6 *Normalization* of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the *root-name* with a *preferred-separator*.
3. Replace each *directory-separator* with a *preferred-separator*.

   [*Note 4*: The generic pathname grammar defines *directory-separator* as one or more slashes and *preferred-separator*s. — *end note*]
4. Remove each dot filename and any immediately following *directory-separator*.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a *directory-separator* and a dot-dot filename, along with any immediately following *directory-separator*.
6. If there is a *root-directory*, remove all dot-dot filenames and any *directory-separator*s immediately following them.

   [*Note 5*: These dot-dot filenames attempt to refer to nonexistent parent directories. — *end note*]
7. If the last filename is dot-dot, remove any trailing *directory-separator*.
8. If the path is empty, add a dot.

The result of normalization is a path in *normal form*, which is said to be *normalized*.

31.12.6.3 Conversions [fs.path.cvt]

31.12.6.3.1 Argument format conversions [fs.path.fmt.cvt]

1 [*Note 1*: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

(1.1) — The generic format is acceptable as a native path.

(1.2) — There is no need to distinguish between native format and generic format in function arguments.

(1.3) — Paths for regular files and paths for directories share the same syntax.

— *end note*]

2 Several functions are defined to accept *detected-format* arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

3 [*Note 2*: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. It is possible that an implementation for an operating system where disambiguation is needed distinguishes between the formats. — *end note*]

4 Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let *G(n)* and *N(g)* in a mathematical sense be the implementation's functions that convert native-to-generic and generic-to-native formats respectively. If *g=G(n)* for some *n*, then *G(N(g))=g*; if *n=N(g)* for some *g*, then *N(G(n))=n*.

[*Note 3*: Neither *G* nor *N* need be invertible. — *end note*]

5 If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.

6 [*Note 4*: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — *end note*]

7 When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (*G* or *N*).

8 When the (new) value *p* of one representation of a path is derived from the representation of that or another path, a value *q* is chosen for the other representation. The value *q* converts to *p* (by *G* or *N* as appropriate) if any such value does so; *q* is otherwise unspecified.

[*Note 5*: If *q* is the result of converting any path at all, it is the result of converting *p*. — *end note*]

31.12.6.3.2 Type and encoding conversions [fs.path.type.cvt]

1 The *native encoding* of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The *native encoding* for wide character strings is the implementation-defined execution wide-character set encoding (16.3.3.3.4).

2 For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

(2.1) — `char`: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.

[*Note 1*: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — *end note*]

[*Note 2*: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error-prone. — *end note*]

(2.2) — `wchar_t`: The encoding is the native wide encoding. The method of conversion is unspecified.

[*Note 3*: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — *end note*]

(2.3) — `char8_t`: The encoding is UTF-8. The method of conversion is unspecified.

(2.4) — `char16_t`: The encoding is UTF-16. The method of conversion is unspecified.

(2.5) — `char32_t`: The encoding is UTF-32. The method of conversion is unspecified.

3 If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

31.12.6.4 Requirements [fs.path.req]

1 In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:

(1.1) — `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range [`source.begin()`, `source.end()`).

(1.2) — `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range [`source.begin()`, `source.end()`).

(1.3) — A type meeting the *Cpp17InputIterator* requirements that iterates over an NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range [`source`, `end`) where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.

(1.4) — A character array that after array-to-pointer decay results in a pointer to the start of an NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range [`source`, `end`) where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.

2 Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either

(2.1) — `Source` is a specialization of `basic_string` or `basic_string_view`, or

(2.2) — the *qualified-id* `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly const encoded character type (13.10.3).

3 [*Note 1*: See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — *end note*]

4 Arguments of type `Source` shall not be null pointers.

31.12.6.5 Members [fs.path.member]

31.12.6.5.1 Constructors [fs.path.construct]

```
path() noexcept;
```

1 *Postconditions*: `empty()` is `true`.

```
path(const path& p);
path(path&& p) noexcept;
```

2 *Effects*: Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

```
path(string_type&& source, format fmt = auto_format);
```

3 *Effects*: Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (31.12.6.3.1), converting format if required (31.12.6.3.1). `source` is left in a valid but unspecified state.

```
template<class Source>
  path(const Source& source, format fmt = auto_format);
template<class InputIterator>
  path(InputIterator first, InputIterator last, format fmt = auto_format);
```

4 *Effects*: Let `s` be the effective range of `source` (31.12.6.4) or the range [`first`, `last`), with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

```
template<class Source>
  path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
  path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
```

5 *Mandates*: The value type of `Source` and `InputIterator` is `char`.

6 *Effects*: Let `s` be the effective range of `source` or the range [`first`, `last`), after converting the encoding as follows:

(6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (31.12.6.3.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.

(6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

7 Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

[*Example 1*: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — *end example*]

31.12.6.5.2 Assignments [fs.path.assign]

```
path& operator=(const path& p);
```

1 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`.

2 *Returns*: `*this`.

```
path& operator=(path&& p) noexcept;
```

3 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`. `p` is left in a valid but unspecified state.

[*Note 1*: A valid implementation is `swap(p)`. — *end note*]

4 *Returns*: `*this`.

```
path& operator=(string_type&& source);
path& assign(string_type&& source);
```

5 *Effects*: Sets the pathname in the detected-format of `source` to the original value of `source`. `source` is left in a valid but unspecified state.

6 *Returns*: `*this`.

```
template<class Source>
  path& operator=(const Source& source);
template<class Source>
  path& assign(const Source& source);
```

```
template<class InputIterator>
  path& assign(InputIterator first, InputIterator last);
```

7 *Effects*: Let `s` be the effective range of `source` (31.12.6.4) or the range [`first`, `last`), with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and sets the pathname in that format to `s`.

8 *Returns*: `*this`.

31.12.6.5.3 Appends [fs.path.append]

1 The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

```
path& operator/=(const path& p);
```

2 *Effects*: If `p.is_absolute() || (p.has_root_name() && p.root_name() != root_name())`, then `operator=(p)`.

3 Otherwise, modifies `*this` as if by these steps:

(3.1) — If `p.has_root_directory()`, then removes any root directory and relative path from the generic format pathname. Otherwise, if `!has_root_directory() && is_absolute()` is `true` or if `has_filename()` is `true`, then appends `path::preferred_separator` to the generic format pathname.

(3.2) — Then appends the native format pathname of `p`, omitting any *root-name* from its generic format pathname, to the native format pathname.

4 [*Example 1*: Even if `//host` is interpreted as a *root-name*, both of the paths `path("//host")/"foo"` and `path("//host/")/"foo"` equal `"//host/foo"` (although the former might use backslash as the preferred separator).

Expression examples:

```
// On POSIX,
path("foo") /= path("");          // yields path("foo/")
path("foo") /= path("/bar");      // yields path("/bar")

// On Windows,
path("foo") /= path("");          // yields path("foo\\")
path("foo") /= path("/bar");      // yields path("/bar")
path("foo") /= path("c:/bar");    // yields path("c:/bar")
path("foo") /= path("c:");        // yields path("c:")
path("c:") /= path("");           // yields path("c:")
path("c:foo") /= path("/bar");    // yields path("c:/bar")
path("c:foo") /= path("c:bar");   // yields path("c:foo\\bar")
```

— *end example*]

5 *Returns*: `*this`.

```
template<class Source>
  path& operator/=(const Source& source);
template<class Source>
  path& append(const Source& source);
```

6 *Effects*: Equivalent to: `return operator/=(path(source));`

```
template<class InputIterator>
  path& append(InputIterator first, InputIterator last);
```

7 *Effects*: Equivalent to: `return operator/=(path(first, last));`

31.12.6.5.4 Concatenation [fs.path.concat]

```
path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
  path& operator+=(const Source& x);
```

```
template<class Source>
  path& concat(const Source& x);
```

1 *Effects*: Appends `path(x).native()` to the pathname in the native format.

[*Note 1*: This directly manipulates the value of `native()`, which is not necessarily portable between operating systems. — *end note*]

2 *Returns*: `*this`.

```
path& operator+=(value_type x);
template<class EcharT>
  path& operator+=(EcharT x);
```

3 *Effects*: Equivalent to: `return *this += basic_string_view(&x, 1);`

```
template<class InputIterator>
  path& concat(InputIterator first, InputIterator last);
```

4 *Effects*: Equivalent to: `return *this += path(first, last);`

31.12.6.5.5 Modifiers [fs.path.modifiers]

```
void clear() noexcept;
```

1 *Postconditions*: `empty()` is `true`.

```
path& make_preferred();
```

2 *Effects*: Each *directory-separator* of the pathname in the generic format is converted to *preferred-separator*.

3 *Returns*: `*this`.

4 [*Example 1*:

```
path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';
```

On an operating system where *preferred-separator* is a slash, the output is:

```
"foo/bar"
"foo/bar"
```

On an operating system where *preferred-separator* is a backslash, the output is:

```
"foo/bar"
"foo\bar"
```

— *end example*]

```
path& remove_filename();
```

5 *Effects*: Remove the generic format pathname of `filename()` from the generic format pathname.

6 *Postconditions*: `!has_filename()`.

7 *Returns*: `*this`.

8 [*Example 2*:

```
path("foo/bar").remove_filename();      // yields "foo/"
path("foo/").remove_filename();         // yields "foo/"
path("/foo").remove_filename();         // yields "/"
path("/").remove_filename();            // yields "/"
```

— *end example*]

```
path& replace_filename(const path& replacement);
```

9 *Effects*: Equivalent to:

```
remove_filename();
operator/=(replacement);
```

10 *Returns*: `*this`.

11 [*Example 3*:

```
path("/foo").replace_filename("bar");    // yields "/bar" on POSIX
path("/").replace_filename("bar");       // yields "/bar" on POSIX
```

— *end example*]

```
path& replace_extension(const path& replacement = path());
```

12 *Effects*:

(12.1) — Any existing `extension()` (31.12.6.5.9) is removed from the pathname in the generic format, then

(12.2) — If `replacement` is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then

(12.3) — `operator+=(replacement);`.

13 *Returns*: `*this`.

```
void swap(path& rhs) noexcept;
```

14 *Effects*: Swaps the contents (in all formats) of the two paths.

15 *Complexity*: Constant time.

31.12.6.5.6 Native format observers [fs.path.native.obs]

1 The string returned by all native format observers is in the native pathname format (31.12.6).

```
const string_type& native() const noexcept;
```

2 *Returns*: The pathname in the native format.

```
const value_type* c_str() const noexcept;
```

3 *Effects*: Equivalent to: `return native().c_str();`

```
operator string_type() const;
```

4 *Returns*: `native()`.

```
template<class EcharT, class traits = char_traits<EcharT>,
         class Allocator = allocator<EcharT>>
  basic_string<EcharT, traits, Allocator>
    string(const Allocator& a = Allocator()) const;
```

5 *Returns*: `native()`.

6 *Remarks*: All memory allocation, including for the return value, shall be performed by `a`. Conversion, if any, is specified by 31.12.6.3.

```
std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;
```

7 *Returns*: `native()`.

8 *Remarks*: Conversion, if any, is performed as specified by 31.12.6.3.

31.12.6.5.7 Generic format observers [fs.path.generic.obs]

1 Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash (`'/'`) character is used as the *directory-separator*.

2 [*Example 1*: On an operating system that uses backslash as its *preferred-separator*,

```
  path("foo\\bar").generic_string()
```

returns `"foo/bar"`. — *end example*]

```
template<class EcharT, class traits = char_traits<EcharT>,
         class Allocator = allocator<EcharT>>
  basic_string<EcharT, traits, Allocator>
    generic_string(const Allocator& a = Allocator()) const;
```

3 *Returns*: The pathname in the generic format.

4 *Remarks*: All memory allocation, including for the return value, shall be performed by `a`. Conversion, if any, is specified by 31.12.6.3.

```
std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
```

5 *Returns*: The pathname in the generic format.

6 *Remarks*: Conversion, if any, is specified by 31.12.6.3.

31.12.6.5.8 Compare [fs.path.compare]

```
int compare(const path& p) const noexcept;
```

1 *Returns*:

(1.1) — Let `rootNameComparison` be the result of `this->root_name().native().compare(p.root_name().native())`. If `rootNameComparison` is not `0`, `rootNameComparison`.

(1.2) — Otherwise, if `!this->has_root_directory()` and `p.has_root_directory()`, a value less than `0`.

(1.3) — Otherwise, if `this->has_root_directory()` and `!p.has_root_directory()`, a value greater than `0`.

(1.4) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically less than `native()` for the elements of `p.relative_path()`, a value less than `0`.

(1.5) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically greater than `native()` for the elements of `p.relative_path()`, a value greater than `0`.

(1.6) — Otherwise, `0`.

```
int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;
```

2 *Effects*: Equivalent to: `return compare(path(s));`

31.12.6.5.9 Decomposition [fs.path.decompose]

```
path root_name() const;
```

1 *Returns*: *root-name*, if the pathname in the generic format includes *root-name*, otherwise `path()`.

```
path root_directory() const;
```

2 *Returns*: *root-directory*, if the pathname in the generic format includes *root-directory*, otherwise `path()`.

```
path root_path() const;
```

3 *Returns*: `root_name() / root_directory()`.

```
path relative_path() const;
```

4 *Returns*: A `path` composed from the pathname in the generic format, if `empty()` is `false`, beginning with the first *filename* after `root_path()`. Otherwise, `path()`.

```
path parent_path() const;
```

5 *Returns*: `*this` if `has_relative_path()` is `false`, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of `*this` that produces one fewer element in its iteration.

`path filename() const;`

6 *Returns*: `relative_path().empty() ? path() : *--end()`.

7 [*Example 1*:

```
path("/foo/bar.txt").filename();        // yields "bar.txt"
path("/foo/bar").filename();            // yields "bar"
path("/foo/bar/").filename();           // yields ""
path("/").filename();                   // yields ""
path("//host").filename();              // yields ""
path(".").filename();                   // yields "."
path("..").filename();                  // yields ".."
```

— *end example*]

`path stem() const;`

8 *Returns*: Let `f` be the generic format pathname of `filename()`. Returns a path whose pathname in the generic format is

(8.1) — `f`, if it contains no periods other than a leading period or consists solely of one or two periods;

(8.2) — otherwise, the prefix of `f` ending before its last period.

9 [*Example 2*:

```
std::cout << path("/foo/bar.txt").stem();       // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
  std::cout << p.extension() << '\n';
  // outputs: .tar
  //          .baz
  //          .bar
```

— *end example*]

`path extension() const;`

10 *Returns*: A path whose pathname in the generic format is the suffix of `filename()` not included in `stem()`.

11 [*Example 3*:

```
path("/foo/bar.txt").extension();       // yields ".txt" and stem() is "bar"
path("/foo/bar").extension();           // yields "" and stem() is "bar"
path("/foo/.profile").extension();      // yields "" and stem() is ".profile"
path(".bar").extension();               // yields "" and stem() is ".bar"
path("..bar").extension();              // yields ".bar" and stem() is "."
```

— *end example*]

12 [*Note 1*: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — *end note*]

13 [*Note 2*: On non-POSIX operating systems, for a path `p`, it is possible that `p.stem() + p.extension() == p.filename()` is `false`, even though the generic format pathnames are the same. — *end note*]

31.12.6.5.10 Query [fs.path.query]

`bool empty() const noexcept;`

1 *Returns*: `true` if the pathname in the generic format is empty, otherwise `false`.

`bool has_root_path() const;`

2 *Returns*: `!root_path().empty()`.

`bool has_root_name() const;`

3 *Returns*: `!root_name().empty()`.

`bool has_root_directory() const;`

4 *Returns*: `!root_directory().empty()`.

`bool has_relative_path() const;`

5 *Returns*: `!relative_path().empty()`.

`bool has_parent_path() const;`

6 *Returns*: `!parent_path().empty()`.

`bool has_filename() const;`

7 *Returns*: `!filename().empty()`.

`bool has_stem() const;`

8 *Returns*: `!stem().empty()`.

`bool has_extension() const;`

9 *Returns*: `!extension().empty()`.

`bool is_absolute() const;`

10 *Returns*: `true` if the pathname in the native format contains an absolute path (31.12.6), otherwise `false`.

11 [*Example 1*: `path("/").is_absolute()` is `true` for POSIX-based operating systems, and `false` for Windows-based operating systems. — *end example*]

`bool is_relative() const;`

12 *Returns*: `!is_absolute()`.

31.12.6.5.11 Generation [fs.path.gen]

`path lexically_normal() const;`

1 *Returns*: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of `*this`.

2 [*Example 1*:

```
assert(path("foo/./bar/..").lexically_normal() == "foo/");
assert(path("foo/.///bar/../").lexically_normal() == "foo/");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality. — *end example*]

`path lexically_relative(const path& base) const;`

3 *Effects*: If:

(3.1) — `root_name() != base.root_name()` is `true`, or

(3.2) — `is_absolute() != base.is_absolute()` is `true`, or

(3.3) — `!has_root_directory() && base.has_root_directory()` is `true`, or

(3.4) — any *filename* in `relative_path()` or `base.relative_path()` can be interpreted as a *root-name*,

returns `path()`.

[*Note 1*: On a POSIX implementation, no *filename* in a *relative-path* is acceptable as a *root-name*. — *end note*]

Determines the first mismatched element of `*this` and `base` as if by:

```
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
```

Then,

(3.5) — if `a == end()` and `b == base.end()`, returns `path(".")`; otherwise

(3.6) — let `n` be the number of *filename* elements in [`b`, `base.end()`) that are not dot or dot-dot or empty, minus the number that are dot-dot. If `n<0`, returns `path()`; otherwise

(3.7) — if `n == 0` and `(a == end() || a->empty())`, returns `path(".")`; otherwise

(3.8) — returns an object of class `path` that is default-constructed, followed by

(3.8.1) — application of `operator/=(path(".."))` `n` times, and then

(3.8.2) — application of `operator/=` for each element in [`a`, `end()`).

4 *Returns*: `*this` made relative to `base`. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) `*this` or `base`.

5 [*Example 2*:

```
assert(path("/a/d").lexically_relative("/a/b/c") == "../../d");
assert(path("/a/b/c").lexically_relative("/a/d") == "../b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == "../..");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == "../../a/b");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality. — *end example*]

6 [*Note 2*: If symlink following semantics are desired, use the operational function `relative()`. — *end note*]

7 [*Note 3*: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. — *end note*]

```
path lexically_proximate(const path& base) const;
```

8 *Returns*: If the value of `lexically_relative(base)` is not an empty path, return it. Otherwise return `*this`.

9 [*Note 4*: If symlink following semantics are desired, use the operational function `proximate()`. — *end note*]

10 [*Note 5*: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. — *end note*]

31.12.6.6 Iterators [fs.path.itr]

1 Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

2 A `path::iterator` is a constant iterator meeting all the requirements of a bidirectional iterator (24.3.5.6) except that, for dereferenceable iterators `a` and `b` of type `path::iterator` with `a == b`, there is no requirement that `*a` and `*b` are bound to the same object. Its `value_type` is `path`.

3 Calling any non-const member function of a `path` object invalidates all iterators referring to elements of that object.

4 For the elements of the pathname in the generic format, the forward traversal order is as follows:

(4.1) — The *root-name* element, if present.

(4.2) — The *root-directory* element, if present.

[*Note 1*: It is possible that the use of the generic format is needed to ensure correct lexicographical comparison. — *end note*]

(4.3) — Each successive *filename* element, if present.

(4.4) — An empty element, if a trailing non-root *directory-separator* is present.

5 The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;
```

6 *Returns*: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

```
iterator end() const;
```

7 *Returns*: The end iterator.

31.12.6.7 Inserter and extractor [fs.path.io]

```
template<class charT, class traits>
  friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const path& p);
```

1 *Effects*: Equivalent to `os << quoted(p.string<charT, traits>())`.

[*Note 1*: The `quoted` function is described in 31.7.9. — *end note*]

2 *Returns*: `os`.

```
template<class charT, class traits>
  friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, path& p);
```

3 *Effects*: Equivalent to:

```
basic_string<charT, traits> tmp;
is >> quoted(tmp);
p = tmp;
```

4 *Returns*: `is`.

31.12.6.8 Non-member functions [fs.path.nonmember]

```
void swap(path& lhs, path& rhs) noexcept;
```

1 *Effects*: Equivalent to `lhs.swap(rhs)`.

```
size_t hash_value(const path& p) noexcept;
```

2 *Returns*: A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_-value(p2)`.

```
friend bool operator==(const path& lhs, const path& rhs) noexcept;
```

3 *Returns*: `lhs.compare(rhs) == 0`.

4 [*Note 1*: Path equality and path equivalence have different semantics.

(4.1) — Equality is determined by the `path` non-member `operator==`, which considers the two paths' lexical representations only.

[*Example 1*: `path("foo") == "bar"` is never `true`. — *end example*]

(4.2) — Equivalence is determined by the `equivalent()` non-member function, which determines if two paths resolve (31.12.6) to the same file system entity.

[*Example 2*: `equivalent("foo", "bar")` will be `true` when both paths resolve to the same file. — *end example*]

— *end note*]

```
friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
```

5 *Returns*: `lhs.compare(rhs) <=> 0`.

```
friend path operator/(const path& lhs, const path& rhs);
```

6 *Effects*: Equivalent to: `return path(lhs) /= rhs;`

31.12.6.9 Formatting support [fs.path.fmtr]

31.12.6.9.1 Formatting support overview [fs.path.fmtr.general]

```
namespace std {
  template<class charT> struct formatter<filesystem::path, charT> {
    constexpr void set_debug_format();

    constexpr typename basic_format_parse_context<charT>::iterator
      parse(basic_format_parse_context<charT>& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(const filesystem::path& path, FormatContext& ctx) const;
  };
}
```

31.12.6.9.2 Formatting support functions [fs.path.fmtr.funcs]

1 Formatting of paths uses formatting specifiers of the form

path-format-spec:
    fill-and-align$_{opt}$ *width*$_{opt}$ `?`$_{opt}$ `g`$_{opt}$

where the productions *fill-and-align* and *width* are described in 28.5.2. If the `?` option is used then the path is formatted as an escaped string (28.5.6.5).

```
constexpr void set_debug_format();
```

2 *Effects*: Modifies the state of the `formatter` to be as if the *path-format-spec* parsed by the last call to `parse` contained the `?` option.

```
constexpr typename basic_format_parse_context<charT>::iterator
  parse(basic_format_parse_context<charT>& ctx);
```

3 *Effects*: Parses the format specifier as a *path-format-spec* and stores the parsed specifiers in `*this`.

4 *Returns*: An iterator past the end of the *path-format-spec*.

```
template<class FormatContext>
  typename FormatContext::iterator
    format(const filesystem::path& p, FormatContext& ctx) const;
```

5 *Effects*: Let `s` be `p.generic_string<filesystem::path::value_type>()` if the `g` option is used, otherwise `p.native()`. Writes `s` into `ctx.out()`, adjusted according to the *path-format-spec*. If `charT` is `char`, `path::value_type` is `wchar_t`, and the literal encoding is UTF-8, then the escaped path is transcoded from the native encoding for wide character strings to UTF-8 with maximal subparts of ill-formed subsequences substituted with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion. If `charT` and `path::value_type` are the same then no transcoding is performed. Otherwise, transcoding is implementation-defined.

6 *Returns*: An iterator past the end of the output range.

31.12.6.10 Hash support [fs.path.hash]

```
template<> struct hash<filesystem::path>;
```

1 For an object `p` of type `filesystem::path`, `hash<filesystem::path>()(p)` evaluates to the same result as `filesystem::hash_value(p)`.

31.12.7 Class `filesystem_error` [fs.class.filesystem.error]

31.12.7.1 General [fs.class.filesystem.error.general]

```
namespace std::filesystem {
  class filesystem_error : public system_error {
  public:
    filesystem_error(const string& what_arg, error_code ec);
    filesystem_error(const string& what_arg,
                     const path& p1, error_code ec);
    filesystem_error(const string& what_arg,
                     const path& p1, const path& p2, error_code ec);

    const path& path1() const noexcept;
    const path& path2() const noexcept;
    const char* what() const noexcept override;
  };
}
```

1 The class `filesystem_error` defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

31.12.7.2 Members [fs.filesystem.error.members]

1 Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

2 *Postconditions*:

(2.1) — `code() == ec` is `true`,

(2.2) — `path1().empty()` is `true`,

(2.3) — `path2().empty()` is `true`, and

(2.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos` is `true`.

`filesystem_error(const string& what_arg, const path& p1, error_code ec);`

3 *Postconditions*:

(3.1) — `code() == ec` is `true`,

(3.2) — `path1()` returns a reference to the stored copy of `p1`,

(3.3) — `path2().empty()` is `true`, and

(3.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos` is `true`.

`filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);`

4 *Postconditions*:

(4.1) — `code() == ec`,

(4.2) — `path1()` returns a reference to the stored copy of `p1`,

(4.3) — `path2()` returns a reference to the stored copy of `p2`, and

(4.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

`const path& path1() const noexcept;`

5 *Returns*: A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

`const path& path2() const noexcept;`

6 *Returns*: A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.

`const char* what() const noexcept override;`

7 *Returns*: An NTBS that incorporates the `what_arg` argument supplied to the constructor. The exact format is unspecified. Implementations should include the `system_error::what()` string and the pathnames of `path1` and `path2` in the native format in the returned string.

31.12.8 Enumerations [fs.enum]

31.12.8.1 Enum `path::format` [fs.enum.path.format]

1 This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 146.

Table 146 — Enum `path::format` [tab:fs.enum.path.format]

Name	Meaning
`native_format`	The native pathname format.
`generic_format`	The generic pathname format.
`auto_format`	The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. *Recommended practice*: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way.

31.12.8.2 Enum class `file_type` [fs.enum.file.type]

1 This enum class specifies constants used to identify file types, with the meanings listed in Table 147. The values of the constants are distinct.

31.12.8.3 Enum class `copy_options` [fs.enum.copy.opts]

1 The `enum class` type `copy_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 148. The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

Table 147 — Enum class `file_type` [tab:fs.enum.file.type]

Constant	Meaning
`none`	The type of the file has not been determined or an error occurred while trying to determine the type.
`not_found`	Pseudo-type indicating the file was not found. [*Note 1*: The file not being found is not considered an error while determining the type of a file. — *end note*]
`regular`	Regular file
`directory`	Directory file
`symlink`	Symbolic link file
`block`	Block special file
`character`	Character special file
`fifo`	FIFO or pipe file
`socket`	Socket file
`implementation-defined`	Implementations that support file systems having file types in addition to the above `file_type` types shall supply implementation-defined `file_type` constants to separately identify each of those additional file types
`unknown`	The file exists but the type cannot be determined

Table 148 — Enum class `copy_options` [tab:fs.enum.copy.opts]

Option group controlling `copy_file` function effects for existing target files	
Constant	**Meaning**
`none`	(Default) Error; file already exists.
`skip_existing`	Do not overwrite existing file, do not report an error.
`overwrite_existing`	Overwrite the existing file.
`update_existing`	Overwrite the existing file if it is older than the replacement file.
Option group controlling `copy` function effects for subdirectories	
Constant	**Meaning**
`none`	(Default) Do not copy subdirectories.
`recursive`	Recursively copy subdirectories and their contents.
Option group controlling `copy` function effects for symbolic links	
Constant	**Meaning**
`none`	(Default) Follow symbolic links.
`copy_symlinks`	Copy symbolic links as symbolic links rather than copying the files that they point to.
`skip_symlinks`	Ignore symbolic links.
Option group controlling `copy` function effects for choosing the form of copying	
Constant	**Meaning**
`none`	(Default) Copy content.
`directories_only`	Copy directory structure only, do not copy non-directory files.
`create_symlinks`	Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory.
`create_hard_links`	Make hard links instead of copies of files.

31.12.8.4 Enum class `perms` [fs.enum.perms]

1 The `enum class` type `perms` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 149.

Table 149 — Enum class `perms` [tab:fs.enum.perms]

Name	Value (octal)	POSIX macro	Definition or notes
`none`	0		There are no permissions set for the file.
`owner_read`	0400	`S_IRUSR`	Read permission, owner
`owner_write`	0200	`S_IWUSR`	Write permission, owner
`owner_exec`	0100	`S_IXUSR`	Execute/search permission, owner
`owner_all`	0700	`S_IRWXU`	Read, write, execute/search by owner; `owner_read | owner_write | owner_exec`
`group_read`	040	`S_IRGRP`	Read permission, group
`group_write`	020	`S_IWGRP`	Write permission, group
`group_exec`	010	`S_IXGRP`	Execute/search permission, group
`group_all`	070	`S_IRWXG`	Read, write, execute/search by group; `group_read | group_write | group_exec`
`others_read`	04	`S_IROTH`	Read permission, others
`others_write`	02	`S_IWOTH`	Write permission, others
`others_exec`	01	`S_IXOTH`	Execute/search permission, others
`others_all`	07	`S_IRWXO`	Read, write, execute/search by others; `others_read | others_write | others_exec`
`all`	0777		`owner_all | group_all | others_all`
`set_uid`	04000	`S_ISUID`	Set-user-ID on execution
`set_gid`	02000	`S_ISGID`	Set-group-ID on execution
`sticky_bit`	01000	`S_ISVTX`	Operating system dependent.
`mask`	07777		`all | set_uid | set_gid | sticky_bit`
`unknown`	0xFFFF		The permissions are not known, such as when a `file_status` object is created without specifying the permissions

31.12.8.5 Enum class `perm_options` [fs.enum.perm.opts]

1 The `enum class` type `perm_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 150. The bitmask constants are bitmask elements. In Table 150 `perm` denotes a value of type `perms` passed to `permissions`.

Table 150 — Enum class `perm_options` [tab:fs.enum.perm.opts]

Name	Meaning
`replace`	`permissions` shall replace the file's permission bits with `perm`
`add`	`permissions` shall replace the file's permission bits with the bitwise OR of `perm` and the file's current permission bits.
`remove`	`permissions` shall replace the file's permission bits with the bitwise AND of the complement of `perm` and the file's current permission bits.
`nofollow`	`permissions` shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.

31.12.8.6 Enum class `directory_options` [fs.enum.dir.opts]

1 The `enum class` type `directory_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 151. The constant `none` represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

Table 151 — Enum class `directory_options`   [tab:fs.enum.dir.opts]

Name	Meaning
`none`	(Default) Skip directory symlinks, permission denied is an error.
`follow_directory_symlink`	Follow rather than skip directory symlinks.
`skip_permission_denied`	Skip directories that would otherwise result in permission denied.

31.12.9 Class `file_status` [fs.class.file.status]

31.12.9.1 General [fs.class.file.status.general]

```
namespace std::filesystem {
  class file_status {
  public:
    // 31.12.9.2, constructors and destructor
    file_status() noexcept : file_status(file_type::none) {}
    explicit file_status(file_type ft,
                         perms prms = perms::unknown) noexcept;
    file_status(const file_status&) noexcept = default;
    file_status(file_status&&) noexcept = default;
    ~file_status();

    // assignments
    file_status& operator=(const file_status&) noexcept = default;
    file_status& operator=(file_status&&) noexcept = default;

    // 31.12.9.4, modifiers
    void       type(file_type ft) noexcept;
    void       permissions(perms prms) noexcept;

    // 31.12.9.3, observers
    file_type  type() const noexcept;
    perms      permissions() const noexcept;

    friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept
      { return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
  };
}
```

1 An object of type `file_status` stores information about the type and permissions of a file.

31.12.9.2 Constructors [fs.file.status.cons]

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

1 *Postconditions*: `type() == ft` and `permissions() == prms`.

31.12.9.3 Observers [fs.file.status.obs]

```
file_type type() const noexcept;
```

1 *Returns*: The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

```
perms permissions() const noexcept;
```

2 *Returns*: The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

31.12.9.4 Modifiers [fs.file.status.mods]

```
void type(file_type ft) noexcept;
```

1 *Postconditions*: `type() == ft`.

```
void permissions(perms prms) noexcept;
```

2 *Postconditions*: `permissions() == prms`.

31.12.10 Class `directory_entry` [fs.class.directory.entry]

31.12.10.1 General [fs.class.directory.entry.general]

```
namespace std::filesystem {
  class directory_entry {
  public:
    // 31.12.10.2, constructors and destructor
    directory_entry() noexcept = default;
    directory_entry(const directory_entry&) = default;
    directory_entry(directory_entry&&) noexcept = default;
    explicit directory_entry(const filesystem::path& p);
    directory_entry(const filesystem::path& p, error_code& ec);
    ~directory_entry();

    // assignments
    directory_entry& operator=(const directory_entry&) = default;
    directory_entry& operator=(directory_entry&&) noexcept = default;

    // 31.12.10.3, modifiers
    void assign(const filesystem::path& p);
    void assign(const filesystem::path& p, error_code& ec);
    void replace_filename(const filesystem::path& p);
    void replace_filename(const filesystem::path& p, error_code& ec);
    void refresh();
    void refresh(error_code& ec) noexcept;

    // 31.12.10.4, observers
    const filesystem::path& path() const noexcept;
    operator const filesystem::path&() const noexcept;
    bool exists() const;
    bool exists(error_code& ec) const noexcept;
    bool is_block_file() const;
    bool is_block_file(error_code& ec) const noexcept;
    bool is_character_file() const;
    bool is_character_file(error_code& ec) const noexcept;
    bool is_directory() const;
    bool is_directory(error_code& ec) const noexcept;
    bool is_fifo() const;
    bool is_fifo(error_code& ec) const noexcept;
    bool is_other() const;
    bool is_other(error_code& ec) const noexcept;
    bool is_regular_file() const;
    bool is_regular_file(error_code& ec) const noexcept;
    bool is_socket() const;
    bool is_socket(error_code& ec) const noexcept;
    bool is_symlink() const;
    bool is_symlink(error_code& ec) const noexcept;
    uintmax_t file_size() const;
    uintmax_t file_size(error_code& ec) const noexcept;
    uintmax_t hard_link_count() const;
    uintmax_t hard_link_count(error_code& ec) const noexcept;
    file_time_type last_write_time() const;
    file_time_type last_write_time(error_code& ec) const noexcept;
    file_status status() const;
    file_status status(error_code& ec) const noexcept;
    file_status symlink_status() const;
    file_status symlink_status(error_code& ec) const noexcept;

    bool operator==(const directory_entry& rhs) const noexcept;
    strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
    // 31.12.10.5, inserter
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

  private:
    filesystem::path path-object;         // exposition only
  };
}
```

1 A `directory_entry` object stores a `path` object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.

2 Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions (31.12.13). Such stored file attribute values are said to be *cached*.

3 [*Note 1*: `directory_iterator` can cache already available attribute values directly into a `directory_entry` object without the cost of a call to `refresh()`. — *end note*]

4 [*Example 1*:

```
using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto&& x : directory_iterator("."))
{
  std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto&& x : directory_iterator("."))
{
  lengthy_function(x.path());    // cache becomes stale
  x.refresh();
  std::cout << x.path() << " " << x.last_write_time() << std::endl;
}
```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. — *end example*]

31.12.10.2 Constructors [fs.dir.entry.cons]

```
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

1 *Effects*: Calls `refresh()` or `refresh(ec)`, respectively.

2 *Postconditions*: `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.

3 *Throws*: As specified in 31.12.5.

31.12.10.3 Modifiers [fs.dir.entry.mods]

```
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

1 *Effects*: Equivalent to `path-object = p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

2 *Throws*: As specified in 31.12.5.

```
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

3 *Effects*: Equivalent to `path-object.replace_filename(p)`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

4 *Throws*: As specified in 31.12.5.

```
void refresh();
void refresh(error_code& ec) noexcept;
```

5 *Effects*: Stores the current values of any cached attributes of the file `p` resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

6 *Throws*: As specified in 31.12.5.

7 [*Note 1*: Implementations of `directory_iterator` (31.12.11) are prohibited from directly or indirectly calling the `refresh` function as described in 31.12.11.1. — *end note*]

31.12.10.4 Observers [fs.dir.entry.obs]

1 Unqualified function names in the *Returns*: elements of the `directory_entry` observers described below refer to members of the `std::filesystem` namespace.

```
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
```

2 *Returns*: *`path-object`*.

```
bool exists() const;
bool exists(error_code& ec) const noexcept;
```

3 *Returns*: `exists(this->status())` or `exists(this->status(ec))`, respectively.

4 *Throws*: As specified in 31.12.5.

```
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
```

5 *Returns*: `is_block_file(this->status())` or `is_block_file(this->status(ec))`, respectively.

6 *Throws*: As specified in 31.12.5.

```
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
```

7 *Returns*: `is_character_file(this->status())` or `is_character_file(this->status(ec))`, respectively.

8 *Throws*: As specified in 31.12.5.

```
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
```

9 *Returns*: `is_directory(this->status())` or `is_directory(this->status(ec))`, respectively.

10 *Throws*: As specified in 31.12.5.

```
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
```

11 *Returns*: `is_fifo(this->status())` or `is_fifo(this->status(ec))`, respectively.

12 *Throws*: As specified in 31.12.5.

```
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
```

13 *Returns*: `is_other(this->status())` or `is_other(this->status(ec))`, respectively.

14 *Throws*: As specified in 31.12.5.

```
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
```

15 *Returns*: `is_regular_file(this->status())` or `is_regular_file(this->status(ec))`, respectively.

16 *Throws*: As specified in 31.12.5.

```
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
```

17 *Returns*: `is_socket(this->status())` or `is_socket(this->status(ec))`, respectively.

18 *Throws*: As specified in 31.12.5.

```
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
```

19 *Returns*: `is_symlink(this->symlink_status())` or `is_symlink(this->symlink_status(ec))`, respectively.

20 *Throws*: As specified in 31.12.5.

```
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
```

21 *Returns*: If cached, the file size attribute value. Otherwise, `file_size(path())` or `file_size(path(), ec)`, respectively.

22 *Throws*: As specified in 31.12.5.

```
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
```

23 *Returns*: If cached, the hard link count attribute value. Otherwise, `hard_link_count(path())` or `hard_link_count(path(), ec)`, respectively.

24 *Throws*: As specified in 31.12.5.

```
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
```

25 *Returns*: If cached, the last write time attribute value. Otherwise, `last_write_time(path())` or `last_write_time(path(), ec)`, respectively.

26 *Throws*: As specified in 31.12.5.

```
file_status status() const;
file_status status(error_code& ec) const noexcept;
```

27 *Returns*: If cached, the status attribute value. Otherwise, `status(path())` or `status(path(), ec)`, respectively.

28 *Throws*: As specified in 31.12.5.

```
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
```

29 *Returns*: If cached, the symlink status attribute value. Otherwise, `symlink_status(path())` or `symlink_status(path(), ec)`, respectively.

30 *Throws*: As specified in 31.12.5.

```
bool operator==(const directory_entry& rhs) const noexcept;
```

31 *Returns*: `path-object == rhs.path-object`.

```
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
```

32 *Returns*: `path-object <=> rhs.path-object`.

31.12.10.5 Inserter [fs.dir.entry.io]

```
template<class charT, class traits>
  friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);
```

1 *Effects*: Equivalent to: `return os << d.path();`

31.12.11 Class `directory_iterator` [fs.class.directory.iterator]

31.12.11.1 General [fs.class.directory.iterator.general]

1 An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the path and any cached attribute values (31.12.10) for each file in a directory or in an implementation-defined directory-like file type.

[*Note 1*: For iteration into subdirectories, see class `recursive_directory_iterator` (31.12.12). — *end note*]

```
namespace std::filesystem {
  class directory_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type        = directory_entry;
    using difference_type   = ptrdiff_t;
    using pointer           = const directory_entry*;
    using reference         = const directory_entry&;

    // 31.12.11.2, member functions
    directory_iterator() noexcept;
    explicit directory_iterator(const path& p);
    directory_iterator(const path& p, directory_options options);
    directory_iterator(const path& p, error_code& ec);
    directory_iterator(const path& p, directory_options options,
                       error_code& ec);
    directory_iterator(const directory_iterator& rhs);
    directory_iterator(directory_iterator&& rhs) noexcept;
    ~directory_iterator();

    directory_iterator& operator=(const directory_iterator& rhs);
    directory_iterator& operator=(directory_iterator&& rhs) noexcept;

    const directory_entry& operator*() const;
    const directory_entry* operator->() const;
    directory_iterator&    operator++();
    directory_iterator&    increment(error_code& ec);

    bool operator==(default_sentinel_t) const noexcept {
      return *this == directory_iterator();
    }

    // other members as required by 24.3.5.3, input iterators
  };
}
```

2 `directory_iterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

3 If an iterator of type `directory_iterator` reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

4 The end iterator is not dereferenceable.

5 Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

6 The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the directory argument from which the iterator was constructed with the filename of the directory entry appended as if by `operator/=`.

7 Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

8 The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.

9 Constructors and non-const `directory_iterator` member functions store the values of any cached attributes (31.12.10) in the `directory_entry` element returned by `operator*()`. `directory_iterator` member functions shall not directly or indirectly call any `directory_entry` `refresh` function.

[*Note 2*: The exact mechanism for storing cached attribute values is not exposed to users. — *end note*]

10 [*Note 3*: A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — *end note*]

11 [*Note 4*: If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir`. — *end note*]

31.12.11.2 Members [fs.dir.itr.members]

```
directory_iterator() noexcept;
```

1 *Effects*: Constructs the end iterator.

```
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);
```

2 *Effects*: For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

3 *Throws*: As specified in 31.12.5.

4 [*Note 1*: To iterate over the current directory, use `directory_iterator(".")` rather than `directory_-iterator("")`. — *end note*]

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

5 *Postconditions*: `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

6 *Effects*: If `*this` and `rhs` are the same object, the member has no effect.

7 *Postconditions*: `*this` has the original value of `rhs`.

8 *Returns*: `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);
```

9 *Effects*: As specified for the prefix increment operation of Input iterators (24.3.5.3).

10 *Returns*: `*this`.

11 *Throws*: As specified in 31.12.5.

31.12.11.3 Non-member functions [fs.dir.itr.nonmembers]

1 These functions enable range access for `directory_iterator`.

```
directory_iterator begin(directory_iterator iter) noexcept;
```

2 *Returns*: `iter`.

```
directory_iterator end(directory_iterator) noexcept;
```

3 *Returns*: `directory_iterator()`.

31.12.12 Class `recursive_directory_iterator` [fs.class.rec.dir.itr]

31.12.12.1 General [fs.class.rec.dir.itr.general]

1 An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory or in an implementation-defined directory-like file type, and its subdirectories.

```
namespace std::filesystem {
  class recursive_directory_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type        = directory_entry;
    using difference_type   = ptrdiff_t;
    using pointer           = const directory_entry*;
    using reference         = const directory_entry&;
    // 31.12.12.2, constructors and destructor
    recursive_directory_iterator() noexcept;
    explicit recursive_directory_iterator(const path& p);
    recursive_directory_iterator(const path& p, directory_options options);
    recursive_directory_iterator(const path& p, directory_options options,
                                 error_code& ec);
    recursive_directory_iterator(const path& p, error_code& ec);
    recursive_directory_iterator(const recursive_directory_iterator& rhs);
    recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
    ~recursive_directory_iterator();

    // 31.12.12.2, observers
    directory_options  options() const;
    int                depth() const;
    bool               recursion_pending() const;

    const directory_entry& operator*() const;
    const directory_entry* operator->() const;

    // 31.12.12.2, modifiers
    recursive_directory_iterator&
      operator=(const recursive_directory_iterator& rhs);
    recursive_directory_iterator&
      operator=(recursive_directory_iterator&& rhs) noexcept;

    recursive_directory_iterator& operator++();
    recursive_directory_iterator& increment(error_code& ec);

    void pop();
    void pop(error_code& ec);
    void disable_recursion_pending();

    bool operator==(default_sentinel_t) const noexcept {
      return *this == recursive_directory_iterator();
    }

    // other members as required by 24.3.5.3, input iterators
  };
}
```

2 Calling `options`, `depth`, `recursion_pending`, `pop` or `disable_recursion_pending` on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.

4 [*Note 1*: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. — *end note*]

31.12.12.2 Members [fs.rec.dir.itr.members]

```
recursive_directory_iterator() noexcept;
```

1 *Effects*: Constructs the end iterator.

```
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
```

2 *Effects*: Constructs an iterator representing the first entry in the directory to which `p` resolves, if any; otherwise, the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

3 *Postconditions*: `options() == options` for the signatures with a `directory_options` argument, otherwise `options() == directory_options::none`.

4 *Throws*: As specified in 31.12.5.

5 [*Note 1*: Use `recursive_directory_iterator(".")` rather than `recursive_directory_iterator("")` to iterate over the current directory. — *end note*]

6 [*Note 2*: By default, `recursive_directory_iterator` does not follow directory symlinks. To follow directory symlinks, specify `options` as `directory_options::follow_directory_symlink`. — *end note*]

```
recursive_directory_iterator(const recursive_directory_iterator& rhs);
```

7 *Postconditions*:

(7.1) — `options() == rhs.options()`

(7.2) — `depth() == rhs.depth()`

(7.3) — `recursion_pending() == rhs.recursion_pending()`

```
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
```

8 *Postconditions*: `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

```
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
```

9 *Effects*: If `*this` and `rhs` are the same object, the member has no effect.

10 *Postconditions*:

(10.1) — `options() == rhs.options()`

(10.2) — `depth() == rhs.depth()`

(10.3) — `recursion_pending() == rhs.recursion_pending()`

11 *Returns*: `*this`.

```
recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;
```

12 *Effects*: If `*this` and `rhs` are the same object, the member has no effect.

13 *Postconditions*: `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

14 *Returns*: `*this`.

```
directory_options options() const;
```

15 *Returns*: The value of the argument passed to the constructor for the `options` parameter, if present, otherwise `directory_options::none`.

16 *Throws*: Nothing.

```
int depth() const;
```

17 *Returns*: The current depth of the directory tree being traversed.

[*Note 3*: The initial directory is depth `0`, its immediate subdirectories are depth `1`, and so forth. — *end note*]

18 *Throws*: Nothing.

```
bool recursion_pending() const;
```

19 *Returns*: `true` if `disable_recursion_pending()` has not been called subsequent to the prior construction or increment operation, otherwise `false`.

20 *Throws*: Nothing.

```
recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);
```

21 *Effects*: As specified for the prefix increment operation of Input iterators (24.3.5.3), except that:

(21.1) — If there are no more entries at the current depth, then if `depth() != 0` iteration over the parent directory resumes; otherwise `*this = recursive_directory_iterator()`.

(21.2) — Otherwise if

```
recursion_pending() && is_directory((*this)->status()) &&
(!is_symlink((*this)->symlink_status()) ||
 (options() & directory_options::follow_directory_symlink) != directory_options::none)
```

then either directory `(*this)->path()` is recursively iterated into or, if

```
(options() & directory_options::skip_permission_denied) != directory_options::none
```

and an error occurs indicating that permission to access directory `(*this)->path()` is denied, then directory `(*this)->path()` is treated as an empty directory and no error is reported.

22 *Returns*: `*this`.

23 *Throws*: As specified in 31.12.5.

```
void pop();
void pop(error_code& ec);
```

24 *Effects*: If `depth() == 0`, set `*this` to `recursive_directory_iterator()`. Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

25 *Throws*: As specified in 31.12.5.

26 *Remarks*: Any copies of the previous value of `*this` are no longer required to be dereferenceable nor to be in the domain of `==`.

```
void disable_recursion_pending();
```

27 *Postconditions*: `recursion_pending() == false`.

28 [*Note 4*: `disable_recursion_pending()` is used to prevent unwanted recursion into a directory. — *end note*]

31.12.12.3 Non-member functions [fs.rec.dir.itr.nonmembers]

1 These functions enable use of `recursive_directory_iterator` with range-based `for` statements.

```
recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
```

2 *Returns*: `iter`.

```
recursive_directory_iterator end(recursive_directory_iterator) noexcept;
```

3 *Returns*: `recursive_directory_iterator()`.

31.12.13 Filesystem operation functions [fs.op.funcs]

31.12.13.1 General [fs.op.funcs.general]

1 Filesystem operation functions query or modify files, including directories, in external storage.

2 [*Note 1*: Because hardware failures, network failures, file system races (31.12.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 31.12.5. — *end note*]

31.12.13.2 Absolute [fs.op.absolute]

```
path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);
```

1 *Effects*: Composes an absolute path referencing the same file system location as `p` according to the operating system (31.12.2.3).

2 *Returns*: The composed path. The signature with argument `ec` returns `path()` if an error occurs.

3 [*Note 1*: For the returned path, `rp`, `rp.is_absolute()` is `true` unless an error occurs. — *end note*]

4 *Throws*: As specified in 31.12.5.

5 [*Note 2*: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider `canonical` (31.12.13.3). — *end note*]

6 [*Note 3*: Implementations are strongly encouraged to not query secondary storage, and not consider `!exists(p)` an error. — *end note*]

7 [*Example 1*: For POSIX-based operating systems, `absolute(p)` is simply `current_path()/p`. For Windows-based operating systems, `absolute` might have the same semantics as `GetFullPathNameW`. — *end example*]

31.12.13.3 Canonical [fs.op.canonical]

```
path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);
```

1 *Effects*: Converts `p` to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

2 *Returns*: A path that refers to the same file system object as `absolute(p)`. The signature with argument `ec` returns `path()` if an error occurs.

3 *Throws*: As specified in 31.12.5.

4 *Remarks*: `!exists(p)` is an error.

31.12.13.4 Copy [fs.op.copy]

```
void filesystem::copy(const path& from, const path& to);
```

1 *Effects*: Equivalent to `copy(from, to, copy_options::none)`.

```
void filesystem::copy(const path& from, const path& to, error_code& ec);
```

2 *Effects*: Equivalent to `copy(from, to, copy_options::none, ec)`.

```
void filesystem::copy(const path& from, const path& to, copy_options options);
void filesystem::copy(const path& from, const path& to, copy_options options,
                      error_code& ec);
```

3 *Preconditions*: At most one element from each option group (31.12.8.3) is set in `options`.

4 *Effects*: Before the first use of `f` and `t`:

(4.1) — If

```
(options & copy_options::create_symlinks) != copy_options::none ||
(options & copy_options::skip_symlinks) != copy_options::none
```

then `auto f = symlink_status(from)` and if needed `auto t = symlink_status(to)`.

(4.2) — Otherwise, if

```
(options & copy_options::copy_symlinks) != copy_options::none
```

then `auto f = symlink_status(from)` and if needed `auto t = status(to)`.

(4.3) — Otherwise, `auto f = status(from)` and if needed `auto t = status(to)`.

Effects are then as follows:

(4.4) — If `f.type()` or `t.type()` is an implementation-defined file type (31.12.8.2), then the effects are implementation-defined.

(4.5) — Otherwise, an error is reported as specified in 31.12.5 if

(4.5.1) — `exists(f)` is `false`, or

(4.5.2) — `equivalent(from, to)` is `true`, or

(4.5.3) — `is_other(f) || is_other(t)` is `true`, or

(4.5.4) — `is_directory(f) && is_regular_file(t)` is `true`.

(4.6) — Otherwise, if `is_symlink(f)`, then:

(4.6.1) — If `(options & copy_options::skip_symlinks) != copy_options::none` then return.

(4.6.2) — Otherwise if

```
!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none
```

then `copy_symlink(from, to)`.

(4.6.3) — Otherwise report an error as specified in 31.12.5.

(4.7) — Otherwise, if `is_regular_file(f)`, then:

(4.7.1) — If `(options & copy_options::directories_only) != copy_options::none`, then return.

(4.7.2) — Otherwise, if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.

(4.7.3) — Otherwise, if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.

(4.7.4) — Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.

(4.7.5) — Otherwise, `copy_file(from, to, options)`.

(4.8) — Otherwise, if

```
is_directory(f) &&
(options & copy_options::create_symlinks) != copy_options::none
```

then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_-directory)`.

(4.9) — Otherwise, if

```
is_directory(f) &&
((options & copy_options::recursive) != copy_options::none ||
 options == copy_options::none)
```

then:

(4.9.1) — If `exists(t)` is `false`, then `create_directory(to, from)`.

(4.9.2) — Then, iterate over the files in `from`, as if by

```
for (const directory_entry& x : directory_iterator(from))
  copy(x.path(), to/x.path().filename(),
       options | copy_options::in-recursive-copy);
```

where *`in-recursive-copy`* is a bitmask element of `copy_options` that is not one of the elements in 31.12.8.3.

(4.10) — Otherwise, for the signature with argument `ec`, `ec.clear()`.

(4.11) — Otherwise, no effects.

5 *Throws*: As specified in 31.12.5.

6 *Remarks*: For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

7 [*Example 1*: Given this directory structure:

```
/dir1
  file1
  file2
  dir2
    file3
```

Calling `copy("/dir1", "/dir3")` would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
```

Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
  dir2
    file3
```

— *end example*]

31.12.13.5 Copy file [fs.op.copy.file]

```
bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);
```

1 *Returns*: `copy_file(from, to, copy_options::none)` or `copy_file(from, to, copy_options::none, ec)`, respectively.

2 *Throws*: As specified in 31.12.5.

```
bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options,
               error_code& ec);
```

3 *Preconditions*: At most one element from each option group (31.12.8.3) is set in `options`.

4 *Effects*: As follows:

(4.1) — Report an error as specified in 31.12.5 if

(4.1.1) — `is_regular_file(from)` is `false`, or

(4.1.2) — `exists(to)` is `true` and `is_regular_file(to)` is `false`, or

(4.1.3) — `exists(to)` is `true` and `equivalent(from, to)` is `true`, or

(4.1.4) — `exists(to)` is `true` and

```
(options & (copy_options::skip_existing |
            copy_options::overwrite_existing |
            copy_options::update_existing)) == copy_options::none
```

(4.2) — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if

(4.2.1) — `exists(to)` is `false`, or

(4.2.2) — `(options & copy_options::overwrite_existing) != copy_options::none`, or

(4.2.3) — `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function (31.12.13.26).

(4.3) — Otherwise, no effects.

5 *Returns*: `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

6 *Throws*: As specified in 31.12.5.

7 *Complexity*: At most one direct or indirect invocation of `status(to)`.

31.12.13.6 Copy symlink [fs.op.copy.symlink]

```
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink,
                  error_code& ec) noexcept;
```

1 *Effects*: Equivalent to *`function`*`(read_symlink(existing_symlink), new_symlink)` or *`function`*`(read_symlink(existing_symlink, ec), new_symlink, ec)`, respectively, where in each case *`function`* is `create_symlink` or `create_directory_symlink` as appropriate.

2 *Throws*: As specified in 31.12.5.

31.12.13.7 Create directories [fs.op.create.directories]

```
bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);
```

1 *Effects*: Calls `create_directory` for each element of `p` that does not exist.

2 *Returns*: `true` if a new directory was created for the directory `p` resolves to, otherwise `false`.

3 *Throws*: As specified in 31.12.5.

4 *Complexity*: $\mathcal{O}(n)$ where n is the number of elements of `p`.

31.12.13.8 Create directory [fs.op.create.directory]

```
bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;
```

1 *Effects*: Creates the directory `p` resolves to, as if by POSIX `mkdir` with a second argument of `static_cast<int>(perms::all)`. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

2 *Returns*: `true` if a new directory was created, otherwise `false`.

3 *Throws*: As specified in 31.12.5.

```
bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

4 *Effects*: Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[*Note 1*: For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`. — *end note*]

5 *Returns*: `true` if a new directory was created with attributes copied from directory `existing_p`, otherwise `false`.

6 *Throws*: As specified in 31.12.5.

31.12.13.9 Create directory symlink [fs.op.create.dir.symlk]

```
void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink,
                                          error_code& ec) noexcept;
```

1 *Effects*: Establishes the postcondition, as if by POSIX `symlink`.

2 *Postconditions*: `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3 *Throws*: As specified in 31.12.5.

4 [*Note 1*: Some operating systems require symlink creation to identify that the link is to a directory. Thus, `create_symlink` (instead of `create_directory_symlink`) cannot be used reliably to create directory symlinks. — *end note*]

5 [*Note 2*: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note*]

31.12.13.10 Create hard link [fs.op.create.hard.lk]

```
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
                                  error_code& ec) noexcept;
```

1 *Effects*: Establishes the postcondition, as if by POSIX `link`.

2 *Postconditions*:

(2.1) — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2) — The contents of the file or directory `to` resolves to are unchanged.

3 *Throws*: As specified in 31.12.5.

4 [*Note 1*: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — *end note*]

31.12.13.11 Create symlink [fs.op.create.symlink]

```
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
                                error_code& ec) noexcept;
```

1 *Effects*: Establishes the postcondition, as if by POSIX `symlink`.

2 *Postconditions*: `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3 *Throws*: As specified in 31.12.5.

4 [*Note 1*: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note*]

31.12.13.12 Current path [fs.op.current.path]

```
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

1 *Returns*: The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd`. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws*: As specified in 31.12.5.

3 *Remarks*: The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

4 [*Note 1*: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — *end note*]

```
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

5 *Effects*: Establishes the postcondition, as if by POSIX `chdir`.

6 *Postconditions*: `equivalent(p, current_path())`.

7 *Throws*: As specified in 31.12.5.

8 [*Note 2*: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — *end note*]

31.12.13.13 Equivalent [fs.op.equivalent]

```
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

1 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.

[*Note 1*: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat` for the two paths, having equal `st_dev` values and equal `st_ino` values. — *end note*]

2 *Returns*: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

4 *Remarks*: `!exists(p1) || !exists(p2)` is an error.

31.12.13.14 Exists [fs.op.exists]

```
bool filesystem::exists(file_status s) noexcept;
```

1 *Returns*: `status_known(s) && s.type() != file_type::not_found`.

```
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

2 Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

3 *Effects*: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

4 *Returns*: `exists(s)`.

5 *Throws*: As specified in 31.12.5.

31.12.13.15 File size [fs.op.file.size]

```
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

1 *Effects*: If `exists(p)` is `false`, an error is reported (31.12.5).

2 *Returns*:

(2.1) — If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat`.

(2.2) — Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.16 Hard link count [fs.op.hard.lk.ct]

```
uintmax_t filesystem::hard_link_count(const path& p);
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;
```

1 *Returns*: The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

2 *Throws*: As specified in 31.12.5.

31.12.13.17 Is block file [fs.op.is.block.file]

```
bool filesystem::is_block_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::block`.

```
bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.18 Is character file [fs.op.is.char.file]

```
bool filesystem::is_character_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::character`.

```
bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.19 Is directory [fs.op.is.directory]

```
bool filesystem::is_directory(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::directory`.

```
bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.20 Is empty [fs.op.is.empty]

```
bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);
```

1 *Effects*:

(1.1) — Determine `file_status s`, as if by `status(p)` or `status(p, ec)`, respectively.

(1.2) — For the signature with argument `ec`, return `false` if an error occurred.

(1.3) — Otherwise, if `is_directory(s)`:

  (1.3.1) — Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.

  (1.3.2) — For the signature with argument `ec`, return `false` if an error occurred.

  (1.3.3) — Otherwise, return `itr == directory_iterator()`.

(1.4) — Otherwise:

  (1.4.1) — Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.

  (1.4.2) — For the signature with argument `ec`, return `false` if an error occurred.

  (1.4.3) — Otherwise, return `sz == 0`.

2 *Throws*: As specified in 31.12.5.

31.12.13.21 Is fifo [fs.op.is.fifo]

```
bool filesystem::is_fifo(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::fifo`.

```
bool filesystem::is_fifo(const path& p);
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.22 Is other [fs.op.is.other]

```
bool filesystem::is_other(file_status s) noexcept;
```

1 *Returns*: `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

```
bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.23 Is regular file [fs.op.is.regular.file]

```
bool filesystem::is_regular_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::regular`.

```
bool filesystem::is_regular_file(const path& p);
```

2 *Returns*: `is_regular_file(status(p))`.

3 *Throws*: `filesystem_error` if `status(p)` would throw `filesystem_error`.

```
bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;
```

4 *Effects*: Sets `ec` as if by `status(p, ec)`.

[*Note 1*: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — *end note*]

5 *Returns*: `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

31.12.13.24 Is socket [fs.op.is.socket]

```
bool filesystem::is_socket(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::socket`.

```
bool filesystem::is_socket(const path& p);
bool filesystem::is_socket(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.25 Is symlink [fs.op.is.symlink]

```
bool filesystem::is_symlink(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::symlink`.

```
bool filesystem::is_symlink(const path& p);
bool filesystem::is_symlink(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_symlink(symlink_status(p))` or `is_symlink(symlink_status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.26 Last write time [fs.op.last.write.time]

```
file_time_type filesystem::last_write_time(const path& p);
file_time_type filesystem::last_write_time(const path& p, error_code& ec) noexcept;
```

1 *Returns*: The time of last data modification of `p`, determined as if by the value of the POSIX `stat` class member `st_mtime` obtained as if by POSIX `stat`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2 *Throws*: As specified in 31.12.5.

```
void filesystem::last_write_time(const path& p, file_time_type new_time);
void filesystem::last_write_time(const path& p, file_time_type new_time,
                                 error_code& ec) noexcept;
```

3 *Effects*: Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens`.

4 *Throws*: As specified in 31.12.5.

5 [*Note 1*: A postcondition of `last_write_time(p) == new_time` is not specified because it does not necessarily hold for file systems with coarse time granularity. — *end note*]

31.12.13.27 Permissions [fs.op.permissions]

```
void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);
```

1 *Preconditions*: Exactly one of the `perm_options` constants `replace`, `add`, or `remove` is present in `opts`.

2 *Effects*: Applies the action specified by `opts` to the file `p` resolves to, or to file `p` itself if `p` is a symbolic link and `perm_options::nofollow` is set in `opts`. The action is applied as if by POSIX `fchmodat`.

3 [*Note 1*: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. — *end note*]

4 *Throws*: As specified in 31.12.5.

5 *Remarks*: The second signature behaves as if it had an additional parameter `perm_options opts` with an argument of `perm_options::replace`.

31.12.13.28 Proximate [fs.op.proximate]

```
path filesystem::proximate(const path& p, error_code& ec);
```

1 *Returns*: `proximate(p, current_path(), ec)`.

2 *Throws*: As specified in 31.12.5.

```
path filesystem::proximate(const path& p, const path& base = current_path());
path filesystem::proximate(const path& p, const path& base, error_code& ec);
```

3 *Returns*: For the first form:

```
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4 *Throws*: As specified in 31.12.5.

31.12.13.29 Read symlink [fs.op.read.symlink]

```
path filesystem::read_symlink(const path& p);
path filesystem::read_symlink(const path& p, error_code& ec);
```

1 *Returns*: If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws*: As specified in 31.12.5.

[*Note 1*: It is an error if `p` does not resolve to a symbolic link. — *end note*]

31.12.13.30 Relative [fs.op.relative]

```
path filesystem::relative(const path& p, error_code& ec);
```

1 *Returns*: `relative(p, current_path(), ec)`.

2 *Throws*: As specified in 31.12.5.

```
path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);
```

3 *Returns*: For the first form:

```
weakly_canonical(p).lexically_relative(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4 *Throws*: As specified in 31.12.5.

31.12.13.31 Remove [fs.op.remove]

```
bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;
```

1 *Effects*: If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove`.

[*Note 1*: A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

2 *Postconditions*: `exists(symlink_status(p))` is `false`.

3 *Returns*: `true` if a file `p` has been removed and `false` otherwise.

[*Note 2*: Absence of a file `p` is not an error. — *end note*]

4 *Throws*: As specified in 31.12.5.

31.12.13.32 Remove all [fs.op.remove.all]

```
uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);
```

1 *Effects*: Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove`.

[*Note 1*: A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

2 *Postconditions*: `exists(symlink_status(p))` is `false`.

3 *Returns*: The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

4 *Throws*: As specified in 31.12.5.

31.12.13.33 Rename [fs.op.rename]

```
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

1 *Effects*: Renames `old_p` to `new_p`, as if by POSIX `rename`.

[*Note 1*:

(1.1) — If `old_p` and `new_p` resolve to the same existing file, no action is taken.

(1.2) — Otherwise, the rename can include the following effects:

(1.2.1) — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,

(1.2.2) — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but might be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — *end note*]

2 *Throws*: As specified in 31.12.5.

31.12.13.34 Resize file [fs.op.resize.file]

```
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

1 *Effects*: Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate`.

2 *Throws*: As specified in 31.12.5.

31.12.13.35 Space [fs.op.space]

```
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

1 *Returns*: An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsize` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.

2 *Throws*: As specified in 31.12.5.

3 *Remarks*: The value of member `space_info::available` is operating system dependent.

[*Note 1*: `available` might be less than `free`. — *end note*]

31.12.13.36 Status [fs.op.status]

```
file_status filesystem::status(const path& p);
```

1 *Effects*: As if by:

```
  error_code ec;
  file_status result = status(p, ec);
  if (result.type() == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
  return result;
```

2 *Returns*: See above.

3 *Throws*: `filesystem_error`.

[*Note 1*: `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — *end note*]

```
file_status filesystem::status(const path& p, error_code& ec) noexcept;
```

4 *Effects*: If possible, determines the attributes of the file `p` resolves to, as if by using POSIX `stat` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`.

[*Note 2*: This allows users to inspect the specifics of underlying API errors even when the value returned by `status` is not `file_status(file_type::none)`. — *end note*]

5 Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

6 *Returns*:

(6.1) — If `ec != error_code()`:

(6.1.1) — If the specific error indicates that `p` cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.

(6.1.2) — Otherwise, if the specific error indicates that `p` can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

(6.1.3) — Otherwise, returns `file_status(file_type::none)`.

[*Note 3*: These semantics distinguish between `p` being known not to exist, `p` existing but not being able to determine its attributes, and there being an error that prevents even knowing if `p` exists. These distinctions are important to some use cases. — *end note*]

(6.2) — Otherwise,

(6.2.1) — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[*Note 4*: `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — *end note*]

(6.2.2) — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[*Note 5*: `file_type::directory` implies that calling `directory_iterator(p)` would succeed. — *end note*]

(6.2.3) — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

(6.2.4) — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

(6.2.5) — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.

(6.2.6) — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.

(6.2.7) — Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::`*`A`*`, prms)`, where *`A`* is the constant for the implementation-defined file type.

(6.2.8) — Otherwise, returns `file_status(file_type::unknown, prms)`.

7 *Remarks*: If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.13.37 Status known [fs.op.status.known]

```
bool filesystem::status_known(file_status s) noexcept;
```

1 *Returns*: `s.type() != file_type::none`.

31.12.13.38 Symlink status [fs.op.symlink.status]

```
file_status filesystem::symlink_status(const path& p);
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;
```

1 *Effects*: Same as `status`, above, except that the attributes of `p` are determined as if by using POSIX `lstat` to obtain a POSIX `struct stat`.

2 Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

3 *Returns*: Same as `status`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`. The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

4 *Throws*: As specified in 31.12.5.

5 *Remarks*: Pathname resolution terminates if `p` names a symbolic link.

31.12.13.39 Temporary directory path [fs.op.temp.dir.path]

```
path filesystem::temp_directory_path();
path filesystem::temp_directory_path(error_code& ec);
```

1 Let `p` be an unspecified directory path suitable for temporary files.

2 *Effects*: If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported (31.12.5).

3 *Returns*: The path `p`. The signature with argument `ec` returns `path()` if an error occurs.

4 *Throws*: As specified in 31.12.5.

5 [*Example 1*: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, `"/tmp"`.

For Windows-based operating systems, an implementation might return the path reported by the Windows `GetTempPath` API function. — *end example*]

31.12.13.40 Weakly canonical [fs.op.weakly.canonical]

```
path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);
```

1 *Effects*: Using `status(p)` or `status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical` with a path argument composed of the leading elements of `p` that exist, if any, followed by the elements of `p` that do not exist, if any. For the first form, `canonical` is called without an `error_code` argument. For the second form, `canonical` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.

2 *Postconditions*: The returned path is in normal form (31.12.6.2).

3 *Returns*: `p` with symlinks resolved and the result normalized (31.12.6.2).

4 *Throws*: As specified in 31.12.5.

31.13 C library files [c.files]

31.13.1 Header <cstdio> synopsis [cstdio.syn]

```
namespace std {
  using size_t = see 17.2.4;

  void clearerr(FILE* stream);
  int feof(FILE* stream);
  int ferror(FILE* stream);
  void perror(const char* s);
}
```

1 The contents and meaning of the header `<cstdio>` are the same as the C standard library header `<stdio.h>`.

2 The return from each function call that delivers data to the host environment to be written to a file (See also: ISO/IEC 9899:2018, 7.21.3) is an observable checkpoint (4.1.2).

3 Calls to the function `tmpnam` with an argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to `tmpnam` with an argument that is a null pointer value.

See also: ISO/IEC 9899:2018, 7.21

31.13.2 Header <cinttypes> synopsis [cinttypes.syn]

```
#include <cstdint>   // see 17.4.1

namespace std {
  using imaxdiv_t = see below;

  constexpr intmax_t imaxabs(intmax_t j);
  constexpr imaxdiv_t imaxdiv(intmax_t numer, intmax_t denom);

1 The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

(1.1) — The header `<cinttypes>` includes the header `<cstdint>` (17.4.1) instead of `<stdint.h>`, and

(1.2) — `intmax_t` and `uintmax_t` are not required to be able to represent all values of extended integer types wider than `long long` and `unsigned long long`, respectively, and

(1.3) — if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```
constexpr intmax_t abs(intmax_t);
constexpr imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `constexpr intmax_t imaxabs(intmax_t)` and `constexpr imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

SEE ALSO: ISO/IEC 9899:2018, 7.8

2 Each of the `PRI` macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1. Each of the `SCN` macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1 and has a suitable `fscanf` length modifier for the type.

32 Concurrency support library [thread]

32.1 General [thread.general]

1 The following subclauses describe components to create and manage threads (6.9.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in Table 152.

Table 152 — Concurrency support library summary [tab:thread.summary]

	Subclause	Header
32.2	Requirements	
32.3	Stop tokens	`<stop_token>`
32.4	Threads	`<thread>`
32.5	Atomic operations	`<atomic>`, `<stdatomic.h>`
32.6	Mutual exclusion	`<mutex>`, `<shared_mutex>`
32.7	Condition variables	`<condition_variable>`
32.8	Semaphores	`<semaphore>`
32.9	Coordination types	`<latch>`, `<barrier>`
32.10	Futures	`<future>`
32.11	Safe reclamation	`<rcu>`, `<hazard_pointer>`

32.2 Requirements [thread.req]

32.2.1 Template parameter names [thread.req.paramname]

1 Throughout this Clause, the names of template parameters are used to express type requirements. `Predicate` is a function object type (22.10). Let `pred` denote an lvalue of type `Predicate`. Then the expression `pred()` shall be well-formed and the type `decltype(pred())` shall model *`boolean-testable`* (18.5.2). The return value of `pred()`, converted to `bool`, yields `true` if the corresponding test condition is satisfied, and `false` otherwise. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` that meets the *Cpp17Clock* requirements (30.3); the program is ill-formed if `is_clock_v<C>` is `false`.

32.2.2 Exceptions [thread.req.exception]

1 Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.8). Such exceptions are thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.14.

[*Example 1*: Consider a function in this Clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when "the caller does not have the privilege to perform the operation", the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — *end example*]

2 The `error_code` reported by such an exception's `code()` member function compares equal to one of the conditions specified in the function's error condition element.

32.2.3 Native handles [thread.req.native]

1 Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined.

[*Note 1*: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — *end note*]

32.2.4 Timing specifications [thread.req.timing]

1 Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in Clause 30.

2 Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a "quality of implementation" delay, expressed as duration D_i. Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a "quality of management" delay, expressed as duration D_m. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

3 The functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.[294] Given a duration argument D_t, the real-time duration of the timeout is $D_t + D_i + D_m$.

4 The functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument C_t, the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time C_a during the timeout, the behavior should be as follows:

(4.1) — If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.

(4.2) — If $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[*Note 1*: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — *end note*]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between C_t and the time point of the call to the `_until` function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

5 [*Note 2*: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. — *end note*]

6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.

7 Implementation-provided clocks that are used for these functions meet the *Cpp17TrivialClock* requirements (30.3).

8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*.

[*Note 3*: Instantiations of clock, time point and duration types supplied by the implementation as specified in 30.7 do not throw exceptions. — *end note*]

32.2.5 Requirements for *Cpp17Lockable* types [thread.req.lockable]

32.2.5.1 General [thread.req.lockable.general]

1 An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents.

[*Note 1*: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — *end note*]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

2 [*Note 2*: Some lockable objects are "agent oblivious" in that they work for any execution agent model because they do not determine or store the agent's ID (e.g., an ordinary spin lock). — *end note*]

294) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.

3 The standard library templates `unique_lock` (32.6.5.4), `shared_lock` (32.6.5.5), `scoped_lock` (32.6.5.3), `lock_guard` (32.6.5.2), `lock`, `try_lock` (32.6.6), and `condition_variable_any` (32.7.5) all operate on user-supplied lockable objects. The *Cpp17BasicLockable* requirements, the *Cpp17Lockable* requirements, the *Cpp17TimedLockable* requirements, the *Cpp17SharedLockable* requirements, and the *Cpp17SharedTimedLockable* requirements list the requirements imposed by these library types in order to acquire or release ownership of a `lock` by a given execution agent.

[*Note 3*: The nature of any lock ownership and any synchronization it entails are not part of these requirements. — *end note*]

4 A lock on an object `m` is said to be

(4.1) — a *non-shared lock* if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on `m`, or

(4.2) — a *shared lock* if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on `m`.

[*Note 4*: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. — *end note*]

32.2.5.2 *Cpp17BasicLockable* requirements [thread.req.lockable.basic]

1 A type `L` meets the *Cpp17BasicLockable* requirements if the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.lock()`

2 *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.unlock()`

3 *Preconditions*: The current execution agent holds a non-shared lock on `m`.

4 *Effects*: Releases a non-shared lock on `m` held by the current execution agent.

5 *Throws*: Nothing.

32.2.5.3 *Cpp17Lockable* requirements [thread.req.lockable.req]

1 A type `L` meets the *Cpp17Lockable* requirements if it meets the *Cpp17BasicLockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.try_lock()`

2 *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

3 *Return type*: `bool`.

4 *Returns*: `true` if the lock was acquired, otherwise `false`.

32.2.5.4 *Cpp17TimedLockable* requirements [thread.req.lockable.timed]

1 A type `L` meets the *Cpp17TimedLockable* requirements if it meets the *Cpp17Lockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of an instantiation of `duration` (30.5), and `abs_time` denotes a value of an instantiation of `time_point` (30.6)).

`m.try_lock_for(rel_time)`

2 *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

3 *Return type*: `bool`.

4 *Returns*: `true` if the lock was acquired, otherwise `false`.

`m.try_lock_until(abs_time)`

5 *Effects*: Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

6 *Return type*: `bool`.

7 *Returns*: `true` if the lock was acquired, otherwise `false`.

32.2.5.5 *Cpp17SharedLockable* requirements [thread.req.lockable.shared]

1 A type `L` meets the *Cpp17SharedLockable* requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (`m` denotes a value of type `L`):

`m.lock_shared()`

2 *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.try_lock_shared()`

3 *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

4 *Returns*: `true` if the lock was acquired, `false` otherwise.

`m.unlock_shared()`

5 *Preconditions*: The current execution agent holds a shared lock on `m`.

6 *Effects*: Releases a shared lock on `m` held by the current execution agent.

7 *Throws*: Nothing.

32.2.5.6 *Cpp17SharedTimedLockable* requirements [thread.req.lockable.shared.timed]

1 A type `L` meets the *Cpp17SharedTimedLockable* requirements if it meets the *Cpp17SharedLockable* requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

`m.try_lock_shared_for(rel_time)`

2 *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

3 *Returns*: `true` if the lock was acquired, `false` otherwise.

`m.try_lock_shared_until(abs_time)`

4 *Effects*: Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

5 *Returns*: `true` if the lock was acquired, `false` otherwise.

32.3 Stop tokens [thread.stoptoken]

32.3.1 Introduction [thread.stoptoken.intro]

1 Subclause 32.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a *stop request*.

2 The concepts *`stoppable-source`*, `stoppable_token`, and *`stoppable-callback-for`* specify the required syntax and semantics of shared access to a *stop state*. Any object modeling *`stoppable-source`*, `stoppable_token`, or *`stoppable-callback-for`* that refers to the same stop state is an *associated* *`stoppable-source`*, `stoppable_token`, or *`stoppable-callback-for`*, respectively.

3 An object of a type that models `stoppable_token` can be passed to an operation that can either

(3.1) — actively poll the token to check if there has been a stop request, or

(3.2) — register a callback that will be called in the event that a stop request is made.

A stop request made via an object whose type models *`stoppable-source`* will be visible to all associated `stoppable_token` and *`stoppable-source`* objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

4 Callbacks registered via an object whose type models *`stoppable-callback-for`* are called when a stop request is first made by any associated *`stoppable-source`* object.

5 The types `stop_source` and `stop_token` and the class template `stop_callback` implement the semantics of shared ownership of a stop state. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

6 An object of type `inplace_stop_source` is the sole owner of its stop state. An object of type `inplace_stop_token` or of a specialization of the class template `inplace_stop_callback` does not participate in ownership of its associated stop state.

[*Note 1*: They are for use when all uses of the associated token and callback objects are known to nest within the lifetime of the `inplace_stop_source` object. — *end note*]

32.3.2 Header `<stop_token>` synopsis [thread.stoptoken.syn]

```
namespace std {
  // 32.3.3, stop token concepts
  template<class CallbackFn, class Token, class Initializer = CallbackFn>
    concept stoppable-callback-for = see below;            // exposition only

  template<class Token>
    concept stoppable_token = see below;

  template<class CallbackFn>
    class inplace_stop_callback;
  template<class T, class CallbackFn>
    using stop_callback_for_t = T::template callback_type<CallbackFn>;
}
```

32.3.3 Stop token concepts [stoptoken.concepts]

1 The exposition-only *stoppable-callback-for* concept checks for a callback compatible with a given `Token` type.

```
template<class CallbackFn, class Token, class Initializer = CallbackFn>
  concept stoppable-callback-for =                          // exposition only
    invocable<CallbackFn> &&
    constructible_from<CallbackFn, Initializer> &&
    requires { typename stop_callback_for_t<Token, CallbackFn>; } &&
    constructible_from<stop_callback_for_t<Token, CallbackFn>, const Token&, Initializer>;
```

2 Let `t` and `u` be distinct, valid objects of type `Token` that reference the same logical stop state; let `init` be an expression such that `same_as<decltype(init), Initializer>` is `true`; and let `SCB` denote the type `stop_callback_for_t<Token, CallbackFn>`.

3 The concept *stoppable-callback-for*`<CallbackFn, Token, Initializer>` is modeled only if:

(3.1) — The following concepts are modeled:

(3.1.1) — `constructible_from<SCB, Token, Initializer>`

(3.1.2) — `constructible_from<SCB, Token&, Initializer>`

(3.1.3) — `constructible_from<SCB, const Token, Initializer>`

(3.2) — An object of type `SCB` has an associated callback function of type `CallbackFn`. Let `scb` be an object of type `SCB` and let `callback_fn` denote `scb`'s associated callback function. Direct-non-list-initializing `scb` from arguments `t` and `init` shall execute a *stoppable callback registration* as follows:

(3.2.1) — If `t.stop_possible()` is `true`:

(3.2.1.1) — `callback_fn` shall be direct-initialized with `init`.

(3.2.1.2) — Construction of `scb` shall only throw exceptions thrown by the initialization of `callback_fn` from `init`.

(3.2.1.3) — The callback invocation `std::forward<CallbackFn>(callback_fn)()` shall be registered with `t`'s associated stop state as follows:

(3.2.1.3) — If `t.stop_requested()` evaluates to `false` at the time of registration, the callback invocation is added to the stop state's list of callbacks such that `std::forward<CallbackFn>( callback_fn)()` is evaluated if a stop request is made on the stop state.

(3.2.1.3) — Otherwise, `std::forward<CallbackFn>(callback_fn)()` shall be immediately evaluated on the thread executing `scb`'s constructor, and the callback invocation shall not be added to the list of callback invocations.

If the callback invocation was added to stop state's list of callbacks, `scb` shall be associated with the stop state.

[*Note 1*: If `t.stop_possible()` is `false`, there is no requirement that the initialization of `scb` causes the initialization of `callback_fn`. — *end note*]

(3.2.2) —

(3.3) — Destruction of `scb` shall execute a *stoppable callback deregistration* as follows (in order):

(3.3.1) — If the constructor of `scb` did not register a callback invocation with `t`'s stop state, then the stoppable callback deregistration shall have no effect other than destroying `callback_fn` if it was constructed.

(3.3.2) — Otherwise, the invocation of `callback_fn` shall be removed from the associated stop state.

(3.3.3) — If `callback_fn` is concurrently executing on another thread, then the stoppable callback deregistration shall block (3.6) until the invocation of `callback_fn` returns such that the return from the invocation of `callback_fn` strongly happens before (6.9.2.2) the destruction of `callback_fn`.

(3.3.4) — If `callback_fn` is executing on the current thread, then the destructor shall not block waiting for the return from the invocation of `callback_fn`.

(3.3.5) — A stoppable callback deregistration shall not block on the completion of the invocation of some other callback registered with the same logical stop state.

(3.3.6) — The stoppable callback deregistration shall destroy `callback_fn`.

4 The `stoppable_token` concept checks for the basic interface of a stop token that is copyable and allows polling to see if stop has been requested and also whether a stop request is possible. The `unstoppable_token` concept checks for a `stoppable_token` type that does not allow stopping.

```
template<template<class> class>
  struct check-type-alias-exists;                              // exposition only

template<class Token>
  concept stoppable_token =
    requires (const Token tok) {
      typename check-type-alias-exists<Token::template callback_type>;
      { tok.stop_requested() } noexcept -> same_as<bool>;
      { tok.stop_possible() } noexcept -> same_as<bool>;
      { Token(tok) } noexcept;                    // see implicit expression variations (18.2)
    } &&
    copyable<Token> &&
    equality_comparable<Token>;

template<class Token>
  concept unstoppable_token =
    stoppable_token<Token> &&
    requires (const Token tok) {
      requires bool_constant<(!tok.stop_possible())>::value;
    };
```

5 An object whose type models `stoppable_token` has at most one associated logical stop state. A `stoppable_token` object with no associated stop state is said to be *disengaged*.

6 Let `SP` be an evaluation of `t.stop_possible()` that is `false`, and let SR be an evaluation of `t.stop_requested()` that is `true`.

7 The type `Token` models `stoppable_token` only if:

(7.1) — Any evaluation of `u.stop_possible()` or `u.stop_requested()` that happens after (6.9.2.2) `SP` is `false`.

(7.2) — Any evaluation of `u.stop_possible()` or `u.stop_requested()` that happens after `SR` is `true`.

(7.3) — For any types `CallbackFn` and `Initializer` such that *`stoppable-callback-for`*`<CallbackFn, Token, Initializer>` is satisfied, *`stoppable-callback-for`*`<CallbackFn, Token, Initializer>` is modeled.

(7.4) — If `t` is disengaged, evaluations of `t.stop_possible()` and `t.stop_requested()` are `false`.

(7.5) — If `t` and `u` reference the same stop state, or if both `t` and `u` are disengaged, `t == u` is `true`; otherwise, it is `false`.

8 An object whose type models the exposition-only *`stoppable-source`* concept can be queried whether stop has been requested (`stop_requested`) and whether stop is possible (`stop_possible`). It is a factory for associated stop tokens (`get_token`), and a stop request can be made on it (`request_stop`). It maintains a list of registered stop callback invocations that it executes when a stop request is first made.

```
template<class Source>
  concept stoppable-source =                                   // exposition only
    requires (Source& src, const Source csrc) {          // see implicit expression variations (18.2)
      { csrc.get_token() } -> stoppable_token;
      { csrc.stop_possible() } noexcept -> same_as<bool>;
      { csrc.stop_requested() } noexcept -> same_as<bool>;
      { src.request_stop() } -> same_as<bool>;
    };
```

9 An object whose type models *`stoppable-source`* has at most one associated logical stop state. If it has no associated stop state, it is said to be disengaged. Let `s` be an object whose type models *`stoppable-source`* and that is disengaged. `s.stop_possible()` and `s.stop_requested()` shall be `false`.

10 Let `t` be an object whose type models *`stoppable-source`*. If `t` is disengaged, `t.get_token()` shall return a disengaged stop token; otherwise, it shall return a stop token that is associated with the stop state of `t`.

11 Calls to the member functions `request_stop`, `stop_requested`, and `stop_possible` and similarly named member functions on associated `stoppable_token` objects do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stoppable_token` or *`stoppable-source`* object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

12 If the *`stoppable-source`* is disengaged, `request_stop` shall have no effect and return `false`. Otherwise, it shall execute a *stop request operation* on the associated stop state. A stop request operation determines whether the stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request shall happen atomically, as-if by a read-modify-write operation (6.9.2.2). If the request was made, the stop state's registered callback invocations shall be synchronously executed. If an invocation of a callback exits via an exception then `terminate` shall be invoked (14.6.2).

[*Note 2*: No constraint is placed on the order in which the callback invocations are executed. — *end note*]

`request_stop` shall return `true` if a stop request was made, and `false` otherwise. After a call to `request_stop` either a call to `stop_possible` shall return `false` or a call to `stop_requested` shall return `true`.

[*Note 3*: A stop request includes notifying all condition variables of type `condition_variable_any` temporarily registered during an interruptible wait (32.7.5.3). — *end note*]

32.3.4 Class `stop_token` [stoptoken]

32.3.4.1 General [stoptoken.general]

1 The class `stop_token` models the concept `stoppable_token`. It shares ownership of its stop state, if any, with its associated `stop_source` object (32.3.5) and any `stop_token` objects to which it compares equal.

```
namespace std {
  class stop_token {
  public:
    template<class CallbackFn>
      using callback_type = stop_callback<CallbackFn>;

    stop_token() noexcept = default;

    // 32.3.4.2, member functions
    void swap(stop_token&) noexcept;

    bool stop_requested() const noexcept;
    bool stop_possible() const noexcept;

    bool operator==(const stop_token& rhs) noexcept = default;

  private:
    shared_ptr<unspecified> stop-state;                         // exposition only
  };
}
```

2 *`stop-state`* refers to the `stop_token`'s associated stop state. A `stop_token` object is disengaged when *`stop-state`* is empty.

32.3.4.2 Member functions [stoptoken.mem]

```
void swap(stop_token& rhs) noexcept;
```

1 *Effects*: Equivalent to:

```
  stop-state.swap(rhs.stop-state);
```

```
bool stop_requested() const noexcept;
```

2 *Returns*: `true` if *`stop-state`* refers to a stop state that has received a stop request; otherwise, `false`.

```
bool stop_possible() const noexcept;
```

3 *Returns*: `false` if

(3.1) — `*this` is disengaged, or

(3.2) — a stop request was not made and there are no associated `stop_source` objects;

otherwise, `true`.

32.3.5 Class `stop_source` [stopsource]

32.3.5.1 General [stopsource.general]

```
namespace std {
  class stop_source {
  public:
    // 32.3.5.2, constructors, copy, and assignment
    stop_source();
    explicit stop_source(nostopstate_t) noexcept {}

    // 32.3.5.3, member functions
    void swap(stop_source&) noexcept;

    bool request_stop() noexcept;

    bool operator==(const stop_source& rhs) noexcept = default;

  private:
    shared_ptr<unspecified> stop-state;                         // exposition only
  };
}
```

1 *`stop-state`* refers to the `stop_source`'s associated stop state. A `stop_source` object is disengaged when *`stop-state`* is empty.

2 `stop_source` models *`stoppable-source`*, `copyable`, `equality_comparable`, and `swappable`.

32.3.5.2 Constructors, copy, and assignment [stopsource.cons]

`stop_source();`

1 *Effects*: Initializes *`stop-state`* with a pointer to a new stop state.

2 *Postconditions*: `stop_possible()` is `true` and `stop_requested()` is `false`.

3 *Throws*: `bad_alloc` if memory cannot be allocated for the stop state.

32.3.5.3 Member functions [stopsource.mem]

`void swap(stop_source& rhs) noexcept;`

1 *Effects*: Equivalent to:

```
stop-state.swap(rhs.stop-state);
```

`stop_token get_token() const noexcept;`

2 *Returns*: `stop_token()` if `stop_possible()` is `false`; otherwise a new associated `stop_token` object; i.e., its *`stop-state`* member is equal to the *`stop-state`* member of `*this`.

`bool stop_possible() const noexcept;`

3 *Returns*: *`stop-state`* `!= nullptr`.

`bool stop_requested() const noexcept;`

4 *Returns*: `true` if *`stop-state`* refers to a stop state that has received a stop request; otherwise, `false`.

`bool request_stop() noexcept;`

5 *Effects*: Executes a stop request operation (32.3.3) on the associated stop state, if any.

32.3.6 Class template stop_callback [stopcallback]

32.3.6.1 General [stopcallback.general]

1
```
namespace std {
  template<class CallbackFn>
  class stop_callback {
  public:
    using callback_type = CallbackFn;

    // 32.3.6.2, constructors and destructor
    template<class Initializer>
      explicit stop_callback(const stop_token& st, Initializer&& init)
        noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
    template<class Initializer>
      explicit stop_callback(stop_token&& st, Initializer&& init)
        noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
    ~stop_callback();

    stop_callback(const stop_callback&) = delete;
    stop_callback(stop_callback&&) = delete;
    stop_callback& operator=(const stop_callback&) = delete;
    stop_callback& operator=(stop_callback&&) = delete;

  private:
    CallbackFn callback-fn;                                         // exposition only
  };

  template<class CallbackFn>
    stop_callback(stop_token, CallbackFn) -> stop_callback<CallbackFn>;
}
```

2 *Mandates*: `stop_callback` is instantiated with an argument for the template parameter `CallbackFn` that satisfies both `invocable` and `destructible`.

3 *Remarks*: For a type `Initializer`, if *`stoppable-callback-for`*`<CallbackFn, stop_token, Initializer>` is satisfied, then *`stoppable-callback-for`*`<CallbackFn, stop_token, Initializer>` is modeled. The exposition-only *`callback-fn`* member is the associated callback function (32.3.3) of `stop_callback<CallbackFn>` objects.

32.3.6.2 Constructors and destructor [stopcallback.cons]

```
template<class Initializer>
  explicit stop_callback(const stop_token& st, Initializer&& init)
    noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);

template<class Initializer>
  explicit stop_callback(stop_token&& st, Initializer&& init)
    noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
```

1 *Constraints*: `CallbackFn` and `Initializer` satisfy `constructible_from<CallbackFn, Initializer>`.

2 *Effects*: Initializes *`callback-fn`* with `std::forward<Initializer>(init)` and executes a stoppable callback registration (32.3.3). If a callback is registered with `st`'s shared stop state, then `*this` acquires shared ownership of that stop state.

```
~stop_callback();
```

3 *Effects*: Executes a stoppable callback deregistration (32.3.3) and releases ownership of the stop state, if any.

32.3.7 Class never_stop_token [stoptoken.never]

1 The class `never_stop_token` models the `unstoppable_token` concept. It provides a stop token interface, but also provides static information that a stop is never possible nor requested.

```
namespace std {
  class never_stop_token {
    struct callback-type {                                     // exposition only
      explicit callback-type(never_stop_token, auto&&) noexcept {}
    };
  public:
    template<class>
      using callback_type = callback-type;

    static constexpr bool stop_requested() noexcept { return false; }
    static constexpr bool stop_possible() noexcept { return false; }

    bool operator==(const never_stop_token&) const = default;
  };
}
```

32.3.8 Class inplace_stop_token [stoptoken.inplace]

32.3.8.1 General [stoptoken.inplace.general]

1 The class `inplace_stop_token` models the concept `stoppable_token`. It references the stop state of its associated `inplace_stop_source` object (32.3.9), if any.

```
namespace std {
  class inplace_stop_token {
  public:
    template<class CallbackFn>
      using callback_type = inplace_stop_callback<CallbackFn>;

    inplace_stop_token() = default;
    bool operator==(const inplace_stop_token&) const = default;

    // 32.3.8.2, member functions
    bool stop_requested() const noexcept;
    bool stop_possible() const noexcept;
    void swap(inplace_stop_token&) noexcept;

  private:
    const inplace_stop_source* stop-source = nullptr;          // exposition only
  };
}
```

32.3.8.2 Member functions [stoptoken.inplace.mem]

`void swap(inplace_stop_token& rhs) noexcept;`

1 *Effects*: Exchanges the values of *`stop-source`* and `rhs.`*`stop-source`*.

`bool stop_requested() const noexcept;`

2 *Effects*: Equivalent to:

```
return stop-source != nullptr && stop-source->stop_requested();
```

3 [*Note 1*: As specified in 6.7.4, the behavior of `stop_requested` is undefined unless the call strongly happens before the start of the destructor of the associated `inplace_stop_source` object, if any. — *end note*]

`stop_possible() const noexcept;`

4 *Returns*: *`stop-source`* `!= nullptr`.

5 [*Note 2*: As specified in 6.7.6.1, the behavior of `stop_possible` is implementation-defined unless the call strongly happens before the end of the storage duration of the associated `inplace_stop_source` object, if any. — *end note*]

32.3.9 Class inplace_stop_source [stopsource.inplace]

32.3.9.1 General [stopsource.inplace.general]

1 The class `inplace_stop_source` models *`stoppable-source`*.

```
namespace std {
  class inplace_stop_source {
  public:
    // 32.3.9.2, constructors
    constexpr inplace_stop_source() noexcept;

    inplace_stop_source(inplace_stop_source&&) = delete;
    inplace_stop_source(const inplace_stop_source&) = delete;
    inplace_stop_source& operator=(inplace_stop_source&&) = delete;
    inplace_stop_source& operator=(const inplace_stop_source&) = delete;
    ~inplace_stop_source();

    // 32.3.9.3, stop handling
    constexpr inplace_stop_token get_token() const noexcept;
    static constexpr bool stop_possible() noexcept { return true; }
    bool stop_requested() const noexcept;
    bool request_stop() noexcept;
  };
}
```

32.3.9.2 Constructors [stopsource.inplace.cons]

`constexpr inplace_stop_source() noexcept;`

1 *Effects*: Initializes a new stop state inside `*this`.

2 *Postconditions*: `stop_requested()` is `false`.

32.3.9.3 Member functions [stopsource.inplace.mem]

`constexpr inplace_stop_token get_token() const noexcept;`

1 *Returns*: A new associated `inplace_stop_token` object whose *`stop-source`* member is equal to `this`.

`bool stop_requested() const noexcept;`

2 *Returns*: `true` if the stop state inside `*this` has received a stop request; otherwise, `false`.

`bool request_stop() noexcept;`

3 *Effects*: Executes a stop request operation (32.3.3).

4 *Postconditions*: `stop_requested()` is `true`.

32.3.10 Class template `inplace_stop_callback` [stopcallback.inplace]

32.3.10.1 General [stopcallback.inplace.general]

```
namespace std {
  template<class CallbackFn>
  class inplace_stop_callback {
  public:
    using callback_type = CallbackFn;

    // 32.3.10.2, constructors and destructor
    template<class Initializer>
      explicit inplace_stop_callback(inplace_stop_token st, Initializer&& init)
        noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
    ~inplace_stop_callback();

    inplace_stop_callback(inplace_stop_callback&&) = delete;
    inplace_stop_callback(const inplace_stop_callback&) = delete;
    inplace_stop_callback& operator=(inplace_stop_callback&&) = delete;
    inplace_stop_callback& operator=(const inplace_stop_callback&) = delete;

  private:
    CallbackFn callback-fn;                                    // exposition only
  };
```

```
    template<class CallbackFn>
      inplace_stop_callback(inplace_stop_token, CallbackFn)
        -> inplace_stop_callback<CallbackFn>;
  }
```

1 *Mandates*: `CallbackFn` satisfies both `invocable` and `destructible`.

2 *Remarks*: For a type `Initializer`, if

```
  stoppable-callback-for<CallbackFn, inplace_stop_token, Initializer>
```

is satisfied, then

```
  stoppable-callback-for<CallbackFn, inplace_stop_token, Initializer>
```

is modeled. For an `inplace_stop_callback<CallbackFn>` object, the exposition-only *`callback-fn`* member is its associated callback function (32.3.3).

32.3.10.2 Constructors and destructor [stopcallback.inplace.cons]

```
template<class Initializer>
  explicit inplace_stop_callback(inplace_stop_token st, Initializer&& init)
    noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
```

1 *Constraints*: `constructible_from<CallbackFn, Initializer>` is satisfied.

2 *Effects*: Initializes *`callback-fn`* with `std::forward<Initializer>(init)` and executes a stoppable callback registration (32.3.3).

```
~inplace_stop_callback();
```

3 *Effects*: Executes a stoppable callback deregistration (32.3.3).

32.4 Threads [thread.threads]

32.4.1 General [thread.threads.general]

1 32.4 describes components that can be used to create and manage threads.

[*Note 1*: These threads are intended to map one-to-one with operating system threads. — *end note*]

32.4.2 Header `<thread>` synopsis [thread.syn]

```
  #include <compare>              // see 17.12.1

  namespace std {
    // 32.4.3, class thread
    class thread;

    void swap(thread& x, thread& y) noexcept;

    // 32.4.4, class jthread
    class jthread;

    // 32.4.5, namespace this_thread
    namespace this_thread {
      thread::id get_id() noexcept;

      void yield() noexcept;
      template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
      template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
    }
  }
```

32.4.3 Class `thread` [thread.thread.class]

32.4.3.1 General [thread.thread.class.general]

1 The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A

thread object uniquely represents a particular thread of execution. That representation may be transferred to other thread objects in such a way that no two thread objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no thread object represents that thread. Objects of class thread can be in a state that does not represent a thread of execution.

[*Note 1*: A thread object does not represent a thread of execution after default construction, after being moved from, or after a successful call to detach or join. — *end note*]

```
namespace std {
  class thread {
  public:
    // 32.4.3.2, class thread::id
    class id;
    using native_handle_type = implementation-defined;         // see 32.2.3

    // construct/copy/destroy
    thread() noexcept;
    template<class F, class... Args> explicit thread(F&& f, Args&&... args);
    ~thread();
    thread(const thread&) = delete;
    thread(thread&&) noexcept;
    thread& operator=(const thread&) = delete;
    thread& operator=(thread&&) noexcept;

    // 32.4.3.6, members
    void swap(thread&) noexcept;
    bool joinable() const noexcept;
    void join();
    void detach();
    id get_id() const noexcept;
    native_handle_type native_handle();                         // see 32.2.3

    // static members
    static unsigned int hardware_concurrency() noexcept;
  };
}
```

32.4.3.2 Class thread::id [thread.thread.id]

```
namespace std {
  class thread::id {
  public:
    id() noexcept;
  };

  bool operator==(thread::id x, thread::id y) noexcept;
  strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

  template<class charT, class traits>
    basic_ostream<charT, traits>&
      operator<<(basic_ostream<charT, traits>& out, thread::id id);

  template<class charT> struct formatter<thread::id, charT>;

  // hash support
  template<class T> struct hash;
  template<> struct hash<thread::id>;
}
```

1 An object of type thread::id provides a unique identifier for each thread of execution and a single distinct value for all thread objects that do not represent a thread of execution (32.4.3). Each thread of execution has an associated thread::id object that is not equal to the thread::id object of any other thread of execution and that is not equal to the thread::id object of any thread object that does not represent threads of execution.

2 The *text representation* for the character type `charT` of an object of type `thread::id` is an unspecified sequence of `charT` such that, for two objects of type `thread::id` `x` and `y`, if `x == y` is `true`, the `thread::id` objects have the same text representation, and if `x != y` is `true`, the `thread::id` objects have distinct text representations.

3 `thread::id` is a trivially copyable class (11.2). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.

4 [*Note 1*: Relational operators allow `thread::id` objects to be used as keys in associative containers. — *end note*]

```
id() noexcept;
```

5 *Postconditions*: The constructed object does not represent a thread of execution.

```
bool operator==(thread::id x, thread::id y) noexcept;
```

6 *Returns*: `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

```
strong_ordering operator<=>(thread::id x, thread::id y) noexcept;
```

7 Let $P(\texttt{x}, \texttt{y})$ be an unspecified total ordering over `thread::id` as described in 26.8.

8 *Returns*: `strong_ordering::less` if $P(\texttt{x}, \texttt{y})$ is `true`. Otherwise, `strong_ordering::greater` if $P(\texttt{y}, \texttt{x})$ is `true`. Otherwise, `strong_ordering::equal`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);
```

9 *Effects*: Inserts the text representation for `charT` of `id` into `out`.

10 *Returns*: `out`.

```
template<class charT> struct formatter<thread::id, charT>;
```

11 `formatter<thread::id, charT>` interprets *format-spec* as a *thread-id-format-spec*. The syntax of format specifications is as follows:

thread-id-format-spec:
  fill-and-align$_{opt}$ *width*$_{opt}$

[*Note 2*: The productions *fill-and-align* and *width* are described in 28.5.2.2. — *end note*]

12 If the *align* option is omitted it defaults to `>`.

13 A `thread::id` object is formatted by writing its text representation for `charT` to the output with additional padding and adjustments as specified by the format specifiers.

```
template<> struct hash<thread::id>;
```

14 The specialization is enabled (22.10.19).

32.4.3.3 Constructors [thread.thread.constr]

```
thread() noexcept;
```

1 *Effects*: The object does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()`.

```
template<class F, class... Args> explicit thread(F&& f, Args&&... args);
```

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `thread`.

4 *Mandates*: The following are all `true`:

(4.1) — `is_constructible_v<decay_t<F>, F>`,

(4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and

(4.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

5 *Effects*: The new thread of execution executes

```
invoke(auto(std::forward<F>(f)),              // for invoke, see 22.10.5
       auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[*Note 1*: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note*]

If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

6 *Synchronization*: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

7 *Postconditions*: `get_id() != id()`. `*this` represents the newly started thread.

8 *Throws*: `system_error` if unable to start the new thread.

9 *Error conditions*:

(9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

10 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

32.4.3.4 Destructor [thread.thread.destr]

```
~thread();
```

1 *Effects*: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

[*Note 1*: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. — *end note*]

32.4.3.5 Assignment [thread.thread.assign]

```
thread& operator=(thread&& x) noexcept;
```

1 *Effects*: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

2 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

3 *Returns*: `*this`.

32.4.3.6 Members [thread.thread.member]

```
void swap(thread& x) noexcept;
```

1 *Effects*: Swaps the state of `*this` and `x`.

```
bool joinable() const noexcept;
```

2 *Returns*: `get_id() != id()`.

```
void join();
```

3 *Effects*: Blocks until the thread represented by `*this` has completed.

4 *Synchronization*: The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

[*Note 1*: Operations on `*this` are not synchronized. — *end note*]

5 *Postconditions*: The thread represented by `*this` has completed. `get_id() == id()`.

6 *Throws*: `system_error` when an exception is required (32.2.2).

7 *Error conditions*:

(7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.

(7.2) — `no_such_process` — if the thread is not valid.

(7.3) — `invalid_argument` — if the thread is not joinable.

`void detach();`

8 *Effects*: The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation releases any owned resources.

9 *Postconditions*: `get_id() == id()`.

10 *Throws*: `system_error` when an exception is required (32.2.2).

11 *Error conditions*:

(11.1) — `no_such_process` — if the thread is not valid.

(11.2) — `invalid_argument` — if the thread is not joinable.

`id get_id() const noexcept;`

12 *Returns*: A default constructed `id` object if `*this` does not represent a thread, otherwise `this_-thread::get_id()` for the thread of execution represented by `*this`.

32.4.3.7 Static members [thread.thread.static]

`unsigned hardware_concurrency() noexcept;`

1 *Returns*: The number of hardware thread contexts.

[*Note 1*: This value should only be considered to be a hint. — *end note*]

If this value is not computable or well-defined, an implementation should return 0.

32.4.3.8 Specialized algorithms [thread.thread.algorithm]

`void swap(thread& x, thread& y) noexcept;`

1 *Effects*: As if by `x.swap(y)`.

32.4.4 Class `jthread` [thread.jthread.class]

32.4.4.1 General [thread.jthread.class.general]

1 The class `jthread` provides a mechanism to create a new thread of execution. The functionality is the same as for class `thread` (32.4.3) with the additional abilities to provide a `stop_token` (32.3) to the new thread of execution, make stop requests, and automatically join.

```
namespace std {
  class jthread {
  public:
    // types

}
```

32.4.4.2 Constructors, move, and assignment [thread.jthread.cons]

`jthread() noexcept;`

1 *Effects*: Constructs a `jthread` object that does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()` is `true` and `ssource.stop_possible()` is `false`.

`template<class F, class... Args> explicit jthread(F&& f, Args&&... args);`

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `jthread`.

4 *Mandates*: The following are all `true`:

(4.1) — `is_constructible_v<decay_t<F>, F>`,

(4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and

(4.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...> ||`
`is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>`.

5 *Effects*: Initializes `ssource`. The new thread of execution executes

```
invoke(auto(std::forward<F>(f)), get_stop_token(),   // for invoke, see 22.10.5
       auto(std::forward<Args>(args))...)
```

if that expression is well-formed, otherwise

```
invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[*Note 1*: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note*]

If the `invoke` expression exits via an exception, `terminate` is called.

6 *Synchronization*: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

7 *Postconditions*: `get_id() != id()` is `true` and `ssource.stop_possible()` is `true` and `*this` represents the newly started thread.

[*Note 2*: The calling thread can make a stop request only once, because it cannot replace this stop token. — *end note*]

8 *Throws*: `system_error` if unable to start the new thread.

9 *Error conditions*:

(9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

`jthread(jthread&& x) noexcept;`

10 *Postconditions*: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction. `ssource` has the value of `x.ssource` prior to the start of construction and `x.ssource.stop_possible()` is `false`.

`~jthread();`

11 *Effects*: If `joinable()` is `true`, calls `request_stop()` and then `join()`.

[*Note 3*: Operations on `*this` are not synchronized. — *end note*]

`jthread& operator=(jthread&& x) noexcept;`

12 *Effects*: If `&x == this` is `true`, there are no effects. Otherwise, if `joinable()` is `true`, calls `request_stop()` and then `join()`, then assigns the state of `x` to `*this` and sets `x` to a default constructed state.

13 *Postconditions*: `get_id()` returns the value of `x.get_id()` prior to the assignment. `ssource` has the value of `x.ssource` prior to the assignment.

14 *Returns*: `*this`.

32.4.4.3 Members [thread.jthread.mem]

`void swap(jthread& x) noexcept;`

1 *Effects*: Exchanges the values of `*this` and `x`.

`bool joinable() const noexcept;`

2 *Returns*: `get_id() != id()`.

`void join();`

3 *Effects*: Blocks until the thread represented by `*this` has completed.

4 *Synchronization*: The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

[*Note 1*: Operations on `*this` are not synchronized. — *end note*]

5 *Postconditions*: The thread represented by `*this` has completed. `get_id() == id()`.

6 *Throws*: `system_error` when an exception is required (32.2.2).

7 *Error conditions*:

(7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.

(7.2) — `no_such_process` — if the thread is not valid.

(7.3) — `invalid_argument` — if the thread is not joinable.

`void detach();`

8 *Effects*: The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation releases any owned resources.

9 *Postconditions*: `get_id() == id()`.

10 *Throws*: `system_error` when an exception is required (32.2.2).

11 *Error conditions*:

(11.1) — `no_such_process` — if the thread is not valid.

(11.2) — `invalid_argument` — if the thread is not joinable.

`id get_id() const noexcept;`

12 *Returns*: A default constructed `id` object if `*this` does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by `*this`.

32.4.4.4 Stop token handling [thread.jthread.stop]

`stop_source get_stop_source() noexcept;`

1 *Effects*: Equivalent to: `return ssource;`

```
stop_token get_stop_token() const noexcept;
```

2 *Effects*: Equivalent to: `return ssource.get_token();`

```
bool request_stop() noexcept;
```

3 *Effects*: Equivalent to: `return ssource.request_stop();`

32.4.4.5 Specialized algorithms [thread.jthread.special]

```
friend void swap(jthread& x, jthread& y) noexcept;
```

1 *Effects*: Equivalent to: `x.swap(y)`.

32.4.4.6 Static members [thread.jthread.static]

```
static unsigned int hardware_concurrency() noexcept;
```

1 *Returns*: `thread::hardware_concurrency()`.

32.4.5 Namespace this_thread [thread.thread.this]

```
  namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
      void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
      void sleep_for(const chrono::duration<Rep, Period>& rel_time);
  }
```

```
thread::id this_thread::get_id() noexcept;
```

1 *Returns*: An object of type `thread::id` that uniquely identifies the current thread of execution. Every invocation from this thread of execution returns the same value. The object returned does not compare equal to a default-constructed `thread::id`.

```
void this_thread::yield() noexcept;
```

2 *Effects*: Offers the implementation the opportunity to reschedule.

3 *Synchronization*: None.

```
template<class Clock, class Duration>
  void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4 *Effects*: Blocks the calling thread for the absolute timeout (32.2.4) specified by `abs_time`.

5 *Synchronization*: None.

6 *Throws*: Timeout-related exceptions (32.2.4).

```
template<class Rep, class Period>
  void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

7 *Effects*: Blocks the calling thread for the relative timeout (32.2.4) specified by `rel_time`.

8 *Synchronization*: None.

9 *Throws*: Timeout-related exceptions (32.2.4).

32.5 Atomic operations [atomics]

32.5.1 General [atomics.general]

1 Subclause 32.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

32.5.2 Header <atomic> synopsis [atomics.syn]

```
  namespace std {
    // 32.5.4, order and consistency
    enum class memory_order : unspecified;                                   // freestanding
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;       // freestanding
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;       // freestanding
    inline constexpr memory_order memory_order_release = memory_order::release;       // freestanding
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;       // freestanding
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;       // freestanding
  }

  // 32.5.5, lock-free property

32.5.3 Type aliases [atomics.alias]

1 The type aliases `atomic_int`N`_t`, `atomic_uint`N`_t`, `atomic_intptr_t`, and `atomic_uintptr_t` are defined if and only if `int`N`_t`, `uint`N`_t`, `intptr_t`, and `uintptr_t` are defined, respectively.

2 The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is `true`.

[*Note 1*: These aliases are optional in freestanding implementations (16.4.2.5). — *end note*]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (32.5.6) are most efficient.

32.5.4 Order and consistency [atomics.order]

```
namespace std {
  enum class memory_order : unspecified {
    relaxed = 0, acquire = 2, release = 3, acq_rel = 4, seq_cst = 5
  };
}
```

1 The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

(1.1) — `memory_order::relaxed`: no operation orders memory.

(1.2) — `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.

(1.3) — `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[*Note 1*: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — *end note*]

2 An atomic operation A that performs a release operation on an atomic object M synchronizes with an atomic operation B that performs an acquire operation on M and takes its value from any side effect in the release sequence headed by A.

3 An atomic operation A on some atomic object M is *coherence-ordered before* another atomic operation B on M if

(3.1) — A is a modification, and B reads the value stored by A, or

(3.2) — A precedes B in the modification order of M, or

(3.3) — A and B are not the same atomic read-modify-write operation, and there exists an atomic modification X of M such that A reads the value stored by X and X precedes B in the modification order of M, or

(3.4) — there exists an atomic modification X of M such that A is coherence-ordered before X and X is coherence-ordered before B.

4 There is a single total order S on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if A and B are `memory_order::seq_cst` operations and A strongly happens before B, then A precedes B in S. Second, for every pair of atomic operations A and B on an object M, where A is coherence-ordered before B, the following four conditions are required to be satisfied by S:

(4.1) — if A and B are both `memory_order::seq_cst` operations, then A precedes B in S; and

(4.2) — if A is a `memory_order::seq_cst` operation and B happens before a `memory_order::seq_cst` fence Y, then A precedes Y in S; and

(4.3) — if a `memory_order::seq_cst` fence X happens before A and B is a `memory_order::seq_cst` operation, then X precedes B in S; and

(4.4) — if a `memory_order::seq_cst` fence X happens before A and B happens before a `memory_order::seq_cst` fence Y, then X precedes Y in S.

5 [*Note 2*: This definition ensures that S is consistent with the modification order of any atomic object M. It also ensures that a `memory_order::seq_cst` load A of M gets its value either from the last modification of M that precedes

A in *S* or from some non-`memory_order::seq_cst` modification of *M* that does not happen before any modification of *M* that precedes *A* in *S*. — *end note*]

6 [*Note 3*: We do not require that *S* be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — *end note*]

7 [*Note 4*: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — *end note*]

8 Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[*Note 5*: For example, with `x` and `y` initially zero,

```
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);

// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing `r1 == r2 == 42`, since the store of 42 to `y` is only possible if the store to `x` stores `42`, which circularly depends on the store to `y` storing `42`. Note that without this restriction, such an execution is possible. — *end note*]

9 [*Note 6*: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with `x` and `y` again initially zero:

```
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);

// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
```

— *end note*]

10 Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

11 *Recommended practice*: The implementation should make atomic stores visible to atomic loads, and atomic loads should observe atomic stores, within a reasonable amount of time.

32.5.5 Lock-free property [atomics.lockfree]

```

#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

1 The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

2 On a hosted implementation (16.4.2.5), at least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

3 The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` (32.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.

4 Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

5 *Recommended practice*: Operations that are lock-free should also be address-free.[295] The implementation of these operations should not depend on any per-process state.

[*Note 1*: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — *end note*]

32.5.6 Waiting and notifying [atomics.wait]

1 *Atomic waiting operations* and *atomic notifying operations* provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function's effects.

[*Note 1*: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — *end note*]

2 [*Note 2*: The following functions are atomic waiting operations:

(2.1) — `atomic<T>::wait`,

(2.2) — `atomic_flag::wait`,

(2.3) — `atomic_wait` and `atomic_wait_explicit`,

(2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and

(2.5) — `atomic_ref<T>::wait`.

— *end note*]

3 [*Note 3*: The following functions are atomic notifying operations:

(3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,

(3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,

(3.3) — `atomic_notify_one` and `atomic_notify_all`,

(3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and

(3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.

— *end note*]

4 A call to an atomic waiting operation on an atomic object `M` is *eligible to be unblocked* by a call to an atomic notifying operation on `M` if there exist side effects `X` and `Y` on `M` such that:

(4.1) — the atomic waiting operation has blocked after observing the result of `X`,

(4.2) — `X` precedes `Y` in the modification order of `M`, and

(4.3) — `Y` happens before the call to the atomic notifying operation.

32.5.7 Class template `atomic_ref` [atomics.ref.generic]

32.5.7.1 General [atomics.ref.generic.general]

```
namespace std {
  template<class T> struct atomic_ref {
  private:
    T* ptr;               // exposition only

  public:
    using value_type = remove_cv_t<T>;
    static constexpr size_t required_alignment = implementation-defined;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr explicit atomic_ref(T&);
    constexpr atomic_ref(const atomic_ref&) noexcept;
    atomic_ref& operator=(const atomic_ref&) = delete;
```

295) That is, atomic operations on the same memory location via two different addresses will communicate atomically.

```
    constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type operator=(value_type) const noexcept;
    constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
    constexpr operator value_type() const noexcept;

    constexpr value_type exchange(value_type,
                                  memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, value_type,
                                         memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, value_type,
                                           memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, value_type,
                                         memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, value_type,
                                           memory_order = memory_order::seq_cst) const noexcept;

    constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
    constexpr void notify_one() const noexcept;
    constexpr void notify_all() const noexcept;
    constexpr T* address() const noexcept;
  };
}
```

1 An `atomic_ref` object applies atomic operations (32.5.1) to the object referenced by `*ptr` such that, for the lifetime (6.7.4) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.9.2.2).

2 The program is ill-formed if `is_trivially_copyable_v<T>` is `false`.

3 The lifetime (6.7.4) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_ref`s that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.

4 Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.

[*Note 1*: Atomic operations or the `atomic_ref` constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — *end note*]

5 The program is ill-formed if `is_always_lock_free` is `false` and `is_volatile_v<T>` is `true`.

32.5.7.2 Operations [atomics.ref.ops]

`static constexpr size_t required_alignment;`

1 The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`.

2 [*Note 1*: Hardware could require an object referenced by an `atomic_ref` to have stricter alignment (6.7.3) than other objects of type `T`. Further, whether operations on an `atomic_ref` are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on `std::complex<double>` could be supported only if aligned to `2*alignof(double)`. — *end note*]

`static constexpr bool is_always_lock_free;`

3 The static data member `is_always_lock_free` is `true` if the `atomic_ref` type's operations are always lock-free, and `false` otherwise.

`bool is_lock_free() const noexcept;`

4 *Returns*: `true` if operations on all objects of the type `atomic_ref<T>` are lock-free, `false` otherwise.

`constexpr atomic_ref(T& obj);`

5 *Preconditions*: The referenced object is aligned to `required_alignment`.

6 *Postconditions*: `*this` references `obj`.

7 *Throws*: Nothing.

```
constexpr atomic_ref(const atomic_ref& ref) noexcept;
```

8 *Postconditions*: `*this` references the object referenced by `ref`.

```
constexpr void store(value_type desired,
                     memory_order order = memory_order::seq_cst) const noexcept;
```

9 *Constraints*: `is_const_v<T>` is `false`.

10 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

11 *Effects*: Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

```
constexpr value_type operator=(value_type desired) const noexcept;
```

12 *Constraints*: `is_const_v<T>` is `false`.

13 *Effects*: Equivalent to:

```
  store(desired);
  return desired;
```

```
constexpr value_type load(memory_order order = memory_order::seq_cst) const noexcept;
```

14 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

15 *Effects*: Memory is affected according to the value of `order`.

16 *Returns*: Atomically returns the value referenced by `*ptr`.

```
constexpr operator value_type() const noexcept;
```

17 *Effects*: Equivalent to: `return load();`

```
constexpr value_type exchange(value_type desired,
                              memory_order order = memory_order::seq_cst) const noexcept;
```

18 *Constraints*: `is_const_v<T>` is `false`.

19 *Effects*: Atomically replaces the value referenced by `*ptr` with `desired`. Memory is affected according to the value of `order`. This operation is an atomic read-modify-write operation (6.9.2).

20 *Returns*: Atomically returns the value referenced by `*ptr` immediately before the effects.

```
constexpr bool compare_exchange_weak(value_type& expected, value_type desired,
                           memory_order success, memory_order failure) const noexcept;

constexpr bool compare_exchange_strong(value_type& expected, value_type desired,
                             memory_order success, memory_order failure) const noexcept;

constexpr bool compare_exchange_weak(value_type& expected, value_type desired,
                           memory_order order = memory_order::seq_cst) const noexcept;

constexpr bool compare_exchange_strong(value_type& expected, value_type desired,
                             memory_order order = memory_order::seq_cst) const noexcept;
```

21 *Constraints*: `is_const_v<T>` is `false`.

22 *Preconditions*: `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

23 *Effects*: Retrieves the value in `expected`. It then atomically compares the value representation of the value referenced by `*ptr` for equality with that previously retrieved from `expected`, and if `true`, replaces the value referenced by `*ptr` with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is `false`, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is `false` then, after the atomic operation, the value in `expected` is replaced by the value read from the value referenced

by `*ptr` during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.9.2.2) on the value referenced by `*ptr`. Otherwise, these operations are atomic load operations on that memory.

24 *Returns*: The result of the comparison.

25 *Remarks*: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `ptr` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

[*Note 2*: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — *end note*]

```
constexpr void wait(value_type old, memory_order order = memory_order::seq_cst) const noexcept;
```

26 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

27 *Effects*: Repeatedly performs the following steps, in order:

(27.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.

(27.2) — If they compare unequal, returns.

(27.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

28 *Remarks*: This function is an atomic waiting operation (32.5.6) on atomic object `*ptr`.

```
constexpr void notify_one() const noexcept;
```

29 *Constraints*: `is_const_v<T>` is `false`.

30 *Effects*: Unblocks the execution of at least one atomic waiting operation on `*ptr` that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

31 *Remarks*: This function is an atomic notifying operation (32.5.6) on atomic object `*ptr`.

```
constexpr void notify_all() const noexcept;
```

32 *Constraints*: `is_const_v<T>` is `false`.

33 *Effects*: Unblocks the execution of all atomic waiting operations on `*ptr` that are eligible to be unblocked (32.5.6) by this call.

34 *Remarks*: This function is an atomic notifying operation (32.5.6) on atomic object `*ptr`.

```
constexpr T* address() const noexcept;
```

35 *Returns*: `ptr`.

32.5.7.3 Specializations for integral types [atomics.ref.int]

1 There are specializations of the `atomic_ref` class template for all integral types except *cv* `bool`. For each such type *`integral-type`*, the specialization `atomic_ref<`*`integral-type`*`>` provides additional atomic operations appropriate to integral types.

[*Note 1*: The specialization `atomic_ref<bool>` uses the primary template (32.5.7). — *end note*]

2 The program is ill-formed if `is_always_lock_free` is `false` and `is_volatile_v<T>` is `true`.

```
namespace std {
  template<> struct atomic_ref<integral-type> {
  private:
    integral-type* ptr;          // exposition only

  public:
    using value_type = remove_cv_t<integral-type>;
    using difference_type = value_type;
    static constexpr size_t required_alignment = implementation-defined;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;
```

```
      constexpr explicit atomic_ref(integral-type&);
      constexpr atomic_ref(const atomic_ref&) noexcept;
      atomic_ref& operator=(const atomic_ref&) = delete;

      constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type operator=(value_type) const noexcept;
      constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
      constexpr operator value_type() const noexcept;

      constexpr value_type exchange(value_type,
                                    memory_order = memory_order::seq_cst) const noexcept;
      constexpr bool compare_exchange_weak(value_type&, value_type,
                                           memory_order, memory_order) const noexcept;
      constexpr bool compare_exchange_strong(value_type&, value_type,
                                             memory_order, memory_order) const noexcept;
      constexpr bool compare_exchange_weak(value_type&, value_type,
                                           memory_order = memory_order::seq_cst) const noexcept;
      constexpr bool compare_exchange_strong(value_type&, value_type,
                                             memory_order = memory_order::seq_cst) const noexcept;

      constexpr value_type fetch_add(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_sub(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_and(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_or(value_type,
                                    memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_xor(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_max(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
      constexpr value_type fetch_min(value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;

      constexpr value_type operator++(int) const noexcept;
      constexpr value_type operator--(int) const noexcept;
      constexpr value_type operator++() const noexcept;
      constexpr value_type operator--() const noexcept;
      constexpr value_type operator+=(value_type) const noexcept;
      constexpr value_type operator-=(value_type) const noexcept;
      constexpr value_type operator&=(value_type) const noexcept;
      constexpr value_type operator|=(value_type) const noexcept;
      constexpr value_type operator^=(value_type) const noexcept;

      constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
      constexpr void notify_one() const noexcept;
      constexpr void notify_all() const noexcept;
      constexpr integral-type* address() const noexcept;
    };
  }
```

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 153.

```
constexpr value_type fetch_key(value_type operand,
  memory_order order = memory_order::seq_cst) const noexcept;
```

5 *Constraints*: `is_const_v<integral-type>` is `false`.

6 *Effects*: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2.2).

7 *Returns*: Atomically, the value referenced by `*ptr` immediately before the effects.

8 *Remarks*: Except for `fetch_max` and `fetch_min`, for signed integer types the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[*Note 2*: There are no undefined results arising from the computation. — *end note*]

9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

```
constexpr value_type operator op=(value_type operand) const noexcept;
```

10 *Constraints*: `is_const_v<integral-type>` is `false`.

11 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.4 Specializations for floating-point types [atomics.ref.float]

1 There are specializations of the `atomic_ref` class template for all floating-point types. For each such type *`floating-point-type`*, the specialization `atomic_ref<floating-point>` provides additional atomic operations appropriate to floating-point types.

2 The program is ill-formed if `is_always_lock_free` is `false` and `is_volatile_v<T>` is `true`.

```
namespace std {
  template<> struct atomic_ref<floating-point-type> {
  private:
    floating-point-type* ptr;    // exposition only

  public:
    using value_type = remove_cv_t<floating-point-type>;
    using difference_type = value_type;
    static constexpr size_t required_alignment = implementation-defined;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr explicit atomic_ref(floating-point-type&);
    constexpr atomic_ref(const atomic_ref&) noexcept;
    atomic_ref& operator=(const atomic_ref&) = delete;

    constexpr void store(floating-point-type,
                         memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type operator=(value_type) const noexcept;
    constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
    constexpr operator floating-point-type() const noexcept;

    constexpr value_type exchange(floating-point-type,
                                  memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, floating-point-type,
                                memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, floating-point-type,
                                  memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, floating-point-type,
                                memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, floating-point-type,
                                  memory_order = memory_order::seq_cst) const noexcept;

    constexpr value_type fetch_add(floating-point-type,
                                   memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type fetch_sub(floating-point-type,
                                   memory_order = memory_order::seq_cst) const noexcept;

    constexpr value_type operator+=(value_type) const noexcept;
    constexpr value_type operator-=(value_type) const noexcept;
    constexpr void wait(floating-point-type,
                        memory_order = memory_order::seq_cst) const noexcept;
    constexpr void notify_one() const noexcept;
    constexpr void notify_all() const noexcept;
    constexpr floating-point-type* address() const noexcept;
  };
}
```

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 153.

```
constexpr value_type fetch_key(value_type operand,
                               memory_order order = memory_order::seq_cst) const noexcept;
```

5 *Constraints*: `is_const_v<floating-point-type>` is `false`.

6 *Effects*: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2.2).

7 *Returns*: Atomically, the value referenced by `*ptr` immediately before the effects.

8 *Remarks*: If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *`floating-point-type`* should conform to the `std::numeric_limits<value_type>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *`floating-point-type`* may be different than the calling thread's floating-point environment.

```
constexpr value_type operator op=(value_type operand) const noexcept;
```

9 *Constraints*: `is_const_v<floating-point-type>` is `false`.

10 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.5 Partial specialization for pointers [atomics.ref.pointer]

1 There are specializations of the `atomic_ref` class template for all pointer-to-object types. For each such type *pointer-type*, the specialization `atomic_ref<pointer-type>` provides additional atomic operations appropriate to pointer types.

2 The program is ill-formed if `is_always_lock_free` is `false` and `is_volatile_v<T>` is `true`.

```
namespace std {
  template<class T> struct atomic_ref<pointer-type> {
  private:
    pointer-type* ptr;          // exposition only

  public:
    using value_type = remove_cv_t<pointer-type>;
    using difference_type = ptrdiff_t;
    static constexpr size_t required_alignment = implementation-defined;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr explicit atomic_ref(pointer-type&);
    constexpr atomic_ref(const atomic_ref&) noexcept;
    atomic_ref& operator=(const atomic_ref&) = delete;

    constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type operator=(value_type) const noexcept;
    constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
    constexpr operator value_type() const noexcept;

    constexpr value_type exchange(value_type,
                                  memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, value_type,
                                         memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, value_type,
                                           memory_order, memory_order) const noexcept;
    constexpr bool compare_exchange_weak(value_type&, value_type,
                                         memory_order = memory_order::seq_cst) const noexcept;
    constexpr bool compare_exchange_strong(value_type&, value_type,
                                           memory_order = memory_order::seq_cst) const noexcept;

    constexpr value_type fetch_add(difference_type,
                                   memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type fetch_sub(difference_type,
                                   memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type fetch_max(value_type,
                                   memory_order = memory_order::seq_cst) const noexcept;
    constexpr value_type fetch_min(value_type,
                                   memory_order = memory_order::seq_cst) const noexcept;

    constexpr value_type operator++(int) const noexcept;
    constexpr value_type operator--(int) const noexcept;
    constexpr value_type operator++() const noexcept;
    constexpr value_type operator--() const noexcept;
    constexpr value_type operator+=(difference_type) const noexcept;
    constexpr value_type operator-=(difference_type) const noexcept;

    constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
    constexpr void notify_one() const noexcept;
    constexpr void notify_all() const noexcept;
    constexpr pointer-type* address() const noexcept;
  };
}
```

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 154.

```
constexpr value_type fetch_key(difference_type operand,
                               memory_order order = memory_order::seq_cst) const noexcept;
```

5 *Constraints*: `is_const_v<pointer-type>` is `false`.

6 *Mandates*: `remove_pointer_t<pointer-type>` is a complete object type.

7 *Effects*: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2.2).

8 *Returns*: Atomically, the value referenced by `*ptr` immediately before the effects.

9 *Remarks*: The result may be an undefined address, but the operations otherwise have no undefined behavior.

10 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

[*Note 1*: If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering (Table 29, 7.6.9). — *end note*]

```
constexpr value_type operator op=(difference_type operand) const noexcept;
```

11 *Constraints*: `is_const_v<pointer-type>` is `false`.

12 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

1 Let *referred-type* be *pointer-type* for the specializations in 32.5.7.5 and be *integral-type* for the specializations in 32.5.7.3.

```
constexpr value_type operator++(int) const noexcept;
```

2 *Constraints*: `is_const_v<referred-type>` is `false`.

3 *Effects*: Equivalent to: `return fetch_add(1);`

```
constexpr value_type operator--(int) const noexcept;
```

4 *Constraints*: `is_const_v<referred-type>` is `false`.

5 *Effects*: Equivalent to: `return fetch_sub(1);`

```
constexpr value_type operator++() const noexcept;
```

6 *Constraints*: `is_const_v<referred-type>` is `false`.

7 *Effects*: Equivalent to: `return fetch_add(1) + 1;`

```
constexpr value_type operator--() const noexcept;
```

8 *Constraints*: `is_const_v<referred-type>` is `false`.

9 *Effects*: Equivalent to: `return fetch_sub(1) - 1;`

32.5.8 Class template atomic [atomics.types.generic]

32.5.8.1 General [atomics.types.generic.general]

```
namespace std {
  template<class T> struct atomic {
    using value_type = T;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const volatile noexcept;
    bool is_lock_free() const noexcept;

    // 32.5.8.2, operations on atomic types
    constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
    constexpr atomic(T) noexcept;
    atomic(const atomic&) = delete;
    atomic& operator=(const atomic&) = delete;
    atomic& operator=(const atomic&) volatile = delete;

    T load(memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr T load(memory_order = memory_order::seq_cst) const noexcept;
    operator T() const volatile noexcept;
    constexpr operator T() const noexcept;
    void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr void store(T, memory_order = memory_order::seq_cst) noexcept;
    T operator=(T) volatile noexcept;
    constexpr T operator=(T) noexcept;

    T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr T exchange(T, memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
    constexpr bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
    bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
    constexpr bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
    bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

    void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr void wait(T, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    constexpr void notify_one() noexcept;
    void notify_all() volatile noexcept;
    constexpr void notify_all() noexcept;
  };
}
```

1 The template argument for `T` shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. The program is ill-formed if any of

(1.1) — `is_trivially_copyable_v<T>`,

(1.2) — `is_copy_constructible_v<T>`,

(1.3) — `is_move_constructible_v<T>`,

(1.4) — `is_copy_assignable_v<T>`,

(1.5) — `is_move_assignable_v<T>`, or

(1.6) — `same_as<T, remove_cv_t<T>>`,

is `false`.

[*Note 1*: Type arguments that are not also statically initializable can be difficult to use. — *end note*]

2 The specialization `atomic<bool>` is a standard-layout struct. It has a trivial destructor.

3 [*Note 2*: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — *end note*]

32.5.8.2 Operations on atomic types [atomics.types.operations]

```
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
```

1 *Constraints*: `is_default_constructible_v<T>` is `true`.

2 *Effects*: Initializes the atomic object with the value of `T()`. Initialization is not an atomic operation (6.9.2).

```
constexpr atomic(T desired) noexcept;
```

3 *Effects*: Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).

[*Note 1*: It is possible to have an access to an atomic object `A` race with its construction, for example by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — *end note*]

```
static constexpr bool is_always_lock_free = implementation-defined;
```

4 The `static` data member `is_always_lock_free` is `true` if the atomic type's operations are always lock-free, and `false` otherwise.

[*Note 2*: The value of `is_always_lock_free` is consistent with the value of the corresponding `ATOMIC_..._-LOCK_FREE` macro, if defined. — *end note*]

```
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
```

5 *Returns*: `true` if the object's operations are lock-free, `false` otherwise.

[*Note 3*: The return value of the `is_lock_free` member function is consistent with the value of `is_always_-lock_free` for the same type. — *end note*]

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void store(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

6 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

7 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_-cst`.

8 *Effects*: Atomically replaces the value pointed to by `this` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) volatile noexcept;
constexpr T operator=(T desired) noexcept;
```

9 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

10 *Effects*: Equivalent to `store(desired)`.

11 *Returns*: `desired`.

```
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr T load(memory_order order = memory_order::seq_cst) const noexcept;
```

12 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

13 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_-cst`.

14 *Effects*: Memory is affected according to the value of `order`.

15 *Returns*: Atomically returns the value pointed to by `this`.

```
operator T() const volatile noexcept;
constexpr operator T() const noexcept;
```

16 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

17 *Effects*: Equivalent to: `return load();`

```
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

18 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

19 *Effects*: Atomically replaces the value pointed to by `this` with `desired`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

20 *Returns*: Atomically returns the value pointed to by `this` immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
constexpr bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) volatile noexcept;
constexpr bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_strong(T& expected, T desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

21 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

22 *Preconditions*: `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

23 *Effects*: Retrieves the value in `expected`. It then atomically compares the value representation of the value pointed to by `this` for equality with that previously retrieved from `expected`, and if true, replaces the value pointed to by `this` with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is false, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is false then, after the atomic operation, the value in `expected` is replaced by the value pointed to by `this` during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.9.2) on the memory pointed to by `this`. Otherwise, these operations are atomic load operations on that memory.

24 *Returns*: The result of the comparison.

25 [*Note 4*: For example, the effect of `compare_exchange_strong` on objects without padding bits (6.8.1) is

```
if (memcmp(this, &expected, sizeof(*this)) == 0)
  memcpy(this, &desired, sizeof(*this));
else
  memcpy(&expected, this, sizeof(*this));
```

— *end note*]

[*Example 1*: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update `expected` when another iteration of the loop is needed.

```
expected = current.load();
do {
  desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
```

— *end example*]

[*Example 2*: Because the expected value is updated only on failure, code releasing the memory containing the `expected` value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

```
do {
  p->next = head;                                    // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p));   // try to insert
```

— *end example*]

26 Implementations should ensure that weak compare-and-exchange operations do not consistently return `false` unless either the atomic object has value different from `expected` or there are concurrent modifications to the atomic object.

27 *Remarks*: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `this` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

[*Note 5*: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — *end note*]

28 [*Note 6*: Under cases where the `memcpy` and `memcmp` semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with `operator==` if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC 60559, floating-point `-0.0` and `+0.0` will not compare equal with `memcmp` but will compare equal with `operator==`, and NaNs with the same payload will compare equal with `memcmp` but will not compare equal with `operator==`. — *end note*]

[*Note 7*: Because compare-and-exchange acts on an object's value representation, padding bits that never participate in the object's value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```
struct padded {
  char clank = 0x42;
  // Padding here.
  unsigned biff = 0xC0DEFEFE;
};
atomic<padded> pad = {};

bool zap() {
  padded expected, desired{0, 0};
  return pad.compare_exchange_strong(expected, desired);
}
```

— *end note*]

[*Note 8*: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```
union pony {
  double celestia = 0.;
```

```
    short luna;        // padded
  };
  atomic<pony> princesses = {};

  bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
  }
```

— *end note*]

```
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

29 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

30 *Effects*: Repeatedly performs the following steps, in order:

(30.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.

(30.2) — If they compare unequal, returns.

(30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31 *Remarks*: This function is an atomic waiting operation (32.5.6).

```
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
```

32 *Effects*: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

33 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
```

34 *Effects*: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

35 *Remarks*: This function is an atomic notifying operation (32.5.6).

32.5.8.3 Specializations for integers [atomics.types.int]

1 There are specializations of the `atomic` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>` (17.4.1). For each such type *`integral-type`*, the specialization `atomic<`*`integral-type`*`>` provides additional atomic operations appropriate to integral types.

[*Note 1*: The specialization `atomic<bool>` uses the primary template (32.5.8). — *end note*]

```
namespace std {
  template<> struct atomic<integral-type> {
    using value_type = integral-type;
    using difference_type = value_type;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const volatile noexcept;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(integral-type) noexcept;
    atomic(const atomic&) = delete;
    atomic& operator=(const atomic&) = delete;
    atomic& operator=(const atomic&) volatile = delete;

    void store(integral-type, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr void store(integral-type, memory_order = memory_order::seq_cst) noexcept;
    integral-type operator=(integral-type) volatile noexcept;
    constexpr integral-type operator=(integral-type) noexcept;
```

```
integral-type load(memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr integral-type load(memory_order = memory_order::seq_cst) const noexcept;
operator integral-type() const volatile noexcept;
constexpr operator integral-type() const noexcept;

    void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    constexpr void notify_one() noexcept;
    void notify_all() volatile noexcept;
    constexpr void notify_all() noexcept;
  };
}
```

2 The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 153.

Table 153 — Atomic arithmetic computations [tab:atomic.types.int.comp]

key	Op	Computation	*key*	Op	Computation
`add`	`+`	addition	`and`	`&`	bitwise and
`sub`	`-`	subtraction	`or`	`|`	bitwise inclusive or
`max`		maximum	`xor`	`^`	bitwise exclusive or
`min`		minimum			

```
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;
```

5 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

6 *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

7 *Returns*: Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks*: Except for `fetch_max` and `fetch_min`, for signed integer types the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[*Note 2*: There are no undefined results arising from the computation. — *end note*]

9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

```
T operator op=(T operand) volatile noexcept;
constexpr T operator op=(T operand) noexcept;
```

10 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

11 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.8.4 Specializations for floating-point types [atomics.types.float]

1 There are specializations of the `atomic` class template for all cv-unqualified floating-point types. For each such type *`floating-point-type`*, the specialization `atomic<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
  template<> struct atomic<floating-point-type> {
    using value_type = floating-point-type;
    using difference_type = value_type;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const volatile noexcept;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(floating-point-type) noexcept;
    atomic(const atomic&) = delete;
    atomic& operator=(const atomic&) = delete;
    atomic& operator=(const atomic&) volatile = delete;

    void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
    floating-point-type operator=(floating-point-type) volatile noexcept;
    constexpr floating-point-type operator=(floating-point-type) noexcept;
    floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
    operator floating-point-type() volatile noexcept;
    constexpr operator floating-point-type() noexcept;

    floating-point-type exchange(floating-point-type,
                                 memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr floating-point-type exchange(floating-point-type,
                                 memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(floating-point-type&, floating-point-type,
                               memory_order, memory_order) volatile noexcept;
    constexpr bool compare_exchange_weak(floating-point-type&, floating-point-type,
                               memory_order, memory_order) noexcept;
    bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                 memory_order, memory_order) volatile noexcept;
    constexpr bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                 memory_order, memory_order) noexcept;
    bool compare_exchange_weak(floating-point-type&, floating-point-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr bool compare_exchange_weak(floating-point-type&, floating-point-type,
                               memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                 memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                 memory_order = memory_order::seq_cst) noexcept;

    floating-point-type fetch_add(floating-point-type,
                                  memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr floating-point-type fetch_add(floating-point-type,
                                  memory_order = memory_order::seq_cst) noexcept;
    floating-point-type fetch_sub(floating-point-type,
                                  memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr floating-point-type fetch_sub(floating-point-type,
                                  memory_order = memory_order::seq_cst) noexcept;

    floating-point-type operator+=(floating-point-type) volatile noexcept;
    constexpr floating-point-type operator+=(floating-point-type) noexcept;
    floating-point-type operator-=(floating-point-type) volatile noexcept;
    constexpr floating-point-type operator-=(floating-point-type) noexcept;

    void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr void wait(floating-point-type,
                        memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    constexpr void notify_one() noexcept;
```

```
      void notify_all() volatile noexcept;
      constexpr void notify_all() noexcept;
    };
  }
```

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 153.

```
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;
```

5 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

6 *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

7 *Returns*: Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks*: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *`floating-point-type`* should conform to the `std::numeric_limits<`*`floating-point-type`*`>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *`floating-point-type`* may be different than the calling thread's floating-point environment.

```
T operator op=(T operand) volatile noexcept;
constexpr T operator op=(T operand) noexcept;
```

9 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

10 *Effects*: Equivalent to: `return fetch_`*`key`*`(operand)` *`op`* `operand;`

11 *Remarks*: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *`floating-point-type`* should conform to the `std::numeric_limits<`*`floating-point-type`*`>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *`floating-point-type`* may be different than the calling thread's floating-point environment.

32.5.8.5 Partial specialization for pointers [atomics.types.pointer]

```
  namespace std {
    template<class T> struct atomic<T*> {
      using value_type = T*;
      using difference_type = ptrdiff_t;

      static constexpr bool is_always_lock_free = implementation-defined;
      bool is_lock_free() const volatile noexcept;
      bool is_lock_free() const noexcept;

      constexpr atomic() noexcept;
      constexpr atomic(T*) noexcept;
      atomic(const atomic&) = delete;
      atomic& operator=(const atomic&) = delete;
      atomic& operator=(const atomic&) volatile = delete;

      void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr void store(T*, memory_order = memory_order::seq_cst) noexcept;
      T* operator=(T*) volatile noexcept;
      constexpr T* operator=(T*) noexcept;
      T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
      constexpr T* load(memory_order = memory_order::seq_cst) const noexcept;
      operator T*() const volatile noexcept;
      constexpr operator T*() const noexcept;
      T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
      bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
      constexpr bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
      bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
      constexpr bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
      bool compare_exchange_weak(T*&, T*,
                                 memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr bool compare_exchange_weak(T*&, T*,
                                 memory_order = memory_order::seq_cst) noexcept;
      bool compare_exchange_strong(T*&, T*,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr bool compare_exchange_strong(T*&, T*,
                                   memory_order = memory_order::seq_cst) noexcept;

      T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
      T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
      T* fetch_max(T*, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr T* fetch_max(T*, memory_order = memory_order::seq_cst) noexcept;
      T* fetch_min(T*, memory_order = memory_order::seq_cst) volatile noexcept;
      constexpr T* fetch_min(T*, memory_order = memory_order::seq_cst) noexcept;

      T* operator++(int) volatile noexcept;
      constexpr T* operator++(int) noexcept;
      T* operator--(int) volatile noexcept;
      constexpr T* operator--(int) noexcept;
      T* operator++() volatile noexcept;
      constexpr T* operator++() noexcept;
      T* operator--() volatile noexcept;
      constexpr T* operator--() noexcept;
      T* operator+=(ptrdiff_t) volatile noexcept;
      constexpr T* operator+=(ptrdiff_t) noexcept;
      T* operator-=(ptrdiff_t) volatile noexcept;
      constexpr T* operator-=(ptrdiff_t) noexcept;

      void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
      constexpr void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
      void notify_one() volatile noexcept;
      constexpr void notify_one() noexcept;
      void notify_all() volatile noexcept;
      constexpr void notify_all() noexcept;
    };
  }
```

1 There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.

2 Descriptions are provided below only for members that differ from the primary template.

3 The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in Table 154.

Table 154 — Atomic pointer computations [tab:atomic.types.pointer.comp]

key	Op	Computation	*key*	Op	Computation
`add`	`+`	addition	`sub`	`-`	subtraction
`max`		maximum	`min`		minimum

```
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;
```

4 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

5 *Mandates*: `T` is a complete object type.

[*Note 1*: Pointer arithmetic on `void*` or function pointers is ill-formed. — *end note*]

6 *Effects*: Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

7 *Returns*: Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks*: The result may be an undefined address, but the operations otherwise have no undefined behavior.

9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

[*Note 2*: If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering (Table 29, 7.6.9). — *end note*]

```
T* operator op=(ptrdiff_t operand) volatile noexcept;
constexpr T* operator op=(ptrdiff_t operand) noexcept;
```

10 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

11 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.8.6 Member operators common to integers and pointers to objects [atomics.types.memop]

```
value_type operator++(int) volatile noexcept;
constexpr value_type operator++(int) noexcept;
```

1 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

2 *Effects*: Equivalent to: `return fetch_add(1);`

```
value_type operator--(int) volatile noexcept;
constexpr value_type operator--(int) noexcept;
```

3 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

4 *Effects*: Equivalent to: `return fetch_sub(1);`

```
value_type operator++() volatile noexcept;
constexpr value_type operator++() noexcept;
```

5 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

6 *Effects*: Equivalent to: `return fetch_add(1) + 1;`

```
value_type operator--() volatile noexcept;
constexpr value_type operator--() noexcept;
```

7 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

8 *Effects*: Equivalent to: `return fetch_sub(1) - 1;`

32.5.8.7 Partial specializations for smart pointers [util.smartptr.atomic]

32.5.8.7.1 General [util.smartptr.atomic.general]

1 The library provides partial specializations of the `atomic` template for shared-ownership smart pointers (20.3.2).

[*Note 1*: The partial specializations are declared in header `<memory>` (20.2.2). — *end note*]

The behavior of all operations is as specified in 32.5.8, unless specified otherwise. The template parameter `T` of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 32.5.8.7, and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[*Note 2*: If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — *end note*]

3 [*Example 1*:

```
template<typename T> class atomic_list {
  struct node {
    T t;
    shared_ptr<node> next;
  };
  atomic<shared_ptr<node>> head;

public:
  shared_ptr<node> find(T t) const {
    auto p = head.load();
    while (p && p->t != t)
      p = p->next;

    return p;
  }

  void push_front(T t) {
    auto p = make_shared<node>();
    p->t = t;
    p->next = head;
    while (!head.compare_exchange_weak(p->next, p)) {}
  }
};
```

— *end example*]

32.5.8.7.2 Partial specialization for shared_ptr [util.smartptr.atomic.shared]

```
namespace std {
  template<class T> struct atomic<shared_ptr<T>> {
    using value_type = shared_ptr<T>;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(nullptr_t) noexcept : atomic() { }
    atomic(shared_ptr<T> desired) noexcept;
    atomic(const atomic&) = delete;
    void operator=(const atomic&) = delete;

    shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
    operator shared_ptr<T>() const noexcept;
    void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
    void operator=(shared_ptr<T> desired) noexcept;
    void operator=(nullptr_t) noexcept;

    shared_ptr<T> exchange(shared_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                               memory_order success, memory_order failure) noexcept;
    bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                 memory_order success, memory_order failure) noexcept;
    bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
    bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                 memory_order order = memory_order::seq_cst) noexcept;

    void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() noexcept;
    void notify_all() noexcept;

  private:
    shared_ptr<T> p;              // exposition only
    };
  }
```

```
constexpr atomic() noexcept;
```

1 *Effects*: Value-initializes `p`.

```
atomic(shared_ptr<T> desired) noexcept;
```

2 *Effects*: Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).
[*Note 1*: It is possible to have an access to an atomic object `A` race with its construction, for example, by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — *end note*]

```
void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_-cst`.

4 *Effects*: Atomically replaces the value pointed to by `this` with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```
void operator=(shared_ptr<T> desired) noexcept;
```

5 *Effects*: Equivalent to `store(desired)`.

```
void operator=(nullptr_t) noexcept;
```

6 *Effects*: Equivalent to `store(nullptr)`.

```
shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

7 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_-cst`.

8 *Effects*: Memory is affected according to the value of `order`.

9 *Returns*: Atomically returns `p`.

```
operator shared_ptr<T>() const noexcept;
```

10 *Effects*: Equivalent to: `return load();`

```
shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

11 *Effects*: Atomically replaces `p` with `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.9.2.2).

12 *Returns*: Atomically returns the value of `p` immediately before the effects.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order success, memory_order failure) noexcept;
```

13 *Preconditions*: `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

14 *Effects*: If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

15 *Returns*: `true` if `p` was equivalent to `expected`, `false` otherwise.

16 *Remarks*: Two `shared_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

17 If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to

the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects*: Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

19 *Effects*: Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

20 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

21 *Effects*: Repeatedly performs the following steps, in order:

(21.1) — Evaluates `load(order)` and compares it to `old`.

(21.2) — If the two are not equivalent, returns.

(21.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

22 *Remarks*: Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```
void notify_one() noexcept;
```

23 *Effects*: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

24 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
void notify_all() noexcept;
```

25 *Effects*: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

26 *Remarks*: This function is an atomic notifying operation (32.5.6).

32.5.8.7.3 Partial specialization for `weak_ptr` [util.smartptr.atomic.weak]

```
namespace std {
  template<class T> struct atomic<weak_ptr<T>> {
    using value_type = weak_ptr<T>;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    atomic(weak_ptr<T> desired) noexcept;
    atomic(const atomic&) = delete;
    void operator=(const atomic&) = delete;

    weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
    operator weak_ptr<T>() const noexcept;
    void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
    void operator=(weak_ptr<T> desired) noexcept;
```

```
      weak_ptr<T> exchange(weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
      bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                 memory_order success, memory_order failure) noexcept;
      bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                   memory_order success, memory_order failure) noexcept;
      bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                 memory_order order = memory_order::seq_cst) noexcept;
      bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                   memory_order order = memory_order::seq_cst) noexcept;

      void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
      void notify_one() noexcept;
      void notify_all() noexcept;

    private:
      weak_ptr<T> p;               // exposition only
    };
  }
```

```
constexpr atomic() noexcept;
```

1 *Effects*: Value-initializes `p`.

```
atomic(weak_ptr<T> desired) noexcept;
```

2 *Effects*: Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).

[*Note 1*: It is possible to have an access to an atomic object `A` race with its construction, for example, by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — *end note*]

```
void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_-cst`.

4 *Effects*: Atomically replaces the value pointed to by `this` with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```
void operator=(weak_ptr<T> desired) noexcept;
```

5 *Effects*: Equivalent to `store(desired)`.

```
weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_-cst`.

7 *Effects*: Memory is affected according to the value of `order`.

8 *Returns*: Atomically returns `p`.

```
operator weak_ptr<T>() const noexcept;
```

9 *Effects*: Equivalent to: `return load();`

```
weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

10 *Effects*: Atomically replaces `p` with `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.9.2.2).

11 *Returns*: Atomically returns the value of `p` immediately before the effects.

```
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order success, memory_order failure) noexcept;
```

12 *Preconditions*: `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

13 *Effects*: If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

14 *Returns*: `true` if `p` was equivalent to `expected`, `false` otherwise.

15 *Remarks*: Two `weak_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

16 If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects*: Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects*: Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

20 *Effects*: Repeatedly performs the following steps, in order:

(20.1) — Evaluates `load(order)` and compares it to `old`.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks*: Two `weak_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```
void notify_one() noexcept;
```

22 *Effects*: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

23 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
void notify_all() noexcept;
```

24 *Effects*: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

25 *Remarks*: This function is an atomic notifying operation (32.5.6).

32.5.9 Non-member functions [atomics.nonmembers]

1 A non-member function template whose name matches the pattern `atomic_`*`f`* or the pattern `atomic_`*`f`*`_explicit` invokes the member function *`f`*, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An

argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

2 [*Note 1*: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — *end note*]

32.5.10 Flag type and operations [atomics.flag]

```
namespace std {
  struct atomic_flag {
    constexpr atomic_flag() noexcept;
    atomic_flag(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) volatile = delete;

    bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr bool test(memory_order = memory_order::seq_cst) const noexcept;
    bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
    void clear(memory_order = memory_order::seq_cst) volatile noexcept;
    constexpr void clear(memory_order = memory_order::seq_cst) noexcept;

    void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    constexpr void notify_one() noexcept;
    void notify_all() volatile noexcept;
    constexpr void notify_all() noexcept;
  };
}
```

1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.

2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.

3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```
constexpr atomic_flag::atomic_flag() noexcept;
```

4 *Effects*: Initializes `*this` to the clear state.

```
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
constexpr bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
constexpr bool atomic_flag_test_explicit(const atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;
```

5 For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

6 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_-cst`.

7 *Effects*: Memory is affected according to the value of `order`.

8 *Returns*: Atomically returns the value pointed to by `object` or `this`.

```
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
constexpr bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
constexpr bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;
```

9 *Effects*: Atomically sets the value pointed to by `object` or by `this` to `true`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

10 *Returns*: Atomically, the value of the object immediately before the effects.

```
void atomic_flag_clear(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
constexpr void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;
```

11 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

12 *Effects*: Atomically sets the value pointed to by `object` or by `this` to `false`. Memory is affected according to the value of `order`.

```
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
constexpr void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object,
                               bool old, memory_order order) noexcept;
constexpr void atomic_flag_wait_explicit(const atomic_flag* object,
                               bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
                                   memory_order::seq_cst) const volatile noexcept;
constexpr void atomic_flag::wait(bool old, memory_order order =
                                   memory_order::seq_cst) const noexcept;
```

13 For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.

14 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

15 *Effects*: Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.

(15.2) — If the result of that evaluation is `true`, returns.

(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 *Remarks*: This function is an atomic waiting operation (32.5.6).

```
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
constexpr void atomic_flag::notify_one() noexcept;
```

17 *Effects*: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

18 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
constexpr void atomic_flag::notify_all() noexcept;
```

19 *Effects*: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

20 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
#define ATOMIC_FLAG_INIT see below
```

21 *Remarks*: The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

32.5.11 Fences [atomics.fences]

1 This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.

2 A release fence A synchronizes with an acquire fence B if there exist atomic operations X and Y, both operating on some atomic object M, such that A is sequenced before X, X modifies M, Y is sequenced before B, and Y reads the value written by X or a value written by any side effect in the hypothetical release sequence X would head if it were a release operation.

3 A release fence A synchronizes with an atomic operation B that performs an acquire operation on an atomic object M if there exists an atomic operation X such that A is sequenced before X, X modifies M, and B reads the value written by X or a value written by any side effect in the hypothetical release sequence X would head if it were a release operation.

4 An atomic operation A that is a release operation on an atomic object M synchronizes with an acquire fence B if there exists some atomic operation X on M such that X is sequenced before B and reads the value written by A or a value written by any side effect in the release sequence headed by A.

```
extern "C" constexpr void atomic_thread_fence(memory_order order) noexcept;
```

5 *Effects*: Depending on the value of `order`, this operation:

(5.1) — has no effects, if `order == memory_order::relaxed`;

(5.2) — is an acquire fence, if `order == memory_order::acquire`;

(5.3) — is a release fence, if `order == memory_order::release`;

(5.4) — is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;

(5.5) — is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.

```
extern "C" constexpr void atomic_signal_fence(memory_order order) noexcept;
```

6 *Effects*: Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

7 [*Note 1*: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — *end note*]

32.5.12 C compatibility [stdatomic.h.syn]

The header `<stdatomic.h>` provides the following definitions:

```
template<class T>
  using std-atomic = std::atomic<T>;        // exposition only

#define _Atomic(T) std-atomic<T>

#define ATOMIC_BOOL_LOCK_FREE see below

using std::atomic_flag_clear_explicit;                        // see below
#define ATOMIC_FLAG_INIT see below

using std::atomic_thread_fence;                               // see below
using std::atomic_signal_fence;                               // see below
```

1 Each *using-declaration* for some name A in the synopsis above makes available the same entity as `std::`A declared in `<atomic>` (32.5.2). Each macro listed above other than `_Atomic(T)` is defined as in `<atomic>`. It is unspecified whether `<stdatomic.h>` makes available any declarations in namespace `std`.

2 Each of the *using-declaration*s for `int`N`_t`, `uint`N`_t`, `intptr_t`, and `uintptr_t` listed above is defined if and only if the implementation defines the corresponding *typedef-name* in 32.5.2.

3 Neither the `_Atomic` macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than `<stdatomic.h>`.

4 *Recommended practice*: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an `_Atomic(T)` from C code and an `atomic<T>` from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

32.6 Mutual exclusion [thread.mutex]

32.6.1 General [thread.mutex.general]

1 Subclause 32.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

32.6.2 Header `<mutex>` synopsis [mutex.syn]

```
namespace std {
  // 32.6.4.2.2, class mutex
  class mutex;
  // 32.6.4.2.3, class recursive_mutex
  class recursive_mutex;
  // 32.6.4.3.2, class timed_mutex
  class timed_mutex;
  // 32.6.4.3.3, class recursive_timed_mutex
  class recursive_timed_mutex;

  struct defer_lock_t { explicit defer_lock_t() = default; };
  struct try_to_lock_t { explicit try_to_lock_t() = default; };
  struct adopt_lock_t { explicit adopt_lock_t() = default; };

  inline constexpr defer_lock_t  defer_lock { };
  inline constexpr try_to_lock_t try_to_lock { };
  inline constexpr adopt_lock_t  adopt_lock { };

  // 32.6.5, locks
  template<class Mutex> class lock_guard;
  template<class... MutexTypes> class scoped_lock;
  template<class Mutex> class unique_lock;

  template<class Mutex>
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
  // 32.6.6, generic locking algorithms
  template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
  template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

  struct once_flag;

  template<class Callable, class... Args>
    void call_once(once_flag& flag, Callable&& func, Args&&... args);
}
```

32.6.3 Header `<shared_mutex>` synopsis [shared.mutex.syn]

```
namespace std {
  // 32.6.4.4.2, class shared_mutex
  class shared_mutex;
  // 32.6.4.5.2, class shared_timed_mutex
  class shared_timed_mutex;
  // 32.6.5.5, class template shared_lock
  template<class Mutex> class shared_lock;
  template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```

32.6.4 Mutex requirements [thread.mutex.requirements]

32.6.4.1 General [thread.mutex.requirements.general]

1 A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (32.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

32.6.4.2 Mutex types [thread.mutex.requirements.mutex]

32.6.4.2.1 General [thread.mutex.requirements.mutex.general]

1 The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 32.6.4.2. In this description, `m` denotes an object of a mutex type.

[*Note 1*: The mutex types meet the *Cpp17Lockable* requirements (32.2.5.3). — *end note*]

2 The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.

3 The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

(3.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.

(3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(3.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

4 The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appears to occur in a single total order.

[*Note 2*: This can be viewed as the modification order (6.9.2) of the mutex. — *end note*]

[*Note 3*: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — *end note*]

5 The expression `m.lock()` is well-formed and has the following semantics:

6 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

7 *Effects*: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

8 *Synchronization*: Prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

9 *Postconditions*: The calling thread owns the mutex.

10 *Return type*: `void`.

11 *Throws*: `system_error` when an exception is required (32.2.2).

12 *Error conditions*:

(12.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(12.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

13 The expression `m.try_lock()` is well-formed and has the following semantics:

14 *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

15 *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[*Note 4*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — *end note*]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

16 *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

[*Note 5*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

17 *Return type*: `bool`.

18 *Returns*: `true` if ownership was obtained, otherwise `false`.

19 *Throws*: Nothing.

20 The expression `m.unlock()` is well-formed and has the following semantics:

21 *Preconditions*: The calling thread owns the mutex.

22 *Effects*: Releases the calling thread's ownership of the mutex.

23 *Return type*: `void`.

24 *Synchronization*: This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

25 *Throws*: Nothing.

32.6.4.2.2 Class `mutex` [thread.mutex.class]

```
namespace std {
  class mutex {
  public:
    constexpr mutex() noexcept;
    ~mutex();

    mutex(const mutex&) = delete;
    mutex& operator=(const mutex&) = delete;

    void lock();
    bool try_lock();
    void unlock();

    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                          // see 32.2.3
  };
}
```

1 The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`.

2 [*Note 1*: After a thread `A` has called `unlock()`, releasing a mutex, it is possible for another thread `B` to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread `A` appears to have returned from its unlock call. Conforming implementations handle such scenarios correctly, as long as thread `A` does not access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — *end note*]

3 The class `mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).

4 [*Note 2*: A program can deadlock if the thread that owns a `mutex` object calls `lock()` on that object. If the implementation can detect the deadlock, a `resource_deadlock_would_occur` error condition might be observed. — *end note*]

5 The behavior of a program is undefined if it destroys a `mutex` object owned by any thread or a thread terminates while owning a `mutex` object.

32.6.4.2.3 Class `recursive_mutex` [thread.mutex.recursive]

```
namespace std {
  class recursive_mutex {
  public:
    recursive_mutex();
    ~recursive_mutex();

    recursive_mutex(const recursive_mutex&) = delete;
    recursive_mutex& operator=(const recursive_mutex&) = delete;

    void lock();
    bool try_lock() noexcept;
    void unlock();

    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                         // see 32.2.3
  };
}
```

1 The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.

2 The class `recursive_mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).

3 A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.

4 The behavior of a program is undefined if

(4.1) — it destroys a `recursive_mutex` object owned by any thread or

(4.2) — a thread terminates while owning a `recursive_mutex` object.

32.6.4.3 Timed mutex types [thread.timedmutex.requirements]

32.6.4.3.1 General [thread.timedmutex.requirements.general]

1 The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_-timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (30.5), and `abs_time` denotes an object of an instantiation of `time_point` (30.6).

[*Note 1*: The timed mutex types meet the *Cpp17TimedLockable* requirements (32.2.5.4). — *end note*]

2 The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

3 *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

4 *Effects*: The function attempts to obtain ownership of the mutex within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the

function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[*Note 2*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

5 *Synchronization*: If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

6 *Return type*: `bool`.

7 *Returns*: `true` if ownership was obtained, otherwise `false`.

8 *Throws*: Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

11 *Effects*: The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[*Note 3*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

12 *Synchronization*: If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.9.2) this operation.

13 *Return type*: `bool`.

14 *Returns*: `true` if ownership was obtained, otherwise `false`.

15 *Throws*: Timeout-related exceptions (32.2.4).

32.6.4.3.2 Class `timed_mutex` [thread.timedmutex.class]

```
namespace std {
  class timed_mutex {
  public:
    timed_mutex();
    ~timed_mutex();

    timed_mutex(const timed_mutex&) = delete;
    timed_mutex& operator=(const timed_mutex&) = delete;

    void lock();     // blocking
    bool try_lock();
    template<class Rep, class Period>
      bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                         // see 32.2.3
  };
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

(3.1) — it destroys a `timed_mutex` object owned by any thread, (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or

(3.3) — a thread terminates while owning a `timed_mutex` object.

32.6.4.3.3 Class `recursive_timed_mutex` [thread.timedmutex.recursive]

```
namespace std {
  class recursive_timed_mutex {
  public:
    recursive_timed_mutex();
    ~recursive_timed_mutex();

    recursive_timed_mutex(const recursive_timed_mutex&) = delete;
    recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

    void lock();     // blocking
    bool try_lock() noexcept;
    template<class Rep, class Period>
      bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                         // see 32.2.3
  };
}
```

1 The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `recursive_timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).

3 A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

4 The behavior of a program is undefined if

(4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or

(4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

32.6.4.4 Shared mutex types [thread.sharedmutex.requirements]

32.6.4.4.1 General [thread.sharedmutex.requirements.general]

1 The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (32.6.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

[*Note 1*: The shared mutex types meet the *Cpp17SharedLockable* requirements (32.2.5.5). — *end note*]

2 In addition to the exclusive lock ownership mode specified in 32.6.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block

until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

3 The expression `m.lock_shared()` is well-formed and has the following semantics:

4 *Preconditions*: The calling thread has no ownership of the mutex.

5 *Effects*: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

6 *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

7 *Postconditions*: The calling thread has a shared lock on the mutex.

8 *Return type*: `void`.

9 *Throws*: `system_error` when an exception is required (32.2.2).

10 *Error conditions*:

(10.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(10.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

11 The expression `m.unlock_shared()` is well-formed and has the following semantics:

12 *Preconditions*: The calling thread holds a shared lock on the mutex.

13 *Effects*: Releases a shared lock on the mutex held by the calling thread.

14 *Return type*: `void`.

15 *Synchronization*: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.

16 *Throws*: Nothing.

17 The expression `m.try_lock_shared()` is well-formed and has the following semantics:

18 *Preconditions*: The calling thread has no ownership of the mutex.

19 *Effects*: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

20 *Synchronization*: If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

21 *Return type*: `bool`.

22 *Returns*: `true` if the shared lock was acquired, otherwise `false`.

23 *Throws*: Nothing.

32.6.4.4.2 Class `shared_mutex` [thread.sharedmutex.class]

```
namespace std {
  class shared_mutex {
  public:
    shared_mutex();
    ~shared_mutex();

    shared_mutex(const shared_mutex&) = delete;
    shared_mutex& operator=(const shared_mutex&) = delete;

    // exclusive ownership
    void lock();                // blocking
    bool try_lock();
    void unlock();

    // shared ownership
    void lock_shared();         // blocking
    bool try_lock_shared();
    void unlock_shared();
    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                         // see 32.2.3
  };
}
```

1 The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_mutex` meets all of the shared mutex requirements (32.6.4.4). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

(3.1) — it destroys a `shared_mutex` object owned by any thread,

(3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or

(3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.

4 `shared_mutex` may be a synonym for `shared_timed_mutex`.

32.6.4.5 Shared timed mutex types [thread.sharedtimedmutex.requirements]

32.6.4.5.1 General [thread.sharedtimedmutex.requirements.general]

1 The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (32.6.4.3), shared mutex types (32.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of `duration` (30.5), and `abs_time` denotes an object of an instantiation of `time_point` (30.6).

[*Note 1*: The shared timed mutex types meet the *Cpp17SharedTimedLockable* requirements (32.2.5.6). — *end note*]

2 The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

3 *Preconditions*: The calling thread has no ownership of the mutex.

4 *Effects*: Attempts to obtain shared lock ownership for the calling thread within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[*Note 2*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

5 *Synchronization*: If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

6 *Return type*: `bool`.

7 *Returns*: `true` if the shared lock was acquired, otherwise `false`.

8 *Throws*: Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions*: The calling thread has no ownership of the mutex.

11 *Effects*: The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[*Note 3*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

12 *Synchronization*: If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

13 *Return type*: `bool`.

14 *Returns*: `true` if the shared lock was acquired, otherwise `false`.

15 *Throws*: Timeout-related exceptions (32.2.4).

32.6.4.5.2 Class `shared_timed_mutex` [thread.sharedtimedmutex.class]

```
namespace std {
  class shared_timed_mutex {
  public:
    shared_timed_mutex();
    ~shared_timed_mutex();

    shared_timed_mutex(const shared_timed_mutex&) = delete;
    shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

    // exclusive ownership
    void lock();                // blocking
    bool try_lock();
    template<class Rep, class Period>
      bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    // shared ownership
    void lock_shared();         // blocking
    bool try_lock_shared();
    template<class Rep, class Period>
      bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock_shared();
  };
}
```

1 The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_timed_mutex` meets all of the shared timed mutex requirements (32.6.4.5). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

(3.1) — it destroys a `shared_timed_mutex` object owned by any thread,

(3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or

(3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

32.6.5 Locks [thread.lock]

32.6.5.1 General [thread.lock.general]

1 A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[*Note 1*: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — *end note*]

2 Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```
namespace std {
  struct defer_lock_t  { };     // do not acquire ownership of the mutex
  struct try_to_lock_t { };     // try to acquire ownership of the mutex
                                // without blocking
  struct adopt_lock_t  { };     // assume the calling thread has already
                                // obtained mutex ownership and manage it

  inline constexpr defer_lock_t   defer_lock { };
  inline constexpr try_to_lock_t  try_to_lock { };
```

```
    inline constexpr adopt_lock_t   adopt_lock { };
  }
```

32.6.5.2 Class template lock_guard [thread.lock.guard]

```
  namespace std {
    template<class Mutex>
    class lock_guard {
    public:
      using mutex_type = Mutex;

      explicit lock_guard(mutex_type& m);
      lock_guard(mutex_type& m, adopt_lock_t);
      ~lock_guard();

      lock_guard(const lock_guard&) = delete;
      lock_guard& operator=(const lock_guard&) = delete;

    private:
      mutex_type& pm;               // exposition only
    };
  }
```

1 An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.7.4). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

```
explicit lock_guard(mutex_type& m);
```

2 *Effects*: Initializes `pm` with `m`. Calls `m.lock()`.

```
lock_guard(mutex_type& m, adopt_lock_t);
```

3 *Preconditions*: The calling thread holds a non-shared lock on `m`.

4 *Effects*: Initializes `pm` with `m`.

5 *Throws*: Nothing.

```
~lock_guard();
```

6 *Effects*: Equivalent to: `pm.unlock()`

32.6.5.3 Class template scoped_lock [thread.lock.scoped]

```
  namespace std {
    template<class... MutexTypes>
    class scoped_lock {
    public:
      using mutex_type = see below;      // Only if sizeof...(MutexTypes) == 1 is true

      explicit scoped_lock(MutexTypes&... m);
      explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
      ~scoped_lock();

      scoped_lock(const scoped_lock&) = delete;
      scoped_lock& operator=(const scoped_lock&) = delete;

    private:
      tuple<MutexTypes&...> pm;    // exposition only
    };
  }
```

1 An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.7.4). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

(1.1) — If `sizeof...(MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the *Cpp17BasicLockable* requirements (32.2.5.2). The member *typedef-name* `mutex_type` denotes the same type as `Mutex`.

(1.2) — Otherwise, all types in the template parameter pack `MutexTypes` shall meet the *Cpp17Lockable* requirements (32.2.5.3) and there is no member `mutex_type`.

```
explicit scoped_lock(MutexTypes&... m);
```

2 *Effects*: Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is `0`, no effects. Otherwise if `sizeof...(MutexTypes)` is `1`, then `m.lock()`. Otherwise, `lock(m...)`.

```
explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
```

3 *Preconditions*: The calling thread holds a non-shared lock on each element of `m`.

4 *Effects*: Initializes `pm` with `tie(m...)`.

5 *Throws*: Nothing.

```
~scoped_lock();
```

6 *Effects*: For all `i` in [`0`, `sizeof...(MutexTypes)`), `get<i>(pm).unlock()`.

32.6.5.4 Class template `unique_lock` [thread.lock.unique]

32.6.5.4.1 General [thread.lock.unique.general]

```
namespace std {
  template<class Mutex>
  class unique_lock {
  public:
    using mutex_type = Mutex;

    // 32.6.5.4.2, construct/copy/destroy
    unique_lock() noexcept;
    explicit unique_lock(mutex_type& m);
    unique_lock(mutex_type& m, defer_lock_t) noexcept;
    unique_lock(mutex_type& m, try_to_lock_t);
    unique_lock(mutex_type& m, adopt_lock_t);
    template<class Clock, class Duration>
      unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
      unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
    ~unique_lock();

    unique_lock(const unique_lock&) = delete;
    unique_lock& operator=(const unique_lock&) = delete;

    unique_lock(unique_lock&& u) noexcept;
    unique_lock& operator=(unique_lock&& u) noexcept;

    // 32.6.5.4.3, locking
    void lock();
    bool try_lock();

    template<class Rep, class Period>
      bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

    void unlock();

    // 32.6.5.4.4, modifiers
    void swap(unique_lock& u) noexcept;
    mutex_type* release() noexcept;

    // 32.6.5.4.5, observers
    bool owns_lock() const noexcept;
    explicit operator bool() const noexcept;
    mutex_type* mutex() const noexcept;

  private:
    mutex_type* pm;                // exposition only
    bool owns;                     // exposition only
  };
}
```

1 An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.4) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

2 [*Note 1*: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (32.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements. — *end note*]

32.6.5.4.2 Constructors, destructor, and assignment [thread.lock.unique.cons]

```
unique_lock() noexcept;
```

1 *Postconditions*: `pm == nullptr` and `owns == false`.

```
explicit unique_lock(mutex_type& m);
```

2 *Effects*: Calls `m.lock()`.

3 *Postconditions*: `pm == addressof(m)` and `owns == true`.

```
unique_lock(mutex_type& m, defer_lock_t) noexcept;
```

4 *Postconditions*: `pm == addressof(m)` and `owns == false`.

```
unique_lock(mutex_type& m, try_to_lock_t);
```

5 *Preconditions*: The supplied `Mutex` type meets the *Cpp17Lockable* requirements (32.2.5.3).

6 *Effects*: Calls `m.try_lock()`.

7 *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

```
unique_lock(mutex_type& m, adopt_lock_t);
```

8 *Preconditions*: The calling thread holds a non-shared lock on `m`.

9 *Postconditions*: `pm == addressof(m)` and `owns == true`.

10 *Throws*: Nothing.

```
template<class Clock, class Duration>
  unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
```

11 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

12 *Effects*: Calls `m.try_lock_until(abs_time)`.

13 *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

```
template<class Rep, class Period>
  unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

14 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

15 *Effects*: Calls `m.try_lock_for(rel_time)`.

16 *Postconditions*: `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

`unique_lock(unique_lock&& u) noexcept;`

17 *Postconditions*: `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

`unique_lock& operator=(unique_lock&& u) noexcept;`

18 *Effects*: Equivalent to: `unique_lock(std::move(u)).swap(*this)`

19 *Returns*: `*this`.

`~unique_lock();`

20 *Effects*: If `owns` calls `pm->unlock()`.

32.6.5.4.3 Locking [thread.lock.unique.locking]

`void lock();`

1 *Effects*: As if by `pm->lock()`.

2 *Postconditions*: `owns == true`.

3 *Throws*: Any exception thrown by `pm->lock()`. `system_error` when an exception is required (32.2.2).

4 *Error conditions*:

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`bool try_lock();`

5 *Preconditions*: The supplied `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3).

6 *Effects*: As if by `pm->try_lock()`.

7 *Postconditions*: `owns == res`, where `res` is the value returned by `pm->try_lock()`.

8 *Returns*: The value returned by `pm->try_lock()`.

9 *Throws*: Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required (32.2.2).

10 *Error conditions*:

(10.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(10.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Clock, class Duration>
  bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

11 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

12 *Effects*: As if by `pm->try_lock_until(abs_time)`.

13 *Postconditions*: `owns == res`, where `res` is the value returned by `pm->try_lock_until(abs_time)`.

14 *Returns*: The value returned by `pm->try_lock_until(abs_time)`.

15 *Throws*: Any exception thrown by `pm->try_lock_until(abstime)`. `system_error` when an exception is required (32.2.2).

16 *Error conditions*:

(16.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(16.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Rep, class Period>
  bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

17 *Preconditions*: The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

18 *Effects*: As if by `pm->try_lock_for(rel_time)`.

19 *Postconditions*: `owns == res`, where `res` is the value returned by `pm->try_lock_for(rel_time)`.

20 *Returns*: The value returned by `pm->try_lock_for(rel_time)`.

21 *Throws*: Any exception thrown by `pm->try_lock_for(rel_time)`. `system_error` when an exception is required (32.2.2).

22 *Error conditions*:

(22.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(22.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

23 *Effects*: As if by `pm->unlock()`.

24 *Postconditions*: `owns == false`.

25 *Throws*: `system_error` when an exception is required (32.2.2).

26 *Error conditions*:

(26.1) — `operation_not_permitted` — if on entry `owns` is `false`.

32.6.5.4.4 Modifiers [thread.lock.unique.mod]

```
void swap(unique_lock& u) noexcept;
```

1 *Effects*: Swaps the data members of `*this` and `u`.

```
mutex_type* release() noexcept;
```

2 *Postconditions*: `pm == 0` and `owns == false`.

3 *Returns*: The previous value of `pm`.

```
template<class Mutex>
  void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4 *Effects*: As if by `x.swap(y)`.

32.6.5.4.5 Observers [thread.lock.unique.obs]

```
bool owns_lock() const noexcept;
```

1 *Returns*: `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns*: `owns`.

```
mutex_type *mutex() const noexcept;
```

3 *Returns*: `pm`.

32.6.5.5 Class template `shared_lock` [thread.lock.shared]

32.6.5.5.1 General [thread.lock.shared.general]

```
namespace std {
  template<class Mutex>
  class shared_lock {
  public:
    using mutex_type = Mutex;

    // 32.6.5.5.2, construct/copy/destroy
    shared_lock() noexcept;
    explicit shared_lock(mutex_type& m);         // blocking
    shared_lock(mutex_type& m, defer_lock_t) noexcept;
    shared_lock(mutex_type& m, try_to_lock_t);
    shared_lock(mutex_type& m, adopt_lock_t);
    template<class Clock, class Duration>
      shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
      shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
    ~shared_lock();
```

```
      shared_lock(const shared_lock&) = delete;
      shared_lock& operator=(const shared_lock&) = delete;

      shared_lock(shared_lock&& u) noexcept;
      shared_lock& operator=(shared_lock&& u) noexcept;

      // 32.6.5.5.3, locking
      void lock();                                // blocking
      bool try_lock();
      template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
      template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
      void unlock();

      // 32.6.5.5.4, modifiers
      void swap(shared_lock& u) noexcept;
      mutex_type* release() noexcept;

      // 32.6.5.5.5, observers
      bool owns_lock() const noexcept;
      explicit operator bool() const noexcept;
      mutex_type* mutex() const noexcept;

    private:
      mutex_type* pm;                             // exposition only
      bool owns;                                  // exposition only
    };
  }
```

1 An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.4) of the `shared_lock` object. The supplied `Mutex` type shall meet the *Cpp17SharedLockable* requirements (32.2.5.5).

2 [*Note 1*: `shared_lock<Mutex>` meets the *Cpp17Lockable* requirements (32.2.5.3). If `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6), `shared_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements (32.2.5.4). — *end note*]

32.6.5.5.2 Constructors, destructor, and assignment [thread.lock.shared.cons]

```
shared_lock() noexcept;
```

1 *Postconditions*: `pm == nullptr` and `owns == false`.

```
explicit shared_lock(mutex_type& m);
```

2 *Effects*: Calls `m.lock_shared()`.

3 *Postconditions*: `pm == addressof(m)` and `owns == true`.

```
shared_lock(mutex_type& m, defer_lock_t) noexcept;
```

4 *Postconditions*: `pm == addressof(m)` and `owns == false`.

```
shared_lock(mutex_type& m, try_to_lock_t);
```

5 *Effects*: Calls `m.try_lock_shared()`.

6 *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared()`.

```
shared_lock(mutex_type& m, adopt_lock_t);
```

7 *Preconditions*: The calling thread holds a shared lock on `m`.

8 *Postconditions*: `pm == addressof(m)` and `owns == true`.

```
template<class Clock, class Duration>
  shared_lock(mutex_type& m,
              const chrono::time_point<Clock, Duration>& abs_time);
```

9 *Preconditions*: `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

10 *Effects*: Calls `m.try_lock_shared_until(abs_time)`.

11 *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_until(abs_time)`.

```
template<class Rep, class Period>
  shared_lock(mutex_type& m,
              const chrono::duration<Rep, Period>& rel_time);
```

12 *Preconditions*: `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

13 *Effects*: Calls `m.try_lock_shared_for(rel_time)`.

14 *Postconditions*: `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

```
~shared_lock();
```

15 *Effects*: If `owns` calls `pm->unlock_shared()`.

```
shared_lock(shared_lock&& sl) noexcept;
```

16 *Postconditions*: `pm == sl_p.pm` and `owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this construction), `sl.pm == nullptr` and `sl.owns == false`.

```
shared_lock& operator=(shared_lock&& sl) noexcept;
```

17 *Effects*: Equivalent to: `shared_lock(std::move(sl)).swap(*this)`

18 *Returns*: `*this`.

32.6.5.5.3 Locking [thread.lock.shared.locking]

```
void lock();
```

1 *Effects*: As if by `pm->lock_shared()`.

2 *Postconditions*: `owns == true`.

3 *Throws*: Any exception thrown by `pm->lock_shared()`. `system_error` when an exception is required (32.2.2).

4 *Error conditions*:

(4.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
bool try_lock();
```

5 *Effects*: As if by `pm->try_lock_shared()`.

6 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared()`.

7 *Returns*: The value returned by the call to `pm->try_lock_shared()`.

8 *Throws*: Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required (32.2.2).

9 *Error conditions*:

(9.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(9.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Clock, class Duration>
  bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

10 *Preconditions*: `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

11 *Effects*: As if by `pm->try_lock_shared_until(abs_time)`.

12 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.

13 *Returns*: The value returned by the call to `pm->try_lock_shared_until(abs_time)`.

14 *Throws*: Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required (32.2.2).

15 *Error conditions*:

(15.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(15.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Rep, class Period>
  bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

16 *Preconditions*: `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

17 *Effects*: As if by `pm->try_lock_shared_for(rel_time)`.

18 *Postconditions*: `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.

19 *Returns*: The value returned by the call to `pm->try_lock_shared_for(rel_time)`.

20 *Throws*: Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (32.2.2).

21 *Error conditions*:

(21.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(21.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

22 *Effects*: As if by `pm->unlock_shared()`.

23 *Postconditions*: `owns == false`.

24 *Throws*: `system_error` when an exception is required (32.2.2).

25 *Error conditions*:

(25.1) — `operation_not_permitted` — if on entry `owns` is `false`.

32.6.5.5.4 Modifiers [thread.lock.shared.mod]

```
void swap(shared_lock& sl) noexcept;
```

1 *Effects*: Swaps the data members of `*this` and `sl`.

```
mutex_type* release() noexcept;
```

2 *Postconditions*: `pm == nullptr` and `owns == false`.

3 *Returns*: The previous value of `pm`.

```
template<class Mutex>
  void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

4 *Effects*: As if by `x.swap(y)`.

32.6.5.5.5 Observers [thread.lock.shared.obs]

```
bool owns_lock() const noexcept;
```

1 *Returns*: `owns`.

```
explicit operator bool() const noexcept;
```

2 *Returns*: `owns`.

```
mutex_type* mutex() const noexcept;
```

3 *Returns*: `pm`.

32.6.6 Generic locking algorithms [thread.lock.algorithm]

```
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

1 *Preconditions*: Each template parameter type meets the *Cpp17Lockable* requirements.

[*Note 1*: The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

2 *Effects*: Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.

3 *Returns*: `-1` if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.

```
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4 *Preconditions*: Each template parameter type meets the *Cpp17Lockable* requirements.

[*Note 2*: The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]

5 *Effects*: All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[*Note 3*: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note*]

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

32.6.7 Call once [thread.once]

32.6.7.1 Struct `once_flag` [thread.once.onceflag]

```
namespace std {
  struct once_flag {
    constexpr once_flag() noexcept;

    once_flag(const once_flag&) = delete;
    once_flag& operator=(const once_flag&) = delete;
  };
}
```

1 The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

```
constexpr once_flag() noexcept;
```

2 *Synchronization*: The construction of a `once_flag` object is not synchronized.

3 *Postconditions*: The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

32.6.7.2 Function `call_once` [thread.once.callonce]

```
template<class Callable, class... Args>
  void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1 *Mandates*: `is_invocable_v<Callable, Args...>` is `true`.

2 *Effects*: An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution evaluates *`INVOKE`*`(std::forward<Callable>(func), std::forward<Args>(args)...)` (22.10.4). If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[*Note 1*: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note*]

3 *Synchronization*: For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

4 *Throws*: `system_error` when an exception is required (32.2.2), or any exception thrown by `func`.

5 [*Example 1*:

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
  std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
  void operator()();
};

void g() {
  static std::once_flag flag2;
  std::call_once(flag2, initializer());
}

// object flag, member function
class information {
  std::once_flag verified;
  void verifier();
public:
  void verify() { std::call_once(verified, &information::verifier, *this); }
};
```

— *end example*]

32.7 Condition variables [thread.condition]

32.7.1 General [thread.condition.general]

1 Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.

2 Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

3 The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:

1. the release of the mutex and entry into the waiting state;
2. the unblocking of the wait; and
3. the reacquisition of the lock.

4 The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the "happens before" order.

5 Condition variable construction and destruction need not be synchronized.

32.7.2 Header `<condition_variable>` synopsis [condition.variable.syn]

```
namespace std {
  // 32.7.4, class condition_variable
  class condition_variable;
  // 32.7.5, class condition_variable_any
  class condition_variable_any;

  // 32.7.3, non-member functions
  void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
  enum class cv_status { no_timeout, timeout };
}
```

32.7.3 Non-member functions [thread.condition.nonmember]

`void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);`

1 *Preconditions*: `lk` is locked by the calling thread and either

(1.1) — no other thread is waiting on `cond`, or

(1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

2 *Effects*: Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```
lk.unlock();
cond.notify_all();
```

3 *Synchronization*: The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.

4 [*Note 1*: The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. — *end note*]

5 [*Note 2*: It is the user's responsibility to ensure that waiting threads do not incorrectly assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. — *end note*]

32.7.4 Class `condition_variable` [thread.condition.condvar]

```
namespace std {
  class condition_variable {
  public:
    condition_variable();
    ~condition_variable();

    condition_variable(const condition_variable&) = delete;
    condition_variable& operator=(const condition_variable&) = delete;

    void notify_one() noexcept;
    void notify_all() noexcept;
    void wait(unique_lock<mutex>& lock);
    template<class Predicate>
      void wait(unique_lock<mutex>& lock, Predicate pred);
    template<class Clock, class Duration>
      cv_status wait_until(unique_lock<mutex>& lock,
                           const chrono::time_point<Clock, Duration>& abs_time);
    template<class Clock, class Duration, class Predicate>
      bool wait_until(unique_lock<mutex>& lock,
                      const chrono::time_point<Clock, Duration>& abs_time,
                      Predicate pred);
    template<class Rep, class Period>
      cv_status wait_for(unique_lock<mutex>& lock,
                         const chrono::duration<Rep, Period>& rel_time);
    template<class Rep, class Period, class Predicate>
      bool wait_for(unique_lock<mutex>& lock,
                    const chrono::duration<Rep, Period>& rel_time,
                    Predicate pred);

    using native_handle_type = implementation-defined;          // see 32.2.3
    native_handle_type native_handle();                         // see 32.2.3
  };
}
```

1 The class `condition_variable` is a standard-layout class (11.2).

```
condition_variable();
```

2 *Throws*: `system_error` when an exception is required (32.2.2).

3 *Error conditions*:

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

```
~condition_variable();
```

4 *Preconditions*: There is no thread blocked on `*this`.

[*Note 1*: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects*: If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects*: Unblocks all threads that are blocked waiting for `*this`.

```
void wait(unique_lock<mutex>& lock);
```

7 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8 *Effects*:

(8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

10 *Throws*: Nothing.

11 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 2*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Predicate>
  void wait(unique_lock<mutex>& lock, Predicate pred);
```

12 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13 *Effects*: Equivalent to:

```
while (!pred())
  wait(lock);
```

14 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

15 *Throws*: Any exception thrown by `pred`.

16 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 3*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration>
  cv_status wait_until(unique_lock<mutex>& lock,
                       const chrono::time_point<Clock, Duration>& abs_time);
```

17 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18 *Effects*:

(18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.

(18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

20 *Returns*: `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

21 *Throws*: Timeout-related exceptions (32.2.4).

22 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 4*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Rep, class Period>
  cv_status wait_for(unique_lock<mutex>& lock,
                     const chrono::duration<Rep, Period>& rel_time);
```

23 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(23.1) — no other thread is waiting on this `condition_variable` object or

(23.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

24 *Effects*: Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

25 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

26 *Returns*: `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

27 *Throws*: Timeout-related exceptions (32.2.4).

28 *Remarks*: If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[*Note 5*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration, class Predicate>
  bool wait_until(unique_lock<mutex>& lock,
                  const chrono::time_point<Clock, Duration>& abs_time,
                  Predicate pred);
```

29 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(29.1) — no other thread is waiting on this `condition_variable` object or

(29.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

30 *Effects*: Equivalent to:

```
while (!pred())
  if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
return true;
```

31 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

32 [*Note 6*: The returned value indicates whether the predicate evaluated to `true` regardless of whether the timeout was triggered. — *end note*]

33 *Throws*: Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

34 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 7*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Rep, class Period, class Predicate>
  bool wait_for(unique_lock<mutex>& lock,
                const chrono::duration<Rep, Period>& rel_time,
                Predicate pred);
```

35 *Preconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(35.1) — no other thread is waiting on this `condition_variable` object or

(35.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

36 *Effects*: Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

37 [*Note 8*: There is no blocking if `pred()` is initially `true`, even if the timeout has already expired. — *end note*]

38 *Postconditions*: `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

39 [*Note 9*: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note*]

40 *Throws*: Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

41 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 10*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

32.7.5 Class `condition_variable_any` [thread.condition.condvarany]

32.7.5.1 General [thread.condition.condvarany.general]

1 In 32.7.5, template arguments for template parameters named `Lock` shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

[*Note 1*: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, any necessary synchronization is assumed to be in place with respect to the predicate associated with the `condition_variable_any` instance. — *end note*]

```
namespace std {
  class condition_variable_any {
  public:
    condition_variable_any();
    ~condition_variable_any();

    condition_variable_any(const condition_variable_any&) = delete;
    condition_variable_any& operator=(const condition_variable_any&) = delete;

    void notify_one() noexcept;
    void notify_all() noexcept;

    // 32.7.5.2, noninterruptible waits
    template<class Lock>
      void wait(Lock& lock);
    template<class Lock, class Predicate>
      void wait(Lock& lock, Predicate pred);

    template<class Lock, class Clock, class Duration>
      cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Lock, class Clock, class Duration, class Predicate>
      bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                      Predicate pred);
    template<class Lock, class Rep, class Period>
      cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
    template<class Lock, class Rep, class Period, class Predicate>
      bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

    // 32.7.5.3, interruptible waits
    template<class Lock, class Predicate>
      bool wait(Lock& lock, stop_token stoken, Predicate pred);
    template<class Lock, class Clock, class Duration, class Predicate>
      bool wait_until(Lock& lock, stop_token stoken,
                      const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
    template<class Lock, class Rep, class Period, class Predicate>
      bool wait_for(Lock& lock, stop_token stoken,
                    const chrono::duration<Rep, Period>& rel_time, Predicate pred);
  };
}
```

`condition_variable_any();`

2 *Throws*: `bad_alloc` or `system_error` when an exception is required (32.2.2).

3 *Error conditions*:

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

(3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

`~condition_variable_any();`

4 *Preconditions*: There is no thread blocked on `*this`.

[*Note 2*: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

`void notify_one() noexcept;`

5 *Effects*: If any threads are blocked waiting for `*this`, unblocks one of those threads.

`void notify_all() noexcept;`

6 *Effects*: Unblocks all threads that are blocked waiting for `*this`.

32.7.5.2 Noninterruptible waits [thread.condvarany.wait]

```
template<class Lock>
  void wait(Lock& lock);
```

1 *Effects*:

(1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.

(1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2 *Postconditions*: `lock` is locked by the calling thread.

3 *Throws*: Nothing.

4 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 1*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Predicate>
  void wait(Lock& lock, Predicate pred);
```

5 *Effects*: Equivalent to:

```
while (!pred())
  wait(lock);
```

```
template<class Lock, class Clock, class Duration>
  cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

6 *Effects*:

(6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.

(6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.

(6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7 *Postconditions*: `lock` is locked by the calling thread.

8 *Returns*: `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

9 *Throws*: Timeout-related exceptions (32.2.4).

10 *Remarks*: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 2*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Rep, class Period>
  cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

11 *Effects*: Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

12 *Postconditions*: `lock` is locked by the calling thread.

13 *Returns*: `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

14 *Throws*: Timeout-related exceptions (32.2.4).

15 *Remarks*: If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[*Note 3*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Clock, class Duration, class Predicate>
  bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

16 *Effects*: Equivalent to:

```
while (!pred())
  if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
return true;
```

17 [*Note 4*: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — *end note*]

18 [*Note 5*: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note*]

```
template<class Lock, class Rep, class Period, class Predicate>
  bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

19 *Effects*: Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

32.7.5.3 Interruptible waits [thread.condvarany.intwait]

1 The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
  bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

2 *Effects*: Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
  if (pred())
    return true;
```

```
      wait(lock);
    }
    return pred();
```

3 [*Note 1*: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request. — *end note*]

4 *Postconditions*: `lock` is locked by the calling thread.

5 *Throws*: Any exception thrown by `pred`.

6 *Remarks*: If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[*Note 2*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Clock, class Duration, class Predicate>
  bool wait_until(Lock& lock, stop_token stoken,
                  const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

7 *Effects*: Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
    while (!stoken.stop_requested()) {
      if (pred())
        return true;
      if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
    }
    return pred();
```

8 [*Note 3*: There is no blocking if `pred()` is initially `true`, `stoken.stop_requested()` was already `true` or the timeout has already expired. — *end note*]

9 [*Note 4*: The returned value indicates whether the predicate evaluated to `true` regardless of whether the timeout was triggered or a stop request was made. — *end note*]

10 *Postconditions*: `lock` is locked by the calling thread.

11 *Throws*: Timeout-related exceptions (32.2.4), or any exception thrown by `pred`.

12 *Remarks*: If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[*Note 5*: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Lock, class Rep, class Period, class Predicate>
  bool wait_for(Lock& lock, stop_token stoken,
                const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

13 *Effects*: Equivalent to:

```
    return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
                      std::move(pred));
```

32.8 Semaphore [thread.sema]

32.8.1 General [thread.sema.general]

1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

32.8.2 Header `<semaphore>` synopsis [semaphore.syn]

```
  namespace std {
    // 32.8.3, class template counting_semaphore
    template<ptrdiff_t least_max_value = implementation-defined>
      class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
  }
```

32.8.3 Class template counting_semaphore [thread.sema.cnt]

```
namespace std {
  template<ptrdiff_t least_max_value = implementation-defined>
  class counting_semaphore {
  public:
    static constexpr ptrdiff_t max() noexcept;

    constexpr explicit counting_semaphore(ptrdiff_t desired);
    ~counting_semaphore();

    counting_semaphore(const counting_semaphore&) = delete;
    counting_semaphore& operator=(const counting_semaphore&) = delete;

    void release(ptrdiff_t update = 1);
    void acquire();
    bool try_acquire() noexcept;
    template<class Rep, class Period>
      bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
      bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

  private:
    ptrdiff_t counter;            // exposition only
  };
}
```

1 Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

2 `least_max_value` shall be non-negative; otherwise the program is ill-formed.

3 Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

4 *Returns*: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

5 *Preconditions*: `desired >= 0` is `true`, and `desired <= max()` is `true`.

6 *Effects*: Initializes `counter` with `desired`.

7 *Throws*: Nothing.

```
void release(ptrdiff_t update = 1);
```

8 *Preconditions*: `update >= 0` is `true`, and `update <= max() - counter` is `true`.

9 *Effects*: Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

10 *Synchronization*: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

11 *Throws*: `system_error` when an exception is required (32.2.2).

12 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_acquire() noexcept;
```

13 *Effects*: Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[*Note 1*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — *end note*]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

14 *Returns*: `true` if `counter` was decremented, otherwise `false`.

```
void acquire();
```

15 *Effects*: Repeatedly performs the following steps, in order:

(15.1) — Evaluates `try_acquire()`. If the result is `true`, returns.

(15.2) — Blocks on `*this` until `counter` is greater than zero.

16 *Throws*: `system_error` when an exception is required (32.2.2).

17 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

```
template<class Rep, class Period>
  bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
  bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

18 *Effects*: Repeatedly performs the following steps, in order:

(18.1) — Evaluates `try_acquire()`. If the result is `true`, returns `true`.

(18.2) — Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (32.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

19 *Throws*: Timeout-related exceptions (32.2.4), or `system_error` when a non-timeout-related exception is required (32.2.2).

20 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

32.9 Coordination types [thread.coord]

32.9.1 General [thread.coord.general]

1 Subclause 32.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

32.9.2 Latches [thread.latch]

32.9.2.1 General [thread.latch.general]

1 A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

32.9.2.2 Header `<latch>` synopsis [latch.syn]

```
namespace std {
  class latch;
}
```

32.9.2.3 Class `latch` [thread.latch.class]

```
namespace std {
  class latch {
  public:
    static constexpr ptrdiff_t max() noexcept;

    constexpr explicit latch(ptrdiff_t expected);
    ~latch();

    latch(const latch&) = delete;
    latch& operator=(const latch&) = delete;
```

```
      void count_down(ptrdiff_t update = 1);
      bool try_wait() const noexcept;
      void wait() const;
      void arrive_and_wait(ptrdiff_t update = 1);

    private:
      ptrdiff_t counter;  // exposition only
    };
  }
```

1 A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

2 Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

3 *Returns*: The maximum value of `counter` that the implementation supports.

```
constexpr explicit latch(ptrdiff_t expected);
```

4 *Preconditions*: `expected >= 0` is `true` and `expected <= max()` is `true`.

5 *Effects*: Initializes `counter` with `expected`.

6 *Throws*: Nothing.

```
void count_down(ptrdiff_t update = 1);
```

7 *Preconditions*: `update >= 0` is `true`, and `update <= counter` is `true`.

8 *Effects*: Atomically decrements `counter` by `update`. If `counter` is equal to zero, unblocks all threads blocked on `*this`.

9 *Synchronization*: Strongly happens before the returns from all calls that are unblocked.

10 *Throws*: `system_error` when an exception is required (32.2.2).

11 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_wait() const noexcept;
```

12 *Returns*: With very low probability `false`. Otherwise `counter == 0`.

```
void wait() const;
```

13 *Effects*: If `counter` equals zero, returns immediately. Otherwise, blocks on `*this` until a call to `count_down` that decrements `counter` to zero.

14 *Throws*: `system_error` when an exception is required (32.2.2).

15 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait(ptrdiff_t update = 1);
```

16 *Effects*: Equivalent to:

```
  count_down(update);
  wait();
```

32.9.3 Barriers [thread.barrier]

32.9.3.1 General [thread.barrier.general]

1 A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[*Note 1*: A barrier is useful for managing repeated tasks that are handled by multiple threads. — *end note*]

32.9.3.2 Header `<barrier>` synopsis [barrier.syn]

```
  namespace std {
    template<class CompletionFunction = see below>
      class barrier;
```

```
}
```

32.9.3.3 Class template `barrier` [thread.barrier.class]

```
namespace std {
  template<class CompletionFunction = see below>
  class barrier {
  public:
    using arrival_token = see below;

    static constexpr ptrdiff_t max() noexcept;

    constexpr explicit barrier(ptrdiff_t expected,
                               CompletionFunction f = CompletionFunction());
    ~barrier();

    barrier(const barrier&) = delete;
    barrier& operator=(const barrier&) = delete;

    arrival_token arrive(ptrdiff_t update = 1);
    void wait(arrival_token&& arrival) const;

    void arrive_and_wait();
    void arrive_and_drop();

  private:
    CompletionFunction completion;      // exposition only
  };
}
```

1 Each *barrier phase* consists of the following steps:

(1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.

(1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to `arrive`, `arrive_and_drop`, or `wait`, except that it is implementation-defined whether the step executes if no thread calls `wait`.

(1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

2 Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.

3 The *phase completion step* that is executed at the end of each phase has the following effects:

(3.1) — Invokes the completion function, equivalent to `completion()`.

(3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

4 Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

5 `CompletionFunction` shall meet the *Cpp17MoveConstructible* (Table 31) and *Cpp17Destructible* (Table 35) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.

6 The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements (Table 30) and `completion()` has no effects.

7 `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* (Table 31), *Cpp17MoveAssignable* (Table 33), and *Cpp17Destructible* (Table 35) requirements.

```
static constexpr ptrdiff_t max() noexcept;
```

8 *Returns*: The maximum expected count that the implementation supports.

```
constexpr explicit barrier(ptrdiff_t expected,
                           CompletionFunction f = CompletionFunction());
```

9 *Preconditions*: `expected >= 0` is `true` and `expected <= max()` is `true`.

10 *Effects*: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[*Note 1*: If `expected` is 0 this object can only be destroyed. — *end note*]

11 *Throws*: Any exception thrown by `CompletionFunction`'s move constructor.

```
arrival_token arrive(ptrdiff_t update = 1);
```

12 *Preconditions*: `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

13 *Effects*: Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

14 *Synchronization*: The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

15 *Returns*: The constructed `arrival_token` object.

16 *Throws*: `system_error` when an exception is required (32.2.2).

17 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

18 [*Note 2*: This call can cause the completion step for the current phase to start. — *end note*]

```
void wait(arrival_token&& arrival) const;
```

19 *Preconditions*: `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

20 *Effects*: Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.

[*Note 3*: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. — *end note*]

21 *Throws*: `system_error` when an exception is required (32.2.2).

22 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait();
```

23 *Effects*: Equivalent to: `wait(arrive())`.

```
void arrive_and_drop();
```

24 *Preconditions*: The expected count for the current barrier phase is greater than zero.

25 *Effects*: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

26 *Synchronization*: The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

27 *Throws*: `system_error` when an exception is required (32.2.2).

28 *Error conditions*: Any of the error conditions allowed for mutex types (32.6.4.2).

29 [*Note 4*: This call can cause the completion step for the current phase to start. — *end note*]

32.10 Futures [futures]

32.10.1 Overview [futures.overview]

1 32.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[*Note 1*: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — *end note*]

32.10.2 Header <future> synopsis [future.syn]

```
namespace std {
  enum class future_errc {
    broken_promise = implementation-defined,
    future_already_retrieved = implementation-defined,
    promise_already_satisfied = implementation-defined,
    no_state = implementation-defined
  };

  enum class launch : unspecified {
    async = unspecified,
    deferred = unspecified,
    implementation-defined
  };

  enum class future_status {
    ready,
    timeout,
    deferred
  };

  // 32.10.3, error handling
  template<> struct is_error_code_enum<future_errc> : public true_type { };
  error_code make_error_code(future_errc e) noexcept;
  error_condition make_error_condition(future_errc e) noexcept;

  const error_category& future_category() noexcept;

  // 32.10.4, class future_error
  class future_error;

  // 32.10.6, class template promise
  template<class R> class promise;
  template<class R> class promise<R&>;
  template<> class promise<void>;

  template<class R>
    void swap(promise<R>& x, promise<R>& y) noexcept;

  template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>;

  // 32.10.7, class template future
  template<class R> class future;
  template<class R> class future<R&>;
  template<> class future<void>;

  // 32.10.8, class template shared_future
  template<class R> class shared_future;
  template<class R> class shared_future<R&>;
  template<> class shared_future<void>;

  // 32.10.10, class template packaged_task
  template<class> class packaged_task;   // not defined
  template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>;

  template<class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

  // 32.10.9, function template async
  template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
      async(F&& f, Args&&... args);
  template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
      async(launch policy, F&& f, Args&&... args);
}
```

1 The `enum` type `launch` is a bitmask type (16.3.3.3.3) with elements `launch::async` and `launch::deferred`.

[*Note 1*: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the "as if" rule. — *end note*]

2 The enum values of `future_errc` are distinct and not zero.

32.10.3 Error handling [futures.errors]

```
const error_category& future_category() noexcept;
```

1 *Returns*: A reference to an object of a type derived from class `error_category`.

2 The object's `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function returns a pointer to the string `"future"`.

```
error_code make_error_code(future_errc e) noexcept;
```

3 *Returns*: `error_code(static_cast<int>(e), future_category())`.

```
error_condition make_error_condition(future_errc e) noexcept;
```

4 *Returns*: `error_condition(static_cast<int>(e), future_category())`.

32.10.4 Class future_error [futures.future.error]

```
namespace std {
  class future_error : public logic_error {
  public:
    explicit future_error(future_errc e);

    const error_code& code() const noexcept;
    const char*       what() const noexcept;

  private:
    error_code ec_;             // exposition only
  };
}
```

```
explicit future_error(future_errc e);
```

1 *Effects*: Initializes `ec_` with `make_error_code(e)`.

```
const error_code& code() const noexcept;
```

2 *Returns*: `ec_`.

```
const char* what() const noexcept;
```

3 *Returns*: An NTBS incorporating `code().message()`.

32.10.5 Shared state [futures.state]

1 Many of the classes introduced in subclause 32.10 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception.

[*Note 1*: Futures, promises, and tasks defined in this Clause reference such shared state. — *end note*]

2 [*Note 2*: The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. — *end note*]

3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (32.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[*Example 1*: Promises and tasks are examples of asynchronous providers. — *end example*]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

(5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and

(5.2) — the return object or provider gives up its reference to its shared state; and

(5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

6 When an asynchronous provider is said to make its shared state ready, it means:

(6.1) — first, the provider marks its shared state as ready; and

(6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

7 When an asynchronous provider is said to abandon its shared state, it means:

(7.1) — first, if that state is not ready, the provider

(7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then

(7.1.2) — makes its shared state ready;

(7.2) — second, the provider releases its shared state.

8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.

10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.7.6.3) is sequenced before making that shared state ready.

11 Access to the result of the same shared state may conflict (6.9.2).

[*Note 3*: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (32.10.8) must either use read-only operations or provide additional synchronization. — *end note*]

32.10.6 Class template `promise` [futures.promise]

```
namespace std {
  template<class R>
  class promise {
  public:
    promise();
    template<class Allocator>
      promise(allocator_arg_t, const Allocator& a);
    promise(promise&& rhs) noexcept;
    promise(const promise&) = delete;
    ~promise();

    // assignment
    promise& operator=(promise&& rhs) noexcept;
    promise& operator=(const promise&) = delete;
    void swap(promise& other) noexcept;
    // retrieving the result
    future<R> get_future();

    // setting the result
    void set_value(see below);
    void set_exception(exception_ptr p);

    // setting the result with deferred notification
    void set_value_at_thread_exit(see below);
    void set_exception_at_thread_exit(exception_ptr p);
  };

  template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>;
}
```

1 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.

2 The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.

3 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
template<class R, class Alloc>
  struct uses_allocator<promise<R>, Alloc>
    : true_type { };
```

4 *Preconditions*: `Alloc` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

```
promise();
template<class Allocator>
  promise(allocator_arg_t, const Allocator& a);
```

5 *Effects*: Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;
```

6 *Effects*: Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

7 *Postconditions*: `rhs` has no shared state.

```
~promise();
```

8 *Effects*: Abandons any shared state (32.10.5).

```
promise& operator=(promise&& rhs) noexcept;
```

9 *Effects*: Abandons any shared state (32.10.5) and then as if `promise(std::move(rhs)).swap(*this)`.

10 *Returns*: `*this`.

```
void swap(promise& other) noexcept;
```

11 *Effects*: Exchanges the shared state of `*this` and `other`.

12 *Postconditions*: `*this` has the shared state (if any) that `other` had prior to the call to `swap`. `other` has the shared state (if any) that `*this` had prior to the call to `swap`.

```
future<R> get_future();
```

13 *Synchronization*: Calls to this function do not introduce data races (6.9.2) with calls to `set_value`, `set_exception`, `set_value_at_thread_exit`, or `set_exception_at_thread_exit`.

[*Note 1*: Such calls need not synchronize with each other. — *end note*]

14 *Returns*: A `future<R>` object with the same shared state as `*this`.

15 *Throws*: `future_error` if `*this` has no shared state or if `get_future` has already been called on a `promise` with the same shared state as `*this`.

16 *Error conditions*:

(16.1) — `future_already_retrieved` if `get_future` has already been called on a `promise` with the same shared state as `*this`.

(16.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();
```

17 *Effects*: Atomically stores the value `r` in the shared state and makes that state ready (32.10.5).

18 *Throws*:

(18.1) — `future_error` if its shared state already has a stored value or exception, or

(18.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

(18.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

19 *Error conditions*:

(19.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(19.2) — `no_state` if `*this` has no shared state.

```
void set_exception(exception_ptr p);
```

20 *Preconditions*: `p` is not null.

21 *Effects*: Atomically stores the exception pointer `p` in the shared state and makes that state ready (32.10.5).

22 *Throws*: `future_error` if its shared state already has a stored value or exception.

23 *Error conditions*:

(23.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(23.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

24 *Effects*: Stores the value `r` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

25 *Throws*:

(25.1) — `future_error` if its shared state already has a stored value or exception, or

(25.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

(25.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

26 *Error conditions*:

(26.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(26.2) — `no_state` if `*this` has no shared state.

```
void set_exception_at_thread_exit(exception_ptr p);
```

27 *Preconditions*: `p` is not null.

28 *Effects*: Stores the exception pointer `p` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

29 *Throws*: `future_error` if an error condition occurs.

30 *Error conditions*:

(30.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(30.2) — `no_state` if `*this` has no shared state.

```
template<class R>
  void swap(promise<R>& x, promise<R>& y) noexcept;
```

31 *Effects*: As if by `x.swap(y)`.

32.10.7 Class template `future` [futures.unique.future]

1 The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (32.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

2 [*Note 1*: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — *end note*]

3 The effect of calling any member function other than the destructor, the move assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

[*Note 2*: It is valid to move from a future object for which `valid() == false`. — *end note*]

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
  template<class R>
  class future {
  public:
    future() noexcept;
    future(future&&) noexcept;
    future(const future&) = delete;
    ~future();
    future& operator=(const future&) = delete;
    future& operator=(future&&) noexcept;
    shared_future<R> share() noexcept;

    // retrieving the value
    see below get();

    // functions to check state
    bool valid() const noexcept;

    void wait() const;
    template<class Rep, class Period>
      future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
    template<class Clock, class Duration>
      future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
  };
}
```

4 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.

5 The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
future() noexcept;
```

6 *Effects*: The object does not refer to a shared state.

7 *Postconditions*: `valid() == false`.

```
future(future&& rhs) noexcept;
```

8 *Effects*: Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

9 *Postconditions*:

(9.1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

(9.2) — `rhs.valid() == false`.

```
~future();
```

10 *Effects*:

(10.1) — Releases any shared state (32.10.5);

(10.2) — destroys `*this`.

```
future& operator=(future&& rhs) noexcept;
```

11 *Effects*: If `addressof(rhs) == this` is `true`, there are no effects. Otherwise:

(11.1) — Releases any shared state (32.10.5).

(11.2) — move assigns the contents of `rhs` to `*this`.

12 *Postconditions*:

(12.1) — `valid()` returns the same value as `rhs.valid()` prior to the assignment.

(12.2) — If `addressof(rhs) == this` is `false`, `rhs.valid() == false`.

```
shared_future<R> share() noexcept;
```

13 *Postconditions*: `valid() == false`.

14 *Returns*: `shared_future<R>(std::move(*this))`.

```
R future::get();
R& future<R&>::get();
void future<void>::get();
```

15 [*Note 3*: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`. — *end note*]

16 *Effects*:

(16.1) — `wait()`s until the shared state is ready, then retrieves the value stored in the shared state;

(16.2) — releases any shared state (32.10.5).

17 *Postconditions*: `valid() == false`.

18 *Returns*:

(18.1) — `future::get()` returns the value `v` stored in the object's shared state as `std::move(v)`.

(18.2) — `future<R&>::get()` returns the reference stored as value in the object's shared state.

(18.3) — `future<void>::get()` returns nothing.

19 *Throws*: The stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

20 *Returns*: `true` only if `*this` refers to a shared state.

```
void wait() const;
```

21 *Effects*: Blocks until the shared state is ready.

```
template<class Rep, class Period>
  future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

22 *Effects*: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by `rel_time` has expired.

23 *Returns*:

(23.1) — `future_status::deferred` if the shared state contains a deferred function.

(23.2) — `future_status::ready` if the shared state is ready.

(23.3) — `future_status::timeout` if the function is returning because the relative timeout (32.2.4) specified by `rel_time` has expired.

24 *Throws*: timeout-related exceptions (32.2.4).

```
template<class Clock, class Duration>
  future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

25 *Effects*: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by `abs_time` has expired.

26 *Returns*:

(26.1) — `future_status::deferred` if the shared state contains a deferred function.

(26.2) — `future_status::ready` if the shared state is ready.

(26.3) — `future_status::timeout` if the function is returning because the absolute timeout (32.2.4) specified by `abs_time` has expired.

27 *Throws*: timeout-related exceptions (32.2.4).

32.10.8 Class template `shared_future` [futures.shared.future]

1 The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (32.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

2 [*Note 1*: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — *end note*]

3 The effect of calling any member function other than the destructor, the move assignment operator, the copy assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.

[*Note 2*: It is valid to copy or move from a `shared_future` object for which `valid()` is `false`. — *end note*]

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
  template<class R>
  class shared_future {
  public:
    shared_future() noexcept;
    shared_future(const shared_future& rhs) noexcept;
    shared_future(future<R>&&) noexcept;
    shared_future(shared_future&& rhs) noexcept;
    ~shared_future();
    shared_future& operator=(const shared_future& rhs) noexcept;
    shared_future& operator=(shared_future&& rhs) noexcept;

    // retrieving the value
    see below get() const;

    // functions to check state
    bool valid() const noexcept;

    void wait() const;
    template<class Rep, class Period>
      future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
    template<class Clock, class Duration>
      future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
  };
}
```

4 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.

5 The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`shared_future() noexcept;`

6 *Effects*: The object does not refer to a shared state.

7 *Postconditions*: `valid() == false`.

`shared_future(const shared_future& rhs) noexcept;`

8 *Effects*: The object refers to the same shared state as `rhs` (if any).

9 *Postconditions*: `valid()` returns the same value as `rhs.valid()`.

```
shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future&& rhs) noexcept;
```

10 *Effects*: Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

11 *Postconditions*:

(11.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(11.2) — `rhs.valid() == false`.

`~shared_future();`

12 *Effects*:

(12.1) — Releases any shared state (32.10.5);

(12.2) — destroys `*this`.

`shared_future& operator=(shared_future&& rhs) noexcept;`

13 *Effects*: If `addressof(rhs) == this` is `true`, there are no effects. Otherwise:

(13.1) — Releases any shared state (32.10.5);

(13.2) — move assigns the contents of `rhs` to `*this`.

14 *Postconditions*:

(14.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the assignment.

(14.2) — If `addressof(rhs) == this` is `false`, `rhs.valid() == false`.

`shared_future& operator=(const shared_future& rhs) noexcept;`

15 *Effects*: If `addressof(rhs) == this` is `true`, there are no effects. Otherwise:

(15.1) — Releases any shared state (32.10.5);

(15.2) — assigns the contents of `rhs` to `*this`.

[*Note 3*: As a result, `*this` refers to the same shared state as `rhs` (if any). — *end note*]

16 *Postconditions*: `valid() == rhs.valid()`.

```
const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;
```

17 [*Note 4*: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`. — *end note*]

18 [*Note 5*: Access to a value object stored in the shared state is unsynchronized, so operations on `R` might introduce a data race (6.9.2). — *end note*]

19 *Effects*: `wait()`s until the shared state is ready, then retrieves the value stored in the shared state.

20 *Returns*:

(20.1) — `shared_future::get()` returns a const reference to the value stored in the object's shared state.

[*Note 6*: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the `shared_future` object that returned the reference. — *end note*]

(20.2) — `shared_future<R&>::get()` returns the reference stored as value in the object's shared state.

(20.3) — `shared_future<void>::get()` returns nothing.

21 *Throws*: The stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

22 *Returns*: `true` only if `*this` refers to a shared state.

```
void wait() const;
```

23 *Effects*: Blocks until the shared state is ready.

```
template<class Rep, class Period>
  future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

24 *Effects*: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by `rel_time` has expired.

25 *Returns*:

(25.1) — `future_status::deferred` if the shared state contains a deferred function.

(25.2) — `future_status::ready` if the shared state is ready.

(25.3) — `future_status::timeout` if the function is returning because the relative timeout (32.2.4) specified by `rel_time` has expired.

26 *Throws*: timeout-related exceptions (32.2.4).

```
template<class Clock, class Duration>
  future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

27 *Effects*: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by `abs_time` has expired.

28 *Returns*:

(28.1) — `future_status::deferred` if the shared state contains a deferred function.

(28.2) — `future_status::ready` if the shared state is ready.

(28.3) — `future_status::timeout` if the function is returning because the absolute timeout (32.2.4) specified by `abs_time` has expired.

29 *Throws*: timeout-related exceptions (32.2.4).

32.10.9 Function template async [futures.async]

1 The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template<class F, class... Args>
  future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
    async(F&& f, Args&&... args);
template<class F, class... Args>
  future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
    async(launch policy, F&& f, Args&&... args);
```

2 *Mandates*: The following are all `true`:

(2.1) — `is_constructible_v<decay_t<F>, F>`,

(2.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and

(2.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

3 *Effects*: The first function behaves the same as a call to the second function with a `policy` argument of `launch::async | launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

(3.1) — If `launch::async` is set in `policy`, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 32.4.3.3) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)`

is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

(3.2) — If `launch::deferred` is set in `policy`, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (32.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

Recommended practice: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async | launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

(3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

4 *Synchronization*: The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

[*Note 1*: These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens. — *end note*]

If the implementation chooses the `launch::async` policy,

(4.1) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (32.4.3.6);

(4.2) — the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

5 *Returns*: An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[*Note 2*: If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — *end note*]

6 *Throws*: `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

7 *Error conditions*:

(7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

8 [*Example 1*:

```
int work1(int value);
int work2(int value);
int work(int value) {
  auto handle = std::async([=]{ return work2(value); });
  int tmp = work1(value);
  return tmp + handle.get();     // #1
}
```

[*Note 3*: Line #1 might not result in concurrency because the `async` call uses the default policy, which might use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*]

— *end example*]

32.10.10 Class template packaged_task [futures.task]

32.10.10.1 General [futures.task.general]

1 The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

2 When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
  template<class> class packaged_task;  // not defined

  template<class R, class... ArgTypes>
  class packaged_task<R(ArgTypes...)> {
  public:
    // construction and destruction
    packaged_task() noexcept;
    template<class F>
      explicit packaged_task(F&& f);
    ~packaged_task();

    // no copy
    packaged_task(const packaged_task&) = delete;
    packaged_task& operator=(const packaged_task&) = delete;

    // move support
    packaged_task(packaged_task&& rhs) noexcept;
    packaged_task& operator=(packaged_task&& rhs) noexcept;
    void swap(packaged_task& other) noexcept;

    bool valid() const noexcept;

    // result retrieval
    future<R> get_future();

    // execution
    void operator()(ArgTypes... );
    void make_ready_at_thread_exit(ArgTypes...);

    void reset();
  };

  template<class R, class... ArgTypes>
    packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>;

  template<class F> packaged_task(F) -> packaged_task<see below>;
}
```

32.10.10.2 Member functions [futures.task.members]

```
packaged_task() noexcept;
```

1 *Effects*: The object has no shared state and no stored task.

```
template<class F>
  explicit packaged_task(F&& f);
```

2 *Constraints*: `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

3 *Mandates*: `is_invocable_r_v<R, decay_t<F>&, ArgTypes...>` is `true`.

4 *Effects*: Constructs a new `packaged_task` object with a stored task of type `decay_t<F>` and a shared state. Initializes the object's stored task with `std::forward<F>(f)`.

5 *Throws*: Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures cannot be allocated.

```
template<class F> packaged_task(F) -> packaged_task<see below>;
```

6 *Constraints*: `&F::operator()` is well-formed when treated as an unevaluated operand (7.2.3) and either

(6.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G::*)(A...)` *cv* `&`$_{opt}$ `noexcept`$_{opt}$ or of the form `R(*)(G, A...) noexcept`$_{opt}$ for a type `G`, or

(6.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*)(A...) noexcept`$_{opt}$.

7 *Remarks*: The deduced type is `packaged_task<R(A...)>`.

```
packaged_task(packaged_task&& rhs) noexcept;
```

8 *Effects*: Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

9 *Postconditions*: `rhs` has no shared state.

```
packaged_task& operator=(packaged_task&& rhs) noexcept;
```

10 *Effects*:

(10.1) — Releases any shared state (32.10.5);

(10.2) — calls `packaged_task(std::move(rhs)).swap(*this)`.

```
~packaged_task();
```

11 *Effects*: Abandons any shared state (32.10.5).

```
void swap(packaged_task& other) noexcept;
```

12 *Effects*: Exchanges the shared states and stored tasks of `*this` and `other`.

13 *Postconditions*: `*this` has the same shared state and stored task (if any) as `other` prior to the call to `swap`. `other` has the same shared state and stored task (if any) as `*this` prior to the call to `swap`.

```
bool valid() const noexcept;
```

14 *Returns*: `true` only if `*this` has a shared state.

```
future<R> get_future();
```

15 *Synchronization*: Calls to this function do not introduce data races (6.9.2) with calls to `operator()` or `make_ready_at_thread_exit`.

[*Note 1*: Such calls need not synchronize with each other. — *end note*]

16 *Returns*: A `future` object that shares the same shared state as `*this`.

17 *Throws*: A `future_error` object if an error occurs.

18 *Error conditions*:

(18.1) — `future_already_retrieved` if `get_future` has already been called on a `packaged_task` object with the same shared state as `*this`.

(18.2) — `no_state` if `*this` has no shared state.

```
void operator()(ArgTypes... args);
```

19 *Effects*: As if by *`INVOKE`*`<R>(f,` t_1`,` t_2`, ...,` t_N`)` (22.10.4), where `f` is the stored task of `*this` and t_1, t_2, ..., t_N are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. The shared state of `*this` is made ready, and any threads blocked in a function waiting for the shared state of `*this` to become ready are unblocked.

20 *Throws*: A `future_error` exception object if there is no shared state or the stored task has already been invoked.

21 *Error conditions*:

(21.1) — `promise_already_satisfied` if the stored task has already been invoked.

(21.2) — `no_state` if `*this` has no shared state.

```
void make_ready_at_thread_exit(ArgTypes... args);
```

22 *Effects*: As if by *INVOKE*<R>(f, t_1, t_2, ..., t_N) (22.10.4), where f is the stored task and t_1, t_2, ..., t_N are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (32.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

23 *Throws*: future_error if an error condition occurs.

24 *Error conditions*:

(24.1) — promise_already_satisfied if the stored task has already been invoked.

(24.2) — no_state if *this has no shared state.

```
void reset();
```

25 *Effects*: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.

[*Note 2*: This constructs a new shared state for *this. The old state is abandoned (32.10.5). — *end note*]

26 *Throws*:

(26.1) — bad_alloc if memory for the new shared state cannot be allocated.

(26.2) — Any exception thrown by the move constructor of the task stored in the shared state.

(26.3) — future_error with an error condition of no_state if *this has no shared state.

32.10.10.3 Globals [futures.task.nonmembers]

```
template<class R, class... ArgTypes>
  void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

1 *Effects*: As if by x.swap(y).

32.11 Safe reclamation [saferecl]

32.11.1 General [saferecl.general]

1 Subclause 32.11 contains safe-reclamation techniques, which are most frequently used to straightforwardly resolve access-deletion races.

32.11.2 Read-copy update (RCU) [saferecl.rcu]

32.11.2.1 General [saferecl.rcu.general]

1 RCU is a synchronization mechanism that can be used for linked data structures that are frequently read, but seldom updated. RCU does not provide mutual exclusion, but instead allows the user to schedule specified actions such as deletion at some later time.

2 A class type T is *rcu-protectable* if it has exactly one base class of type rcu_obj_base<T, D> for some D, and that base is public and non-virtual, and it has no base classes of type rcu_obj_base<X, Y> for any other combination X, Y. An object is rcu-protectable if it is of rcu-protectable type.

3 An invocation of unlock U on an rcu_domain dom corresponds to an invocation of lock L on dom if L is sequenced before U and either

(3.1) — no other invocation of lock on dom is sequenced after L and before U, or

(3.2) — every invocation of unlock $U2$ on dom such that L is sequenced before $U2$ and $U2$ is sequenced before U corresponds to an invocation of lock $L2$ on dom such that L is sequenced before $L2$ and $L2$ is sequenced before $U2$.

[*Note 1*: This pairs nested locks and unlocks on a given domain in each thread. — *end note*]

4 A *region of RCU protection* on a domain dom starts with a lock L on dom and ends with its corresponding unlock U.

5 Given a region of RCU protection R on a domain dom and given an evaluation E that scheduled another evaluation F in dom, if E does not strongly happen before the start of R, the end of R strongly happens before evaluating F.

6 The evaluation of a scheduled evaluation is potentially concurrent with any other scheduled evaluation. Each scheduled evaluation is evaluated at most once.

32.11.2.2 Header `<rcu>` synopsis [rcu.syn]

```
namespace std {
  // 32.11.2.3, class template rcu_obj_base
  template<class T, class D = default_delete<T>> class rcu_obj_base;

  // 32.11.2.4, class rcu_domain
  class rcu_domain;

  // 32.11.2.4.3, non-member functions
  rcu_domain& rcu_default_domain() noexcept;
  void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
  void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
  template<class T, class D = default_delete<T>>
    void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
}
```

32.11.2.3 Class template `rcu_obj_base` [saferecl.rcu.base]

1 Objects of type `T` to be protected by RCU inherit from a specialization `rcu_obj_base<T, D>` for some `D`.

```
namespace std {
  template<class T, class D = default_delete<T>>
  class rcu_obj_base {
  public:
    void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
  protected:
    rcu_obj_base() = default;
    rcu_obj_base(const rcu_obj_base&) = default;
    rcu_obj_base(rcu_obj_base&&) = default;
    rcu_obj_base& operator=(const rcu_obj_base&) = default;
    rcu_obj_base& operator=(rcu_obj_base&&) = default;
    ~rcu_obj_base() = default;
  private:
    D deleter;              // exposition only
  };
}
```

2 The behavior of a program that adds specializations for `rcu_obj_base` is undefined.

3 `T` may be an incomplete type. It shall be complete before any member of the resulting specialization of `rcu_obj_base` is referenced.

4 `D` shall be a function object type (22.10) for which, given a value `d` of type `D` and a value `ptr` of type `T*`, the expression `d(ptr)` is valid.

5 `D` shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.

6 If `D` is trivially copyable, all specializations of `rcu_obj_base<T, D>` are trivially copyable.

```
void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
```

7 *Mandates*: `T` is an rcu-protectable type.

8 *Preconditions*: `*this` is a base class subobject of an object `x` of type `T`. The member function `rcu_obj_base<T, D>::retire` was not invoked on `x` before. The assignment to *`deleter`* does not exit via an exception.

9 *Effects*: Evaluates *`deleter`* `= std::move(d)` and schedules the evaluation of the expression *`deleter`*`(addressof(x))` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.

[*Note 1*: If such evaluations acquire resources held across any invocation of `retire` on `dom`, deadlock can occur. — *end note*]

32.11.2.4 Class `rcu_domain` [saferecl.rcu.domain]

32.11.2.4.1 General [saferecl.rcu.domain.general]

```
namespace std {
  class rcu_domain {
  public:
    rcu_domain(const rcu_domain&) = delete;
    rcu_domain& operator=(const rcu_domain&) = delete;

    void lock() noexcept;
    bool try_lock() noexcept;
    void unlock() noexcept;
  };
}
```

1 This class meets the requirements of *Cpp17Lockable* (32.2.5.3) and provides regions of RCU protection.

[*Example 1*:

```
std::scoped_lock<rcu_domain> rlock(rcu_default_domain());
```

— *end example*]

2 The functions `lock` and `unlock` establish (possibly nested) regions of RCU protection.

32.11.2.4.2 Member functions [saferecl.rcu.domain.members]

```
void lock() noexcept;
```

1 *Effects*: Opens a region of RCU protection.

2 *Remarks*: Calls to `lock` do not introduce a data race (6.9.2.2) involving `*this`.

```
bool try_lock() noexcept;
```

3 *Effects*: Equivalent to `lock()`.

4 *Returns*: `true`.

```
void unlock() noexcept;
```

5 *Preconditions*: A call to `lock` that opened an unclosed region of RCU protection is sequenced before the call to `unlock`.

6 *Effects*: Closes the unclosed region of RCU protection that was most recently opened. May invoke scheduled evaluations in `*this`.

7 [*Note 1*: If such evaluations acquire resources held across any invocation of `unlock` on `*this`, deadlock can occur. — *end note*]

8 *Remarks*: Calls to `unlock` do not introduce a data race involving `*this`.

[*Note 2*: Evaluation of scheduled evaluations can still cause a data race. — *end note*]

32.11.2.4.3 Non-member functions [saferecl.rcu.domain.func]

```
rcu_domain& rcu_default_domain() noexcept;
```

1 *Returns*: A reference to a static-duration object of type `rcu_domain`. A reference to the same object is returned every time this function is called.

```
void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
```

2 *Effects*: If the call to `rcu_synchronize` does not strongly happen before the lock opening an RCU protection region `R` on `dom`, blocks until the `unlock` closing `R` happens.

3 *Synchronization*: The `unlock` closing `R` strongly happens before the return from `rcu_synchronize`.

```
void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
```

4 *Effects*: May evaluate any scheduled evaluations in `dom`. For any evaluation that happens before the call to `rcu_barrier` and that schedules an evaluation E in `dom`, blocks until E has been evaluated.

5 *Synchronization*: The evaluation of any such E strongly happens before the return from `rcu_barrier`.

[*Note 1*: A call to `rcu_barrier` does not imply a call to `rcu_synchronize` and vice versa. — *end note*]

```
template<class T, class D = default_delete<T>>
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
```

6 *Mandates*: `is_move_constructible_v<D>` is `true` and the expression `d(p)` is well-formed.

7 *Preconditions*: `D` meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements.

8 *Effects*: May allocate memory. It is unspecified whether the memory allocation is performed by invoking `operator new`. Initializes an object `d1` of type `D` from `std::move(d)`. Schedules the evaluation of `d1(p)` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.

[*Note 2*: If `rcu_retire` exits via an exception, no evaluation is scheduled. — *end note*]

9 *Throws*: `bad_alloc` or any exception thrown by the initialization of `d1`.

10 [*Note 3*: If scheduled evaluations acquire resources held across any invocation of `rcu_retire` on `dom`, deadlock can occur. — *end note*]

32.11.3 Hazard pointers [saferecl.hp]

32.11.3.1 General [saferecl.hp.general]

1 A hazard pointer is a single-writer multi-reader pointer that can be owned by at most one thread at any time. Only the owner of the hazard pointer can set its value, while any number of threads may read its value. The owner thread sets the value of a hazard pointer to point to an object in order to indicate to concurrent threads—which may delete such an object—that the object is not yet safe to delete.

2 A class type `T` is *hazard-protectable* if it has exactly one base class of type `hazard_pointer_obj_base<T, D>` for some `D`, that base is public and non-virtual, and it has no base classes of type `hazard_pointer_obj_-base<T2, D2>` for any other combination `T2`, `D2`. An object is *hazard-protectable* if it is of hazard-protectable type.

3 The time span between creation and destruction of a hazard pointer h is partitioned into a series of *protection epochs*; in each protection epoch, h either is *associated with* a hazard-protectable object, or is *unassociated*. Upon creation, a hazard pointer is unassociated. Changing the association (possibly to the same object) initiates a new protection epoch and ends the preceding one.

4 An object `x` of hazard-protectable type `T` is *retired* with a deleter of type `D` when the member function `hazard_pointer_obj_base<T, D>::retire` is invoked on `x`. Any given object `x` shall be retired at most once.

5 A retired object `x` is *reclaimed* by invoking its deleter with a pointer to `x`; the behavior is undefined if that invocation exits via an exception.

6 A hazard-protectable object `x` is *possibly-reclaimable* with respect to an evaluation A if

(6.1) — `x` is not reclaimed; and

(6.2) — `x` is retired in an evaluation R and A does not happen before R; and

(6.3) — for all hazard pointers h and for every protection epoch E of h during which h is associated with `x`:

(6.3.1) — if the beginning of E happens before R, the end of E strongly happens before A; and

(6.3.2) — if E began by an evaluation of `try_protect` with argument `src`, label its atomic load operation L. If there exists an atomic modification B on `src` such that L observes a modification that is modification-ordered before B, and B happens before `x` is retired, the end of E strongly happens before A.

[*Note 1*: In typical use, a store to `src` sequenced before retiring `x` will be such an atomic operation B. — *end note*]

[*Note 2*: The latter two conditions convey the informal notion that a protection epoch that began before retiring `x`, as implied either by the happens-before relation or the coherence order of some source, delays the reclamation of `x`. — *end note*]

7 The number of possibly-reclaimable objects has an unspecified bound.

[*Note 3*: The bound can be a function of the number of hazard pointers, the number of threads that retire objects, and the number of threads that use hazard pointers. — *end note*]

[*Example 1*: The following example shows how hazard pointers allow updates to be carried out in the presence of concurrent readers. The object of type `hazard_pointer` in `print_name` protects the object `*ptr` from being reclaimed by `ptr->retire` until the end of the protection epoch.

```
struct Name : public hazard_pointer_obj_base<Name> { /* details */ };
atomic<Name*> name;
// called often and in parallel!
void print_name() {
  hazard_pointer h = make_hazard_pointer();
  Name* ptr = h.protect(name);          // Protection epoch starts
  // ... safe to access *ptr
}                                       // Protection epoch ends.

// called rarely, but possibly concurrently with print_name
void update_name(Name* new_name) {
  Name* ptr = name.exchange(new_name);
  ptr->retire();
}
```

— *end example*]

32.11.3.2 Header <hazard_pointer> synopsis [hazard.pointer.syn]

```
namespace std {
  // 32.11.3.3, class template hazard_pointer_obj_base
  template<class T, class D = default_delete<T>> class hazard_pointer_obj_base;

  // 32.11.3.4, class hazard_pointer
  class hazard_pointer;

  // 32.11.3.4.4, non-member functions
  hazard_pointer make_hazard_pointer();
  void swap(hazard_pointer&, hazard_pointer&) noexcept;
}
```

32.11.3.3 Class template hazard_pointer_obj_base [saferecl.hp.base]

```
namespace std {
  template<class T, class D = default_delete<T>>
  class hazard_pointer_obj_base {
  public:
    void retire(D d = D()) noexcept;
  protected:
    hazard_pointer_obj_base() = default;
    hazard_pointer_obj_base(const hazard_pointer_obj_base&) = default;
    hazard_pointer_obj_base(hazard_pointer_obj_base&&) = default;
    hazard_pointer_obj_base& operator=(const hazard_pointer_obj_base&) = default;
    hazard_pointer_obj_base& operator=(hazard_pointer_obj_base&&) = default;
    ~hazard_pointer_obj_base() = default;
  private:
    D deleter;        // exposition only
  };
}
```

1 D shall be a function object type (22.10.4) for which, given a value d of type D and a value ptr of type T*, the expression d(ptr) is valid.

2 The behavior of a program that adds specializations for hazard_pointer_obj_base is undefined.

3 D shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.

4 T may be an incomplete type. It shall be complete before any member of the resulting specialization of hazard_pointer_obj_base is referenced.

```
void retire(D d = D()) noexcept;
```

5 *Mandates*: T is a hazard-protectable type.

6 *Preconditions*: *this is a base class subobject of an object x of type T. x is not retired. Move-assigning d to deleter does not exit via an exception.

7 *Effects*: Move-assigns d to deleter, thereby setting it as the deleter of x, then retires x. May reclaim possibly-reclaimable objects.

32.11.3.4 Class `hazard_pointer` [saferecl.hp.holder]

32.11.3.4.1 General [saferecl.hp.holder.general]

```
namespace std {
  class hazard_pointer {
  public:
    hazard_pointer() noexcept;
    hazard_pointer(hazard_pointer&&) noexcept;
    hazard_pointer& operator=(hazard_pointer&&) noexcept;
    ~hazard_pointer();

    bool empty() const noexcept;
    template<class T> T* protect(const atomic<T*>& src) noexcept;
    template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
    template<class T> void reset_protection(const T* ptr) noexcept;
    void reset_protection(nullptr_t = nullptr) noexcept;
    void swap(hazard_pointer&) noexcept;
  };
}
```

1 An object of type `hazard_pointer` is either empty or *owns* a hazard pointer. Each hazard pointer is owned by exactly one object of type `hazard_pointer`.

[*Note 1*: An empty `hazard_pointer` object is different from a `hazard_pointer` object that owns an unassociated hazard pointer. An empty `hazard_pointer` object does not own any hazard pointers. — *end note*]

32.11.3.4.2 Constructors, destructor, and assignment [saferecl.hp.holder.ctor]

`hazard_pointer() noexcept;`

1 *Postconditions*: `*this` is empty.

`hazard_pointer(hazard_pointer&& other) noexcept;`

2 *Postconditions*: If `other` is empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`; `other` is empty.

`~hazard_pointer();`

3 *Effects*: If `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

`hazard_pointer& operator=(hazard_pointer&& other) noexcept;`

4 *Effects*: If `this == &other` is `true`, no effect. Otherwise, if `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

5 *Postconditions*: If `other` was empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`. If `this != &other` is `true`, `other` is empty.

6 *Returns*: `*this`.

32.11.3.4.3 Member functions [saferecl.hp.holder.mem]

`bool empty() const noexcept;`

1 *Returns*: `true` if and only if `*this` is empty.

`template<class T> T* protect(const atomic<T*>& src) noexcept;`

2 *Effects*: Equivalent to:

```
T* ptr = src.load(memory_order::relaxed);
while (!try_protect(ptr, src)) {}
return ptr;
```

`template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;`

3 *Mandates*: `T` is a hazard-protectable type.

4 *Preconditions*: `*this` is not empty.

5 *Effects*: Performs the following steps in order:

(5.1) — Initializes a variable `old` of type `T*` with the value of `ptr`.

(5.2) — Evaluates `reset_protection(old)`.

(5.3) — Assigns the value of `src.load(memory_order::acquire)` to `ptr`.

(5.4) — If `old == ptr` is `false`, evaluates `reset_protection()`.

6 *Returns*: `old == ptr`.

```
template<class T> void reset_protection(const T* ptr) noexcept;
```

7 *Mandates*: `T` is a hazard-protectable type.

8 *Preconditions*: `*this` is not empty.

9 *Effects*: If `ptr` is a null pointer value, invokes `reset_protection()`. Otherwise, associates the hazard pointer owned by `*this` with `*ptr`, thereby ending the current protection epoch.

10 *Complexity*: Constant.

```
void reset_protection(nullptr_t = nullptr) noexcept;
```

11 *Preconditions*: `*this` is not empty.

12 *Postconditions*: The hazard pointer owned by `*this` is unassociated.

13 *Complexity*: Constant.

```
void swap(hazard_pointer& other) noexcept;
```

14 *Effects*: Swaps the hazard pointer ownership of this object with that of `other`.

[*Note 1*: The owned hazard pointers, if any, remain unchanged during the swap and continue to be associated with the respective objects that they were protecting before the swap, if any. No protection epochs are ended or initiated. — *end note*]

15 *Complexity*: Constant.

32.11.3.4.4 Non-member functions [saferecl.hp.holder.nonmem]

```
hazard_pointer make_hazard_pointer();
```

1 *Effects*: Constructs a hazard pointer.

2 *Returns*: A `hazard_pointer` object that owns the newly-constructed hazard pointer.

3 *Throws*: May throw `bad_alloc` if memory for the hazard pointer could not be allocated.

```
void swap(hazard_pointer& a, hazard_pointer& b) noexcept;
```

4 *Effects*: Equivalent to `a.swap(b)`.

33 Execution control library [exec]

33.1 General [exec.general]

1 This Clause describes components supporting execution of function objects (22.10).

2 The following subclauses describe the requirements, concepts, and components for execution control primitives as summarized in Table 155.

Table 155 — Execution control library summary [tab:exec.summary]

	Subclause	Header
33.6	Schedulers	`<execution>`
33.7	Receivers	
33.8	Operation states	
33.9	Senders	

3 Table 156 shows the types of customization point objects (16.3.3.3.5) used in the execution control library.

Table 156 — Types of customization point objects in the execution control library [tab:exec.pos]

Customization point object type	Purpose	Examples
core	provide core execution functionality, and connection between core components	e.g., `connect`, `start`
completion functions	called by senders to announce the completion of the work (success, error, or cancellation)	`set_value`, `set_error`, `set_stopped`
senders	allow the specialization of the provided sender algorithms	— sender factories (e.g., `schedule`, `just`, `read_env`) — sender adaptors (e.g., `continues_on`, `then`, `let_value`) — sender consumers (e.g., `sync_wait`)
queries	allow querying different properties of objects	— general queries (e.g., `get_allocator`, `get_stop_token`) — environment queries (e.g., `get_scheduler`, `get_delegation_scheduler`) — scheduler queries (e.g., `get_forward_progress_guarantee`) — sender attribute queries (e.g., `get_completion_scheduler`)

4 This clause makes use of the following exposition-only entities.

5 For a subexpression `expr`, let *`MANDATE-NOTHROW`*`(expr)` be expression-equivalent to `expr`.

Mandates: `noexcept(expr)` is `true`.

6
```
namespace std {
  template<class T>
    concept movable-value =                                         // exposition only
      move_constructible<decay_t<T>> &&
      constructible_from<decay_t<T>, T> &&
      (!is_array_v<remove_reference_t<T>>);
}
```

7 For function types `F1` and `F2` denoting `R1(Args1...)` and `R2(Args2...)`, respectively, *`MATCHING-SIG`*`(F1, F2)` is `true` if and only if `same_as<R1(Args1&&...), R2(Args2&&...)>` is `true`.

8 For a subexpression `err`, let `Err` be `decltype((err))` and let *`AS-EXCEPT-PTR`*`(err)` be:

(8.1) — `err` if `decay_t<Err>` denotes the type `exception_ptr`.

Preconditions: `!err` is `false`.

(8.2) — Otherwise, `make_exception_ptr(system_error(err))` if `decay_t<Err>` denotes the type `error_code`.

(8.3) — Otherwise, `make_exception_ptr(err)`.

9 For a subexpression `expr`, let *`AS-CONST`*`(expr)` be expression-equivalent to

```
[](const auto& x) noexcept -> const auto& { return x; }(expr)
```

33.2 Queries and queryables [exec.queryable]

33.2.1 General [exec.queryable.general]

1 A *queryable object* is a read-only collection of key/value pair where each key is a customization point object known as a *query object*. A *query* is an invocation of a query object with a queryable object as its first argument and a (possibly empty) set of additional arguments. A query imposes syntactic and semantic requirements on its invocations.

2 Let `q` be a query object, let `args` be a (possibly empty) pack of subexpressions, let `env` be a subexpression that refers to a queryable object `o` of type `O`, and let `cenv` be a subexpression referring to `o` such that `decltype((cenv))` is `const O&`. The expression `q(env, args...)` is equal to (18.2) the expression `q(cenv, args...)`.

3 The type of a query expression cannot be `void`.

4 The expression `q(env, args...)` is equality-preserving (18.2) and does not modify the query object or the arguments.

5 If the expression `env.query(q, args...)` is well-formed, then it is expression-equivalent to `q(env, args...)`.

6 Unless otherwise specified, the result of a query is valid as long as the queryable object is valid.

33.2.2 queryable concept [exec.queryable.concept]

```
namespace std {
  template<class T>
    concept queryable = destructible<T>;    // exposition only
}
```

1 The exposition-only *`queryable`* concept specifies the constraints on the types of queryable objects.

2 Let `env` be an object of type `Env`. The type `Env` models *`queryable`* if for each callable object `q` and a pack of subexpressions `args`, if `requires { q(env, args...) }` is `true` then `q(env, args...)` meets any semantic requirements imposed by `q`.

33.3 Asynchronous operations [exec.async.ops]

1 An *execution resource* is a program entity that manages a (possibly dynamic) set of execution agents (32.2.5.1), which it uses to execute parallel work on behalf of callers.

[*Example 1*: The currently active thread, a system-provided thread pool, and uses of an API associated with an external hardware accelerator are all examples of execution resources. — *end example*]

Execution resources execute asynchronous operations. An execution resource is either valid or invalid.

2 An *asynchronous operation* is a distinct unit of program execution that

(2.1) — is explicitly created;

(2.2) — can be explicitly started once at most;

(2.3) — once started, eventually completes exactly once with a (possibly empty) set of result datums and in exactly one of three *dispositions*: success, failure, or cancellation;

  (2.3.1) — A successful completion, also known as a *value completion*, can have an arbitrary number of result datums.

  (2.3.2) — A failure completion, also known as an *error completion*, has a single result datum.

  (2.3.3) — A cancellation completion, also known as a *stopped completion*, has no result datum.

  An asynchronous operation's *async result* is its disposition and its (possibly empty) set of result datums.

(2.4) — can complete on a different execution resource than the execution resource on which it started; and

(2.5) — can create and start other asynchronous operations called *child operations*. A child operation is an asynchronous operation that is created by the parent operation and, if started, completes before the parent operation completes. A *parent operation* is the asynchronous operation that created a particular child operation.

[*Note 1*: An asynchronous operation can execute synchronously; that is, it can complete during the execution of its start operation on the thread of execution that started it. — *end note*]

3 An asynchronous operation has associated state known as its *operation state*.

4 An asynchronous operation has an associated environment. An *environment* is a queryable object (33.2) representing the execution-time properties of the operation's caller. The caller of an asynchronous operation is its parent operation or the function that created it.

5 An asynchronous operation has an associated receiver. A *receiver* is an aggregation of three handlers for the three asynchronous completion dispositions:

(5.1) — a value completion handler for a value completion,

(5.2) — an error completion handler for an error completion, and

(5.3) — a stopped completion handler for a stopped completion.

A receiver has an associated environment. An asynchronous operation's operation state owns the operation's receiver. The environment of an asynchronous operation is equal to its receiver's environment.

6 For each completion disposition, there is a *completion function*. A completion function is a customization point object (16.3.3.3.5) that accepts an asynchronous operation's receiver as the first argument and the result datums of the asynchronous operation as additional arguments. The value completion function invokes the receiver's value completion handler with the value result datums; likewise for the error completion function and the stopped completion function. A completion function has an associated type known as its *completion tag* that is the unqualified type of the completion function. A valid invocation of a completion function is called a *completion operation*.

7 The *lifetime of an asynchronous operation*, also known as the operation's *async lifetime*, begins when its start operation begins executing and ends when its completion operation begins executing. If the lifetime of an asynchronous operation's associated operation state ends before the lifetime of the asynchronous operation, the behavior is undefined. After an asynchronous operation executes a completion operation, its associated operation state is invalid. Accessing any part of an invalid operation state is undefined behavior.

8 An asynchronous operation shall not execute a completion operation before its start operation has begun executing. After its start operation has begun executing, exactly one completion operation shall execute. The lifetime of an asynchronous operation's operation state can end during the execution of the completion operation.

9 A *sender* is a factory for one or more asynchronous operations. *Connecting* a sender and a receiver creates an asynchronous operation. The asynchronous operation's associated receiver is equal to the receiver used to create it, and its associated environment is equal to the environment associated with the receiver used to create it. The lifetime of an asynchronous operation's associated operation state does not depend on the lifetimes of either the sender or the receiver from which it was created. A sender is started when it is connected to a receiver and the resulting asynchronous operation is started. A sender's async result is the async result of the asynchronous operation created by connecting it to a receiver. A sender sends its results by way of the asynchronous operation(s) it produces, and a receiver receives those results. A sender is either valid or invalid; it becomes invalid when its parent sender (see below) becomes invalid.

10 A *scheduler* is an abstraction of an execution resource with a uniform, generic interface for scheduling work onto that resource. It is a factory for senders whose asynchronous operations execute value completion operations on an execution agent belonging to the scheduler's associated execution resource. A *schedule-expression* obtains such a sender from a scheduler. A *schedule sender* is the result of a schedule expression. On success, an asynchronous operation produced by a schedule sender executes a value completion operation with an empty set of result datums. Multiple schedulers can refer to the same execution resource. A scheduler can be valid or invalid. A scheduler becomes invalid when the execution resource to which it refers becomes invalid, as do any schedule senders obtained from the scheduler, and any operation states obtained from those senders.

11 An asynchronous operation has one or more associated completion schedulers for each of its possible dispositions. A *completion scheduler* is a scheduler whose associated execution resource is used to execute a completion operation for an asynchronous operation. A value completion scheduler is a scheduler on which an asynchronous operation's value completion operation can execute. Likewise for error completion schedulers and stopped completion schedulers.

12 A sender has an associated queryable object (33.2) known as its *attributes* that describes various characteristics of the sender and of the asynchronous operation(s) it produces. For each disposition, there is a query object for reading the associated completion scheduler from a sender's attributes; i.e., a value completion scheduler query object for reading a sender's value completion scheduler, etc. If a completion scheduler query is well-formed, the returned completion scheduler is unique for that disposition for any asynchronous operation the sender creates. A schedule sender is required to have a value completion scheduler attribute whose value is equal to the scheduler that produced the schedule sender.

13 A *completion signature* is a function type that describes a completion operation. An asynchronous operation has a finite set of possible completion signatures corresponding to the completion operations that the asynchronous operation potentially evaluates (6.3). For a completion function `set`, receiver `rcvr`, and pack of arguments `args`, let `c` be the completion operation `set(rcvr, args...)`, and let `F` be the function type `decltype(auto(set))(decltype((args))...)`. A completion signature `Sig` is associated with `c` if and only if `*MATCHING-SIG*(Sig, F)` is `true` (33.1). Together, a sender type and an environment type `Env` determine the set of completion signatures of an asynchronous operation that results from connecting the sender with a receiver that has an environment of type `Env`. The type of the receiver does not affect an asynchronous operation's completion signatures, only the type of the receiver's environment.

14 A sender algorithm is a function that takes and/or returns a sender. There are three categories of sender algorithms:

(14.1) — A *sender factory* is a function that takes non-senders as arguments and that returns a sender.

(14.2) — A *sender adaptor* is a function that constructs and returns a parent sender from a set of one or more child senders and a (possibly empty) set of additional arguments. An asynchronous operation created by a parent sender is a parent operation to the child operations created by the child senders.

(14.3) — A *sender consumer* is a function that takes one or more senders and a (possibly empty) set of additional arguments, and whose return type is not the type of a sender.

33.4 Header `<execution>` synopsis [execution.syn]

```
namespace std {
  // 26.3.6.2, execution policy type trait
  template<class T> struct is_execution_policy;                  // freestanding

      struct with_awaitable_senders;
  }
```

1 The exposition-only type *variant-or-empty*<Ts...> is defined as follows:

(1.1) — If sizeof...(Ts) is greater than zero, *variant-or-empty*<Ts...> denotes variant<Us...> where Us... is the pack decay_t<Ts>... with duplicate types removed.

(1.2) — Otherwise, *variant-or-empty*<Ts...> denotes the exposition-only class type:

```
namespace std::execution {
  struct empty-variant {          // exposition only
    empty-variant() = delete;
  };
}
```

2 For types Sndr and Env, *single-sender-value-type*<Sndr, Env> is an alias for:

(2.1) — value_types_of_t<Sndr, Env, decay_t, type_identity_t> if that type is well-formed,

(2.2) — Otherwise, void if value_types_of_t<Sndr, Env, tuple, variant> is variant<tuple<>> or variant<>,

(2.3) — Otherwise, value_types_of_t<Sndr, Env, *decayed-tuple*, type_identity_t> if that type is well-formed,

(2.4) — Otherwise, *single-sender-value-type*<Sndr, Env> is ill-formed.

3 The exposition-only concept *single-sender* is defined as follows:

```
namespace std::execution {
  template<class Sndr, class Env>
    concept single-sender = sender_in<Sndr, Env> &&
      requires {
        typename single-sender-value-type<Sndr, Env>;
      };
}
```

33.5 Queries [exec.queries]

33.5.1 `forwarding_query` [exec.fwd.env]

1 `forwarding_query` asks a query object whether it should be forwarded through queryable adaptors.

2 The name `forwarding_query` denotes a query object. For some query object `q` of type `Q`, `forwarding_query(q)` is expression-equivalent to:

(2.1) — *`MANDATE-NOTHROW`*`(q.query(forwarding_query))` if that expression is well-formed.

Mandates: The expression above has type `bool` and is a core constant expression if `q` is a core constant expression.

(2.2) — Otherwise, `true` if `derived_from<Q, forwarding_query_t>` is `true`.

(2.3) — Otherwise, `false`.

33.5.2 `get_allocator` [exec.get.allocator]

1 `get_allocator` asks a queryable object for its associated allocator.

2 The name `get_allocator` denotes a query object. For a subexpression `env`, `get_allocator(env)` is expression-equivalent to *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(env).query(get_allocator))`.

Mandates: If the expression above is well-formed, its type satisfies *`simple-allocator`* (16.4.4.6.1).

3 `forwarding_query(get_allocator)` is a core constant expression and has value `true`.

33.5.3 `get_stop_token` [exec.get.stop.token]

1 `get_stop_token` asks a queryable object for an associated stop token.

2 The name `get_stop_token` denotes a query object. For a subexpression `env`, `get_stop_token(env)` is expression-equivalent to:

(2.1) — *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(env).query(get_stop_token))` if that expression is well-formed.

Mandates: The type of the expression above satisfies `stoppable_token`.

(2.2) — Otherwise, `never_stop_token{}`.

3 `forwarding_query(get_stop_token)` is a core constant expression and has value `true`.

33.5.4 `execution::get_env` [exec.get.env]

1 `execution::get_env` is a customization point object. For a subexpression `o`, `execution::get_env(o)` is expression-equivalent to:

(1.1) — *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(o).get_env())` if that expression is well-formed.

Mandates: The type of the expression above satisfies *`queryable`* (33.2).

(1.2) — Otherwise, `env<>{}`.

2 The value of `get_env(o)` shall be valid while `o` is valid.

3 [*Note 1*: When passed a sender object, `get_env` returns the sender's associated attributes. When passed a receiver, `get_env` returns the receiver's associated execution environment. — *end note*]

33.5.5 `execution::get_domain` [exec.get.domain]

1 `get_domain` asks a queryable object for its associated execution domain tag.

2 The name `get_domain` denotes a query object. For a subexpression `env`, `get_domain(env)` is expression-equivalent to *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(env).query(get_domain))`.

3 `forwarding_query(execution::get_domain)` is a core constant expression and has value `true`.

33.5.6 `execution::get_scheduler` [exec.get.scheduler]

1 `get_scheduler` asks a queryable object for its associated scheduler.

2 The name `get_scheduler` denotes a query object. For a subexpression `env`, `get_scheduler(env)` is expression-equivalent to *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(env).query(get_scheduler))`.

Mandates: If the expression above is well-formed, its type satisfies `scheduler`.

3 `forwarding_query(execution::get_scheduler)` is a core constant expression and has value `true`.

33.5.7 `execution::get_delegation_scheduler` [exec.get.delegation.scheduler]

1 `get_delegation_scheduler` asks a queryable object for a scheduler that can be used to delegate work to for the purpose of forward progress delegation (6.9.2.3).

2 The name `get_delegation_scheduler` denotes a query object. For a subexpression `env`, `get_delegation_scheduler(env)` is expression-equivalent to *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(env).query(get_delegation_scheduler))`.

Mandates: If the expression above is well-formed, its type satisfies `scheduler`.

3 `forwarding_query(execution::get_delegation_scheduler)` is a core constant expression and has value `true`.

33.5.8 `execution::get_forward_progress_guarantee` [exec.get.fwd.progress]

```
namespace std::execution {
  enum class forward_progress_guarantee {
    concurrent,
    parallel,
    weakly_parallel
  };
}
```

1 `get_forward_progress_guarantee` asks a scheduler about the forward progress guarantee of execution agents created by that scheduler's associated execution resource (6.9.2.3).

2 The name `get_forward_progress_guarantee` denotes a query object. For a subexpression `sch`, let `Sch` be `decltype((sch))`. If `Sch` does not satisfy `scheduler`, `get_forward_progress_guarantee` is ill-formed. Otherwise, `get_forward_progress_guarantee(sch)` is expression-equivalent to:

(2.1) — *`MANDATE-NOTHROW`*`(`*`AS-CONST`*`(sch).query(get_forward_progress_guarantee))`, if that expression is well-formed.

Mandates: The type of the expression above is `forward_progress_guarantee`.

(2.2) — Otherwise, `forward_progress_guarantee::weakly_parallel`.

3 If `get_forward_progress_guarantee(sch)` for some scheduler `sch` returns `forward_progress_guarantee::concurrent`, all execution agents created by that scheduler's associated execution resource shall provide the concurrent forward progress guarantee. If it returns `forward_progress_guarantee::parallel`, all such execution agents shall provide at least the parallel forward progress guarantee.

33.5.9 `execution::get_completion_scheduler` [exec.get.compl.sched]

1 `get_completion_scheduler<`*`completion-tag`*`>` obtains the completion scheduler associated with a completion tag from a sender's attributes.

2 The name `get_completion_scheduler` denotes a query object template. For a subexpression `q`, the expression `get_completion_scheduler<`*`completion-tag`*`>(q)` is ill-formed if *`completion-tag`* is not one of `set_value_t`, `set_error_t`, or `set_stopped_t`. Otherwise, `get_completion_scheduler<`*`completion-tag`*`>(q)` is expression-equivalent to

```
MANDATE-NOTHROW(AS-CONST(q).query(get_completion_scheduler<completion-tag>))
```

Mandates: If the expression above is well-formed, its type satisfies `scheduler`.

3 Let *`completion-fn`* be a completion function (33.3); let *`completion-tag`* be the associated completion tag of *`completion-fn`*; let `args` be a pack of subexpressions; and let `sndr` be a subexpression such that `sender<decltype((sndr))>` is `true` and `get_completion_scheduler<`*`completion-tag`*`>(get_env(sndr))` is well-formed and denotes a scheduler `sch`. If an asynchronous operation created by connecting `sndr` with a

receiver rcvr causes the evaluation of *completion-fn*(rcvr, args...), the behavior is undefined unless the evaluation happens on an execution agent that belongs to sch's associated execution resource.

4 The expression forwarding_query(get_completion_scheduler<*completion-tag*>) is a core constant expression and has value true.

33.6 Schedulers [exec.sched]

1 The scheduler concept defines the requirements of a scheduler type (33.3). schedule is a customization point object that accepts a scheduler. A valid invocation of schedule is a schedule-expression.

```
namespace std::execution {
  template<class Sch>
    concept scheduler =
      derived_from<typename remove_cvref_t<Sch>::scheduler_concept, scheduler_t> &&
      queryable<Sch> &&
      requires(Sch&& sch) {
        { schedule(std::forward<Sch>(sch)) } -> sender;
        { auto(get_completion_scheduler<set_value_t>(
            get_env(schedule(std::forward<Sch>(sch))))) }
              -> same_as<remove_cvref_t<Sch>>;
      } &&
      equality_comparable<remove_cvref_t<Sch>> &&
      copyable<remove_cvref_t<Sch>>;
}
```

2 Let Sch be the type of a scheduler and let Env be the type of an execution environment for which sender_-in<schedule_result_t<Sch>, Env> is satisfied. Then *sender-in-of*<schedule_result_t<Sch>, Env> shall be modeled.

3 No operation required by copyable<remove_cvref_t<Sch>> and equality_comparable<remove_cvref_-t<Sch>> shall exit via an exception. None of these operations, nor a scheduler type's schedule function, shall introduce data races as a result of potentially concurrent (6.9.2.2) invocations of those operations from different threads.

4 For any two values sch1 and sch2 of some scheduler type Sch, sch1 == sch2 shall return true only if both sch1 and sch2 share the same associated execution resource.

5 For a given scheduler expression sch, the expression get_completion_scheduler<set_value_t>(get_-env(schedule(sch))) shall compare equal to sch.

6 For a given scheduler expression sch, if the expression get_domain(sch) is well-formed, then the expression get_domain(get_env(schedule(sch))) is also well-formed and has the same type.

7 A scheduler type's destructor shall not block pending completion of any receivers connected to the sender objects returned from schedule.

[*Note 1*: The ability to wait for completion of submitted function objects can be provided by the associated execution resource of the scheduler. — *end note*]

33.7 Receivers [exec.recv]

33.7.1 Receiver concepts [exec.recv.concepts]

1 A receiver represents the continuation of an asynchronous operation. The receiver concept defines the requirements for a receiver type (33.3). The receiver_of concept defines the requirements for a receiver type that is usable as the first argument of a set of completion operations corresponding to a set of completion signatures. The get_env customization point object is used to access a receiver's associated environment.

```
namespace std::execution {
  template<class Rcvr>
    concept receiver =
      derived_from<typename remove_cvref_t<Rcvr>::receiver_concept, receiver_t> &&
      requires(const remove_cvref_t<Rcvr>& rcvr) {
        { get_env(rcvr) } -> queryable;
      } &&
      move_constructible<remove_cvref_t<Rcvr>> &&        // rvalues are movable, and
      constructible_from<remove_cvref_t<Rcvr>, Rcvr>;    // lvalues are copyable
  template<class Signature, class Rcvr>
    concept valid-completion-for =                  // exposition only
      requires (Signature* sig) {
        []<class Tag, class... Args>(Tag(*)(Args...))
            requires callable<Tag, remove_cvref_t<Rcvr>, Args...>
        {}(sig);
      };

  template<class Rcvr, class Completions>
    concept has-completions =                       // exposition only
      requires (Completions* completions) {
        []<valid-completion-for<Rcvr>...Sigs>(completion_signatures<Sigs...>*)
        {}(completions);
      };

  template<class Rcvr, class Completions>
    concept receiver_of =
      receiver<Rcvr> && has-completions<Rcvr, Completions>;
}
```

2 Class types that are marked `final` do not model the `receiver` concept.

3 Let `rcvr` be a receiver and let `op_state` be an operation state associated with an asynchronous operation created by connecting `rcvr` with a sender. Let `token` be a stop token equal to `get_stop_token(get_-env(rcvr))`. `token` shall remain valid for the duration of the asynchronous operation's lifetime (33.3).

[*Note 1*: This means that, unless it knows about further guarantees provided by the type of `rcvr`, the implementation of `op_state` cannot use `token` after it executes a completion operation. This also implies that any stop callbacks registered on token must be destroyed before the invocation of the completion operation. — *end note*]

33.7.2 `execution::set_value` [exec.set.value]

1 `set_value` is a value completion function (33.3). Its associated completion tag is `set_value_t`. The expression `set_value(rcvr, vs...)` for a subexpression `rcvr` and pack of subexpressions `vs` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to *`MANDATE-NOTHROW`*`(rcvr.set_-value(vs...))`.

33.7.3 `execution::set_error` [exec.set.error]

1 `set_error` is an error completion function (33.3). Its associated completion tag is `set_error_t`. The expression `set_error(rcvr, err)` for some `subexpressions` `rcvr` and `err` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to *`MANDATE-NOTHROW`*`(rcvr.set_-error(err))`.

33.7.4 `execution::set_stopped` [exec.set.stopped]

1 `set_stopped` is a stopped completion function (33.3). Its associated completion tag is `set_stopped_t`. The expression `set_stopped(rcvr)` for a subexpression `rcvr` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to *`MANDATE-NOTHROW`*`(rcvr.set_stopped())`.

33.8 Operation states [exec.opstate]

33.8.1 General [exec.opstate.general]

1 The `operation_state` concept defines the requirements of an operation state type (33.3).

```
namespace std::execution {
  template<class O>
    concept operation_state =
      derived_from<typename O::operation_state_concept, operation_state_t> &&
      is_object_v<O> &&
      requires (O& o) {
        { start(o) } noexcept;
      };
}
```

2 If an `operation_state` object is destroyed during the lifetime of its asynchronous operation (33.3), the behavior is undefined.

[*Note 1*: The `operation_state` concept does not impose requirements on any operations other than destruction and `start`, including copy and move operations. Invoking any such operation on an object whose type models `operation_state` can lead to undefined behavior. — *end note*]

3 The program is ill-formed if it performs a copy or move construction or assignment operation on an operation state object created by connecting a library-provided sender.

33.8.2 `execution::start` [exec.opstate.start]

1 The name `start` denotes a customization point object that starts (33.3) the asynchronous operation associated with the operation state object. For a subexpression `op`, the expression `start(op)` is ill-formed if `op` is an rvalue. Otherwise, it is expression-equivalent to *`MANDATE-NOTHROW`*`(op.start())`.

2 If `op.start()` does not start (33.3) the asynchronous operation associated with the operation state `op`, the behavior of calling `start(op)` is undefined.

33.9 Senders [exec.snd]

33.9.1 General [exec.snd.general]

1 Subclauses 33.9.11 and 33.9.12 define customizable algorithms that return senders. Each algorithm has a default implementation. Let `sndr` be the result of an invocation of such an algorithm or an object equal to the result (18.2), and let `Sndr` be `decltype((sndr))`. Let `rcvr` be a receiver of type `Rcvr` with associated environment `env` of type `Env` such that `sender_to<Sndr, Rcvr>` is `true`. For the default implementation of the algorithm that produced `sndr`, connecting `sndr` to `rcvr` and starting the resulting operation state (33.3) necessarily results in the potential evaluation (6.3) of a set of completion operations whose first argument is a subexpression equal to `rcvr`. Let `Sigs` be a pack of completion signatures corresponding to this set of completion operations. Then the type of the expression `get_completion_signatures(sndr, env)` is a specialization of the class template `completion_signatures` (33.10.1), the set of whose template arguments is `Sigs`. If a user-provided implementation of the algorithm that produced `sndr` is selected instead of the default, any completion signature that is in the set of types denoted by `completion_signatures_of_t<Sndr, Env>` and that is not part of `Sigs` shall correspond to error or stopped completion operations, unless otherwise specified.

33.9.2 Exposition-only entities [exec.snd.expos]

1 Subclause 33.9 makes use of the following exposition-only entities.

2 For a queryable object `env`, *`FWD-ENV`*`(env)` is an expression whose type satisfies *`queryable`* such that for a query object `q` and a pack of subexpressions `as`, the expression *`FWD-ENV`*`(env).query(q, as...)` is ill-formed if `forwarding_query(q)` is `false`; otherwise, it is expression-equivalent to `env.query(q, as...)`.

3 For a query object `q` and a subexpression `v`, *`MAKE-ENV`*`(q, v)` is an expression `env` whose type satisfies *`queryable`* such that the result of `env.query(q)` has a value equal to `v` (18.2). Unless otherwise stated, the object to which `env.query(q)` refers remains valid while `env` remains valid.

4 For two queryable objects `env1` and `env2`, a query object `q`, and a pack of subexpressions `as`, *`JOIN-ENV`*`(env1, env2)` is an expression `env3` whose type satisfies *`queryable`* such that `env3.query(q, as...)` is expression-equivalent to:

(4.1) — `env1.query(q, as...)` if that expression is well-formed,

(4.2) — otherwise, `env2.query(q, as...)` if that expression is well-formed,

(4.3) — otherwise, `env3.query(q, as...)` is ill-formed.

5 The results of *`FWD-ENV`*, *`MAKE-ENV`*, and *`JOIN-ENV`* can be context-dependent; i.e., they can evaluate to expressions with different types and value categories in different contexts for the same arguments.

6 For a scheduler `sch`, *`SCHED-ATTRS`*`(sch)` is an expression `o1` whose type satisfies *`queryable`* such that `o1.query(get_completion_scheduler<Tag>)` is an expression with the same type and value as `sch` where `Tag` is one of `set_value_t` or `set_stopped_t`, and such that `o1.query(get_domain)` is expression-equivalent to `sch.query(get_domain)`. *`SCHED-ENV`*`(sch)` is an expression `o2` whose type satisfies *`queryable`* such that `o2.query(get_scheduler)` is a prvalue with the same type and value as `sch`, and such that `o2.query(get_domain)` is expression-equivalent to `sch.query(get_domain)`.

7 For two subexpressions `rcvr` and `expr`, *`SET-VALUE`*`(rcvr, expr)` is expression-equivalent to `(expr, set_value(std::move(rcvr)))` if the type of `expr` is `void`; otherwise, `set_value(std::move(rcvr), expr)`. *`TRY-EVAL`*`(rcvr, expr)` is equivalent to:

```
try {
  expr;
} catch(...) {
  set_error(std::move(rcvr), current_exception());
}
```

if `expr` is potentially-throwing; otherwise, `expr`. *`TRY-SET-VALUE`*`(rcvr, expr)` is

```
TRY-EVAL(rcvr, SET-VALUE(rcvr, expr))
```

except that `rcvr` is evaluated only once.

```
template<class Default = default_domain, class Sndr>
  constexpr auto completion-domain(const Sndr& sndr) noexcept;
```

8 *`COMPL-DOMAIN`*`(T)` is the type of the expression `get_domain(get_completion_scheduler<T>(get_-env(sndr)))`.

9 *Effects*: If all of the types *`COMPL-DOMAIN`*`(set_value_t)`, *`COMPL-DOMAIN`*`(set_error_t)`, and *`COMPL-DOMAIN`*`(set_stopped_t)` are ill-formed, `completion-domain<Default>(sndr)` is a default-constructed prvalue of type `Default`. Otherwise, if they all share a common type (21.3.8.7) (ignoring those types that are ill-formed), then *`completion-domain`*`<Default>(sndr)` is a default-constructed prvalue of that type. Otherwise, *`completion-domain`*`<Default>(sndr)` is ill-formed.

```
template<class Tag, class Env, class Default>
  constexpr decltype(auto) query-with-default(
    Tag, const Env& env, Default&& value) noexcept(see below);
```

10 Let `e` be the expression `Tag()(env)` if that expression is well-formed; otherwise, it is `static_-cast<Default>(std::forward<Default>(value))`.

11 *Returns*: `e`.

12 *Remarks*: The expression in the noexcept clause is `noexcept(e)`.

```
template<class Sndr>
  constexpr auto get-domain-early(const Sndr& sndr) noexcept;
```

13 *Effects*: Equivalent to:

```
return Domain();
```

where `Domain` is the decayed type of the first of the following expressions that is well-formed:

(13.1) — `get_domain(get_env(sndr))`

(13.2) — *`completion-domain`*`(sndr)`

(13.3) — `default_domain()`

```
template<class Sndr, class Env>
  constexpr auto get-domain-late(const Sndr& sndr, const Env& env) noexcept;
```

14 *Effects*: Equivalent to:

(14.1) — If *`sender-for`*`<Sndr, continues_on_t>` is `true`, then

```
return Domain();
```

where `Domain` is the type of the following expression:

```
[] {
  auto [_, sch, _] = sndr;
  return query-or-default(get_domain, sch, default_domain());
}();
```

[*Note 1*: The `continues_on` algorithm works in tandem with `schedule_from` (33.9.12.5) to give scheduler authors a way to customize both how to transition onto (`continues_on`) and off of (`schedule_from`) a given execution context. Thus, `continues_on` ignores the domain of the predecessor and uses the domain of the destination scheduler to select a customization, a property that is unique to `continues_on`. That is why it is given special treatment here. — *end note*]

(14.2) — Otherwise,

```
return Domain();
```

where `Domain` is the first of the following expressions that is well-formed and whose type is not `void`:

(14.2.1) — `get_domain(get_env(sndr))`

(14.2.2) — `completion-domain<void>(sndr)`

(14.2.3) — `get_domain(env)`

(14.2.4) — `get_domain(get_scheduler(env))`

(14.2.5) — `default_domain()`

15
```
template<callable Fun>
  requires is_nothrow_move_constructible_v<Fun>
struct emplace-from {
  Fun fun;                                                    // exposition only
  using type = call-result-t<Fun>;

  constexpr operator type() && noexcept(nothrow-callable<Fun>) {
    return std::move(fun)();
  }

  constexpr type operator()() && noexcept(nothrow-callable<Fun>) {
    return std::move(fun)();
  }
};
```

[*Note 2*: *`emplace-from`* is used to emplace non-movable types into `tuple`, `optional`, `variant`, and similar types. — *end note*]

16
```
struct on-stop-request {
  inplace_stop_source& stop-src;        // exposition only
  void operator()() noexcept { stop-src.request_stop(); }
};
```

17
```
template<class T₀, class T₁, ..., class Tₙ>
struct product-type {          // exposition only
  T₀ t₀;                  // exposition only
  T₁ t₁;                  // exposition only
    ...
  Tₙ tₙ;                  // exposition only

  template<size_t I, class Self>
  constexpr decltype(auto) get(this Self&& self) noexcept;       // exposition only

  template<class Self, class Fn>
  constexpr decltype(auto) apply(this Self&& self, Fn&& fn)      // exposition only
    noexcept(see below);
};
```

18 [*Note 3*: *`product-type`* is presented here in pseudo-code form for the sake of exposition. It can be approximated in standard C++ with a tuple-like implementation that takes care to keep the type an aggregate that can be used as the initializer of a structured binding declaration. — *end note*]

[*Note 4*: An expression of type *`product-type`* is usable as the initializer of a structured binding declaration (9.7). — *end note*]

```
template<size_t I, class Self>
constexpr decltype(auto) get(this Self&& self) noexcept;
```

19 *Effects*: Equivalent to:

```
auto& [...ts] = self;
return std::forward_like<Self>(ts...[I]);
```

```
template<class Self, class Fn>
constexpr decltype(auto) apply(this Self&& self, Fn&& fn) noexcept(see below);
```

20 *Constraints*: The expression in the `return` statement below is well-formed.

21 *Effects*: Equivalent to:

```
auto& [...ts] = self;
```

```
      return std::forward<Fn>(fn)(std::forward_like<Self>(ts)...);
```

22 *Remarks*: The expression in the `noexcept` clause is `true` if the `return` statement above is not potentially throwing; otherwise, `false`.

```
template<class Tag, class Data = see below, class... Child>
  constexpr auto make-sender(Tag tag, Data&& data, Child&&... child);
```

23 *Mandates*: The following expressions are `true`:

(23.1) — `semiregular<Tag>`

(23.2) — `movable-value<Data>`

(23.3) — `(sender<Child> &&...)`

24 *Returns*: A prvalue of type `basic-sender<Tag, decay_t<Data>, decay_t<Child>...>` that has been direct-list-initialized with the forwarded arguments, where `basic-sender` is the following exposition-only class template except as noted below.

```
namespace std::execution {
  template<class Tag>
  concept completion-tag =                                        // exposition only
    same_as<Tag, set_value_t> || same_as<Tag, set_error_t> || same_as<Tag, set_stopped_t>;

  template<template<class...> class T, class... Args>
  concept valid-specialization =                                  // exposition only
    requires { typename T<Args...>; };

  struct default-impls {                                          // exposition only
    static constexpr auto get-attrs = see below;                 // exposition only
    static constexpr auto get-env = see below;                   // exposition only
    static constexpr auto get-state = see below;                 // exposition only
    static constexpr auto start = see below;                     // exposition only
    static constexpr auto complete = see below;                  // exposition only
  };

  template<class Tag>
  struct impls-for : default-impls {};        // exposition only

  template<class Sndr, class Rcvr>                                // exposition only
  using state-type = decay_t<call-result-t<
    decltype(impls-for<tag_of_t<Sndr>>::get-state), Sndr, Rcvr&>>;

  template<class Index, class Sndr, class Rcvr>                   // exposition only
  using env-type = call-result-t<
    decltype(impls-for<tag_of_t<Sndr>>::get-env), Index,
    state-type<Sndr, Rcvr>&, const Rcvr&>;

  template<class Sndr, size_t I = 0>
  using child-type = decltype(declval<Sndr>().template get<I+2>());      // exposition only

  template<class Sndr>
  using indices-for = remove_reference_t<Sndr>::indices-for;            // exposition only

  template<class Sndr, class Rcvr>
  struct basic-state {                                            // exposition only
    basic-state(Sndr&& sndr, Rcvr&& rcvr) noexcept(see below)
      : rcvr(std::move(rcvr))
      , state(impls-for<tag_of_t<Sndr>>::get-state(std::forward<Sndr>(sndr), rcvr)) { }

    Rcvr rcvr;                                                    // exposition only
    state-type<Sndr, Rcvr> state;                                 // exposition only
  };
```

```
template<class Sndr, class Rcvr, class Index>
  requires valid-specialization<env-type, Index, Sndr, Rcvr>
struct basic-receiver {                                          // exposition only
  using receiver_concept = receiver_t;

  using tag-t = tag_of_t<Sndr>;                                  // exposition only
  using state-t = state-type<Sndr, Rcvr>;                        // exposition only
  static constexpr const auto& complete = impls-for<tag-t>::complete;    // exposition only

  template<class... Args>
    requires callable<decltype(complete), Index, state-t&, Rcvr&, set_value_t, Args...>
  void set_value(Args&&... args) && noexcept {
    complete(Index(), op->state, op->rcvr, set_value_t(), std::forward<Args>(args)...);
  }

  template<class Error>
    requires callable<decltype(complete), Index, state-t&, Rcvr&, set_error_t, Error>
  void set_error(Error&& err) && noexcept {
    complete(Index(), op->state, op->rcvr, set_error_t(), std::forward<Error>(err));
  }

  void set_stopped() && noexcept
    requires callable<decltype(complete), Index, state-t&, Rcvr&, set_stopped_t> {
    complete(Index(), op->state, op->rcvr, set_stopped_t());
  }

  auto get_env() const noexcept -> env-type<Index, Sndr, Rcvr> {
    return impls-for<tag-t>::get-env(Index(), op->state, op->rcvr);
  }

  basic-state<Sndr, Rcvr>* op;                                  // exposition only
};

constexpr auto connect-all = see below;                         // exposition only

template<class Sndr, class Rcvr>
using connect-all-result = call-result-t<                       // exposition only
  decltype(connect-all), basic-state<Sndr, Rcvr>*, Sndr, indices-for<Sndr>>;

template<class Sndr, class Rcvr>
  requires valid-specialization<state-type, Sndr, Rcvr> &&
           valid-specialization<connect-all-result, Sndr, Rcvr>
struct basic-operation : basic-state<Sndr, Rcvr> {              // exposition only
  using operation_state_concept = operation_state_t;
  using tag-t = tag_of_t<Sndr>;                                  // exposition only

  connect-all-result<Sndr, Rcvr> inner-ops;                     // exposition only

  basic-operation(Sndr&& sndr, Rcvr&& rcvr) noexcept(see below)  // exposition only
    : basic-state<Sndr, Rcvr>(std::forward<Sndr>(sndr), std::move(rcvr)),
      inner-ops(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))
  {}

  void start() & noexcept {
    auto& [...ops] = inner-ops;
    impls-for<tag-t>::start(this->state, this->rcvr, ops...);
  }
};

template<class Sndr, class Env>
using completion-signatures-for = see below;                    // exposition only
```

```
  template<class Tag, class Data, class... Child>
  struct basic-sender : product-type<Tag, Data, Child...> {     // exposition only
    using sender_concept = sender_t;
    using indices-for = index_sequence_for<Child...>;        // exposition only

    decltype(auto) get_env() const noexcept {
      auto& [_, data, ...child] = *this;
      return impls-for<Tag>::get-attrs(data, child...);
    }

    template<decays-to<basic-sender> Self, receiver Rcvr>
    auto connect(this Self&& self, Rcvr rcvr) noexcept(see below)
      -> basic-operation<Self, Rcvr> {
      return {std::forward<Self>(self), std::move(rcvr)};
    }

    template<decays-to<basic-sender> Self, class Env>
    auto get_completion_signatures(this Self&& self, Env&& env) noexcept
      -> completion-signatures-for<Self, Env> {
      return {};
    }
  };
}
```

25 The default template argument for the `Data` template parameter denotes an unspecified empty trivially copyable class type that models `semiregular`.

26 It is unspecified whether a specialization of *`basic-sender`* is an aggregate.

27 An expression of type *`basic-sender`* is usable as the initializer of a structured binding declaration (9.7).

28 The expression in the `noexcept` clause of the constructor of *`basic-state`* is

```
is_nothrow_move_constructible_v<Rcvr> &&
nothrow-callable<decltype(impls-for<tag_of_t<Sndr>>::get-state), Sndr, Rcvr&> &&
(same_as<state-type<Sndr, Rcvr>, get-state-result> ||
 is_nothrow_constructible_v<state-type<Sndr, Rcvr>, get-state-result>)
```

where *`get-state-result`* is

```
call-result-t<decltype(impls-for<tag_of_t<Sndr>>::get-state), Sndr, Rcvr&>.
```

29 The object *`connect-all`* is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr, size_t... Is>(
  basic-state<Sndr, Rcvr>* op, Sndr&& sndr, index_sequence<Is...>) noexcept(see below)
    -> decltype(auto) {
    auto& [_, data, ...child] = sndr;
    return product-type{connect(
      std::forward_like<Sndr>(child),
      basic-receiver<Sndr, Rcvr, integral_constant<size_t, Is>>{op})...};
  }
```

30 *Constraints*: The expression in the `return` statement is well-formed.

31 *Remarks*: The expression in the `noexcept` clause is `true` if the `return` statement is not potentially throwing; otherwise, `false`.

32 The expression in the `noexcept` clause of the constructor of *`basic-operation`* is:

```
is_nothrow_constructible_v<basic-state<Self, Rcvr>, Self, Rcvr> &&
noexcept(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))
```

33 The expression in the `noexcept` clause of the `connect` member function of *`basic-sender`* is:

```
is_nothrow_constructible_v<basic-operation<Self, Rcvr>, Self, Rcvr>
```

34 The member *`default-impls::get-attrs`* is initialized with a callable object equivalent to the following lambda:

```
[](const auto&, const auto&... child) noexcept -> decltype(auto) {
  if constexpr (sizeof...(child) == 1)
```

```
    return (FWD-ENV(get_env(child)), ...);
  else
    return env<>();
}
```

35 The member *default-impls*::*get-env* is initialized with a callable object equivalent to the following lambda:

```
[](auto, auto&, const auto& rcvr) noexcept -> decltype(auto) {
  return FWD-ENV(get_env(rcvr));
}
```

36 The member *default-impls*::*get-state* is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept -> decltype(auto) {
  auto& [_, data, ...child] = sndr;
  return std::forward_like<Sndr>(data);
}
```

37 The member *default-impls*::*start* is initialized with a callable object equivalent to the following lambda:

```
[](auto&, auto&, auto&... ops) noexcept -> void {
  (execution::start(ops), ...);
}
```

38 The member *default-impls*::*complete* is initialized with a callable object equivalent to the following lambda:

```
[]<class Index, class Rcvr, class Tag, class... Args>(
  Index, auto& state, Rcvr& rcvr, Tag, Args&&... args) noexcept
    -> void requires callable<Tag, Rcvr, Args...> {
  static_assert(Index::value == 0);
  Tag()(std::move(rcvr), std::forward<Args>(args)...);
}
```

39 For a subexpression `sndr` let `Sndr` be `decltype((sndr))`. Let `rcvr` be a receiver with an associated environment of type `Env` such that `sender_in<Sndr, Env>` is `true`. *completion-signatures-for*`<Sndr, Env>` denotes a specialization of `completion_signatures`, the set of whose template arguments correspond to the set of completion operations that are potentially evaluated as a result of starting (33.3) the operation state that results from connecting `sndr` and `rcvr`. When `sender_in<Sndr, Env>` is `false`, the type denoted by *completion-signatures-for*`<Sndr, Env>`, if any, is not a specialization of `completion_signatures`.

Recommended practice: When `sender_in<Sndr, Env>` is `false`, implementations are encouraged to use the type denoted by *completion-signatures-for*`<Sndr, Env>` to communicate to users why.

```
template<sender Sndr, queryable Env>
  constexpr auto write-env(Sndr&& sndr, Env&& env);      // exposition only
```

40 *write-env* is an exposition-only sender adaptor that, when connected with a receiver `rcvr`, connects the adapted sender with a receiver whose execution environment is the result of joining the *queryable* argument `env` to the result of `get_env(rcvr)`.

41 Let *write-env-t* be an exposition-only empty class type.

42 *Returns*:

```
make-sender(write-env-t(), std::forward<Env>(env), std::forward<Sndr>(sndr))
```

43 *Remarks*: The exposition-only class template *impls-for* (33.9.1) is specialized for *write-env-t* as follows:

```
template<>
struct impls-for<write-env-t> : default-impls {
  static constexpr auto get-env =
    [](auto, const auto& state, const auto& rcvr) noexcept {
      return see below;
    };
};
```

Invocation of *impls-for*`<`*write-env-t*`>`::*get-env* returns an object `e` such that

(43.1) — `decltype(e)` models *queryable* and

(43.2) — given a query object `q`, the expression `e.query(q)` is expression-equivalent to `state.query(q)` if that expression is valid, otherwise, `e.query(q)` is expression-equivalent to `get_env(rcvr).query(q)`.

33.9.3 Sender concepts [exec.snd.concepts]

1 The `sender` concept defines the requirements for a sender type (33.3). The `sender_in` concept defines the requirements for a sender type that can create asynchronous operations given an associated environment type. The `sender_to` concept defines the requirements for a sender type that can connect with a specific receiver type. The `get_env` customization point object is used to access a sender's associated attributes. The connect customization point object is used to connect (33.3) a sender and a receiver to produce an operation state.

```
namespace std::execution {
  template<class Sigs>
    concept valid-completion-signatures = see below;            // exposition only

  template<class Sndr>
    concept is-sender =                                         // exposition only
      derived_from<typename Sndr::sender_concept, sender_t>;

  template<class Sndr>
    concept enable-sender =                                     // exposition only
      is-sender<Sndr> ||
      is-awaitable<Sndr, env-promise<env<>>>;                  // 33.9.4

  template<class Sndr>
    concept sender =
      bool(enable-sender<remove_cvref_t<Sndr>>) &&
      requires (const remove_cvref_t<Sndr>& sndr) {
        { get_env(sndr) } -> queryable;
      } &&
      move_constructible<remove_cvref_t<Sndr>> &&
      constructible_from<remove_cvref_t<Sndr>, Sndr>;

  template<class Sndr, class Env = env<>>
    concept sender_in =
      sender<Sndr> &&
      queryable<Env> &&
      requires (Sndr&& sndr, Env&& env) {
        { get_completion_signatures(std::forward<Sndr>(sndr), std::forward<Env>(env)) }
          -> valid-completion-signatures;
      };

  template<class Sndr, class Rcvr>
    concept sender_to =
      sender_in<Sndr, env_of_t<Rcvr>> &&
      receiver_of<Rcvr, completion_signatures_of_t<Sndr, env_of_t<Rcvr>>> &&
      requires (Sndr&& sndr, Rcvr&& rcvr) {
        connect(std::forward<Sndr>(sndr), std::forward<Rcvr>(rcvr));
      };
}
```

2 Given a subexpression `sndr`, let `Sndr` be `decltype((sndr))` and let `rcvr` be a receiver with an associated environment whose type is `Env`. A completion operation is a *permissible completion* for `Sndr` and `Env` if its completion signature appears in the argument list of the specialization of `completion_signatures` denoted by `completion_signatures_of_t<Sndr, Env>`. `Sndr` and `Env` model `sender_in<Sndr, Env>` if all the completion operations that are potentially evaluated by connecting `sndr` to `rcvr` and starting the resulting operation state are permissible completions for `Sndr` and `Env`.

3 A type models the exposition-only concept *`valid-completion-signatures`* if it denotes a specialization of the `completion_signatures` class template.

4 The exposition-only concepts *`sender-of`* and *`sender-in-of`* define the requirements for a sender type that completes with a given unique set of value result types.

```
namespace std::execution {
  template<class... As>
    using value-signature = set_value_t(As...);               // exposition only

  template<class Sndr, class Env, class... Values>
    concept sender-in-of =
      sender_in<Sndr, Env> &&
      MATCHING-SIG(                        // see 33.1
        set_value_t(Values...),
        value_types_of_t<Sndr, Env, value-signature, type_identity_t>);

  template<class Sndr, class... Values>
    concept sender-of = sender-in-of<Sndr, env<>, Values...>;
}
```

5 Let `sndr` be an expression such that `decltype((sndr))` is `Sndr`. The type `tag_of_t<Sndr>` is as follows:

(5.1) — If the declaration

```
auto&& [tag, data, ...children] = sndr;
```

would be well-formed, `tag_of_t<Sndr>` is an alias for `decltype(auto(tag))`.

(5.2) — Otherwise, `tag_of_t<Sndr>` is ill-formed.

6 Let *`sender-for`* be an exposition-only concept defined as follows:

```
namespace std::execution {
  template<class Sndr, class Tag>
  concept sender-for =
    sender<Sndr> &&
    same_as<tag_of_t<Sndr>, Tag>;
}
```

7 For a type `T`, *`SET-VALUE-SIG`*`(T)` denotes the type `set_value_t()` if `T` is *cv* `void`; otherwise, it denotes the type `set_value_t(T)`.

8 Library-provided sender types

(8.1) — always expose an overload of a member `connect` that accepts an rvalue sender and

(8.2) — only expose an overload of a member `connect` that accepts an lvalue sender if they model `copy_constructible`.

33.9.4 Awaitable helpers [exec.awaitable]

1 The sender concepts recognize awaitables as senders. For Clause 33, an *awaitable* is an expression that would be well-formed as the operand of a `co_await` expression within a given context.

2 For a subexpression `c`, let *`GET-AWAITER`*`(c, p)` be expression-equivalent to the series of transformations and conversions applied to `c` as the operand of an *await-expression* in a coroutine, resulting in lvalue `e` as described by 7.6.2.4, where `p` is an lvalue referring to the coroutine's promise, which has type `Promise`.

[*Note 1*: This includes the invocation of the promise type's `await_transform` member if any, the invocation of the `operator co_await` picked by overload resolution if any, and any necessary implicit conversions and materializations. — *end note*]

3 Let *`is-awaitable`* be the following exposition-only concept:

```
namespace std {
  template<class T>
  concept await-suspend-result = see below;                    // exposition only

  template<class A, class Promise>
  concept is-awaiter =                                         // exposition only
    requires (A& a, coroutine_handle<Promise> h) {
      a.await_ready() ? 1 : 0;
      { a.await_suspend(h) } -> await-suspend-result;
      a.await_resume();
    };
  template<class C, class Promise>
  concept is-awaitable =                                    // exposition only
    requires (C (*fc)() noexcept, Promise& p) {
      { GET-AWAITER(fc(), p) } -> is-awaiter<Promise>;
    };
}
```

await-suspend-result<T> is true if and only if one of the following is true:

(3.1) — T is void, or

(3.2) — T is bool, or

(3.3) — T is a specialization of coroutine_handle.

4 For a subexpression c such that decltype((c)) is type C, and an lvalue p of type Promise, *await-result-type*<C, Promise> denotes the type decltype(*GET-AWAITER*(c, p).await_resume()).

5 Let *with-await-transform* be the exposition-only class template:

```
namespace std::execution {
  template<class T, class Promise>
    concept has-as-awaitable =                              // exposition only
      requires (T&& t, Promise& p) {
        { std::forward<T>(t).as_awaitable(p) } -> is-awaitable<Promise&>;
      };

  template<class Derived>
    struct with-await-transform {                           // exposition only
      template<class T>
        T&& await_transform(T&& value) noexcept {
          return std::forward<T>(value);
        }

      template<has-as-awaitable<Derived> T>
        decltype(auto) await_transform(T&& value)
          noexcept(noexcept(std::forward<T>(value).as_awaitable(declval<Derived&>()))) {
          return std::forward<T>(value).as_awaitable(static_cast<Derived&>(*this));
        }
    };
}
```

6 Let *env-promise* be the exposition-only class template:

```
namespace std::execution {
  template<class Env>
  struct env-promise : with-await-transform<env-promise<Env>> { // exposition only
    unspecified get_return_object() noexcept;
    unspecified initial_suspend() noexcept;
    unspecified final_suspend() noexcept;
    void unhandled_exception() noexcept;
    void return_void() noexcept;
    coroutine_handle<> unhandled_stopped() noexcept;

    const Env& get_env() const noexcept;
  };
}
```

[*Note 2*: Specializations of *env-promise* are used only for the purpose of type computation; its members need not be defined. — *end note*]

33.9.5 execution::default_domain [exec.domain.default]

1
```
namespace std::execution {
  struct default_domain {
    template<sender Sndr, queryable... Env>
        requires (sizeof...(Env) <= 1)
      static constexpr sender decltype(auto) transform_sender(Sndr&& sndr, const Env&... env)
        noexcept(see below);
    template<sender Sndr, queryable Env>
      static constexpr queryable decltype(auto) transform_env(Sndr&& sndr, Env&& env) noexcept;

    template<class Tag, sender Sndr, class... Args>
      static constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
        noexcept(see below);
  };
}
```

```
template<sender Sndr, queryable... Env>
  requires (sizeof...(Env) <= 1)
constexpr sender decltype(auto) transform_sender(Sndr&& sndr, const Env&... env)
  noexcept(see below);
```

2 Let `e` be the expression

```
tag_of_t<Sndr>().transform_sender(std::forward<Sndr>(sndr), env...)
```

if that expression is well-formed; otherwise, `std::forward<Sndr>(sndr)`.

3 *Returns*: `e`.

4 *Remarks*: The exception specification is equivalent to `noexcept(e)`.

```
template<sender Sndr, queryable Env>
  constexpr queryable decltype(auto) transform_env(Sndr&& sndr, Env&& env) noexcept;
```

5 Let `e` be the expression

```
tag_of_t<Sndr>().transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
```

if that expression is well-formed; otherwise, `static_cast<Env>(std::forward<Env>(env))`.

6 *Mandates*: `noexcept(e)` is `true`.

7 *Returns*: `e`.

```
template<class Tag, sender Sndr, class... Args>
constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
  noexcept(see below);
```

8 Let `e` be the expression

```
  Tag().apply_sender(std::forward<Sndr>(sndr), std::forward<Args>(args)...)
```

9 *Constraints*: `e` is a well-formed expression.

10 *Returns*: `e`.

11 *Remarks*: The exception specification is equivalent to `noexcept(e)`.

33.9.6 `execution::transform_sender` [exec.snd.transform]

```
namespace std::execution {
  template<class Domain, sender Sndr, queryable... Env>
      requires (sizeof...(Env) <= 1)
    constexpr sender decltype(auto) transform_sender(Domain dom, Sndr&& sndr, const Env&... env)
      noexcept(see below);
}
```

1 Let *`transformed-sndr`* be the expression

```
dom.transform_sender(std::forward<Sndr>(sndr), env...)
```

if that expression is well-formed; otherwise,

```
default_domain().transform_sender(std::forward<Sndr>(sndr), env...)
```

Let *`final-sndr`* be the expression *`transformed-sndr`* if *`transformed-sndr`* and *`sndr`* have the same type ignoring cv-qualifiers; otherwise, it is the expression `transform_sender(dom, `*`transformed-sndr`*`, env...)`.

2 *Returns*: *`final-sndr`*.

3 *Remarks*: The exception specification is equivalent to `noexcept(`*`final-sndr`*`)`.

33.9.7 `execution::transform_env` [exec.snd.transform.env]

```
namespace std::execution {
  template<class Domain, sender Sndr, queryable Env>
    constexpr queryable decltype(auto) transform_env(Domain dom, Sndr&& sndr, Env&& env) noexcept;
}
```

1 Let `e` be the expression

```
dom.transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
```

if that expression is well-formed; otherwise,

```
default_domain().transform_env(std::forward<Sndr>(sndr), std::forward<Env>(env))
```

2 *Mandates*: `noexcept(e)` is `true`.

3 *Returns*: `e`.

33.9.8 `execution::apply_sender` [exec.snd.apply]

```
namespace std::execution {
  template<class Domain, class Tag, sender Sndr, class... Args>
    constexpr decltype(auto) apply_sender(Domain dom, Tag, Sndr&& sndr, Args&&... args)
      noexcept(see below);
}
```

1 Let *e* be the expression

```
dom.apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)
```

if that expression is well-formed; otherwise,

```
default_domain().apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)
```

2 *Constraints*: The expression *e* is well-formed.

3 *Returns*: *e*.

4 *Remarks*: The exception specification is equivalent to `noexcept(`*e*`)`.

33.9.9 `execution::get_completion_signatures` [exec.getcomplsigs]

1 `get_completion_signatures` is a customization point object. Let `sndr` be an expression such that `decltype((sndr))` is `Sndr`, and let `env` be an expression such that `decltype((env))` is `Env`. Let `new_sndr` be the expression `transform_sender(decltype(`*`get-domain-late`*`(sndr, env)){}, sndr, env)`, and let `NewSndr` be `decltype((new_sndr))`. Then `get_completion_signatures(sndr, env)` is expression-equivalent to `(void(sndr), void(env), CS())` except that `void(sndr)` and `void(env)` are indeterminately sequenced, where `CS` is:

(1.1) — `decltype(new_sndr.get_completion_signatures(env))` if that type is well-formed,

(1.2) — Otherwise, `remove_cvref_t<NewSndr>::completion_signatures` if that type is well-formed,

(1.3) — Otherwise, if *`is-awaitable`*`<NewSndr, `*`env-promise`*`<Env>>` is `true`, then:

```
completion_signatures<
  SET-VALUE-SIG(await-result-type<NewSndr, env-promise<Env>>),        // (33.9.3)
  set_error_t(exception_ptr),
  set_stopped_t()>
```

(1.4) — Otherwise, `CS` is ill-formed.

2 Let `rcvr` be an rvalue whose type `Rcvr` models `receiver`, and let `Sndr` be the type of a sender such that `sender_in<Sndr, env_of_t<Rcvr>>` is `true`. Let `Sigs...` be the template arguments of the `completion_signatures` specialization named by `completion_signatures_of_t<Sndr, env_of_t<Rcvr>>`. Let `CSO` be a completion function. If sender `Sndr` or its operation state cause the expression `CSO(rcvr, args...)` to be potentially evaluated (6.3) then there shall be a signature `Sig` in `Sigs...` such that

```
MATCHING-SIG(decayed-typeof<CSO>(decltype(args)...), Sig)
```

is `true` (33.1).

33.9.10 `execution::connect` [exec.connect]

1 `connect` connects (33.3) a sender with a receiver.

2 The name connect denotes a customization point object. For subexpressions sndr and rcvr, let Sndr be decltype((sndr)) and Rcvr be decltype((rcvr)), let new_sndr be the expression

```
transform_sender(decltype(get-domain-late(sndr, get_env(rcvr))){}, sndr, get_env(rcvr))
```

and let DS and DR be decay_t<decltype((new_sndr))> and decay_t<Rcvr>, respectively.

3 Let *connect-awaitable-promise* be the following exposition-only class:

```
namespace std::execution {
  struct connect-awaitable-promise : with-await-transform<connect-awaitable-promise> {

    connect-awaitable-promise(DS&, DR& rcvr) noexcept : rcvr(rcvr) {}

    suspend_always initial_suspend() noexcept { return {}; }
    [[noreturn]] suspend_always final_suspend() noexcept { terminate(); }
    [[noreturn]] void unhandled_exception() noexcept { terminate(); }
    [[noreturn]] void return_void() noexcept { terminate(); }

    coroutine_handle<> unhandled_stopped() noexcept {
      set_stopped(std::move(rcvr));
      return noop_coroutine();
    }

    operation-state-task get_return_object() noexcept {
      return operation-state-task{
        coroutine_handle<connect-awaitable-promise>::from_promise(*this)};
    }

    env_of_t<DR> get_env() const noexcept {
      return execution::get_env(rcvr);
    }

  private:
    DR& rcvr;                             // exposition only
  };
}
```

4 Let *operation-state-task* be the following exposition-only class:

```
namespace std::execution {
  struct operation-state-task {                         // exposition only
    using operation_state_concept = operation_state_t;
    using promise_type = connect-awaitable-promise;

    explicit operation-state-task(coroutine_handle<> h) noexcept : coro(h) {}
    operation-state-task(operation-state-task&&) = delete;
    ~operation-state-task() { coro.destroy(); }

    void start() & noexcept {
      coro.resume();
    }

  private:
    coroutine_handle<> coro;                            // exposition only
  };
}
```

5 Let V name the type *await-result-type*<DS, *connect-awaitable-promise*>, let Sigs name the type

```
completion_signatures<
  SET-VALUE-SIG(V),           // see (33.9.3)
  set_error_t(exception_ptr),
  set_stopped_t()>
```

and let *connect-awaitable* be an exposition-only coroutine defined as follows:

```
namespace std::execution {
  template<class Fun, class... Ts>
```

```
    auto suspend-complete(Fun fun, Ts&&... as) noexcept {     // exposition only
      auto fn = [&, fun]() noexcept { fun(std::forward<Ts>(as)...); };

      struct awaiter {
        decltype(fn) fn;                                      // exposition only

        static constexpr bool await_ready() noexcept { return false; }
        void await_suspend(coroutine_handle<>) noexcept { fn(); }
        [[noreturn]] void await_resume() noexcept { unreachable(); }
      };
      return awaiter{fn};
    }

    operation-state-task connect-awaitable(DS sndr, DR rcvr) requires receiver_of<DR, Sigs> {
      exception_ptr ep;
      try {
        if constexpr (same_as<V, void>) {
          co_await std::move(sndr);
          co_await suspend-complete(set_value, std::move(rcvr));
        } else {
          co_await suspend-complete(set_value, std::move(rcvr), co_await std::move(sndr));
        }
      } catch(...) {
        ep = current_exception();
      }
      co_await suspend-complete(set_error, std::move(rcvr), std::move(ep));
    }
  }
```

6 The expression `connect(sndr, rcvr)` is expression-equivalent to:

(6.1) — `new_sndr.connect(rcvr)` if that expression is well-formed.

Mandates: The type of the expression above satisfies `operation_state`.

(6.2) — Otherwise, `connect-awaitable(new_sndr, rcvr)`.

Mandates: `sender<Sndr> && receiver<Rcvr>` is `true`.

33.9.11 Sender factories [exec.factories]

33.9.11.1 `execution::schedule` [exec.schedule]

1 `schedule` obtains a schedule sender (33.3) from a scheduler.

2 The name `schedule` denotes a customization point object. For a subexpression `sch`, the expression `schedule(sch)` is expression-equivalent to `sch.schedule()`.

3 *Mandates*: The type of `sch.schedule()` satisfies `sender`.

4 If the expression

```
get_completion_scheduler<set_value_t>(get_env(sch.schedule())) == sch
```

is ill-formed or evaluates to `false`, the behavior of calling `schedule(sch)` is undefined.

33.9.11.2 `execution::just`, `execution::just_error`, `execution::just_stopped` [exec.just]

1 `just`, `just_error`, and `just_stopped` are sender factories whose asynchronous operations complete synchronously in their start operation with a value completion operation, an error completion operation, or a stopped completion operation, respectively.

2 The names `just`, `just_error`, and `just_stopped` denote customization point objects. Let `just-cpo` be one of `just`, `just_error`, or `just_stopped`. For a pack of subexpressions `ts`, let `Ts` be the pack of types `decltype((ts))`. The expression `just-cpo(ts...)` is ill-formed if

(2.1) — `(movable-value<Ts> &&...)` is `false`, or

(2.2) — `just-cpo` is `just_error` and `sizeof...(ts) == 1` is `false`, or

(2.3) — `just-cpo` is `just_stopped` and `sizeof...(ts) == 0` is `false`.

Otherwise, it is expression-equivalent to *make-sender*(*just-cpo*, *product-type*{ts...}).

For `just`, `just_error`, and `just_stopped`, let *set-cpo* be `set_value`, `set_error`, and `set_stopped`, respectively. The exposition-only class template *impls-for* (33.9.1) is specialized for *just-cpo* as follows:

```
namespace std::execution {
  template<>
  struct impls-for<decayed-typeof<just-cpo>> : default-impls {
    static constexpr auto start =
      [](auto& state, auto& rcvr) noexcept -> void {
        auto& [...ts] = state;
        set-cpo(std::move(rcvr), std::move(ts)...);
      };
  };
}
```

33.9.11.3 `execution::read_env` [exec.read.env]

1 `read_env` is a sender factory for a sender whose asynchronous operation completes synchronously in its start operation with a value completion result equal to a value read from the receiver's associated environment.

2 `read_env` is a customization point object. For some query object `q`, the expression `read_env(q)` is expression-equivalent to *make-sender*(`read_env, q`).

3 The exposition-only class template *impls-for* (33.9.1) is specialized for `read_env` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<decayed-typeof<read_env>> : default-impls {
    static constexpr auto start =
      [](auto query, auto& rcvr) noexcept -> void {
        TRY-SET-VALUE(rcvr, query(get_env(rcvr)));
      };
  };
}
```

33.9.12 Sender adaptors [exec.adapt]

33.9.12.1 General [exec.adapt.general]

1 Subclause 33.9.12 specifies a set of sender adaptors.

2 The bitwise inclusive OR operator is overloaded for the purpose of creating sender chains. The adaptors also support function call syntax with equivalent semantics.

3 Unless otherwise specified:

(3.1) — A sender adaptor is prohibited from causing observable effects, apart from moving and copying its arguments, before the returned sender is connected with a receiver using `connect`, and `start` is called on the resulting operation state.

(3.2) — A parent sender (33.3) with a single child sender `sndr` has an associated attribute object equal to *FWD-ENV*(`get_env(sndr)`) (33.5.1).

(3.3) — A parent sender with more than one child sender has an associated attributes object equal to `env<>{}`.

(3.4) — When a parent sender is connected to a receiver `rcvr`, any receiver used to connect a child sender has an associated environment equal to *FWD-ENV*(`get_env(rcvr)`).

(3.5) — These requirements apply to any function that is selected by the implementation of the sender adaptor.

4 If a sender returned from a sender adaptor specified in 33.9.12 is specified to include `set_error_t(Err)` among its set of completion signatures where `decay_t<Err>` denotes the type `exception_ptr`, but the implementation does not potentially evaluate an error completion operation with an `exception_ptr` argument, the implementation is allowed to omit the `exception_ptr` error completion signature from the set.

33.9.12.2 Closure objects [exec.adapt.obj]

1 A *pipeable sender adaptor closure object* is a function object that accepts one or more `sender` arguments and returns a `sender`. For a pipeable sender adaptor closure object `c` and an expression `sndr` such that `decltype((sndr))` models `sender`, the following expressions are equivalent and yield a `sender`:

```
c(sndr)
sndr | c
```

Given an additional pipeable sender adaptor closure object `d`, the expression `c | d` produces another pipeable sender adaptor closure object `e`:

`e` is a perfect forwarding call wrapper (22.10.4) with the following properties:

(1.1) — Its target object is an object `d2` of type `decltype(auto(d))` direct-non-list-initialized with `d`.

(1.2) — It has one bound argument entity, an object `c2` of type `decltype(auto(c))` direct-non-list-initialized with `c`.

(1.3) — Its call pattern is `d2(c2(arg))`, where arg is the argument used in a function call expression of `e`.

The expression `c | d` is well-formed if and only if the initializations of the state entities (22.10.3) of `e` are all well-formed.

2 An object `t` of type `T` is a pipeable sender adaptor closure object if `T` models `derived_from<sender_-adaptor_closure<T>>`, `T` has no other base classes of type `sender_adaptor_closure<U>` for any other type `U`, and `T` does not satisfy `sender`.

3 The template parameter `D` for `sender_adaptor_closure` can be an incomplete type. Before any expression of type *cv* `D` appears as an operand to the `|` operator, `D` shall be complete and model `derived_from<sender_-adaptor_closure<D>>`. The behavior of an expression involving an object of type *cv* `D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined `operator|` function.

4 A *pipeable sender adaptor object* is a customization point object that accepts a `sender` as its first argument and returns a `sender`. If a pipeable sender adaptor object accepts only one argument, then it is a pipeable sender adaptor closure object.

5 If a pipeable sender adaptor object adaptor accepts more than one argument, then let `sndr` be an expression such that `decltype((sndr))` models `sender`, let `args...` be arguments such that `adaptor(sndr, args...)` is a well-formed expression as specified below, and let `BoundArgs` be a pack that denotes `decltype(auto(args))...`. The expression `adaptor(args...)` produces a pipeable sender adaptor closure object `f` that is a perfect forwarding call wrapper with the following properties:

(5.1) — Its target object is a copy of adaptor.

(5.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decltype((args))>(args)...`, respectively.

(5.3) — Its call pattern is `adaptor(rcvr, bound_args...)`, where `rcvr` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initializations of the bound argument entities of the result, as specified above, are all well-formed.

33.9.12.3 `execution::starts_on` [exec.starts.on]

1 `starts_on` adapts an input sender into a sender that will start on an execution agent belonging to a particular scheduler's associated execution resource.

2 The name `starts_on` denotes a customization point object. For subexpressions `sch` and `sndr`, if `decltype((sch))` does not satisfy `scheduler`, or `decltype((sndr))` does not satisfy `sender`, `starts_on(sch, sndr)` is ill-formed.

3 Otherwise, the expression `starts_on(sch, sndr)` is expression-equivalent to:

```
transform_sender(
  query-or-default(get_domain, sch, default_domain()),
  make-sender(starts_on, sch, sndr))
```

except that `sch` is evaluated only once.

4 Let `out_sndr` and `env` be subexpressions such that `OutSndr` is `decltype((out_sndr))`. If *`sender-for`*`<OutSndr, starts_on_t>` is `false`, then the expressions `starts_on.transform_env(out_sndr, env)` and `starts_on.transform_sender(out_sndr, env)` are ill-formed; otherwise

(4.1) — `starts_on.transform_env(out_sndr, env)` is equivalent to:

```
auto&& [_, sch, _] = out_sndr;
return JOIN-ENV(SCHED-ENV(sch), FWD-ENV(env));
```

(4.2) — `starts_on.transform_sender(out_sndr, env)` is equivalent to:

```
auto&& [_, sch, sndr] = out_sndr;
return let_value(
  schedule(sch),
  [sndr = std::forward_like<OutSndr>(sndr)]() mutable
    noexcept(is_nothrow_move_constructible_v<decay_t<OutSndr>>) {
    return std::move(sndr);
  });
```

5 Let `out_sndr` be a subexpression denoting a sender returned from `starts_on(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is `true`. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on an execution agent of the associated execution resource of `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

33.9.12.4 `execution::continues_on` [exec.continues.on]

1 `continues_on` adapts a sender into one that completes on the specified scheduler.

2 The name `continues_on` denotes a pipeable sender adaptor object. For subexpressions `sch` and `sndr`, if `decltype((sch))` does not satisfy `scheduler`, or `decltype((sndr))` does not satisfy `sender`, `continues_on(sndr, sch)` is ill-formed.

3 Otherwise, the expression `continues_on(sndr, sch)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(continues_on, sch, sndr))
```

except that `sndr` is evaluated only once.

4 The exposition-only class template *`impls-for`* is specialized for `continues_on_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<continues_on_t> : default-impls {
    static constexpr auto get-attrs =
      [](const auto& data, const auto& child) noexcept -> decltype(auto) {
        return JOIN-ENV(SCHED-ATTRS(data), FWD-ENV(get_env(child)));
      };
  };
}
```

5 Let `sndr` and `env` be subexpressions such that `Sndr` is `decltype((sndr))`. If *`sender-for`*`<Sndr, continues_on_t>` is `false`, then the expression `continues_on.transform_sender(sndr, env)` is ill-formed; otherwise, it is equal to:

```
auto [_, data, child] = sndr;
return schedule_from(std::move(data), std::move(child));
```

[*Note 1*: This causes the `continues_on(sndr, sch)` sender to become `schedule_from(sch, sndr)` when it is connected with a receiver whose execution domain does not customize `continues_on`. — *end note*]

6 Let `out_sndr` be a subexpression denoting a sender returned from `continues_on(sndr, sch)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is `true`. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on the current execution agent and execute completion operations on `out_rcvr` on an execution agent of the execution resource associated with `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

33.9.12.5 `execution::schedule_from` [exec.schedule.from]

1 `schedule_from` schedules work dependent on the completion of a sender onto a scheduler's associated execution resource.

[*Note 1*: `schedule_from` is not meant to be used in user code; it is used in the implementation of `continues_on`. — *end note*]

2 The name `schedule_from` denotes a customization point object. For some subexpressions `sch` and `sndr`, let `Sch` be `decltype((sch))` and `Sndr` be `decltype((sndr))`. If `Sch` does not satisfy `scheduler`, or `Sndr` does not satisfy `sender`, `schedule_from(sch, sndr)` is ill-formed.

3 Otherwise, the expression `schedule_from(sch, sndr)` is expression-equivalent to:

```
transform_sender(
  query-or-default(get_domain, sch, default_domain()),
  make-sender(schedule_from, sch, sndr))
```

except that `sch` is evaluated only once.

4 The exposition-only class template *`impls-for`* (33.9.1) is specialized for `schedule_from_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<schedule_from_t> : default-impls {
    static constexpr auto get-attrs = see below;
    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
  };
}
```

5 The member *`impls-for`*`<schedule_from_t>::`*`get-attrs`* is initialized with a callable object equivalent to the following lambda:

```
[](const auto& data, const auto& child) noexcept -> decltype(auto) {
  return JOIN-ENV(SCHED-ATTRS(data), FWD-ENV(get_env(child)));
}
```

6 The member *`impls-for`*`<schedule_from_t>::`*`get-state`* is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(see below)
    requires sender_in<child-type<Sndr>, env_of_t<Rcvr>> {

  auto& [_, sch, child] = sndr;

  using sched_t = decltype(auto(sch));
  using variant_t = see below;
  using receiver_t = see below;
  using operation_t = connect_result_t<schedule_result_t<sched_t>, receiver_t>;
  constexpr bool nothrow = noexcept(connect(schedule(sch), receiver_t{nullptr}));

  struct state-type {
    Rcvr& rcvr;                   // exposition only
    variant_t async-result;       // exposition only
    operation_t op-state;         // exposition only

    explicit state-type(sched_t sch, Rcvr& rcvr) noexcept(nothrow)
      : rcvr(rcvr), op-state(connect(schedule(sch), receiver_t{this})) {}
  };

  return state-type{sch, rcvr};
}
```

7 Objects of the local class *`state-type`* can be used to initialize a structured binding.

8 Let `Sigs` be a pack of the arguments to the `completion_signatures` specialization named by `completion_-signatures_of_t<@`*`child-type`*`<Sndr>, env_of_t<Rcvr>>`. Let *`as-tuple`* be an alias template that transforms a completion signature `Tag(Args...)` into the tuple specialization *`decayed-tuple`*`<Tag, Args...>`. Then `variant_t` denotes the type `variant<monostate, `*`as-tuple`*`<Sigs>...>`, except with duplicate types removed.

9 `receiver_t` is an alias for the following exposition-only class:

```
namespace std::execution {
  struct receiver-type {
    using receiver_concept = receiver_t;
    state-type* state;            // exposition only
```

```
      void set_value() && noexcept {
        visit(
          [this]<class Tuple>(Tuple& result) noexcept -> void {
            if constexpr (!same_as<monostate, Tuple>) {
              auto& [tag, ...args] = result;
              tag(std::move(state->rcvr), std::move(args)...);
            }
          },
          state->async-result);
      }

      template<class Error>
      void set_error(Error&& err) && noexcept {
        execution::set_error(std::move(state->rcvr), std::forward<Error>(err));
      }

      void set_stopped() && noexcept {
        execution::set_stopped(std::move(state->rcvr));
      }

      decltype(auto) get_env() const noexcept {
        return FWD-ENV(execution::get_env(state->rcvr));
      }
    };
  }
```

10 The expression in the `noexcept` clause of the lambda is `true` if the construction of the returned *`state-type`* object is not potentially throwing; otherwise, `false`.

11 The member *`impls-for`*`<schedule_from_t>::`*`complete`* is initialized with a callable object equivalent to the following lambda:

```
  []<class Tag, class... Args>(auto, auto& state, auto& rcvr, Tag, Args&&... args) noexcept
      -> void {
    using result_t = decayed-tuple<Tag, Args...>;
    constexpr bool nothrow = is_nothrow_constructible_v<result_t, Tag, Args...>;

    try {
      state.async-result.template emplace<result_t>(Tag(), std::forward<Args>(args)...);
    } catch (...) {
      if constexpr (!nothrow) {
        set_error(std::move(rcvr), current_exception());
        return;
      }
    }
    start(state.op-state);
  };
```

12 Let `out_sndr` be a subexpression denoting a sender returned from `schedule_from(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is `true`. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on the current execution agent and execute completion operations on `out_rcvr` on an execution agent of the execution resource associated with `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

33.9.12.6 `execution::on` [exec.on]

1 The `on` sender adaptor has two forms:

(1.1) — `on(sch, sndr)`, which starts a sender `sndr` on an execution agent belonging to a scheduler `sch`'s associated execution resource and that, upon `sndr`'s completion, transfers execution back to the execution resource on which the `on` sender was started.

(1.2) — `on(sndr, sch, closure)`, which upon completion of a sender `sndr`, transfers execution to an execution agent belonging to a scheduler `sch`'s associated execution resource, then executes a sender adaptor closure `closure` with the async results of the sender, and that then transfers execution back to the execution resource on which `sndr` completed.

2 The name `on` denotes a pipeable sender adaptor object. For subexpressions `sch` and `sndr`, `on(sch, sndr)` is ill-formed if any of the following is `true`:

(2.1) — `decltype((sch))` does not satisfy `scheduler`, or

(2.2) — `decltype((sndr))` does not satisfy `sender` and `sndr` is not a pipeable sender adaptor closure object (33.9.12.2), or

(2.3) — `decltype((sndr))` satisfies `sender` and `sndr` is also a pipeable sender adaptor closure object.

3 Otherwise, if `decltype((sndr))` satisfies `sender`, the expression `on(sch, sndr)` is expression-equivalent to:

```
transform_sender(
  query-or-default(get_domain, sch, default_domain()),
  make-sender(on, sch, sndr))
```

except that `sch` is evaluated only once.

4 For subexpressions `sndr`, `sch`, and `closure`, if

(4.1) — `decltype((sch))` does not satisfy `scheduler`, or

(4.2) — `decltype((sndr))` does not satisfy `sender`, or

(4.3) — `closure` is not a pipeable sender adaptor closure object (33.9.12.2),

the expression `on(sndr, sch, closure)` is ill-formed; otherwise, it is expression-equivalent to:

```
transform_sender(
  get-domain-early(sndr),
  make-sender(on, product-type{sch, closure}, sndr))
```

except that `sndr` is evaluated only once.

5 Let `out_sndr` and `env` be subexpressions, let `OutSndr` be `decltype((out_sndr))`, and let `Env` be `decltype((env))`. If *`sender-for`*`<OutSndr, on_t>` is `false`, then the expressions `on.transform_env(out_sndr, env)` and `on.transform_sender(out_sndr, env)` are ill-formed.

6 Otherwise: Let *`not-a-scheduler`* be an unspecified empty class type, and let *`not-a-sender`* be the exposition-only type:

```
struct not-a-sender {
  using sender_concept = sender_t;

  auto get_completion_signatures(auto&&) const {
    return see below;
  }
};
```

where the member function `get_completion_signatures` returns an object of a type that is not a specialization of the `completion_signatures` class template.

7 The expression `on.transform_env(out_sndr, env)` has effects equivalent to:

```
auto&& [_, data, _] = out_sndr;
if constexpr (scheduler<decltype(data)>) {
  return JOIN-ENV(SCHED-ENV(std::forward_like<OutSndr>(data)), FWD-ENV(std::forward<Env>(env)));
} else {
  return std::forward<Env>(env);
}
```

8 The expression `on.transform_sender(out_sndr, env)` has effects equivalent to:

```
auto&& [_, data, child] = out_sndr;
if constexpr (scheduler<decltype(data)>) {
  auto orig_sch =
    query-with-default(get_scheduler, env, not-a-scheduler());

  if constexpr (same_as<decltype(orig_sch), not-a-scheduler>) {
    return not-a-sender{};
  } else {
    return continues_on(
      starts_on(std::forward_like<OutSndr>(data), std::forward_like<OutSndr>(child)),
      std::move(orig_sch));
  }
} else {
  auto& [sch, closure] = data;
  auto orig_sch = query-with-default(
    get_completion_scheduler<set_value_t>,
    get_env(child),
    query-with-default(get_scheduler, env, not-a-scheduler()));

  if constexpr (same_as<decltype(orig_sch), not-a-scheduler>) {
    return not-a-sender{};
  } else {
    return write-env(
      continues_on(
        std::forward_like<OutSndr>(closure)(
          continues_on(
            write-env(std::forward_like<OutSndr>(child), SCHED-ENV(orig_sch)),
            sch)),
        orig_sch),
      SCHED-ENV(sch));
  }
}
```

9 *Recommended practice*: Implementations should use the return type of *not-a-sender*::get_completion_signatures to inform users that their usage of on is incorrect because there is no available scheduler onto which to restore execution.

10 Let out_sndr be a subexpression denoting a sender returned from on(sch, sndr) or one equal to such, and let OutSndr be the type decltype((out_sndr)). Let out_rcvr be a subexpression denoting a receiver that has an environment of type Env such that sender_in<OutSndr, Env> is true. Let op be an lvalue referring to the operation state that results from connecting out_sndr with out_rcvr. Calling start(op) shall

- (10.1) — remember the current scheduler, get_scheduler(get_env(rcvr));
- (10.2) — start sndr on an execution agent belonging to sch's associated execution resource;
- (10.3) — upon sndr's completion, transfer execution back to the execution resource associated with the scheduler remembered in step 1; and
- (10.4) — forward sndr's async result to out_rcvr.

If any scheduling operation fails, an error completion on out_rcvr shall be executed on an unspecified execution agent.

11 Let out_sndr be a subexpression denoting a sender returned from on(sndr, sch, closure) or one equal to such, and let OutSndr be the type decltype((out_sndr)). Let out_rcvr be a subexpression denoting a receiver that has an environment of type Env such that sender_in<OutSndr, Env> is true. Let op be an lvalue referring to the operation state that results from connecting out_sndr with out_rcvr. Calling start(op) shall

- (11.1) — remember the current scheduler, which is the first of the following expressions that is well-formed:
  - (11.1.1) — get_completion_scheduler<set_value_t>(get_env(sndr))
  - (11.1.2) — get_scheduler(get_env(rcvr));
- (11.2) — start sndr on the current execution agent;
- (11.3) — upon sndr's completion, transfer execution to an agent owned by sch's associated execution resource;
- (11.4) — forward sndr's async result as if by connecting and starting a sender closure(S), where S is a sender that completes synchronously with sndr's async result; and
- (11.5) — upon completion of the operation started in the previous step, transfer execution back to the execution resource associated with the scheduler remembered in step 1 and forward the operation's async result to out_rcvr.

If any scheduling operation fails, an error completion on out_rcvr shall be executed on an unspecified execution agent.

33.9.12.7 `execution::then`, `execution::upon_error`, `execution::upon_stopped` [exec.then]

1 `then` attaches an invocable as a continuation for an input sender's value completion operation. `upon_error` and `upon_stopped` do the same for the error and stopped completion operations, respectively, sending the result of the invocable as a value completion.

2 The names `then`, `upon_error`, and `upon_stopped` denote pipeable sender adaptor objects. Let the expression *`then-cpo`* be one of `then`, `upon_error`, or `upon_stopped`. For subexpressions `sndr` and `f`, if `decltype((sndr))` does not satisfy `sender`, or `decltype((f))` does not satisfy *`movable-value`*, *`then-cpo`*`( sndr, f)` is ill-formed.

3 Otherwise, the expression *`then-cpo`*`(sndr, f)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(then-cpo, f, sndr))
```

except that `sndr` is evaluated only once.

4 For `then`, `upon_error`, and `upon_stopped`, let *`set-cpo`* be `set_value`, `set_error`, and `set_stopped`, respectively. The exposition-only class template *`impls-for`* (33.9.1) is specialized for *`then-cpo`* as follows:

```
namespace std::execution {
  template<>
  struct impls-for<decayed-typeof<then-cpo>> : default-impls {
    static constexpr auto complete =
      []<class Tag, class... Args>
        (auto, auto& fn, auto& rcvr, Tag, Args&&... args) noexcept -> void {
          if constexpr (same_as<Tag, decayed-typeof<set-cpo>>) {
            TRY-SET-VALUE(rcvr,
                          invoke(std::move(fn), std::forward<Args>(args)...));
          } else {
            Tag()(std::move(rcvr), std::forward<Args>(args)...);
          }
        };
  };
}
```

5 The expression *`then-cpo`*`(sndr, f)` has undefined behavior unless it returns a sender `out_sndr` that

(5.1) — invokes `f` or a copy of such with the value, error, or stopped result datums of `sndr` for `then`, `upon_error`, and `upon_stopped`, respectively, using the result value of `f` as `out_sndr`'s value completion, and

(5.2) — forwards all other completion operations unchanged.

33.9.12.8 `execution::let_value`, `execution::let_error`, `execution::let_stopped` [exec.let]

1 `let_value`, `let_error`, and `let_stopped` transform a sender's value, error, and stopped completions, respectively, into a new child asynchronous operation by passing the sender's result datums to a user-specified callable, which returns a new sender that is connected and started.

2 For `let_value`, `let_error`, and `let_stopped`, let *`set-cpo`* be `set_value`, `set_error`, and `set_stopped`, respectively. Let the expression *`let-cpo`* be one of `let_value`, `let_error`, or `let_stopped`. For a subexpression `sndr`, let *`let-env`*`(sndr)` be expression-equivalent to the first well-formed expression below:

(2.1) — *`SCHED-ENV`*`(get_completion_scheduler<`*`decayed-typeof`*`<`*`set-cpo`*`>>(get_env(sndr)))`

(2.2) — *`MAKE-ENV`*`(get_domain, get_domain(get_env(sndr)))`

(2.3) — `(void(sndr), env<>{})`

3 The names `let_value`, `let_error`, and `let_stopped` denote pipeable sender adaptor objects. For subexpressions `sndr` and `f`, let `F` be the decayed type of `f`. If `decltype((sndr))` does not satisfy `sender` or if `decltype((f))` does not satisfy *`movable-value`*, the expression *`let-cpo`*`(sndr, f)` is ill-formed. If `F` does not satisfy `invocable`, the expression `let_stopped(sndr, f)` is ill-formed.

4 Otherwise, the expression *`let-cpo`*`(sndr, f)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(let-cpo, f, sndr))
```

except that `sndr` is evaluated only once.

5 The exposition-only class template *`impls-for`* (33.9.1) is specialized for *`let-cpo`* as follows:

```
namespace std::execution {
  template<class State, class Rcvr, class... Args>
  void let-bind(State& state, Rcvr& rcvr, Args&&... args);       // exposition only

  template<>
  struct impls-for<decayed-typeof<let-cpo>> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
  };
}
```

6 Let *receiver2* denote the following exposition-only class template:

```
namespace std::execution {
  template<class Rcvr, class Env>
  struct receiver2 {
    using receiver_concept = receiver_t;

    template<class... Args>
    void set_value(Args&&... args) && noexcept {
      execution::set_value(std::move(rcvr), std::forward<Args>(args)...);
    }

    template<class Error>
    void set_error(Error&& err) && noexcept {
      execution::set_error(std::move(rcvr), std::forward<Error>(err));
    }

    void set_stopped() && noexcept {
      execution::set_stopped(std::move(rcvr));
    }

    decltype(auto) get_env() const noexcept {
      return see below;
    }

    Rcvr& rcvr;                    // exposition only
    Env env;                       // exposition only
  };
}
```

Invocation of the function *receiver2*`::get_env` returns an object `e` such that

(6.1) — `decltype(e)` models *queryable* and

(6.2) — given a query object `q`, the expression `e.query(q)` is expression-equivalent to *env*`.query(q)` if that expression is valid, otherwise `e.query(q)` is expression-equivalent to `get_env(`*rcvr*`).query(q)`.

7 *impls-for<decayed-typeof<let-cpo>>::get-state* is initialized with a callable object equivalent to the following:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) requires see below {
  auto& [_, fn, child] = sndr;
  using fn_t = decay_t<decltype(fn)>;
  using env_t = decltype(let-env(child));
  using args_variant_t = see below;
  using ops2_variant_t = see below;

  struct state-type {
    fn_t fn;                      // exposition only
    env_t env;                    // exposition only
    args_variant_t args;          // exposition only
    ops2_variant_t ops2;          // exposition only
  };
  return state-type{std::forward_like<Sndr>(fn), let-env(child), {}, {}};
}
```

8 Let `Sigs` be a pack of the arguments to the `completion_signatures` specialization named by `completion_signatures_of_t<`*`child-type`*`<Sndr>, env_of_t<Rcvr>>`. Let `LetSigs` be a pack of those types in `Sigs` with a return type of *`decayed-typeof`*`<`*`set-cpo`*`>`. Let *`as-tuple`* be an alias template such that *`as-tuple`*`<Tag(Args...)>` denotes the type *`decayed-tuple`*`<Args...>`. Then `args_variant_t` denotes the type `variant<monostate, `*`as-tuple`*`<LetSigs>...>` except with duplicate types removed.

9 Given a type `Tag` and a pack `Args`, let *`as-sndr2`* be an alias template such that *`as-sndr2`*`<Tag(Args...)>` denotes the type *`call-result-t`*`<Fn, decay_t<Args>&...>`. Then `ops2_variant_t` denotes the type

```
variant<monostate, connect_result_t<as-sndr2<LetSigs>, receiver2<Rcvr, Env>>...>
```

except with duplicate types removed.

10 The *requires-clause* constraining the above lambda is satisfied if and only if the types `args_variant_t` and `ops2_variant_t` are well-formed.

11 The exposition-only function template *`let-bind`* has effects equivalent to:

```
using args_t = decayed-tuple<Args...>;
auto mkop2 = [&] {
  return connect(
    apply(std::move(state.fn),
          state.args.template emplace<args_t>(std::forward<Args>(args)...)),
    receiver2{rcvr, std::move(state.env)});
};
start(state.ops2.template emplace<decltype(mkop2())>(emplace-from{mkop2}));
```

12 *`impls-for`*`<`*`decayed-typeof`*`<let-cpo>>::`*`complete`* is initialized with a callable object equivalent to the following:

```
[]<class Tag, class... Args>
  (auto, auto& state, auto& rcvr, Tag, Args&&... args) noexcept -> void {
    if constexpr (same_as<Tag, decayed-typeof<set-cpo>>) {
      TRY-EVAL(rcvr, let-bind(state, rcvr, std::forward<Args>(args)...));
    } else {
      Tag()(std::move(rcvr), std::forward<Args>(args)...);
    }
  }
```

13 Let `sndr` and `env` be subexpressions, and let `Sndr` be `decltype((sndr))`. If *`sender-for`*`<Sndr, `*`decayed-typeof`*`<`*`let-cpo`*`>>` is `false`, then the expression *`let-cpo`*`.transform_env(sndr, env)` is ill-formed. Otherwise, it is equal to *`JOIN-ENV`*`(`*`let-env`*`(sndr), `*`FWD-ENV`*`(env))`.

14 Let the subexpression `out_sndr` denote the result of the invocation *`let-cpo`*`(sndr, f)` or an object equal to such, and let the subexpression `rcvr` denote a receiver such that the expression `connect(out_sndr, rcvr)` is well-formed. The expression `connect(out_sndr, rcvr)` has undefined behavior unless it creates an asynchronous operation (33.3) that, when started:

(14.1) — invokes `f` when *`set-cpo`* is called with `sndr`'s result datums,

(14.2) — makes its completion dependent on the completion of a sender returned by `f`, and

(14.3) — propagates the other completion operations sent by `sndr`.

33.9.12.9 `execution::bulk` [exec.bulk]

1 `bulk` runs a task repeatedly for every index in an index space.

The name `bulk` denotes a pipeable sender adaptor object. For subexpressions `sndr`, `shape`, and `f`, let `Shape` be `decltype(auto(shape))`. If

(1.1) — `decltype((sndr))` does not satisfy `sender`, or

(1.2) — `Shape` does not satisfy `integral`, or

(1.3) — `decltype((f))` does not satisfy *`movable-value`*,

`bulk(sndr, shape, f)` is ill-formed.

2 Otherwise, the expression `bulk(sndr, shape, f)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(bulk, product-type{shape, f}, sndr))
```

except that `sndr` is evaluated only once.

3 The exposition-only class template *impls-for* (33.9.1) is specialized for `bulk_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<bulk_t> : default-impls {
    static constexpr auto complete = see below;
  };
}
```

4 The member *impls-for*`<bulk_t>::`*complete* is initialized with a callable object equivalent to the following lambda:

```
[]<class Index, class State, class Rcvr, class Tag, class... Args>
  (Index, State& state, Rcvr& rcvr, Tag, Args&&... args) noexcept -> void requires see below {
    if constexpr (same_as<Tag, set_value_t>) {
      auto& [shape, f] = state;
      constexpr bool nothrow = noexcept(f(auto(shape), args...));
      TRY-EVAL(rcvr, [&]() noexcept(nothrow) {
        for (decltype(auto(shape)) i = 0; i < shape; ++i) {
          f(auto(i), args...);
        }
        Tag()(std::move(rcvr), std::forward<Args>(args)...);
      }());
    } else {
      Tag()(std::move(rcvr), std::forward<Args>(args)...);
    }
  }
```

5 The expression in the *requires-clause* of the lambda above is `true` if and only if `Tag` denotes a type other than `set_value_t` or if the expression `f(auto(shape), args...)` is well-formed.

6 Let the subexpression `out_sndr` denote the result of the invocation `bulk(sndr, shape, f)` or an object equal to such, and let the subexpression `rcvr` denote a receiver such that the expression `connect(out_sndr, rcvr)` is well-formed. The expression `connect(out_sndr, rcvr)` has undefined behavior unless it creates an asynchronous operation (33.3) that, when started,

(6.1) — on a value completion operation, invokes `f(i, args...)` for every `i` of type `Shape` in $[0, \texttt{shape})$, where `args` is a pack of lvalue subexpressions referring to the value completion result datums of the input sender, and

(6.2) — propagates all completion operations sent by `sndr`.

33.9.12.10 `execution::split` [exec.split]

1 `split` adapts an arbitrary sender into a sender that can be connected multiple times.

2 Let *split-env* be the type of an environment such that, given an instance `env`, the expression `get_stop_token(env)` is well-formed and has type `inplace_stop_token`.

3 The name `split` denotes a pipeable sender adaptor object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `sender_in<Sndr,` *split-env*`>` is `false`, `split(sndr)` is ill-formed.

4 Otherwise, the expression `split(sndr)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(split, {}, sndr))
```

except that `sndr` is evaluated only once.

[*Note 1*: The default implementation of `transform_sender` will have the effect of connecting the sender to a receiver. It will return a sender with a different tag type. — *end note*]

5 Let *local-state* denote the following exposition-only class template:

```
namespace std::execution {
  struct local-state-base {                                    // exposition only
    virtual ~local-state-base() = default;
    virtual void notify() noexcept = 0;                        // exposition only
  };
```

```
    template<class Sndr, class Rcvr>
    struct local-state : local-state-base {                      // exposition only
      using on-stop-callback =                                   // exposition only
        stop_callback_for_t<stop_token_of_t<env_of_t<Rcvr>>, on-stop-request>;

      local-state(Sndr&& sndr, Rcvr& rcvr) noexcept;
      ~local-state();

      void notify() noexcept override;

    private:
      optional<on-stop-callback> on_stop;                        // exposition only
      shared-state<Sndr>* sh_state;                              // exposition only
      Rcvr* rcvr;                                                // exposition only
    };
  }
```

`local-state(Sndr&& sndr, Rcvr& rcvr) noexcept;`

6 *Effects*: Equivalent to:

```
auto& [_, data, _] = sndr;
this->sh_state = data.sh_state.get();
this->sh_state->inc-ref();
this->rcvr = addressof(rcvr);
```

`~local-state();`

7 *Effects*: Equivalent to:

```
sh_state->dec-ref();
```

`void notify() noexcept override;`

8 *Effects*: Equivalent to:

```
on_stop.reset();
visit(
  [this](const auto& tupl) noexcept -> void {
    apply(
      [this](auto tag, const auto&... args) noexcept -> void {
        tag(std::move(*rcvr), args...);
      },
      tupl);
  },
  sh_state->result);
```

9 Let *split-receiver* denote the following exposition-only class template:

```
  namespace std::execution {
    template<class Sndr>
    struct split-receiver {                                      // exposition only
      using receiver_concept = receiver_t;

      template<class Tag, class... Args>
      void complete(Tag, Args&&... args) noexcept {              // exposition only
        using tuple_t = decayed-tuple<Tag, Args...>;
        try {
          sh_state->result.template emplace<tuple_t>(Tag(), std::forward<Args>(args)...);
        } catch (...) {
          using tuple_t = tuple<set_error_t, exception_ptr>;
          sh_state->result.template emplace<tuple_t>(set_error, current_exception());
        }
        sh_state->notify();
      }

      template<class... Args>
      void set_value(Args&&... args) && noexcept {
        complete(execution::set_value, std::forward<Args>(args)...);
      }

      template<class Error>
      void set_error(Error&& err) && noexcept {
        complete(execution::set_error, std::forward<Error>(err));
      }

      void set_stopped() && noexcept {
        complete(execution::set_stopped);
      }

      struct env {                                              // exposition only
        shared-state<Sndr>* sh-state;                           // exposition only

        inplace_stop_token query(get_stop_token_t) const noexcept {
          return sh-state->stop_src.get_token();
        }
      };

      env get_env() const noexcept {
        return env{sh_state};
      }

      shared-state<Sndr>* sh_state;                             // exposition only
    };
  }
```

10 Let *shared-state* denote the following exposition-only class template:

```
  namespace std::execution {
    template<class Sndr>
    struct shared-state {
      using variant-type = see below;                           // exposition only
      using state-list-type = see below;                        // exposition only

      explicit shared-state(Sndr&& sndr);

      void start-op() noexcept;                                 // exposition only
      void notify() noexcept;                                   // exposition only
      void inc-ref() noexcept;                                  // exposition only
      void dec-ref() noexcept;                                  // exposition only

      inplace_stop_source stop_src{};                           // exposition only
      variant-type result{};                                    // exposition only
      state-list-type waiting_states;                           // exposition only
      atomic<bool> completed{false};                            // exposition only
      atomic<size_t> ref_count{1};                              // exposition only
      connect_result_t<Sndr, split-receiver<Sndr>> op_state;    // exposition only
    };
  }
```

11 Let `Sigs` be a pack of the arguments to the `completion_signatures` specialization named by `completion_-signatures_of_t<Sndr>`. For type `Tag` and pack `Args`, let *as-tuple* be an alias template such that *as-tuple*`<Tag(Args...)>` denotes the type *decayed-tuple*`<Tag, Args...>`. Then *variant-type* denotes the type

```
  variant<tuple<set_stopped_t>, tuple<set_error_t, exception_ptr>, as-tuple<Sigs>...>
```

but with duplicate types removed.

12 Let *state-list-type* be a type that stores a list of pointers to *local-state-base* objects and that permits atomic insertion.

```
explicit shared-state(Sndr&& sndr);
```

13 *Effects*: Initializes *op_state* with the result of `connect(std::forward<Sndr>(sndr), split-receiver{this})`.

14 *Postconditions*: *waiting_states* is empty, and *completed* is false.

```
void start-op() noexcept;
```

15 *Effects*: Evaluates *inc-ref*(). If stop_src.stop_requested() is true, evaluates *notify*(); otherwise, evaluates start(*op_state*).

```
void notify() noexcept;
```

16 *Effects*: Atomically does the following:

(16.1) — Sets completed to true, and

(16.2) — Exchanges waiting_states with an empty list, storing the old value in a local prior_states.

Then, for each pointer p in prior_states, evaluates p->*notify*(). Finally, evaluates *dec-ref*().

```
void inc-ref() noexcept;
```

17 *Effects*: Increments *ref_count*.

```
void dec-ref() noexcept;
```

18 *Effects*: Decrements *ref_count*. If the new value of *ref_count* is 0, calls delete this.

19 *Synchronization*: If an evaluation of *dec-ref*() does not decrement the ref_count to 0 then synchronizes with the evaluation of dec-ref() that decrements ref_count to 0.

20 Let *split-impl-tag* be an empty exposition-only class type. Given an expression sndr, the expression split.transform_sender(sndr) is equivalent to:

```
auto&& [tag, _, child] = sndr;
auto* sh_state = new shared-state{std::forward_like<decltype((sndr))>(child)};
return make-sender(split-impl-tag(), shared-wrapper{sh_state, tag});
```

where *shared-wrapper* is an exposition-only class that manages the reference count of the *shared-state* object pointed to by sh_state. *shared-wrapper* models copyable with move operations nulling out the moved-from object, copy operations incrementing the reference count by calling sh_state->*inc-ref*(), and assignment operations performing a copy-and-swap operation. The destructor has no effect if sh_state is null; otherwise, it decrements the reference count by evaluating sh_state->*dec-ref*().

21 The exposition-only class template *impls-for* (33.9.1) is specialized for *split-impl-tag* as follows:

```
namespace std::execution {
  template<>
  struct impls-for<split-impl-tag> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto start = see below;
  };
}
```

22 The member *impls-for*<*split-impl-tag*>::*get-state* is initialized with a callable object equivalent to the following lambda expression:

```
[]<class Sndr>(Sndr&& sndr, auto& rcvr) noexcept {
  return local-state{std::forward<Sndr>(sndr), rcvr};
}
```

23 The member *impls-for*<*split-impl-tag*>::*start* is initialized with a callable object that has a function call operator equivalent to the following:

```
template<class Sndr, class Rcvr>
void operator()(local-state<Sndr, Rcvr>& state, Rcvr& rcvr) const noexcept;
```

Effects: If state.*sh_state*->*completed* is true, evaluates state.*notify*() and returns. Otherwise, does the following in order:

(23.1) — Evaluates

```
state.on_stop.emplace(
  get_stop_token(get_env(rcvr)),
  on-stop-request{state.sh_state->stop_src});
```

(23.2) — Then atomically does the following:

(23.2.1) — Reads the value c of state.*sh_state*->*completed*, and

(23.2.2) — Inserts `addressof(state)` into `state.`*`sh_state`*`->`*`waiting_states`* if `c` is `false`.

(23.3) — If `c` is `true`, calls `state.`*`notify`*`()` and returns.

(23.4) — Otherwise, if `addressof(state)` is the first item added to `state.`*`sh_state`*`->`*`waiting_states`*, evaluates `state.`*`sh_state`*`->`*`start-op`*`()`.

33.9.12.11 `execution::when_all` [exec.when.all]

1 `when_all` and `when_all_with_variant` both adapt multiple input senders into a sender that completes when all input senders have completed. `when_all` only accepts senders with a single value completion signature and on success concatenates all the input senders' value result datums into its own value completion operation. `when_all_with_variant(sndrs...)` is semantically equivalent to `when_all(into_variant(sndrs)...)`, where `sndrs` is a pack of subexpressions whose types model `sender`.

2 The names `when_all` and `when_all_with_variant` denote customization point objects. Let `sndrs` be a pack of subexpressions, let `Sndrs` be a pack of the types `decltype((sndrs))...`, and let `CD` be the type `common_type_t<decltype(`*`get-domain-early`*`(sndrs))...>`. The expressions `when_all(sndrs...)` and `when_all_with_variant(sndrs...)` are ill-formed if any of the following is `true`:

(2.1) — `sizeof...(sndrs)` is `0`, or

(2.2) — `(sender<Sndrs> && ...)` is `false`, or

(2.3) — `CD` is ill-formed.

3 The expression `when_all(sndrs...)` is expression-equivalent to:

```
transform_sender(CD(), make-sender(when_all, {}, sndrs...))
```

4 The exposition-only class template *`impls-for`* (33.9.1) is specialized for `when_all_t` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<when_all_t> : default-impls {
    static constexpr auto get-attrs = see below;
    static constexpr auto get-env = see below;
    static constexpr auto get-state = see below;
    static constexpr auto start = see below;
    static constexpr auto complete = see below;
  };
}
```

5 The member *`impls-for`*`<when_all_t>::`*`get-attrs`* is initialized with a callable object equivalent to the following lambda expression:

```
[](auto&&, auto&&... child) noexcept {
  if constexpr (same_as<CD, default_domain>) {
    return env<>();
  } else {
    return MAKE-ENV(get_domain, CD());
  }
}
```

6 The member *`impls-for`*`<when_all_t>::`*`get-env`* is initialized with a callable object equivalent to the following lambda expression:

```
[]<class State, class Rcvr>(auto&&, State& state, const Receiver& rcvr) noexcept {
  return see below;
}
```

Returns an object `e` such that

(6.1) — `decltype(e)` models *`queryable`*, and

(6.2) — `e.query(get_stop_token)` is expression-equivalent to `state.`*`stop-src`*`.get_token()`, and

(6.3) — given a query object `q` with type other than *cv* `stop_token_t`, `e.query(q)` is expression-equivalent to `get_env(rcvr).query(q)`.

7 The member *`impls-for`*`<when_all_t>::`*`get-state`* is initialized with a callable object equivalent to the following lambda expression:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(e) -> decltype(e) {
  return e;
}
```

where *e* is the expression

```
std::forward<Sndr>(sndr).apply(make-state<Rcvr>())
```

and where *make-state* is the following exposition-only class template:

```
template<class Sndr, class Env>
concept max-1-sender-in = sender_in<Sndr, Env> &&               // exposition only
  (tuple_size_v<value_types_of_t<Sndr, Env, tuple, tuple>> <= 1);

enum class disposition { started, error, stopped };              // exposition only

template<class Rcvr>
struct make-state {
  template<max-1-sender-in<env_of_t<Rcvr>>... Sndrs>
  auto operator()(auto, auto, Sndrs&&... sndrs) const {
    using values_tuple = see below;
    using errors_variant = see below;
    using stop_callback = stop_callback_for_t<stop_token_of_t<env_of_t<Rcvr>>, on-stop-request>;

    struct state-type {
      void arrive(Rcvr& rcvr) noexcept {                         // exposition only
        if (0 == --count) {
          complete(rcvr);
        }
      }

      void complete(Rcvr& rcvr) noexcept;                        // exposition only

      atomic<size_t> count{sizeof...(sndrs)};                    // exposition only
      inplace_stop_source stop_src{};                            // exposition only
      atomic<disposition> disp{disposition::started};            // exposition only
      errors_variant errors{};                                   // exposition only
      values_tuple values{};                                     // exposition only
      optional<stop_callback> on_stop{nullopt};                  // exposition only
    };

    return state-type{};
  }
};
```

8 Let *copy-fail* be `exception_ptr` if decay-copying any of the child senders' result datums can potentially throw; otherwise, *none-such*, where *none-such* is an unspecified empty class type.

9 The alias `values_tuple` denotes the type

```
tuple<value_types_of_t<Sndrs, env_of_t<Rcvr>, decayed-tuple, optional>...>
```

if that type is well-formed; otherwise, `tuple<>`.

10 The alias `errors_variant` denotes the type `variant<none-such, copy-fail, Es...>` with duplicate types removed, where `Es` is the pack of the decayed types of all the child senders' possible error result datums.

11 The member `void state-type::complete(Rcvr& rcvr) noexcept` behaves as follows:

(11.1) — If `disp` is equal to `disposition::started`, evaluates:

```
auto tie = []<class... T>(tuple<T...>& t) noexcept { return tuple<T&...>(t); };
auto set = [&](auto&... t) noexcept { set_value(std::move(rcvr), std::move(t)...); };

on_stop.reset();
apply(
  [&](auto&... opts) noexcept {
    apply(set, tuple_cat(tie(*opts)...));
  },
  values);
```

(11.2) — Otherwise, if `disp` is equal to *`disposition::error`*, evaluates:

```
on_stop.reset();
visit(
  [&]<class Error>(Error& error) noexcept {
    if constexpr (!same_as<Error, none-such>) {
      set_error(std::move(rcvr), std::move(error));
    }
  },
  errors);
```

(11.3) — Otherwise, evaluates:

```
on_stop.reset();
set_stopped(std::move(rcvr));
```

12 The member *`impls-for`*`<when_all_t>::`*`start`* is initialized with a callable object equivalent to the following lambda expression:

```
[]<class State, class Rcvr, class... Ops>(
    State& state, Rcvr& rcvr, Ops&... ops) noexcept -> void {
  state.on_stop.emplace(
    get_stop_token(get_env(rcvr)),
    on-stop-request{state.stop_src});
  if (state.stop_src.stop_requested()) {
    state.on_stop.reset();
    set_stopped(std::move(rcvr));
  } else {
    (start(ops), ...);
  }
}
```

13 The member *`impls-for<when_all_t>::complete`* is initialized with a callable object equivalent to the following lambda expression:

```
[]<class Index, class State, class Rcvr, class Set, class... Args>(
    this auto& complete, Index, State& state, Rcvr& rcvr, Set, Args&&... args) noexcept -> void {
  if constexpr (same_as<Set, set_error_t>) {
    if (disposition::error != state.disp.exchange(disposition::error)) {
      state.stop_src.request_stop();
      TRY-EMPLACE-ERROR(state.errors, std::forward<Args>(args)...);
    }
  } else if constexpr (same_as<Set, set_stopped_t>) {
    auto expected = disposition::started;
    if (state.disp.compare_exchange_strong(expected, disposition::stopped)) {
      state.stop_src.request_stop();
    }
  } else if constexpr (!same_as<decltype(State::values), tuple<>>) {
    if (state.disp == disposition::started) {
      auto& opt = get<Index::value>(state.values);
      TRY-EMPLACE-VALUE(complete, opt, std::forward<Args>(args)...);
    }
  }
  state.arrive(rcvr);
}
```

where *`TRY-EMPLACE-ERROR`*`(v, e)`, for subexpressions `v` and `e`, is equivalent to:

```
try {
  v.template emplace<decltype(auto(e))>(e);
} catch (...) {
  v.template emplace<exception_ptr>(current_exception());
}
```

if the expression `decltype(auto(e))(e)` is potentially throwing; otherwise, `v.template emplace<decltype(auto(e))>(e)`; and where *`TRY-EMPLACE-VALUE`*`(c, o, as...)`, for subexpressions `c`, `o`, and pack of subexpressions `as`, is equivalent to:

```
try {
  o.emplace(as...);
} catch (...) {
  c(Index(), state, rcvr, set_error, current_exception());
  return;
}
```

if the expression `decayed-tuple<decltype(as)...>{as...}` is potentially throwing; otherwise, `o.emplace(as...)`.

14 The expression `when_all_with_variant(sndrs...)` is expression-equivalent to:

```
transform_sender(CD(), make-sender(when_all_with_variant, {}, sndrs...));
```

15 Given subexpressions `sndr` and `env`, if `sender-for<decltype((sndr)), when_all_with_variant_t>` is `false`, then the expression `when_all_with_variant.transform_sender(sndr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, _, ...child] = sndr;
return when_all(into_variant(std::forward_like<decltype((sndr))>(child))...);
```

[*Note 1*: This causes the `when_all_with_variant(sndrs...)` sender to become `when_all(into_variant(sndrs)...)` when it is connected with a receiver whose execution domain does not customize `when_all_with_variant`. — *end note*]

33.9.12.12 `execution::into_variant` [exec.into.variant]

1 `into_variant` adapts a sender with multiple value completion signatures into a sender with just one value completion signature consisting of a `variant` of `tuple`s.

2 The name `into_variant` denotes a pipeable sender adaptor object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `Sndr` does not satisfy `sender`, `into_variant(sndr)` is ill-formed.

3 Otherwise, the expression `into_variant(sndr)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(into_variant, {}, sndr))
```

except that `sndr` is only evaluated once.

4 The exposition-only class template *`impls-for`* (33.9.1) is specialized for `into_variant` as follows:

```
namespace std::execution {
  template<>
  struct impls-for<into_variant_t> : default-impls {
    static constexpr auto get-state = see below;
    static constexpr auto complete = see below;
  };
}
```

5 The member *`impls-for`*`<into_variant_t>::`*`get-state`* is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept
  -> type_identity<value_types_of_t<child-type<Sndr>, env_of_t<Rcvr>>> {
  return {};
}
```

6 The member *`impls-for`*`<into_variant_t>::`*`complete`* is initialized with a callable object equivalent to the following lambda:

```
[]<class State, class Rcvr, class Tag, class... Args>(
    auto, State, Rcvr& rcvr, Tag, Args&&... args) noexcept -> void {
  if constexpr (same_as<Tag, set_value_t>) {
    using variant_type = typename State::type;
    TRY-SET-VALUE(rcvr, variant_type(decayed-tuple<Args...>{std::forward<Args>(args)...}));
  } else {
    Tag()(std::move(rcvr), std::forward<Args>(args)...);
  }
}
```

33.9.12.13 `execution::stopped_as_optional` [exec.stopped.opt]

1 `stopped_as_optional` maps a sender's stopped completion operation into a value completion operation as a disengaged `optional`. The sender's value completion operation is also converted into an `optional`. The

result is a sender that never completes with stopped, reporting cancellation by completing with a disengaged `optional`.

2 The name `stopped_as_optional` denotes a pipeable sender adaptor object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. The expression `stopped_as_optional(sndr)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(stopped_as_optional, {}, sndr))
```

except that `sndr` is only evaluated once.

3 Let `sndr` and `env` be subexpressions such that `Sndr` is `decltype((sndr))` and `Env` is `decltype((env))`. If *`sender-for`*`<Sndr, stopped_as_optional_t>` is `false`, or if the type *`single-sender-value-type`*`<Sndr, Env>` is ill-formed or `void`, then the expression `stopped_as_optional.transform_sender(sndr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, _, child] = sndr;
using V = single-sender-value-type<Sndr, Env>;
return let_stopped(
    then(std::forward_like<Sndr>(child),
         []<class... Ts>(Ts&&... ts) noexcept(is_nothrow_constructible_v<V, Ts...>) {
           return optional<V>(in_place, std::forward<Ts>(ts)...);
         }),
    []() noexcept { return just(optional<V>()); });
```

33.9.12.14 `execution::stopped_as_error` [exec.stopped.err]

1 `stopped_as_error` maps an input sender's stopped completion operation into an error completion operation as a custom error type. The result is a sender that never completes with stopped, reporting cancellation by completing with an error.

2 The name `stopped_as_error` denotes a pipeable sender adaptor object. For some subexpressions `sndr` and `err`, let `Sndr` be `decltype((sndr))` and let `Err` be `decltype((err))`. If the type `Sndr` does not satisfy `sender` or if the type `Err` does not satisfy *`movable-value`*, `stopped_as_error(sndr, err)` is ill-formed. Otherwise, the expression `stopped_as_error(sndr, err)` is expression-equivalent to:

```
transform_sender(get-domain-early(sndr), make-sender(stopped_as_error, err, sndr))
```

except that `sndr` is only evaluated once.

3 Let `sndr` and `env` be subexpressions such that `Sndr` is `decltype((sndr))` and `Env` is `decltype((env))`. If *`sender-for`*`<Sndr, stopped_as_error_t>` is `false`, then the expression `stopped_as_error.transform_-sender(sndr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, err, child] = sndr;
using E = decltype(auto(err));
return let_stopped(
    std::forward_like<Sndr>(child),
    [err = std::forward_like<Sndr>(err)]() mutable noexcept(is_nothrow_move_constructible_v<E>) {
      return just_error(std::move(err));
    });
```

33.9.13 Sender consumers [exec.consumers]

33.9.13.1 `this_thread::sync_wait` [exec.sync.wait]

1 `this_thread::sync_wait` and `this_thread::sync_wait_with_variant` are used to block the current thread of execution until the specified sender completes and to return its async result. `sync_wait` mandates that the input sender has exactly one value completion signature.

2 Let *`sync-wait-env`* be the following exposition-only class type:

```
namespace std::this_thread {
  struct sync-wait-env {
    execution::run_loop* loop;                                    // exposition only

    auto query(execution::get_scheduler_t) const noexcept {
      return loop->get_scheduler();
    }

    auto query(execution::get_delegation_scheduler_t) const noexcept {
      return loop->get_scheduler();
      }
    };
  }
```

3 Let *sync-wait-result-type* and *sync-wait-with-variant-result-type* be exposition-only alias templates defined as follows:

```
namespace std::this_thread {
  template<execution::sender_in<sync-wait-env> Sndr>
    using sync-wait-result-type =
      optional<execution::value_types_of_t<Sndr, sync-wait-env, decayed-tuple,
                type_identity_t>>;

  template<execution::sender_in<sync-wait-env> Sndr>
    using sync-wait-with-variant-result-type =
      optional<execution::value_types_of_t<Sndr, sync-wait-env>>;
}
```

4 The name `this_thread::sync_wait` denotes a customization point object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `sender_in<Sndr, sync-wait-env>` is `false`, the expression `this_thread::sync_wait(sndr)` is ill-formed. Otherwise, it is expression-equivalent to the following, except that `sndr` is evaluated only once:

```
apply_sender(get-domain-early(sndr), sync_wait, sndr)
```

Mandates:

(4.1) — The type `sync-wait-result-type<Sndr>` is well-formed.

(4.2) — `same_as<decltype(e), sync-wait-result-type<Sndr>>` is `true`, where *e* is the `apply_sender` expression above.

5 Let *sync-wait-state* and *sync-wait-receiver* be the following exposition-only class templates:

```
namespace std::this_thread {
  template<class Sndr>
  struct sync-wait-state {                                      // exposition only
    execution::run_loop loop;                                   // exposition only
    exception_ptr error;                                        // exposition only
    sync-wait-result-type<Sndr> result;                         // exposition only
  };

  template<class Sndr>
  struct sync-wait-receiver {                                   // exposition only
    using receiver_concept = execution::receiver_t;
    sync-wait-state<Sndr>* state;                               // exposition only

    template<class... Args>
    void set_value(Args&&... args) && noexcept;

    template<class Error>
    void set_error(Error&& err) && noexcept;

    void set_stopped() && noexcept;

    sync-wait-env get_env() const noexcept { return {&state->loop}; }
  };
}
```

```
template<class... Args>
void set_value(Args&&... args) && noexcept;
```

6 *Effects*: Equivalent to:

```
try {
  state->result.emplace(std::forward<Args>(args)...);
} catch (...) {
  state->error = current_exception();
}
state->loop.finish();
```

```
template<class Error>
void set_error(Error&& err) && noexcept;
```

7 *Effects*: Equivalent to:

```
state->error = AS-EXCEPT-PTR(std::forward<Error>(err));    // see 33.1
state->loop.finish();
```

```
void set_stopped() && noexcept;
```

8 *Effects*: Equivalent to `state->loop.finish()`.

9 For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `sender_to<Sndr, sync-wait-receiver<Sndr>>` is `false`, the expression `sync_wait.apply_sender(sndr)` is ill-formed; otherwise, it is equivalent to:

```
sync-wait-state<Sndr> state;
auto op = connect(sndr, sync-wait-receiver<Sndr>{&state});
start(op);

state.loop.run();
if (state.error) {
  rethrow_exception(std::move(state.error));
}
return std::move(state.result);
```

10 The behavior of `this_thread::sync_wait(sndr)` is undefined unless:

- (10.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.9.2.3) until the specified sender completes.

  [*Note 1*: The default implementation of `sync_wait` achieves forward progress guarantee delegation by providing a `run_loop` scheduler via the `get_delegation_scheduler` query on the *sync-wait-receiver*'s environment. The `run_loop` is driven by the current thread of execution. — *end note*]

- (10.2) — It returns the specified sender's async results as follows:
  - (10.2.1) — For a value completion, the result datums are returned in a `tuple` in an engaged `optional` object.
  - (10.2.2) — For an error completion, an exception is thrown.
  - (10.2.3) — For a stopped completion, a disengaged `optional` object is returned.

33.9.13.2 `this_thread::sync_wait_with_variant` [exec.sync.wait.var]

1 The name `this_thread::sync_wait_with_variant` denotes a customization point object. For a subexpression `sndr`, let `Sndr` be `decltype(into_variant(sndr))`. If `sender_in<Sndr, sync-wait-env>` is `false`, `this_thread::sync_wait_with_variant(sndr)` is ill-formed. Otherwise, it is expression-equivalent to the following, except `sndr` is evaluated only once:

```
apply_sender(get-domain-early(sndr), sync_wait_with_variant, sndr)
```

Mandates:

- (1.1) — The type `sync-wait-with-variant-result-type<Sndr>` is well-formed.
- (1.2) — `same_as<decltype(`*e*`), sync-wait-with-variant-result-type<Sndr>>` is `true`, where *e* is the `apply_sender` expression above.

2 If `callable<sync_wait_t, Sndr>` is `false`, the expression `sync_wait_with_variant.apply_sender(sndr)` is ill-formed. Otherwise, it is equivalent to:

```
using result_type = sync-wait-with-variant-result-type<Sndr>;
if (auto opt_value = sync_wait(into_variant(sndr))) {
  return result_type(std::move(get<0>(*opt_value)));
}
return result_type(nullopt);
```

3 The behavior of `this_thread::sync_wait_with_variant(sndr)` is undefined unless:

- (3.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.9.2.3) until the specified sender completes.

  [*Note 1*: The default implementation of `sync_wait_with_variant` achieves forward progress guarantee delegation by relying on the forward progress guarantee delegation provided by `sync_wait`. — *end note*]

(3.2) — It returns the specified sender's async results as follows:

(3.2.1) — For a value completion, the result datums are returned in an engaged `optional` object that contains a `variant` of `tuple`s.

(3.2.2) — For an error completion, an exception is thrown.

(3.2.3) — For a stopped completion, a disengaged `optional` object is returned.

33.10 Sender/receiver utilities [exec.util]

33.10.1 `execution::completion_signatures` [exec.util.cmplsig]

1 `completion_signatures` is a type that encodes a set of completion signatures (33.3).

2 [*Example 1*:

```
struct my_sender {
  using sender_concept = sender_t;
  using completion_signatures =
    execution::completion_signatures<
      set_value_t(),
      set_value_t(int, float),
      set_error_t(exception_ptr),
      set_error_t(error_code),
      set_stopped_t()>;
};
```

Declares `my_sender` to be a sender that can complete by calling one of the following for a receiver expression `rcvr`:

(2.1) — `set_value(rcvr)`

(2.2) — `set_value(rcvr, int{...}, float{...})`

(2.3) — `set_error(rcvr, exception_ptr{...})`

(2.4) — `set_error(rcvr, error_code{...})`

(2.5) — `set_stopped(rcvr)`

— *end example*]

3 This subclause makes use of the following exposition-only entities:

```
template<class Fn>
  concept completion-signature = see below;
```

4 A type `Fn` satisfies *`completion-signature`* if and only if it is a function type with one of the following forms:

(4.1) — `set_value_t(Vs...)`, where `Vs` is a pack of object or reference types.

(4.2) — `set_error_t(Err)`, where `Err` is an object or reference type.

(4.3) — `set_stopped_t()`

5
```
template<bool>
  struct indirect-meta-apply {
    template<template<class...> class T, class... As>
      using meta-apply = T<As...>;                               // exposition only
  };

template<class...>
  concept always-true = true;                                    // exposition only

template<class Tag,
         valid-completion-signatures Completions,
         template<class...> class Tuple,
         template<class...> class Variant>
  using gather-signatures = see below;
```

6 Let `Fns` be a pack of the arguments of the `completion_signatures` specialization named by `Completions`, let `TagFns` be a pack of the function types in `Fns` whose return types are `Tag`, and let `Ts`$_n$ be a pack of the function argument types in the n-th type in `TagFns`. Then, given two variadic templates `Tuple` and `Variant`, the type *`gather-signatures`*`<Tag, Completions, Tuple, Variant>` names the type

```
META-APPLY(Variant, META-APPLY(Tuple, Ts0...),
                    META-APPLY(Tuple, Ts1...),
                    ...,
                    META-APPLY(Tuple, Tsm-1...))
```

where m is the size of the pack `TagFns` and `META-APPLY(T, As...)` is equivalent to:

```
typename indirect-meta-apply<always-true<As...>>::template meta-apply<T, As...>
```

7 [*Note 1*: The purpose of *`META-APPLY`* is to make it valid to use non-variadic templates as `Variant` and `Tuple` arguments to *`gather-signatures`*. — *end note*]

8
```
namespace std::execution {
  template<completion-signature... Fns>
    struct completion_signatures {};

  template<class Sndr, class Env = env<>,
           template<class...> class Tuple = decayed-tuple,
           template<class...> class Variant = variant-or-empty>
      requires sender_in<Sndr, Env>
    using value_types_of_t =
      gather-signatures<set_value_t, completion_signatures_of_t<Sndr, Env>, Tuple, Variant>;

  template<class Sndr, class Env = env<>,
           template<class...> class Variant = variant-or-empty>
      requires sender_in<Sndr, Env>
    using error_types_of_t =
      gather-signatures<set_error_t, completion_signatures_of_t<Sndr, Env>,
                        type_identity_t, Variant>;

  template<class Sndr, class Env = env<>>
      requires sender_in<Sndr, Env>
    constexpr bool sends_stopped =
      !same_as<type-list<>,
               gather-signatures<set_stopped_t, completion_signatures_of_t<Sndr, Env>,
                                 type-list, type-list>>;
}
```

33.10.2 `execution::transform_completion_signatures` [exec.util.cmplsig.trans]

1 `transform_completion_signatures` is an alias template used to transform one set of completion signatures into another. It takes a set of completion signatures and several other template arguments that apply modifications to each completion signature in the set to generate a new specialization of `completion_signatures`.

2 [*Example 1*: Given a sender `Sndr` and an environment `Env`, adapt the completion signatures of `Sndr` by lvalue-ref qualifying the values, adding an additional `exception_ptr` error completion if it is not already there, and leaving the other completion signatures alone.

```
template<class... Args>
  using my_set_value_t =
    completion_signatures<
      set_value_t(add_lvalue_reference_t<Args>...)>;

using my_completion_signatures =
  transform_completion_signatures<
    completion_signatures_of_t<Sndr, Env>,
    completion_signatures<set_error_t(exception_ptr)>,
    my_set_value_t>;
```

— *end example*]

3 This subclause makes use of the following exposition-only entities:

```
template<class... As>
  using default-set-value =
    completion_signatures<set_value_t(As...)>;
```

```
template<class Err>
  using default-set-error =
    completion_signatures<set_error_t(Err)>;
```

4
```
namespace std::execution {
  template<valid-completion-signatures InputSignatures,
           valid-completion-signatures AdditionalSignatures = completion_signatures<>,
           template<class...> class SetValue = default-set-value,
           template<class> class SetError = default-set-error,
           valid-completion-signatures SetStopped = completion_signatures<set_stopped_t()>>
  using transform_completion_signatures = completion_signatures<see below>;
}
```

5 `SetValue` shall name an alias template such that for any pack of types `As`, the type `SetValue<As...>` is either ill-formed or else *`valid-completion-signatures`*`<SetValue<As...>>` is satisfied. `SetError` shall name an alias template such that for any type `Err`, `SetError<Err>` is either ill-formed or else *`valid-completion-signatures`*`<SetError<Err>>` is satisfied.

6 Let `Vs` be a pack of the types in the *`type-list`* named by *`gather-signatures`*`<set_value_t, InputSignatures, SetValue,` *`type-list`*`>`.

7 Let `Es` be a pack of the types in the *`type-list`* named by *`gather-signatures`*`<set_error_t, InputSignatures, type_identity_t,` *`error-list`*`>`, where *`error-list`* is an alias template such that *`error-list`*`<Ts...>` is *`type-list`*`<SetError<Ts>...>`.

8 Let `Ss` name the type `completion_signatures<>` if *`gather-signatures`*`<set_stopped_t, InputSignatures,` *`type-list`*`,` *`type-list`*`>` is an alias for the type *`type-list`*`<>`; otherwise, `SetStopped`.

9 If any of the above types are ill-formed, then

```
transform_completion_signatures<InputSignatures, AdditionalSignatures,
                                SetValue, SetError, SetStopped>
```

is ill-formed. Otherwise,

```
transform_completion_signatures<InputSignatures, AdditionalSignatures,
                                SetValue, SetError, SetStopped>
```

is the type `completion_signatures<Sigs...>` where `Sigs...` is the unique set of types in all the template arguments of all the `completion_signatures` specializations in the set `AdditionalSignatures`, `Vs...`, `Es...`, `Ss`.

33.11 Queryable utilities [exec.envs]

33.11.1 Class template prop [exec.prop]

```
namespace std::execution {
  template<class QueryTag, class ValueType>
  struct prop {
    QueryTag query_;            // exposition only
    ValueType value_;           // exposition only

    constexpr const ValueType& query(QueryTag) const noexcept {
      return value_;
    }
  };

  template<class QueryTag, class ValueType>
    prop(QueryTag, ValueType) -> prop<QueryTag, unwrap_reference_t<ValueType>>;
}
```

1 Class template `prop` is for building a queryable object from a query object and a value.

2 *Mandates*: *`callable`*`<QueryTag,` *`prop-like`*`<ValueType>>` is modeled, where *`prop-like`* is the following exposition-only class template:

```
template<class ValueType>
struct prop-like {              // exposition only
  const ValueType& query(auto) const noexcept;
};
```

3 [*Example 1*:

```
template<sender Sndr>
sender auto parameterize_work(Sndr sndr) {
  // Make an environment such that get_allocator(env) returns a reference to a copy of my_alloc{}.
  auto e = prop(get_allocator, my_alloc{});

  // Parameterize the input sender so that it will use our custom execution environment.
  return write_env(sndr, e);
}
```

— *end example*]

4 Specializations of `prop` are not assignable.

33.11.2 Class template `env` [exec.env]

```
namespace std::execution {
  template<queryable... Envs>
  struct env {
    Envs₀ envs₀;                // exposition only
    Envs₁ envs₁;                // exposition only
      ⋮
    Envsₙ₋₁ envsₙ₋₁;            // exposition only

    template<class QueryTag>
      constexpr decltype(auto) query(QueryTag q) const noexcept(see below);
  };

  template<class... Envs>
    env(Envs...) -> env<unwrap_reference_t<Envs>...>;
}
```

1 The class template `env` is used to construct a queryable object from several queryable objects. Query invocations on the resulting object are resolved by attempting to query each subobject in lexical order.

2 Specializations of `env` are not assignable.

3 It is unspecified whether `env` supports initialization using a parenthesized *expression-list* (9.5), unless the *expression-list* consist of a single element of type (possibly const) `env`.

4 [*Example 1*:

```
template<sender Sndr>
sender auto parameterize_work(Sndr sndr) {
  // Make an environment such that:
  // get_allocator(env) returns a reference to a copy of my_alloc{}
  // get_scheduler(env) returns a reference to a copy of my_sched{}
  auto e = env{prop(get_allocator, my_alloc{}),
               prop(get_scheduler, my_sched{})};

  // Parameterize the input sender so that it will use our custom execution environment.
  return write_env(sndr, e);
}
```

— *end example*]

```
template<class QueryTag>
constexpr decltype(auto) query(QueryTag q) const noexcept(see below);
```

5 Let *`has-query`* be the following exposition-only concept:

```
template<class Env, class QueryTag>
  concept has-query =                    // exposition only
    requires (const Env& env) {
      env.query(QueryTag());
    };
```

6 Let *`fe`* be the first element of $envs_0$, $envs_1$, ..., $envs_{n-1}$ such that the expression *`fe`*`.query(q)` is well-formed.

7 *Constraints*: `(has-query<Envs, QueryTag> || ...)` is `true`.

8 *Effects*: Equivalent to: `return fe.query(q);`

9 *Remarks*: The expression in the `noexcept` clause is equivalent to `noexcept(fe.query(q))`.

33.12 Execution contexts [exec.ctx]

33.12.1 `execution::run_loop` [exec.run.loop]

33.12.1.1 General [exec.run.loop.general]

1 A `run_loop` is an execution resource on which work can be scheduled. It maintains a thread-safe first-in-first-out queue of work. Its `run` member function removes elements from the queue and executes them in a loop on the thread of execution that calls `run`.

2 A `run_loop` instance has an associated *count* that corresponds to the number of work items that are in its queue. Additionally, a `run_loop` instance has an associated state that can be one of *starting*, *running*, *finishing*, or *finished*.

3 Concurrent invocations of the member functions of `run_loop` other than `run` and its destructor do not introduce data races. The member functions *`pop-front`*, *`push-back`*, and `finish` execute atomically.

4 *Recommended practice*: Implementations should use an intrusive queue of operation states to hold the work units to make scheduling allocation-free.

```
namespace std::execution {
  class run_loop {
    // 33.12.1.2, associated types
    class run-loop-scheduler;                               // exposition only
    class run-loop-sender;                                  // exposition only
    struct run-loop-opstate-base {                          // exposition only
      virtual void execute() = 0;                           // exposition only
      run_loop* loop;                                       // exposition only
      run-loop-opstate-base* next;                          // exposition only
    };
    template<class Rcvr>
      using run-loop-opstate = unspecified;                 // exposition only

    // 33.12.1.4, member functions
    run-loop-opstate-base* pop-front();                     // exposition only
    void push-back(run-loop-opstate-base*);                 // exposition only

  public:
    // 33.12.1.3, constructor and destructor
    run_loop() noexcept;
    run_loop(run_loop&&) = delete;
    ~run_loop();

    // 33.12.1.4, member functions
    run-loop-scheduler get_scheduler();
    void run();
    void finish();
  };
}
```

33.12.1.2 Associated types [exec.run.loop.types]

```
class run-loop-scheduler;
```

1 *`run-loop-scheduler`* is an unspecified type that models `scheduler`.

2 Instances of *`run-loop-scheduler`* remain valid until the end of the lifetime of the `run_loop` instance from which they were obtained.

3 Two instances of *`run-loop-scheduler`* compare equal if and only if they were obtained from the same `run_loop` instance.

4 Let *`sch`* be an expression of type *`run-loop-scheduler`*. The expression `schedule(sch)` has type *`run-loop-sender`* and is not potentially-throwing if *`sch`* is not potentially-throwing.

```
class run-loop-sender;
```

5 *run-loop-sender* is an exposition-only type that satisfies `sender`. For any type `Env`, `completion_-signatures_of_t<`*run-loop-sender*`, Env>` is

```
  completion_signatures<set_value_t(), set_error_t(exception_ptr), set_stopped_t()>
```

6 An instance of *run-loop-sender* remains valid until the end of the lifetime of its associated `run_loop` instance.

7 Let *sndr* be an expression of type *run-loop-sender*, let *rcvr* be an expression such that `receiver_-of<decltype((`*rcvr*`)), CS>` is `true` where `CS` is the `completion_signatures` specialization above. Let `C` be either `set_value_t` or `set_stopped_t`. Then:

(7.1) — The expression `connect(`*sndr*`, `*rcvr*`)` has type *run-loop-opstate*`<decay_t<decltype((`*rcvr*`))>>` and is potentially-throwing if and only if `(void(`*sndr*`), auto(`*rcvr*`))` is potentially-throwing.

(7.2) — The expression `get_completion_scheduler<C>(get_env(`*sndr*`))` is potentially-throwing if and only if *sndr* is potentially-throwing, has type *run-loop-scheduler*, and compares equal to the *run-loop-scheduler* instance from which *sndr* was obtained.

```
template<class Rcvr>
  struct run-loop-opstate;
```

8 *run-loop-opstate*`<Rcvr>` inherits privately and unambiguously from *run-loop-opstate-base*.

9 Let *o* be a non-const lvalue of type *run-loop-opstate*`<Rcvr>`, and let `REC(`*o*`)` be a non-const lvalue reference to an instance of type `Rcvr` that was initialized with the expression *rcvr* passed to the invocation of connect that returned *o*. Then:

(9.1) — The object to which *REC*`(`*o*`)` refers remains valid for the lifetime of the object to which *o* refers.

(9.2) — The type *run-loop-opstate*`<Rcvr>` overrides *run-loop-opstate-base*`::`*execute*`()` such that *o*`.`*execute*`()` is equivalent to:

```
    if (get_stop_token(REC(o)).stop_requested()) {
      set_stopped(std::move(REC(o)));
    } else {
      set_value(std::move(REC(o)));
    }
```

(9.3) — The expression `start(`*o*`)` is equivalent to:

```
    try {
      o.loop->push-back(addressof(o));
    } catch(...) {
      set_error(std::move(REC(o)), current_exception());
    }
```

33.12.1.3 Constructor and destructor [exec.run.loop.ctor]

```
run_loop() noexcept;
```

1 *Postconditions*: *count* is `0` and *state* is *starting*.

```
~run_loop();
```

2 *Effects*: If *count* is not `0` or if *state* is *running*, invokes `terminate` (14.6.2). Otherwise, has no effects.

33.12.1.4 Member functions [exec.run.loop.members]

```
run-loop-opstate-base* pop-front();
```

1 *Effects*: Blocks (3.6) until one of the following conditions is `true`:

(1.1) — *count* is `0` and *state* is *finishing*, in which case *pop-front* sets *state* to *finished* and returns `nullptr`; or

(1.2) — *count* is greater than `0`, in which case an item is removed from the front of the queue, *count* is decremented by `1`, and the removed item is returned.

```
void push-back(run-loop-opstate-base* item);
```

2 *Effects*: Adds `item` to the back of the queue and increments *`count`* by `1`.

3 *Synchronization*: This operation synchronizes with the *`pop-front`* operation that obtains `item`.

```
run-loop-scheduler get_scheduler();
```

4 *Returns*: An instance of *`run-loop-scheduler`* that can be used to schedule work onto this `run_loop` instance.

```
void run();
```

5 *Preconditions*: *`state`* is either *`starting`* or *`finishing`*.

6 *Effects*: If *`state`* is *`starting`*, sets the *`state`* to *`running`*, otherwise leaves *`state`* unchanged. Then, equivalent to:

```
while (auto* op = pop-front()) {
  op->execute();
}
```

7 *Remarks*: When *`state`* changes, it does so without introducing data races.

```
void finish();
```

8 *Preconditions*: *`state`* is either *`starting`* or *`running`*.

9 *Effects*: Changes *`state`* to *`finishing`*.

10 *Synchronization*: `finish` synchronizes with the *`pop-front`* operation that returns `nullptr`.

33.13 Coroutine utilities [exec.coro.util]

33.13.1 `execution::as_awaitable` [exec.as.awaitable]

1 `as_awaitable` transforms an object into one that is awaitable within a particular coroutine. Subclause 33.13 makes use of the following exposition-only entities:

```
namespace std::execution {
  template<class Sndr, class Promise>
    concept awaitable-sender =
      single-sender<Sndr, env_of_t<Promise>> &&
      sender_to<Sndr, awaitable-receiver> &&    // see below
      requires (Promise& p) {
        { p.unhandled_stopped() } -> convertible_to<coroutine_handle<>>;
      };

  template<class Sndr, class Promise>
    class sender-awaitable;                                 // exposition only
}
```

2 The type *`sender-awaitable`*`<Sndr, Promise>` is equivalent to:

```
namespace std::execution {
  template<class Sndr, class Promise>
  class sender-awaitable {
    struct unit {};                                         // exposition only
    using value-type =                                      // exposition only
      single-sender-value-type<Sndr, env_of_t<Promise>>;
    using result-type =                                     // exposition only
      conditional_t<is_void_v<value-type>, unit, value-type>;
    struct awaitable-receiver;                              // exposition only

    variant<monostate, result-type, exception_ptr> result{};    // exposition only
    connect_result_t<Sndr, awaitable-receiver> state;           // exposition only

  public:
    sender-awaitable(Sndr&& sndr, Promise& p);
    static constexpr bool await_ready() noexcept { return false; }
    void await_suspend(coroutine_handle<Promise>) noexcept { start(state); }
    value-type await_resume();
    };
  }
```

3 *awaitable-receiver* is equivalent to:

```
struct awaitable-receiver {
  using receiver_concept = receiver_t;
  variant<monostate, result-type, exception_ptr>* result-ptr;    // exposition only
  coroutine_handle<Promise> continuation;                        // exposition only
  // see below
};
```

4 Let `rcvr` be an rvalue expression of type *awaitable-receiver*, let `crcvr` be a const lvalue that refers to `rcvr`, let `vs` be a pack of subexpressions, and let `err` be an expression of type `Err`. Then:

(4.1) — If `constructible_from<result-type, decltype((vs))...>` is satisfied, the expression `set_value(rcvr, vs...)` is equivalent to:

```
try {
  rcvr.result-ptr->template emplace<1>(vs...);
} catch(...) {
  rcvr.result-ptr->template emplace<2>(current_exception());
}
rcvr.continuation.resume();
```

Otherwise, `set_value(rcvr, vs...)` is ill-formed.

(4.2) — The expression `set_error(rcvr, err)` is equivalent to:

```
rcvr.result-ptr->template emplace<2>(AS-EXCEPT-PTR(err));     // see 33.1
rcvr.continuation.resume();
```

(4.3) — The expression `set_stopped(rcvr)` is equivalent to:

```
static_cast<coroutine_handle<>>(rcvr.continuation.promise().unhandled_stopped()).resume();
```

(4.4) — For any expression `tag` whose type satisfies *forwarding-query* and for any pack of subexpressions `as`, `get_env(crcvr).query(tag, as...)` is expression-equivalent to:

```
tag(get_env(as_const(crcvr.continuation.promise())), as...)
```

```
sender-awaitable(Sndr&& sndr, Promise& p);
```

5 *Effects*: Initializes *state* with

```
connect(std::forward<Sndr>(sndr),
        awaitable-receiver{addressof(result), coroutine_handle<Promise>::from_promise(p)})
```

```
value-type await_resume();
```

6 *Effects*: Equivalent to:

```
if (result.index() == 2)
  rethrow_exception(get<2>(result));
if constexpr (!is_void_v<value-type>)
  return std::forward<value-type>(get<1>(result));
```

7 `as_awaitable` is a customization point object. For subexpressions `expr` and `p` where `p` is an lvalue, `Expr` names the type `decltype((expr))` and `Promise` names the type `decay_t<decltype((p))>`, `as_awaitable(expr, p)` is expression-equivalent to, except that the evaluations of `expr` and `p` are indeterminately sequenced:

(7.1) — `expr.as_awaitable(p)` if that expression is well-formed.

Mandates: *is-awaitable*`<A, Promise>` is `true`, where `A` is the type of the expression above.

(7.2) — Otherwise, `(void(p), expr)` if *is-awaitable*`<Expr, U>` is `true`, where `U` is an unspecified class type that is not `Promise` and that lacks a member named `await_transform`.

Preconditions: *is-awaitable*`<Expr, Promise>` is `true` and the expression `co_await expr` in a coroutine with promise type `U` is expression-equivalent to the same expression in a coroutine with promise type `Promise`.

(7.3) — Otherwise, *sender-awaitable*`{expr, p}` if *awaitable-sender*`<Expr, Promise>` is `true`.

(7.4) — Otherwise, `(void(p), expr)`.

33.13.2 `execution::with_awaitable_senders` [exec.with.awaitable.senders]

1 `with_awaitable_senders`, when used as the base class of a coroutine promise type, makes senders awaitable in that coroutine type.

In addition, it provides a default implementation of `unhandled_stopped` such that if a sender completes by calling `set_stopped`, it is treated as if an uncatchable "stopped" exception were thrown from the *await-expression*.

[*Note 1*: The coroutine is never resumed, and the `unhandled_stopped` of the coroutine caller's promise type is called. — *end note*]

```
namespace std::execution {
  template<class-type Promise>
    struct with_awaitable_senders {
      template<class OtherPromise>
        requires (!same_as<OtherPromise, void>)
      void set_continuation(coroutine_handle<OtherPromise> h) noexcept;

      coroutine_handle<> continuation() const noexcept { return continuation; }

      coroutine_handle<> unhandled_stopped() noexcept {
        return stopped-handler(continuation.address());
      }

      template<class Value>
      see below await_transform(Value&& value);

    private:
      [[noreturn]] static coroutine_handle<>
        default-unhandled-stopped(void*) noexcept {             // exposition only
        terminate();
      }
      coroutine_handle<> continuation{};                        // exposition only
      coroutine_handle<> (*stopped-handler)(void*) noexcept =   // exposition only
        &default-unhandled-stopped;
    };
}
```

```
template<class OtherPromise>
  requires (!same_as<OtherPromise, void>)
void set_continuation(coroutine_handle<OtherPromise> h) noexcept;
```

2 *Effects*: Equivalent to:

```
continuation = h;
if constexpr ( requires(OtherPromise& other) { other.unhandled_stopped(); } ) {
  stopped-handler = [](void* p) noexcept -> coroutine_handle<> {
    return coroutine_handle<OtherPromise>::from_address(p)
      .promise().unhandled_stopped();
  };
} else {
  stopped-handler = &default-unhandled-stopped;
}
```

```
template<class Value>
call-result-t<as_awaitable_t, Value, Promise&> await_transform(Value&& value);
```

3 *Effects*: Equivalent to:

```
return as_awaitable(std::forward<Value>(value), static_cast<Promise&>(*this));
```

Annex A (informative) Grammar summary [gram]

A.1 General [gram.general]

1 This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.10, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords [gram.key]

1 New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.9.2), class (Clause 11), enumeration (9.8.1), and `template` (Clause 13) declarations.

typedef-name:
 identifier
 simple-template-id

namespace-name:
 identifier
 namespace-alias

namespace-alias:
 identifier

class-name:
 identifier
 simple-template-id

  type-constraint *identifier*$_{opt}$ `=` *type-id*

type-parameter-key:
  `class`
  `typename`

type-constraint:
  nested-name-specifier$_{opt}$ *concept-name*
  nested-name-specifier$_{opt}$ *concept-name* `<` *template-argument-list*$_{opt}$ `>`

type-tt-parameter:
  template-head type-parameter-key `...`$_{opt}$ *identifier*$_{opt}$
  template-head type-parameter-key *identifier*$_{opt}$ *type-tt-parameter-default*

type-tt-parameter-default:
  `=` *nested-name-specifier*$_{opt}$ *template-name*
  `=` *nested-name-specifier* `template` *template-name*

variable-tt-parameter:
  template-head `auto` `...`$_{opt}$ *identifier*$_{opt}$
  template-head `auto` *identifier*$_{opt}$ `=` *nested-name-specifier*$_{opt}$ *template-name*

concept-tt-parameter:
  `template` `<` *template-parameter-list* `>` `concept` `...`$_{opt}$ *identifier*$_{opt}$
  `template` `<` *template-parameter-list* `>` `concept` *identifier*$_{opt}$ `=` *nested-name-specifier*$_{opt}$ *template-name*

simple-template-id:
  template-name `<` *template-argument-list*$_{opt}$ `>`

template-id:
  simple-template-id
  operator-function-id `<` *template-argument-list*$_{opt}$ `>`
  literal-operator-id `<` *template-argument-list*$_{opt}$ `>`

template-name:
  identifier

template-argument-list:
  template-argument `...`$_{opt}$
  template-argument-list `,` *template-argument* `...`$_{opt}$

template-argument:
  constant-expression
  type-id
  nested-name-specifier$_{opt}$ *template-name*
  nested-name-specifier `template` *template-name*

constraint-expression:
  logical-or-expression

deduction-guide:
  explicit-specifier$_{opt}$ *template-name* `(` *parameter-declaration-clause* `)` `->` *simple-template-id requires-clause*$_{opt}$ `;`

concept-definition:
  `concept` *concept-name attribute-specifier-seq*$_{opt}$ `=` *constraint-expression* `;`

concept-name:
  identifier

typename-specifier:
  `typename` *nested-name-specifier identifier*
  `typename` *nested-name-specifier* `template`$_{opt}$ *simple-template-id*

explicit-instantiation:
  `extern`$_{opt}$ `template` *declaration*

explicit-specialization:
  `template < >` *declaration*

A.12 Exception handling [gram.except]

try-block:
  `try` *compound-statement handler-seq*

function-try-block:
  `try` *ctor-initializer*$_{opt}$ *compound-statement handler-seq*

handler-seq:
  handler handler-seq$_{opt}$

handler:
  `catch (` *exception-declaration* `)` *compound-statement*

exception-declaration:
  attribute-specifier-seq$_{opt}$ *type-specifier-seq declarator*
  attribute-specifier-seq$_{opt}$ *type-specifier-seq abstract-declarator*$_{opt}$
  `...`

noexcept-specifier:
  `noexcept (` *constant-expression* `)`
  `noexcept`

A.13 Preprocessing directives [gram.cpp]

preprocessing-file:
  group$_{opt}$
  module-file

module-file:
  pp-global-module-fragment$_{opt}$ *pp-module group*$_{opt}$ *pp-private-module-fragment*$_{opt}$

pp-global-module-fragment:
  `module ;` *new-line group*$_{opt}$

pp-private-module-fragment:
  `module : private ;` *new-line group*$_{opt}$

group:
  group-part
  group group-part

group-part:
  control-line
  if-section
  text-line
  `#` *conditionally-supported-directive*

control-line:
  `# include` *pp-tokens new-line*
  pp-import
  `# embed` *pp-tokens new-line*
  `# define` *identifier replacement-list new-line*
  `# define` *identifier lparen identifier-list*$_{opt}$ `)` *replacement-list new-line*
  `# define` *identifier lparen* `... )` *replacement-list new-line*
  `# define` *identifier lparen identifier-list* `, ... )` *replacement-list new-line*
  `# undef` *identifier new-line*
  `# line` *pp-tokens new-line*
  `# error` *pp-tokens*$_{opt}$ *new-line*
  `# warning` *pp-tokens*$_{opt}$ *new-line*
  `# pragma` *pp-tokens*$_{opt}$ *new-line*
  `#` *new-line*

if-section:
  if-group elif-groups$_{opt}$ *else-group*$_{opt}$ *endif-line*

if-group:
  `# if` *constant-expression new-line group*$_{opt}$
  `# ifdef` *identifier new-line group*$_{opt}$
  `# ifndef` *identifier new-line group*$_{opt}$

elif-groups:
  elif-group elif-groups$_{opt}$

elif-group:
  `# elif` *constant-expression new-line group*$_{opt}$
  `# elifdef` *identifier new-line group*$_{opt}$
  `# elifndef` *identifier new-line group*$_{opt}$

else-group:
  `# else` *new-line group*$_{opt}$

endif-line:
  `# endif` *new-line*

text-line:
  pp-tokens$_{opt}$ *new-line*

conditionally-supported-directive:
  pp-tokens new-line

lparen:
  a `(` character not immediately preceded by whitespace

identifier-list:
  identifier
  identifier-list `,` *identifier*

replacement-list:
  pp-tokens$_{opt}$

pp-tokens:
  preprocessing-token pp-tokens$_{opt}$

embed-parameter-seq:
  embed-parameter embed-parameter-seq$_{opt}$

embed-parameter:
  embed-standard-parameter
  embed-prefixed-parameter

embed-standard-parameter:
  `limit (` *pp-balanced-token-seq* `)`
  `prefix (` *pp-balanced-token-seq*$_{opt}$ `)`
  `suffix (` *pp-balanced-token-seq*$_{opt}$ `)`
  `if_empty (` *pp-balanced-token-seq*$_{opt}$ `)`

embed-prefixed-parameter:
  identifier :: *identifier*
  identifier :: *identifier* `(` *pp-balanced-token-seq*$_{opt}$ `)`

pp-balanced-token-seq:
    pp-balanced-token pp-balanced-token-seq$_{opt}$

pp-balanced-token:
    `(` *pp-balanced-token-seq*$_{opt}$ `)`
    `[` *pp-balanced-token-seq*$_{opt}$ `]`
    `{` *pp-balanced-token-seq*$_{opt}$ `}`
    any *pp-token* except:
        parenthesis (U+0028 LEFT PARENTHESIS and U+0029 RIGHT PARENTHESIS),
        bracket (U+005B LEFT SQUARE BRACKET and U+005D RIGHT SQUARE BRACKET), or
        brace (U+007B LEFT CURLY BRACKET and U+007D RIGHT CURLY BRACKET).

new-line:
    the new-line character

defined-macro-expression:
    `defined` *identifier*
    `defined (` *identifier* `)`

h-preprocessing-token:
    any *preprocessing-token* other than `>`

h-pp-tokens:
    h-preprocessing-token h-pp-tokens$_{opt}$

header-name-tokens:
    string-literal
    `<` *h-pp-tokens* `>`

has-include-expression:
    `__has_include (` *header-name* `)`
    `__has_include (` *header-name-tokens* `)`

has-embed-expression:
    `__has_embed (` *pp-balanced-token-seq* `)`

va-opt-replacement:
    `__VA_OPT__ (` *pp-tokens*$_{opt}$ `)`

Annex B
(informative)

Implementation quantities [implimits]

1 Implementations can exhibit limitations for various quantities; some possibilities are presented in the following list. The bracketed number following each quantity is a potential minimum value for that quantity.

(1.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].

(1.2) — Nesting levels of conditional inclusion (15.2) [256].

(1.3) — Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].

(1.4) — Nesting levels of parenthesized expressions (7.5.4) within a full-expression [256].

(1.5) — Number of characters in an internal identifier (5.11) or macro name (15.7) [1 024].

(1.6) — Number of characters in an external identifier (5.11, 6.6) [1 024].

(1.7) — External identifiers (6.6) in one translation unit [65 536].

(1.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].

(1.9) — Structured bindings (9.7) introduced in one declaration [256].

(1.10) — Macro identifiers (15.7) simultaneously defined in one translation unit [65 536].

(1.11) — Parameters in one function definition (9.6.1) [256].

(1.12) — Arguments in one function call (7.6.1.3) [256].

(1.13) — Parameters in one macro definition (15.7) [256].

(1.14) — Arguments in one macro invocation (15.7) [256].

(1.15) — Characters in one logical source line (5.2) [65 536].

(1.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].

(1.17) — Size of an object (6.7.2) [262 144].

(1.18) — Nesting levels for `#include` files (15.3) [256].

(1.19) — Case labels for a `switch` statement (8.5.3) (excluding those for any nested `switch` statements) [16 384].

(1.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].

(1.21) — Lambda-captures in one *lambda-expression* (7.5.6.3) [256].

(1.22) — Enumeration constants in a single enumeration (9.8.1) [4 096].

(1.23) — Levels of nested class definitions (11.4.12) in a single *member-specification* [256].

(1.24) — Functions registered by `atexit()` (17.5) [32].

(1.25) — Functions registered by `at_quick_exit()` (17.5) [32].

(1.26) — Direct and indirect base classes (11.7) [16 384].

(1.27) — Direct base classes for a single class (11.7) [1 024].

(1.28) — Class members declared in a single *member-specification* (including member functions) (11.4) [4 096].

(1.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].

(1.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].

(1.31) — Static data members of a class (11.4.9.3) [1 024].

(1.32) — Friend declarations in a class (11.8.4) [4 096].

(1.33) — Access control declarations in a class (11.8.2) [4 096].

(1.34) — Member initializers in a constructor definition (11.9.3) [6 144].

(1.35) — *initializer-clause*s in one *braced-init-list* (9.5) [16 384].

(1.36) — Scope qualifications of one identifier (7.5.5.3) [256].

(1.37) — Nested *linkage-specification*s (9.12) [1 024].

(1.38) — Recursive constexpr function invocations (9.2.6) [512].

(1.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].

(1.40) — Template parameters in a template declaration (13.2) [1 024].

(1.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].

(1.42) — Handlers per try block (14.4) [256].

(1.43) — Number of placeholders (22.10.15.5) [10].

(1.44) — Number of hazard-protectable possibly-reclaimable objects (32.11.3.1) [256].

Annex C
(informative)

Compatibility [diff]

C.1 C++ and ISO C++ 2023 [diff.cpp23]

C.1.1 General [diff.cpp23.general]

1 Subclause C.1 lists the differences between C++ and ISO C++ 2023, by the chapters of this document.

C.1.2 Clause 5: Lexical conventions [diff.cpp23.lex]

1 **Affected subclause:** 5.12
Change: New keywords.
Rationale: Required for new features.

(1.1) — The `contract_assert` keyword is added to introduce a contract assertion through an *assertion-statement* (8.8).

Effect on original feature: Valid C++ 2023 code using `contract_assert` as an identifier is not valid in this revision of C++.

C.1.3 Clause 7: expressions [diff.cpp23.expr]

1 **Affected subclause:** 7.4
Change: Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are no longer valid.
Rationale: Reinforcing type safety.
Effect on original feature: A valid C++ 2023 program that performs operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type is ill-formed.

[*Example 1*:

```
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7;       // ill-formed; previously well-formed
int  k = f - e;          // ill-formed; previously well-formed
auto x = true ? e : f;   // ill-formed; previously well-formed
```

— *end example*]

2 **Affected subclauses:** 7.6.9 and 7.6.10
Change: Comparing two objects of array type is no longer valid.
Rationale: The old behavior was confusing since it compared not the contents of the two arrays, but their addresses.
Effect on original feature: A valid C++ 2023 program directly comparing two array objects is rejected as ill-formed in this document.

[*Example 2*:

```
int arr1[5];
int arr2[5];
bool same = arr1 == arr2;        // ill-formed; previously well-formed
bool idem = arr1 == +arr2;       // compare addresses
bool less = arr1 < +arr2;        // compare addresses, unspecified result
```

— *end example*]

3 **Affected subclause:** 7.6.2.9
Change: Calling `delete` on a pointer to an incomplete class is ill-formed.
Rationale: Reduce undefined behavior.

Effect on original feature: A valid C++ 2023 program that calls `delete` on an incomplete class type is ill-formed.

[*Example 3*:

```
struct S;

void f(S *p) {
  delete p;                // ill-formed; previously well-formed
}

struct S {};
```

— end example]

C.1.4 Clause 9: declarations [diff.cpp23.dcl.dcl]

1 **Affected subclause:** 9.3.1
Change: Introduction of `trivially_relocatable_if_eligible` and `replaceable_if_eligible` as identifiers with special meaning (5.11).
Rationale: Support declaration of trivially relocatable and replaceable types (11.2).
Effect on original feature: Valid C++ 2023 code can become ill-formed.

[*Example 1*:

```
struct C {};
struct C replaceable_if_eligible {};     // was well-formed (new variable replaceable_if_eligible)
                                         // now ill-formed (redefines C)
```

— end example]

2 **Affected subclause:** 9.5.5
Change: Pointer comparisons between `initializer_list` objects' backing arrays are unspecified.
Rationale: Permit the implementation to store backing arrays in static read-only memory.
Effect on original feature: Valid C++ 2023 code that relies on the result of pointer comparison between backing arrays may change behavior.

[*Example 2*:

```
bool ne(std::initializer_list<int> a, std::initializer_list<int> b) {
  return a.begin() != b.begin() + 1;
}
bool b = ne({2,3}, {1,2,3});     // unspecified result; previously false
```

— end example]

3 **Affected subclause:** 9.3.4.5
Change: Previously, `T...[n]` would declare a pack of function parameters. `T...[n]` is now a *pack-index-specifier*.
Rationale: Improve the handling of packs.
Effect on original feature: Valid C++ 2023 code that declares a pack of parameters without specifying a *declarator-id* becomes ill-formed.

[*Example 3*:

```
template <typename... T>
void f(T... [1]);
template <typename... T>
void g(T... ptr[1]);
int main() {
  f<int, double>(nullptr, nullptr);     // ill-formed, previously void f<int, double>(int [1], double
[1])
  g<int, double>(nullptr, nullptr);     // ok
}
```

— end example]

C.1.5 Clause 13: templates [diff.cpp23.temp]

1 **Affected subclause:** 13.5
Change: Some atomic constraints become fold expanded constraints.

Rationale: Permit the subsumption of fold expressions.
Effect on original feature: Valid C++ 2023 code may become ill-formed.

[*Example 1*:

```
template <typename ...V> struct A;
struct S {
  static constexpr int compare(const S&) { return 1; }
};

template <typename ...T, typename ...U>
void f(A<T ...> *, A<U ...> *)
requires (T::compare(U{}) && ...);       // was well-formed (atomic constraint of type bool),
                                         // now ill-formed (results in an atomic constraint of type int)
void g(A<S, S> *ap) {
  f(ap, ap);
}
```

— *end example*]

2 **Affected subclause:** 13.10.3.2
Change: Template argument deduction from overload sets succeeds in more cases.
Rationale: Allow consideration of constraints to disambiguate overload sets used as parameters in function calls.
Effect on original feature: Valid C++ 2023 code may become ill-formed.

[*Example 2*:

```
template <typename T>
void f(T &&, void (*)(T &&));

void g(int &);                 // #1
inline namespace A {
  void g(short &&);            // #2
}
inline namespace B {
  void g(short &&);            // #3
}

void q() {
  int x;
  f(x, g);             // ill-formed; previously well-formed, deducing T = int&
}
```

There is no change to the applicable deduction rules for the individual `g` candidates: Type deduction from #1 does not succeed; type deductions from #2 and #3 both succeed. — *end example*]

C.1.6 Clause 16: library introduction [diff.cpp23.library]

1 **Affected subclause:** 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<contracts>` (17.10), `<debugging>` (19.7.2), `<hazard_pointer>` (32.11.3.2), `<hive>` (23.3.8), `<inplace_vector>` (23.3.15), `<linalg>` (29.9.2), `<rcu>` (32.11.2.2), `<simd>` (29.10.3), `<stdbit.h>` (22.12), `<stdckdint.h>` (29.11.1), and `<text_encoding>` (28.4.1). Valid C++ 2023 code that `#includes` headers with these names may be invalid in this revision of C++.

2 **Affected subclause:** 16.4.6.3
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of special identifiers may not be used as macro names. Valid C++ 2023 code that defines `replaceable_if_eligible` or `trivially_relocatable_if_eligible` as macros is invalid in this revision of C++.

C.1.7 Clause 27: strings library [diff.cpp23.strings]

1 **Affected subclause:** 27.4.5
Change: Output of floating-point overloads of `to_string` and `to_wstring`.
Rationale: Prevent loss of information and improve consistency with other formatting facilities.
Effect on original feature: `to_string` and `to_wstring` function calls that take floating-point arguments may produce a different output.

[*Example 1*:

```
auto s = std::to_string(1e-7);  // "1e-07"
                                // previously "0.000000" with '.' possibly
                                // changed according to the global C locale
```

— *end example*]

C.1.8 Clause 23: containers library [diff.cpp23.containers]

1 **Affected subclause:** 23.7.2.2.1
Change: `span<const T>` is constructible from `initializer_list<T>`.
Rationale: Permit passing a braced initializer list to a function taking `span`.
Effect on original feature: Valid C++ 2023 code that relies on the lack of this constructor may refuse to compile, or change behavior in this revision of C++.

[*Example 1*:

```
void one(pair<int, int>);       // #1
void one(span<const int>);      // #2
void t1() { one({1, 2}); }      // ambiguous between #1 and #2; previously called #1

void two(span<const int, 2>);
void t2() { two({{1, 2}}); }    // ill-formed; previously well-formed

void *a[10];
int x = span<void* const>{a, 0}.size();      // x is 2; previously 0
any b[10];
int y = span<const any>{b, b + 10}.size();   // y is 2; previously 10
```

— *end example*]

C.1.9 Annex D: compatibility features [diff.cpp23.depr]

1 **Change:** Remove the type alias `allocator<T>::is_always_equal`.
Rationale: Non-empty allocator classes derived from `allocator` needed to explicitly define an `is_always_-equal` member type so that `allocator_traits` would not use the one from the allocator base class.
Effect on original feature: It is simpler to correctly define an allocator class with an allocator base class.

[*Example 1*:

```
template <class T>
struct MyAlloc : allocator<T> {
  int tag;
};

static_assert(!allocator_traits<MyAlloc<int>>::is_always_equal);        // Error in C++ 2023,
                                                                        // OK in C++ 2026
```

— *end example*]

2 **Change:** Removal of atomic access API for `shared_ptr` objects.
Rationale: The old behavior was brittle. `shared_ptr` objects using the old API were not protected by the type system, and certain interactions with code not using this API would, in some cases, silently produce undefined behavior. A complete type-safe replacement is provided in the form of `atomic<shared_ptr<T>>`.
Effect on original feature: A valid C++ 2023 program that relies on the presence of the removed functions may fail to compile.

3 **Change:** Remove the `basic_string::reserve()` overload with no parameters.
Rationale: The overload of `reserve` with no parameters is redundant. The `shrink_to_fit` member function can be used instead.
Effect on original feature: A valid C++ 2023 program that calls `reserve()` on a `basic_string` object

may fail to compile. The old functionality can be achieved by calling `shrink_to_fit()` instead, or the function call can be safely eliminated with no side effects.

4 **Change:** Remove header `<codecvt>` and all its contents.
Rationale: The header has been deprecated for the previous three editions of this document and no longer implements the current Unicode standard, supporting only the obsolete UCS-2 encoding. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.
Effect on original feature: A valid C++ 2023 program `#include`-ing the header or importing the header unit may fail to compile. Code that uses any of the following names by importing the standard library modules may fail to compile:

(4.1) — `codecvt_mode`,

(4.2) — `codecvt_utf16`,

(4.3) — `codecvt_utf8`,

(4.4) — `codecvt_utf8_utf16`,

(4.5) — `consume_header`,

(4.6) — `generate_header`, and

(4.7) — `little_endian`.

5 **Change:** Remove header `<strstream>` and all its contents.
Rationale: The header has been deprecated since the original C++ standard; the `<spanstream>` header provides an updated, safer facility. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.
Effect on original feature: A valid C++ 2023 program `#include`-ing the header or importing the header unit may become ill-formed. Code that uses any of the following classes by importing one of the standard library modules may become ill-formed:

(5.1) — `istrstream`

(5.2) — `ostrstream`

(5.3) — `strstream`

(5.4) — `strstreambuf`

6 **Change:** Remove convenience interfaces `wstring_convert` and `wbuffer_convert`.
Rationale: These features were underspecified with no clear error reporting mechanism and were deprecated for the last three editions of this document. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.
Effect on original feature: A valid C++ 2023 program using these interfaces may become ill-formed.

C.2 C++ and ISO C++ 2020 [diff.cpp20]

C.2.1 General [diff.cpp20.general]

1 Subclause C.2 lists the differences between C++ and ISO C++ 2020, in addition to those listed above, by the chapters of this document.

C.2.2 Clause 5: lexical conventions [diff.cpp20.lex]

1 **Affected subclause:** 5.11
Change: Previously valid identifiers containing characters not present in UAX #44 properties XID_Start or XID_Continue, or not in Normalization Form C, are now rejected.
Rationale: Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.
Effect on original feature: Some identifiers are no longer well-formed.

2 **Affected subclause:** 5.13.5
Change: Concatenated *string-literal*s can no longer have conflicting *encoding-prefix*es.
Rationale: Removal of unimplemented conditionally-supported feature.
Effect on original feature: Concatenation of *string-literal*s with different *encoding-prefix*es is now ill-formed.

[*Example 1*:

```
auto c = L"a" U"b";                // was conditionally-supported; now ill-formed
```

— *end example*]

C.2.3 Clause 7: expressions [diff.cpp20.expr]

1 **Affected subclause:** 7.5.5.2
Change: Change move-eligible *id-expression*s from lvalues to xvalues.
Rationale: Simplify the rules for implicit move.
Effect on original feature: Valid C++ 2020 code that relies on a returned *id-expression*'s being an lvalue may change behavior or fail to compile.

[*Example 1*:

```
decltype(auto) f(int&& x) { return (x); }        // returns int&&; previously returned int&
int& g(int&& x) { return x; }                    // ill-formed; previously well-formed
```

— *end example*]

2 **Affected subclause:** 7.6.1.2
Change: Change the meaning of comma in subscript expressions.
Rationale: Enable repurposing a deprecated syntax to support multidimensional indexing.
Effect on original feature: Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile.

[*Example 2*:

```
arr[1, 2]                   // was equivalent to arr[(1, 2)],
                            // now equivalent to arr.operator[](1, 2) or ill-formed
```

— *end example*]

C.2.4 Clause 8: statements [diff.cpp20.stmt]

1 **Affected subclause:** 8.6.5
Change: The lifetime of temporary objects in the *for-range-initializer* is extended until the end of the loop (6.7.7).
Rationale: Improve usability of the range-based `for` statement.
Effect on original feature: Destructors of some temporary objects are invoked later.

[*Example 1*:

```
void f() {
  std::vector<int> v = { 42, 17, 13 };
  std::mutex m;

  for (int x :
       static_cast<void>(std::lock_guard<std::mutex>(m)), v) {  // lock released in C++ 2020
    std::lock_guard<std::mutex> guard(m);                       // OK in C++ 2020, now deadlocks
  }
}
```

— *end example*]

C.2.5 Clause 9: declarations [diff.cpp20.dcl]

1 **Affected subclause:** 9.5.3
Change: UTF-8 string literals may initialize arrays of `char` or `unsigned char`.
Rationale: Compatibility with previously written code that conformed to previous versions of this document.
Effect on original feature: Arrays of `char` or `unsigned char` may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates.

[*Example 1*:

```
struct A {
  char8_t s[10];
};
struct B {
  char s[10];
};

void f(A);
void f(B);
```

```
int main() {
  f({u8""});                // ambiguous
}
```

— *end example*]

C.2.6 Clause 13: templates [diff.cpp20.temp]

1 **Affected subclause:** 13.10.3.6
Change: Deducing template arguments from exception specifications.
Rationale: Facilitate generic handling of throwing and non-throwing functions.
Effect on original feature: Valid ISO C++ 2020 code may be ill-formed in this revision of C++.

[*Example 1*:

```
template<bool> struct A { };
template<bool B> void f(void (*)(A<B>) noexcept(B));
void g(A<false>) noexcept;
void h() {
  f(g);                             // ill-formed; previously well-formed
}
```

— *end example*]

C.2.7 Clause 16: library introduction [diff.cpp20.library]

1 **Affected subclause:** 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<expected>` (22.8.2), `<flat_map>` (23.6.7), `<flat_set>` (23.6.10), `<generator>` (25.8.2), `<mdspan>` (23.7.3.2), `<print>` (31.7.4), `<spanstream>` (31.9.2), `<stacktrace>` (19.6.2), `<stdatomic.h>` (32.5.12), and `<stdfloat>` (17.4.2). Valid C++ 2020 code that `#include`s headers with these names may be invalid in this revision of C++.

C.2.8 Clause 18: concepts library [diff.cpp20.concepts]

1 **Affected subclauses:** 17.12.4, 18.5.4, and 18.5.5
Change: Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.
Rationale: Allow uncopyable, but movable, types to model these concepts.
Effect on original feature: Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++.

[*Example 1*:

```
template<class T, class U>
  requires equality_comparable_with<T, U>
bool attempted_equals(const T&, const U& u);      // previously selected overload

template<class T, class U>
  requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u);    // ambiguous overload; previously
                                                  // rejected by partial ordering
bool test(shared_ptr<int> p) {
  return attempted_equals(p, nullptr);            // ill-formed; previously well-formed
}
```

— *end example*]

C.2.9 Clause 20: memory management library [diff.cpp20.memory]

1 **Affected subclause:** 20.2.9.1
Change: Forbid partial and explicit program-defined specializations of `allocator_traits`.
Rationale: Allow addition of `allocate_at_least` to `allocator_traits`, and potentially other members in the future.
Effect on original feature: Valid C++ 2020 code that partially or explicitly specializes `allocator_traits` is ill-formed with no diagnostic required in this revision of C++.

C.2.10 Clause 22: general utilities library [diff.cpp20.utilities]

1 **Affected subclause:** 28.5
Change: Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.
Rationale: Improve safety via compile-time format string checks, avoid unnecessary template instantiations.
Effect on original feature: Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed.

[*Example 1*:

```
auto s = std::format("{:d}", "I am not a number");        // ill-formed,
                                                          // previously threw format_error
```

— *end example*]

2 **Affected subclause:** 28.5
Change: Signature changes: `format`, `format_to`, `format_to_n`, `formatted_size`.
Rationale: Enable formatting of views that do not support iteration when const-qualified and that are not copyable.
Effect on original feature: Valid C++ 2020 code that passes bit-fields to formatting functions may become ill-formed.

[*Example 2*:

```
struct tiny {
  int bit: 1;
};

auto t = tiny();
std::format("{}", t.bit);         // ill-formed, previously returned "0"
```

— *end example*]

3 **Affected subclause:** 28.5.2.2
Change: Restrict types of formatting arguments used as *width* or *precision* in a *std-format-spec*.
Rationale: Disallow types that do not have useful or portable semantics as a formatting width or precision.
Effect on original feature: Valid C++ 2020 code that passes a boolean or character type as *arg-id* becomes invalid.

[*Example 3*:

```
std::format("{:*^{}}", "", true);   // ill-formed, previously returned "*"
std::format("{:*^{}}", "", '1');    // ill-formed, previously returned an
                                    // implementation-defined number of '*' characters
```

— *end example*]

4 **Affected subclause:** 28.5.6.4
Change: Removed the `formatter` specialization:

```
template<size_t N> struct formatter<const charT[N], charT>;
```

Rationale: The specialization is inconsistent with the design of `formatter`, which is intended to be instantiated only with cv-unqualified object types.
Effect on original feature: Valid C++ 2020 code that instantiated the removed specialization can become ill-formed.

C.2.11 Clause 27: strings library [diff.cpp20.strings]

1 **Affected subclause:** 27.4
Change: Additional rvalue overload for the `substr` member function and the corresponding constructor.
Rationale: Improve efficiency of operations on rvalues.
Effect on original feature: Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++.

[*Example 1*:

```
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2);        // unspecified, previously guaranteed to be true
```

```
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2);          // unspecified, previously guaranteed to be true
```

— *end example*]

C.2.12 Clause 23: containers library [diff.cpp20.containers]

1 **Affected subclauses:** 23.2.7 and 23.2.8
Change: Heterogeneous `extract` and `erase` overloads for associative containers.
Rationale: Improve efficiency of erasing elements from associative containers.
Effect on original feature: Valid C++ 2020 code may fail to compile in this revision of C++.

[*Example 1*:

```
struct B {
  auto operator<=>(const B&) const = default;
};

struct D : private B {
  void f(std::set<B, std::less<>>& s) {
    s.erase(*this);               // ill-formed; previously well-formed
  }
};
```

— *end example*]

C.2.13 Clause 32: concurrency support library [diff.cpp20.thread]

1 **Affected subclause:** 32.9.3
Change: In this revision of C++, it is implementation-defined whether a barrier's phase completion step runs if no thread calls `wait`. Previously the phase completion step was guaranteed to run on the last thread that calls `arrive` or `arrive_and_drop` during the phase. In this revision of C++, it can run on any of the threads that arrived or waited at the barrier during the phase.
Rationale: Correct contradictory wording and improve implementation flexibility for performance.
Effect on original feature: Valid C++ 2020 code using a barrier might have different semantics in this revision of C++ if it depends on a completion function's side effects occurring exactly once, on a specific thread running the phase completion step, or on a completion function's side effects occurring without `wait` having been called.

[*Example 1*:

```
auto b0 = std::barrier(1);
b0.arrive();
b0.arrive();               // implementation-defined; previously well-defined

int data = 0;
auto b1 = std::barrier(1, [&] { data++; });
b1.arrive();
assert(data == 1);         // implementation-defined; previously well-defined
b1.arrive();               // implementation-defined; previously well-defined
```

— *end example*]

C.3 C++ and ISO C++ 2017 [diff.cpp17]

C.3.1 General [diff.cpp17.general]

1 Subclause C.3 lists the differences between C++ and ISO C++ 2017, in addition to those listed above, by the chapters of this document.

C.3.2 Clause 5: lexical conventions [diff.cpp17.lex]

1 **Affected subclauses:** 5.5, 10.1, 10.3, 15.1, 15.5, and 15.6
Change: New identifiers with special meaning.
Rationale: Required for new features.
Effect on original feature: Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++.

[*Example 1*:

```
class module {};
module m1;          // was variable declaration; now module-declaration
module *m2;         // variable declaration

class import {};
import j1;          // was variable declaration; now module-import-declaration
::import j2;        // variable declaration
```

— *end example*]

2 **Affected subclause:** 5.6
Change: *header-name* tokens are formed in more contexts.
Rationale: Required for new features.
Effect on original feature: When the identifier `import` is followed by a `<` character, a *header-name* token may be formed.

[*Example 2*:

```
template<typename> class import {};
import<int> f();                // ill-formed; previously well-formed
::import<int> g();              // OK
```

— *end example*]

3 **Affected subclause:** 5.12
Change: New keywords.
Rationale: Required for new features.

(3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).

(3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).

(3.3) — The `consteval` keyword is added to declare immediate functions (9.2.6).

(3.4) — The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).

(3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.6.4).

(3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.8).

Effect on original feature: Valid C++ 2017 code using `char8_t`, `concept`, `consteval`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

4 **Affected subclause:** 5.8
Change: New operator `<=>`.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++.

[*Example 3*:

```
namespace N {
  struct X {};
  bool operator<=(X, X);
  template<bool(X, X)> struct Y {};
  Y<operator<=> y;              // ill-formed; previously well-formed
}
```

— *end example*]

5 **Affected subclause:** 5.13
Change: Type of UTF-8 string and character literals.
Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.
Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type "array of `const char`" and UTF-8 character literals having type "`char`" is not valid in this revision of C++.

[*Example 4*:

```
const auto *u8s = u8"text";     // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;          // ill-formed; previously well-formed

auto u8c = u8'c';              // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;               // ill-formed; previously well-formed

std::string s = u8"text";      // ill-formed; previously well-formed

void f(const char *s);
f(u8"text");                   // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
  using type = char;
};
ct<decltype(u8'c')>::type x;   // ill-formed; previously well-formed.
```

— *end example*]

C.3.3 Clause 6: basics [diff.cpp17.basic]

1 **Affected subclause:** 6.7.4
Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.
Rationale: Increase consistency of the language model.
Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++.

[*Example 1*:

```
int f() {
  int a = 123;
  using T = int;
  a.~T();
  return a;           // undefined behavior; previously returned 123
}
```

— *end example*]

2 **Affected subclause:** 6.9.2.2
Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.
Rationale: Removal of rarely used and confusing feature.
Effect on original feature: If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_acquire` load no longer provides any "happens before" guarantees, even in the absence of intervening stores by another thread.

C.3.4 Clause 7: expressions [diff.cpp17.expr]

1 **Affected subclause:** 7.5.6.3
Change: Implicit lambda capture may capture additional entities.
Rationale: Rule simplification, necessary to resolve interactions with constexpr if.
Effect on original feature: Lambdas with a *capture-default* may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

C.3.5 Clause 9: declarations [diff.cpp17.dcl.dcl]

1 **Affected subclause:** 9.2.4
Change: Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.
Rationale: Necessary for implementability.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++.

[*Example 1*:

```
typedef struct {
  void f() {}           // ill-formed; previously well-formed
} S;
```

— *end example*]

2 **Affected subclause:** 9.3.4.7
Change: A function cannot have different default arguments in different translation units.
Rationale: Required for modules support.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required.

[*Example 2*:
```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; }         // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); }              // used to return 42
```
— *end example*]

3 **Affected subclause:** 9.5.2
Change: A class that has user-declared constructors is never an aggregate.
Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.
Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++.

[*Example 3*:
```
struct A {                // not an aggregate; previously an aggregate
  A() = delete;
};

struct B {                // not an aggregate; previously an aggregate
  B() = default;
  int i = 0;
};

struct C {                // not an aggregate; previously an aggregate
  C(C&&) = default;
  int a, b;
};

A a{};                    // ill-formed; previously well-formed
B b = {1};                // ill-formed; previously well-formed
auto* c = new C{2, 3};    // ill-formed; previously well-formed

struct Y;

struct X {
  operator Y();
};

struct Y {                // not an aggregate; previously an aggregate
  Y(const Y&) = default;
  X x;
};

Y y{X{}};                 // copy constructor call; previously aggregate-initialization
```
— *end example*]

4 **Affected subclause:** 9.5.5
Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++.

[*Example 4*:
```
bool y[] = { "bc" };      // ill-formed; previously well-formed
```

— *end example*]

C.3.6 Clause 11: classes [diff.cpp17.class]

1 **Affected subclauses:** 11.4.5 and 11.4.8.3
Change: The class name can no longer be used parenthesized immediately after an `explicit` *decl-specifier* in a constructor declaration. The *conversion-function-id* can no longer be used parenthesized immediately after an `explicit` *decl-specifier* in a conversion function declaration.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++.

[*Example 1*:

```
struct S {
  explicit (S)(const S&);         // ill-formed; previously well-formed
  explicit (operator int)();      // ill-formed; previously well-formed
  explicit(true) (S)(int);        // OK
};
```

— *end example*]

2 **Affected subclauses:** 11.4.5 and 11.4.7
Change: A *simple-template-id* is no longer valid as the *declarator-id* of a constructor or destructor.
Rationale: Remove potentially error-prone option for redundancy.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++.

[*Example 2*:

```
template<class T>
struct A {
  A<T>();             // error: simple-template-id not allowed for constructor
  A(int);             // OK, injected-class-name used
  ~A<T>();            // error: simple-template-id not allowed for destructor
};
```

— *end example*]

3 **Affected subclause:** 11.9.6
Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.
Rationale: Side effect of making it easier to write more efficient code that takes advantage of moves.
Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++.

[*Example 3*:

```
struct base {
  base();
  base(base const &);
private:
  base(base &&);
};

struct derived : base {};

base f(base b) {
  throw b;                        // error: base(base &&) is private
  derived d;
  return d;                       // error: base(base &&) is private
}

struct S {
  S(const char *s) : m(s) { }
  S(const S&) = default;
  S(S&& other) : m(other.m) { other.m = nullptr; }
  const char * m;
};
```

```
S consume(S&& s) { return s; }

void g() {
  S s("text");
  consume(static_cast<S&&>(s));
  char c = *s.m;                  // undefined behavior; previously ok
}
```

— *end example*]

C.3.7 Clause 12: overloading [diff.cpp17.over]

1 **Affected subclause:** 12.2.2.3
Change: Equality and inequality expressions can now find reversed and rewritten candidates.
Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.
Effect on original feature: For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous.

[*Example 1*:

```
struct A {
  operator int() const;
};

bool operator==(A, int);          // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
  return (x == y) +               // ill-formed; previously well-formed
    (10 == x) +                   // calls #1, previously selected #2
    (10 != x);                    // calls #1, previously selected #3
}
```

— *end example*]

2 **Affected subclause:** 12.2.2.3
Change: Overload resolution may change for equality operators (7.6.10).
Rationale: Support calling `operator==` with reversed order of arguments.
Effect on original feature: Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++.

[*Example 2*:

```
struct A {
  operator int() const { return 10; }
};

bool operator==(A, int);          // #1
// #2 is built-in candidate: bool operator==(int, int);
bool b = 10 == A();               // calls #1 with reversed order of arguments; previously selected #2

struct B {
  bool operator==(const B&);      // member function with no cv-qualifier
};
B b1;
bool eq = (b1 == b1);             // ambiguous; previously well-formed
```

— *end example*]

C.3.8 Clause 13: templates [diff.cpp17.temp]

1 **Affected subclause:** 13.3
Change: An *unqualified-id* that is followed by a `<` and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument-dependent lookup to be performed.

Rationale: It was problematic to call a function template with an explicit template argument list via argument-dependent lookup because of the need to have a template with the same name visible via normal lookup.
Effect on original feature: Previously valid code that uses a function name as the left operand of a `<` operator would become ill-formed.

[*Example 1*:

```
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
  A a;
  f < a;     // ill-formed; previously well-formed
  (f) < a;   // still well-formed
}
```

— *end example*]

C.3.9 Clause 14: exception handling [diff.cpp17.except]

1 **Affected subclause:** 14.5
Change: Remove `throw()` exception specification.
Rationale: Removal of obsolete feature that has been replaced by `noexcept`.
Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

[*Note 1*: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — *end note*]

C.3.10 Clause 16: library introduction [diff.cpp17.library]

1 **Affected subclause:** 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<barrier>` (32.9.3.2), `<bit>` (22.11.2), `<charconv>` (28.2.1), `<compare>` (17.12.1), `<concepts>` (18.3), `<coroutine>` (17.13.2), `<format>` (28.5.1), `<latch>` (32.9.2.2), `<numbers>` (29.8.1), `<ranges>` (25.2), `<semaphore>` (32.8.2), `<source_location>` (17.8.1), `<span>` (23.7.2.1), `<stop_token>` (32.3.2), `<syncstream>` (31.11.1), and `<version>` (17.3.1). Valid C++ 2017 code that `#include`s headers with these names may be invalid in this revision of C++.

2 **Affected subclause:** 16.4.2.3
Change: Remove vacuous C++ header files.
Rationale: The empty headers implied a false requirement to achieve C compatibility with the C++ headers.
Effect on original feature: A valid C++ 2017 program that `#include`s any of the following headers may fail to compile: `<ccomplex>`, `<ciso646>`, `<cstdalign>`, `<cstdbool>`, and `<ctgmath>`. To retain the same behavior:

(2.1) — a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` (29.4.2),

(2.2) — a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` (29.7.1) and a `#include` of `<complex>`, and

(2.3) — a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

C.3.11 Clause 23: containers library [diff.cpp17.containers]

1 **Affected subclauses:** 23.3.7 and 23.3.11
Change: Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.
Rationale: Improve efficiency and convenience of finding number of removed elements.
Effect on original feature: Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.3.12 Clause 24: iterators library [diff.cpp17.iterators]

1 **Affected subclause:** 24.3.2.3
Change: The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.
Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.
Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

C.3.13 Clause 26: algorithms library [diff.cpp17.alg.reqs]

1 **Affected subclause:** 26.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.
Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

C.3.14 Clause 31: input/output library [diff.cpp17.input.output]

1 **Affected subclause:** 31.7.5.3.3
Change: Character array extraction only takes array types.
Rationale: Increase safety via preventing buffer overflow at compile time.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++.

[*Example 1*:

```
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;         // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;         // OK
```

— *end example*]

2 **Affected subclause:** 31.7.6.3.4
Change: Overload resolution for ostream inserters used with UTF-8 literals.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[*Example 2*:

```
std::cout << u8"text";          // previously called operator<<(const char*) and printed a string;
                                // now ill-formed
std::cout << u8'X';             // previously called operator<<(char) and printed a character;
                                // now ill-formed
```

— *end example*]

3 **Affected subclause:** 31.7.6.3.4
Change: Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.
Rationale: Removal of surprising behavior.
Effect on original feature: Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[*Example 3*:

```
std::cout << u"text";           // previously formatted the string as a pointer value;
                                // now ill-formed
std::cout << u'X';              // previously formatted the character as an integer value;
                                // now ill-formed
```

— *end example*]

4 **Affected subclause:** 31.12.6
Change: Return type of filesystem path format observer member functions.
Rationale: Required for new features.

Effect on original feature: Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++.

[*Example 4*:

```
std::filesystem::path p;
std::string s1 = p.u8string();          // ill-formed; previously well-formed
std::string s2 = p.generic_u8string();  // ill-formed; previously well-formed
```

— *end example*]

C.3.15 Annex D: compatibility features [diff.cpp17.depr]

1 **Change:** Remove `uncaught_exception`.
Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.
Effect on original feature: A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.

2 **Change:** Remove support for adaptable function API.
Rationale: The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.
Effect on original feature: A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

3 **Change:** Remove redundant members from `std::allocator`.
Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.
Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

4 **Change:** Remove `raw_storage_iterator`.
Rationale: The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.
Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 **Change:** Remove temporary buffers API.
Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

6 **Change:** Remove `shared_ptr::unique`.
Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.
Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

7 **Affected subclause:** D.13
Change: Remove deprecated type traits.
Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.
Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.4 C++ and ISO C++ 2014 [diff.cpp14]

C.4.1 General [diff.cpp14.general]

1 Subclause C.4 lists the differences between C++ and ISO C++ 2014, in addition to those listed above, by the chapters of this document.

C.4.2 Clause 5: lexical conventions [diff.cpp14.lex]

1 **Affected subclause:** 5.2
Change: Removal of trigraph support as a required feature.
Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.
Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

2 **Affected subclause:** 5.7
Change: *pp-number* can contain `p` *sign* and `P` *sign*.
Rationale: Necessary to enable *hexadecimal-floating-point-literal*s.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++.

[*Example 1*:

```
#define F(a) b ## a
int b0p = F(0p+0);   // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
```

— *end example*]

C.4.3 Clause 7: expressions [diff.cpp14.expr]

1 **Affected subclauses:** 7.6.1.6 and 7.6.2.3
Change: Remove increment operator with `bool` operand.
Rationale: Obsolete feature with occasionally surprising semantics.
Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this revision of C++.

2 **Affected subclauses:** 7.6.2.8 and 7.6.2.9
Change: Dynamic allocation mechanism for over-aligned types.
Rationale: Simplify use of over-aligned types.
Effect on original feature: In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this revision of C++, `::operator new(std::size_t, std::align_val_t)` is used instead.

C.4.4 Clause 9: declarations [diff.cpp14.dcl.dcl]

1 **Affected subclause:** 9.2.2
Change: Removal of `register` *storage-class-specifier*.
Rationale: Enable repurposing of deprecated keyword in future revisions of C++.
Effect on original feature: A valid C++ 2014 declaration utilizing the `register` *storage-class-specifier* is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

2 **Affected subclause:** 9.2.9.7
Change: `auto` deduction from *braced-init-list*.
Rationale: More intuitive deduction behavior.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.

[*Example 1*:

```
auto x1{1};          // was std::initializer_list<int>, now int
auto x2{1, 2};       // was std::initializer_list<int>, now ill-formed
```

— *end example*]

3 **Affected subclause:** 9.3.4.6
Change: Make exception specifications be part of the type system.
Rationale: Improve type-safety.
Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this revision of C++.

[*Example 2*:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);              // ill-formed; previously well-formed
```

— *end example*]

4 **Affected subclause:** 9.5.2
Change: Definition of an aggregate is extended to apply to user-defined types with base classes.
Rationale: To increase convenience of aggregate initialization.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types.

[*Example 3*:

```
struct derived;
struct base {
  friend struct derived;
private:
  base();
};
struct derived : base {};

derived d1{};           // error; the code was well-formed in C++ 2014
derived d2;             // still OK
```

— *end example*]

C.4.5 Clause 11: classes [diff.cpp14.class]

1 **Affected subclause:** 11.9.4
Change: Inheriting a constructor no longer injects a constructor into the derived class.
Rationale: Better interaction with other language features.
Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

[*Example 1*:

```
struct A {
  template<typename T> A(T, typename T::type = 0);
  A(int);
};
struct B : A {
  using A::A;
  B(int);
};
B b(42L);               // now calls B(int), used to call B<long>(long),
                        // which called A(int) due to substitution failure
                        // in A<long>(long).
```

— *end example*]

C.4.6 Clause 13: templates [diff.cpp14.temp]

1 **Affected subclause:** 13.10.3.6
Change: Allowance to deduce from the type of a constant template argument.
Rationale: In combination with the ability to declare constant template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the constant template argument.

Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++.

[*Example 1*:

```
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
  foo(p);              // ill-formed; previously well-formed
}
```

— *end example*]

C.4.7 Clause 14: exception handling [diff.cpp14.except]

1 **Affected subclause:** 14.5
Change: Remove dynamic exception specifications.
Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.
Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected`, and it is unspecified whether stack unwinding is performed prior to such a call.

C.4.8 Clause 16: library introduction [diff.cpp14.library]

1 **Affected subclause:** 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<any>` (22.7.2), `<charconv>` (28.2.1), `<execution>` (33.4), `<filesystem>` (31.12.4), `<memory_resource>` (20.5.1), `<optional>` (22.5.2), `<string_view>` (27.3.2), and `<variant>` (22.6.2). Valid C++ 2014 code that `#include`s headers with these names may be invalid in this revision of C++.

2 **Affected subclause:** 16.4.5.2.3
Change: New reserved namespaces.
Rationale: Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.
Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of *digits* (5.11) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

C.4.9 Clause 22: general utilities library [diff.cpp14.utilities]

1 **Affected subclause:** 22.10.17
Change: Constructors taking allocators removed.
Rationale: No implementation consensus.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

2 **Affected subclause:** 20.3.2.2
Change: Different constraint on conversions from `unique_ptr`.
Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.

[*Example 1*:

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr));    // error: int(*)[] is not compatible with int*
```

— *end example*]

C.4.10 Clause 27: strings library [diff.cpp14.string]

1 **Affected subclause:** 27.4.3
Change: Non-const `.data()` member added.
Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.
Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this revision of C++.

[*Example 1*:

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data());            // ill-formed; previously well-formed
```

— *end example*]

C.4.11 Clause 23: containers library [diff.cpp14.containers]

1 **Affected subclause:** 23.2.7
Change: Requirements change:
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++.

[*Example 1*:

```
#include <set>

struct compare
{
  bool operator()(int a, int b)
  {
    return a < b;
  }
};

int main() {
  const std::set<int, compare> s;
  s.find(0);
}
```

— *end example*]

C.4.12 Annex D: compatibility features [diff.cpp14.depr]

1 **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

2 **Change:** Remove old iostreams members [depr.ios.members].
Rationale: Redundant feature for compatibility with pre-standard code has served its time.
Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.5 C++ and ISO C++ 2011 [diff.cpp11]

C.5.1 General [diff.cpp11.general]

1 Subclause C.5 lists the differences between C++ and ISO C++ 2011, in addition to those listed above, by the chapters of this document.

C.5.2 Clause 5: lexical conventions [diff.cpp11.lex]

1 **Affected subclause:** 5.7
Change: *pp-number* can contain one or more single quotes.
Rationale: Necessary to enable single quotes as digit separators.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++.

[*Example 1*:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5) };
// int x[2] = { 5 };       — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
```

— *end example*]

C.5.3 Clause 6: basics [diff.cpp11.basic]

1 **Affected subclause:** 6.7.6.5.3
Change: New usual (non-placement) deallocator.
Rationale: Required for sized deallocation.
Effect on original feature: Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.7.6.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

C.5.4 Clause 7: expressions [diff.cpp11.expr]

1 **Affected subclause:** 7.6.16
Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.
Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.
Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++.

[*Example 1*:

```
struct S {
  int x = 1;
  void mf() { x = 2; }
};
int f(bool cond) {
  S s;
  (cond ? s : throw 0).mf();
  return s.x;
}
```

In C++ 2011, `f(true)` returns `1`. In this revision of C++, it returns `2`.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.
— *end example*]

C.5.5 Clause 9: declarations [diff.cpp11.dcl.dcl]

1 **Affected subclause:** 9.2.6
Change: `constexpr` non-static member functions are not implicitly `const` member functions.
Rationale: Necessary to allow `constexpr` member functions to mutate the object.
Effect on original feature: Valid C++ 2011 code may fail to compile in this revision of C++.

[*Example 1*:

```
struct S {
  constexpr const int &f();
  int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types. — *end example*]

2 **Affected subclause:** 9.5.2
Change: Classes with default member initializers can be aggregates.
Rationale: Necessary to allow default member initializers to be used by aggregate initialization.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++.

[*Example 2*:

```
struct S {            // Aggregate in C++ 2014 onwards.
  int m = 1;
};
struct X {
  operator int();
  operator S();
};
X a{};
S b{a};               // uses copy constructor in C++ 2011,
                      // performs aggregate initialization in this revision of C++
```

— *end example*]

C.5.6 Clause 16: library introduction [diff.cpp11.library]

1 **Affected subclause:** 16.4.2.3
Change: New header.
Rationale: New functionality.
Effect on original feature: The C++ header `<shared_mutex>` (32.6.3) is new. Valid C++ 2011 code that `#include`s a header with that name may be invalid in this revision of C++.

C.5.7 Clause 31: input/output library [diff.cpp11.input.output]

1 **Affected subclause:** 31.13
Change: `gets` is not defined.
Rationale: Use of `gets` is considered dangerous.
Effect on original feature: Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.

C.6 C++ and ISO C++ 2003 [diff.cpp03]

C.6.1 General [diff.cpp03.general]

1 Subclause C.6 lists the differences between C++ and ISO C++ 2003, in addition to those listed above, by the chapters of this document.

C.6.2 Clause 5: lexical conventions [diff.cpp03.lex]

1 **Affected subclause:** 5.5
Change: New kinds of *string-literal*s.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named `R`, `u8`, `u8R`, `u`, `uR`, `U`, `UR`, or `LR` will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*.

[*Example 1*:

```
#define u8 "abc"
const char* s = u8"def";        // Previously "abcdef", now "def"
```

— *end example*]

2 **Affected subclause:** 5.5
Change: User-defined literal string support.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 2*:

```
#define _x "there"
"hello"_x            // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro `_x` would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded. — *end example*]

3 **Affected subclause:** 5.12
Change: New keywords.
Rationale: Required for new features.
Effect on original feature: Added to Table 5, the following identifiers are new keywords: `alignas`, `alignof`, `char16_t`, `char32_t`, `constexpr`, `decltype`, `noexcept`, `nullptr`, `static_assert`, and `thread_local`. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

4 **Affected subclause:** 5.13.2
Change: Type of integer literals.
Rationale: C99 compatibility.
Effect on original feature: Certain integer literals larger than can be represented by `long` could change from an unsigned integer type to `signed long long`.

C.6.3 Clause 7: expressions [diff.cpp03.expr]

1 **Affected subclause:** 7.3.12
Change: Only literals are integer null pointer constants.
Rationale: Removing surprising interactions with templates and constant expressions.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 1*:

```
void f(void *);      // #1
void f(...);         // #2
template<int N> void g() {
  f(0*N);            // calls #2; used to call #1
}
```

— *end example*]

2 **Affected subclause:** 7.6.1.8
Change: Evaluation of operands in `typeid`.
Rationale: Introduce additional expression value categories.
Effect on original feature: Valid C++ 2003 code that uses xvalues as operands for `typeid` may change behavior in this revision of C++.

[*Example 2*:

```
void f() {
  struct B {
    B() {}
    virtual ~B() { }
  };

  struct C { B b; };
  typeid(C().b);     // unevaluated in C++ 2003, evaluated in C++ 2011
}
```

— *end example*]

3 **Affected subclause:** 7.6.5
Change: Specify rounding for results of integer `/` and `%`.
Rationale: Increase portability, C99 compatibility.
Effect on original feature: Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

4 **Affected subclause:** 7.6.14
Change: `&&` is valid in a *type-name*.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[*Example 3*:

```
bool b1 = new int && false;             // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false;    // previously false, now ill-formed
```

— *end example*]

5 **Affected subclause:** 7.6.16
Change: Fewer copies in the conditional operator.
Rationale: Introduce additional expression value categories.
Effect on original feature: Valid C++ 2003 code that uses xvalues as operands for the conditional operator may change behavior in this revision of C++.

[*Example 4*:

```
void f() {
  struct B {
    B() {}
    B(const B&) { }
  };
  struct D : B {};

  struct BB { B b; };
  struct DD { D d; };

  true ? BB().b : DD().d;        // additional copy in C++ 2003, no copy or move in C++ 2011
}
```

— *end example*]

C.6.4 Clause 9: declarations [diff.cpp03.dcl.dcl]

1 **Affected subclause:** 9.2
Change: Remove `auto` as a storage class specifier.
Rationale: New feature.
Effect on original feature: Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier may be invalid in this revision of C++. In this revision of C++, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

2 **Affected subclause:** 9.5.5
Change: Narrowing restrictions in aggregate initializers.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2003 code may fail to compile in this revision of C++.

[*Example 1*:

```
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion.
— *end example*]

3 **Affected subclause:** 9.12
Change: Names declared in an anonymous namespace changed from external linkage to internal linkage; language linkage applies to names with external linkage only.
Rationale: Alignment with user expectations.
Effect on original feature: Valid C++ 2003 code may violate the one-definition rule (6.3) in this revision of C++.

[*Example 2*:

```
namespace { extern "C" { extern int x; } }  // #1, previously external linkage and C language linkage,
                                            // now internal linkage and C++ language linkage
namespace A { extern "C" int x = 42; }      // #2, external linkage and C language linkage
int main(void) { return x; }
```

This code is valid in C++ 2003, but #2 is not a definition for #1 in this revision of C++, violating the one-definition rule. *— end example*]

C.6.5 Clause 11: classes [diff.cpp03.class]

1 **Affected subclauses:** 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6
Change: Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.
Rationale: Improves template argument deduction failure.
Effect on original feature: A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2 **Affected subclause:** 11.4.7
Change: User-declared destructors have an implicit exception specification.
Rationale: Clarification of destructor requirements.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

C.6.6 Clause 13: templates [diff.cpp03.temp]

1 **Affected subclause:** 13.2
Change: Repurpose `export` for modules (Clause 10, 15.5, 15.6).
Rationale: No implementation consensus for the C++ 2003 meaning of `export`.
Effect on original feature: A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.

2 **Affected subclause:** 13.4
Change: Remove whitespace requirement for nested closing template right angle brackets.
Rationale: Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.
Effect on original feature: Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“`>`”) followed immediately by another right angle bracket may now be treated as closing two templates.

[*Example 1*:

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

This code is valid in C++ 2003 because “`>>`” is a right-shift operator, but invalid in this revision of C++ because “`>>`” closes two templates. *— end example*]

3 **Affected subclause:** 13.8.4.2
Change: Allow dependent calls of functions with internal linkage.
Rationale: Overly constrained, simplify overload resolution rules.
Effect on original feature: A valid C++ 2003 program can get a different result in this revision of C++.

C.6.7 Clause 16: library introduction [diff.cpp03.library]

1 **Affected:** Clause 16 – Clause 33
Change: New reserved identifiers.
Rationale: Required by new features.
Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

2 **Affected subclause:** 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<array>` (23.3.2), `<atomic>` (32.5.2),

`<chrono>` (30.2), `<condition_variable>` (32.7.2), `<forward_list>` (23.3.6), `<future>` (32.10.2), `<initializer_list>` (17.11.2), `<mutex>` (32.6.2), `<random>` (29.5.2), `<ratio>` (21.4.2), `<regex>` (28.6.3), `<scoped_allocator>` (20.6.1), `<system_error>` (19.5.2), `<thread>` (32.4.2), `<tuple>` (22.4.2), `<typeindex>` (17.7.6), `<type_traits>` (21.3.3), `<unordered_map>` (23.5.2), and `<unordered_set>` (23.5.5). In addition the following C compatibility headers are new: `<cfenv>` (29.3.1), `<cinttypes>` (31.13.2), `<cstdint>` (17.4.1), and `<cuchar>` (28.7.4). Valid C++ 2003 code that `#include`s headers with these names may be invalid in this revision of C++.

3 **Affected subclause:** 16.4.4.3
Change: Function `swap` moved to a different header.
Rationale: Remove dependency on `<algorithm>` (26.4) for `swap`.
Effect on original feature: Valid C++ 2003 code that has been compiled expecting `swap` to be in `<algorithm>` (26.4) may have to instead include `<utility>` (22.2.1).

4 **Affected subclause:** 16.4.5.2.2
Change: New reserved namespace.
Rationale: New functionality.
Effect on original feature: The global namespace `posix` is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace `posix` may be invalid in this revision of C++.

5 **Affected subclause:** 16.4.5.3.3
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, or `noreturn` as macros is invalid in this revision of C++.

C.6.8 Clause 17: language support library [diff.cpp03.language.support]

1 **Affected subclause:** 17.6.3.2
Change: `operator new` may throw exceptions other than `std::bad_alloc`.
Rationale: Consistent application of `noexcept`.
Effect on original feature: Valid C++ 2003 code that assumes that global `operator new` only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable `operator new` is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

C.6.9 Clause 19: diagnostics library [diff.cpp03.diagnostics]

1 **Affected subclause:** 19.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.

C.6.10 Clause 22: general utilities library [diff.cpp03.utilities]

1 **Affected subclauses:** 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11
Change: Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.
Rationale: Superseded by new feature; `unary_function` and `binary_function` are no longer defined.
Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

C.6.11 Clause 27: strings library [diff.cpp03.strings]

1 **Affected subclause:** 27.4
Change: `basic_string` requirements no longer allow reference-counted strings.
Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++.

2 **Affected subclause:** 27.4.3.2
Change: Loosen `basic_string` invalidation rules.
Rationale: Allow small-string optimization.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

C.6.12 Clause 23: containers library [diff.cpp03.containers]

1 **Affected subclause:** 23.2
Change: Complexity of `size()` member functions now constant.
Rationale: Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.
Effect on original feature: Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

2 **Affected subclause:** 23.2
Change: Requirements change: relaxation.
Rationale: Clarification.
Effect on original feature: Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

(2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;

(2.2) — not all containers are empty after construction (`array`);

(2.3) — not all containers have constant complexity for `swap()` (`array`).

3 **Affected subclause:** 23.2
Change: Requirements change: default constructible.
Rationale: Clarification of container requirements.
Effect on original feature: Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4 **Affected subclauses:** 23.2.4 and 23.2.7
Change: Signature changes: from `void` return types.
Rationale: Old signature threw away useful information that may be expensive to recalculate.
Effect on original feature: The following member functions have changed:

(4.1) — `erase(iter)` for `set`, `multiset`, `map`, `multimap`

(4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`

(4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`

(4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

5 **Affected subclauses:** 23.2.4 and 23.2.7
Change: Signature changes: from `iterator` to `const_iterator` parameters.
Rationale: Overspecification.
Effect on original feature: The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

(5.1) — `insert(iter, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`

(5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

(5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`

(5.4) — all forms of `list::splice`

(5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

6 **Affected subclauses:** 23.2.4 and 23.2.7
Change: Signature changes: `resize`.
Rationale: Performance, compatibility with move semantics.
Effect on original feature: For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

C.6.13 Clause 26: algorithms library [diff.cpp03.algorithms]

1 **Affected subclause:** 26.1
Change: Result state of inputs after application of some algorithms.
Rationale: Required by new feature.
Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.

C.6.14 Clause 29: numerics library [diff.cpp03.numerics]

1 **Affected subclause:** 29.4
Change: Specified representation of complex numbers.
Rationale: Compatibility with C99.
Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.

C.6.15 28.3: localization library [diff.cpp03.locale]

1 **Affected subclause:** 28.3.4.3.2.3
Change: The `num_get` facet recognizes hexadecimal floating point values.
Rationale: Required by new feature.
Effect on original feature: Valid C++ 2003 code may have different behavior in this revision of C++.

C.6.16 Clause 31: input/output library [diff.cpp03.input.output]

1 **Affected subclauses:** 31.7.5.2.4, 31.7.6.2.4, and 31.5.4.4
Change: Specify use of `explicit` in existing boolean conversion functions.
Rationale: Clarify intentions, avoid workarounds.
Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

(1.1) — passing a value to a function that takes an argument of type `bool`;

(1.2) — using `operator==` to compare to `false` or `true`;

(1.3) — returning a value from a function with a return type of `bool`;

(1.4) — initializing members of type `bool` via aggregate initialization;

(1.5) — initializing a `const bool&` which would bind to a temporary object.

2 **Affected subclause:** 31.5.2.2.1
Change: Change base class of `std::ios_base::failure`.
Rationale: More detailed error messages.
Effect on original feature: `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

3 **Affected subclause:** 31.5.2
Change: Flag types in `std::ios_base` are now bitmasks with values defined as constexpr static members.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++.

[*Example 1*:

```
#include <iostream>

int main() {
  int flag = std::ios_base::hex;
  std::cout.setf(flag);          // error: setf does not take argument of type int
}
```

— end example]

C.7 C++ and C [diff.iso]

C.7.1 General [diff.iso.general]

1 Subclause C.7 lists the differences between C++ and C, in addition to those listed above, by the chapters of this document.

C.7.2 Clause 5: lexical conventions [diff.lex]

1 **Affected subclause:** 5.12
Change: New Keywords.
New keywords are added to C++; see 5.12.
Rationale: These keywords were added in order to implement the new semantics of C++.
Effect on original feature: Change to semantics of well-defined feature. Any C programs that used any of these keywords as identifiers are not valid C++ programs.
Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.
How widely used: Common.

2 **Affected subclause:** 5.13.3
Change: Type of *character-literal* is changed from `int` to `char`.
Rationale: This is needed for improved overloaded function argument type matching.

[*Example 1*:

```
int function( int i );
int function( char c );

function( 'x' );
```

It is preferable that this call match the second version of function rather than the first. — *end example*]

Effect on original feature: Change to semantics of well-defined feature. C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.
Difficulty of converting: Simple.
How widely used: Programs which depend upon `sizeof('x')` are probably rare.

3 **Affected subclause:** 5.13.5
Change: Concatenated *string-literal*s can no longer have conflicting *encoding-prefix*es.
Rationale: Removal of non-portable feature.
Effect on original feature: Concatenation of *string-literal*s with different *encoding-prefix*es is now ill-formed.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

4 **Affected subclause:** 5.13.5
Change: String literals made const.
The type of a *string-literal* is changed from "array of `char`" to "array of `const char`". The type of a UTF-8 string literal is changed from "array of `char`" to "array of `const char8_t`". The type of a UTF-16 string literal is changed from "array of *some-integer-type*" to "array of `const char16_t`". The type of a UTF-32 string literal is changed from "array of *some-integer-type*" to "array of `const char32_t`". The type of a wide string literal is changed from "array of `wchar_t`" to "array of `const wchar_t`".
Rationale: This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Syntactic transformation. The fix is to add a cast:

```
char* p = "abc";                // valid in C, invalid in C++
void f(char*) {
  char* p = (char*)"abc";       // OK, cast added
  f(p);
  f((char*)"def");              // OK, cast added
}
```

How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

C.7.3 Clause 6: basics [diff.basic]

1 **Affected subclause:** 6.2
Change: C++ does not have “tentative definitions” as in C.

[*Example 1*: At file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. — *end example*]

This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C.

[*Example 2*:

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

— *end example*]

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.
How widely used: Seldom.

2 **Affected subclause:** 6.4
Change: A `struct` is a scope in C++, not in C.

[*Example 3*:

```
struct X {
  struct Y { int a; } b;
};
struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`. — *end example*]

Rationale: Class scope is crucial to C++, and a struct is a class.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 **Affected subclause:** 6.6 [also 9.2.9]
Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.
Rationale: Because const objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each const object. This feature allows the user to put const objects in source files that are included in more than one translation unit.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

4 **Affected subclause:** 6.9.3.1
Change: The `main` function cannot be called recursively and cannot have its address taken.
Rationale: The `main` function may require special actions.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.
How widely used: Seldom.

5 **Affected subclause:** 6.8
Change: C allows “compatible types” in several places, C++ does not.
For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The "typesafe linkage" mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the "layout compatibility rules" of this document.
How widely used: Common.

C.7.4 Clause 7: expressions [diff.expr]

1 **Affected subclause:** 7.3.12
Change: Converting `void*` to a pointer-to-object type requires casting.

[*Example 1*:

```
char a[10];
void* b=a;
void foo() {
  char* c=b;
}
```

C accepts this usage of pointer to `void` being assigned to a pointer to object type. C++ does not. — *end example*]

Rationale: C++ tries harder than C to enforce compile-time type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast.

[*Example 2*:

```
char* c = (char*) b;
```

— *end example*]

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some C translators will give a warning if the cast is not used.

2 **Affected subclause:** 7.4
Change: Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are not valid.

[*Example 3*:

```
enum E1 { e };
enum E2 { f };
int b = e <= 3.7;           // valid in C; ill-formed in C++
int k = f - e;              // valid in C; ill-formed in C++
int x = 1 ? e : f;          // valid in C; ill-formed in C++
```

— *end example*]

Rationale: Reinforcing type safety in C++.
Effect on original feature: Well-formed C code will not compile with this International Standard.
Difficulty of converting: Violations will be diagnosed by the C++ translator. The original behavior can be restored with a cast or integral promotion.

[*Example 4*:

```
enum E1 { e };
enum E2 { f };
int b = (int)e <= 3.7;
int k = +f - e;
```

— *end example*]

How widely used: Uncommon.

3 **Affected subclauses:** 7.6.1.6 and 7.6.2.3
Change: Decrement operator is not allowed with `bool` operand.
Rationale: Feature with surprising semantics.
Effect on original feature: A valid C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` (17.15.5)) is ill-formed in C++.

4 **Affected subclauses:** 7.6.2.5 and 7.6.3
Change: In C++, types can only be defined in declarations, not in expressions.
In C, a `sizeof` expression or cast expression may define a new type.

[*Example 5*:

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, struct `x`. — *end example*]

Rationale: This prohibition helps to clarify the location of definitions in the source code.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

5 **Affected subclauses:** 7.6.9 and 7.6.10
Change: C allows directly comparing two objects of array type; C++ does not.
Rationale: The behavior is confusing because it compares not the contents of the two arrays, but their addresses.
Effect on original feature: Deletion of semantically well-defined feature that had unspecified behavior in common use cases.
Difficulty of converting: Violations will be diagnosed by the C++ translator. The original behavior can be replicated by explicitly casting either array to a pointer, such as by using a unary `+`.

[*Example 6*:

```
int arr1[5];
int arr2[5];
int same = arr1 == arr2;        // valid C, ill-formed C++
int idem = arr1 == +arr2;       // valid in both C and C++
```

— *end example*]

How widely used: Rare.

6 **Affected subclauses:** 7.6.16, 7.6.19, and 7.6.20
Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.
Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.
Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results.

[*Example 7*:

```
char arr[100];
sizeof(0, arr)
```

yields `100` in C++ and `sizeof(char*)` in C. — *end example*]

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.
How widely used: Rare.

C.7.5 Clause 8: statements [diff.stat]

1 **Affected subclauses:** 8.5.3 and 8.7.6
Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).
Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

2 **Affected subclause:** 8.7.4
Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with `void` and `int` return types.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.
How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.7.6 Clause 9: declarations [diff.dcl]

1 **Affected subclause:** 9.2.2
Change: In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

[*Example 1*:

```
static struct S {                // valid C, invalid in C++
  int i;
};
```

— *end example*]

Rationale: Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Storage class specifiers on type declarations can be confusing for users.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

2 **Affected subclause:** 9.2.2
Change: In C++, `register` is not a storage class specifier.
Rationale: The storage class specifier had no effect in C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common.

3 **Affected subclause:** 9.2.4
Change: A C++ *typedef-name* must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a *typedef-name* and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

[*Example 2*:

```
typedef struct name1 { /* ... */ } name1;         // valid C and C++
struct name { /* ... */ };
typedef int name;                // valid C, invalid C++
```

— *end example*]

Rationale: For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

[*Example 3*:

```
class name { /* ... */ };
name i;                          // i has type class name
```

— *end example*]

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.
How widely used: Seldom.

4 **Affected subclause:** 9.2.9 [see also 6.6]
Change: Const objects must be initialized in C++ but can be left uninitialized in C.
Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

5 **Affected subclause:** 9.2.9.7
Change: The keyword `auto` cannot be used as a storage class specifier.

[*Example 4*:

```
void f() {
  auto int x;        // valid C, invalid C++
}
```

— *end example*]

Rationale: Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

6 **Affected subclause:** 9.3.4.6
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

[*Example 5*:

```
int f();             // means int f(void) in C++
                     // int f( unknown ) in C
```

— *end example*]

Rationale: This is to avoid function calls with the wrong number or type of arguments.
Effect on original feature: Change to semantics of well-defined feature. This feature was marked as "obsolescent" in C.
Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.
How widely used: Common.

7 **Affected subclause:** 9.3.4.6 [see 7.6.2.5]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

[*Example 6*:

```
void f( struct S { int a; } arg ) {}     // valid C, invalid C++
enum E { A, B, C } f() {}                // valid C, invalid C++
```

— *end example*]

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.
How widely used: Seldom. This style of type definition is seen as poor coding style.

8 **Affected subclause:** 9.6
Change: In C++, the syntax for function definition excludes the "old-style" C function. In C, "old-style" syntax is allowed, but deprecated as "obsolescent".
Rationale: Prototypes are essential to type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common in old programs, but already known to be obsolescent.

9 **Affected subclause:** 9.5.2
Change: In C++, designated initialization support is restricted compared to the corresponding functionality

in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

[*Example 7*:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2};  // valid C, invalid C++
int arr[3] = {[1] = 5};         // valid C, invalid C++
struct B b = {.a.x = 0};        // valid C, invalid C++
struct A c = {.x = 1, 2};       // valid C, invalid C++
```

— *end example*]

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so member initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.
Effect on original feature: Deletion of feature that is incompatible with C++.
Difficulty of converting: Syntactic transformation.
How widely used: Out-of-order initializers are common. The other features are seldom used.

10 **Affected subclause:** 9.5.3
Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating `'\0'`) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating `'\0'`.

[*Example 8*:

```
char array[4] = "abcd";         // valid C, invalid C++
```

— *end example*]

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating `'\0'`.
How widely used: Seldom. This style of array initialization is seen as poor coding style.

11 **Affected subclause:** 9.8.1
Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

[*Example 9*:

```
enum color { red, blue, green };
enum color c = 1;               // valid C, invalid C++
```

— *end example*]

Rationale: The type-safe nature of C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)
How widely used: Common.

12 **Affected subclause:** 9.8.1
Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

[*Example 10*:

```
enum e { A };
sizeof(A) == sizeof(int)        // in C
sizeof(A) == sizeof(e)          // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

— *end example*]

Rationale: In C++, an enumeration is a distinct type.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

13 **Affected subclause:** 9.13.2
Change: In C++, an *alignment-specifier* is an *attribute-specifier*. In C, an *alignment-specifier* is a *declaration-specifier*.

[*Example 11*:

```
#include <stdalign.h>
unsigned alignas(8) int x;      // valid C, invalid C++
unsigned int y alignas(8);      // valid C++, invalid C
```

— *end example*]

Rationale: C++ requires unambiguous placement of the *alignment-specifier*.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

C.7.7 Clause 11: classes [diff.class]

1 **Affected subclause:** 11.3 [see also 9.2.4]
Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

[*Example 1*:

```
int x[99];
void f() {
  struct x { int a; };
  sizeof(x);  /* size of the array in C */
  /* size of the struct in C++ */
}
```

— *end example*]

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.
How widely used: Seldom.

2 **Affected subclause:** 11.4.5.3
Change: Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue.

[*Example 2*: The following is valid in C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1;               // invalid C++
struct X x3;
x3 = x1;                        // also invalid C++
```

— *end example*]

Rationale: Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases

and members.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.
How widely used: Seldom.

3 **Affected subclause:** 11.4.10
Change: Bit-fields of type plain `int` are signed.
Rationale: The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.
Effect on original feature: The choice is implementation-defined in C, but not so in C++.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

4 **Affected subclause:** 11.4.12
Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

[*Example 3*:
```
struct X {
  struct Y { /* ... */ } y;
};
struct Y yy;                    // valid C, invalid C++
```
— *end example*]

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined.

[*Example 4*:
```
struct Y;                       // struct Y and struct X are at the same scope
struct X {
  struct Y { /* ... */ } y;
};
```
— *end example*]

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.4.
How widely used: Seldom.

5 **Affected subclause:** 6.5.2
Change: In C++, a *typedef-name* may not be redeclared in a class definition after being used in that definition.

[*Example 5*:
```
typedef int I;
struct S {
  I i;
  int I;            // valid C, invalid C++
};
```
— *end example*]

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of `I` really is.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. Either the type or the struct member has to be

renamed.
How widely used: Seldom.

C.7.8 Clause 15: preprocessing directives [diff.cpp]

1 **Affected subclause:** 15.12
Change: Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.
Rationale: C++ is not identical to C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Programs and headers that reference `__STDC__` are quite common.

C.8 C standard library [diff.library]

C.8.1 General [diff.library.general]

1 Subclause C.8 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.8.2 Modifications to headers [diff.mods.to.headers]

1 For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.15.

2 There are no C++ headers for the C standard library's headers `<stdnoreturn.h>` and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.

3 The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.8.3 Modifications to definitions [diff.mods.to.definitions]

C.8.3.1 Types `char16_t` and `char32_t` [diff.char16]

1 The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in C++ (5.12). They do not appear as macro or type names defined in `<cuchar>` (28.7.4).

C.8.3.2 Type `wchar_t` [diff.wchar.t]

1 The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ (5.12). It does not appear as a macro or type name defined in any of `<cstddef>` (17.2.1), `<cstdlib>` (17.2.2), or `<cwchar>` (28.7.3).

C.8.3.3 Header `<assert.h>` [diff.header.assert.h]

1 The token `static_assert` is a keyword in C++. It does not appear as a macro name defined in `<cassert>` (19.3.2).

C.8.3.4 Header `<iso646.h>` [diff.header.iso646.h]

1 The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ (5.12), and are not introduced as macros by `<iso646.h>` (17.15.3).

C.8.3.5 Header `<stdalign.h>` [diff.header.stdalign.h]

1 The token `alignas` is a keyword in C++ (5.12), and is not introduced as a macro by `<stdalign.h>` (17.15.4).

C.8.3.6 Header `<stdbool.h>` [diff.header.stdbool.h]

1 The tokens `bool`, `true`, and `false` are keywords in C++ (5.12), and are not introduced as macros by `<stdbool.h>` (17.15.5).

C.8.3.7 Macro `NULL` [diff.null]

1 The macro `NULL`, defined in any of `<clocale>` (28.3.5.1), `<cstddef>` (17.2.1), `<cstdio>` (31.13.1), `<cstdlib>` (17.2.2), `<cstring>` (27.5.1), `<ctime>` (30.15), or `<cwchar>` (28.7.3), is an implementation-defined null pointer constant in C++ (17.2).

C.8.4 Modifications to declarations [diff.mods.to.declarations]

1 Header `<cstring>` (27.5.1): The following functions have different declarations:

(1.1) — `strchr`

(1.2) — `strpbrk`

(1.3) — `strrchr`

(1.4) — `strstr`

(1.5) — `memchr`

Subclause 27.5.1 describes the changes.

2 Header `<cwchar>` (28.7.3): The following functions have different declarations:

(2.1) — `wcschr`

(2.2) — `wcspbrk`

(2.3) — `wcsrchr`

(2.4) — `wcsstr`

(2.5) — `wmemchr`

Subclause 28.7.3 describes the changes.

3 Header `<cstddef>` (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in (17.2.5), in addition to the names declared in `<stddef.h>` (17.15) in the C standard library.

C.8.5 Modifications to behavior [diff.mods.to.behavior]

C.8.5.1 General [diff.mods.to.behavior.general]

1 Header `<cstdlib>` (17.2.2): The following functions have different behavior:

(1.1) — `atexit`

(1.2) — `exit`

(1.3) — `abort`

Subclause 17.5 describes the changes.

2 Header `<csetjmp>` (17.14.3): The following functions have different behavior:

(2.1) — `longjmp`

Subclause 17.14.3 describes the changes.

C.8.5.2 Macro `offsetof(`*`type`*`, `*`member-designator`*`)` [diff.offsetof]

1 The macro `offsetof`, defined in `<cstddef>` (17.2.1), accepts a restricted set of *`type`* arguments in C++. Subclause 17.2.4 describes the change.

C.8.5.3 Memory allocation functions [diff.malloc]

1 The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.

Annex D
(normative)

Compatibility features [depr]

D.1 General [depr.general]

1 This Annex describes features of this document that are specified for compatibility with existing implementations.

2 These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the `deprecated` attribute (9.13.4).

D.2 Non-local use of TU-local entities [depr.local]

1 A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[*Note 1*: Such a declaration in an importable module unit is ill-formed. — *end note*]

[*Example 1*:

```
namespace {
  struct A {
    void f() {}
  };
}
A h();                          // deprecated: not internal linkage
inline void g() {A().f();}      // deprecated: inline and not internal linkage
```

— *end example*]

D.3 Implicit capture of `*this` by reference [depr.capture.this]

1 For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* `=` (7.5.6.3) may implicitly capture `*this` by reference.

[*Example 1*:

```
struct X {
  int x;
  void foo(int n) {
    auto f = [=]() { x = n; };         // deprecated: x means this->x, not a copy thereof
    auto g = [=, this]() { x = n; };   // recommended replacement
  }
};
```

— *end example*]

D.4 Deprecated `volatile` types [depr.volatile.type]

1 Postfix `++` and `--` expressions (7.6.1.6) and prefix `++` and `--` expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[*Example 1*:

```
volatile int velociraptor;
++velociraptor;                     // deprecated
```

— *end example*]

2 Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[*Example 2*:

```
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck;                 // OK
tail = brachiosaur;                 // OK
tail = brachiosaur = neck;          // deprecated
brachiosaur += neck;                // OK
```

— *end example*]

3 A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[*Example 3*:

```
volatile struct amber jurassic();                                 // deprecated
void trex(volatile short left_arm, volatile short right_arm);    // deprecated
void fly(volatile struct pterosaur* pteranodon);                  // OK
```

— *end example*]

4 A structured binding (9.7) of a volatile-qualified type is deprecated.

[*Example 4*:

```
struct linhenykus { short forelimb; };
void park(linhenykus alvarezsauroid) {
  volatile auto [what_is_this] = alvarezsauroid;                  // deprecated
  // ...
}
```

— *end example*]

D.5 Non-comma-separated ellipsis parameters [depr.ellipsis.comma]

A *parameter-declaration-clause* of the form *parameter-declaration-list* `...` is deprecated (9.3.4.6).

[*Example 1*:

```
void f(int...);          // deprecated
void g(auto...);         // OK, declares a function parameter pack
void h(auto......);      // deprecated
```

— *end example*]

D.6 Implicit declaration of copy functions [depr.impldec]

1 The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.6.3).

D.7 Redeclaration of static constexpr data members [depr.static.constexpr]

1 For compatibility with prior revisions of C++, a `constexpr` static data member may be redundantly redeclared outside the class with no initializer (6.2, 11.4.9.3). This usage is deprecated.

[*Example 1*:

```
struct A {
  static constexpr int n = 5;    // definition (declaration in C++ 2014)
};

constexpr int A::n;              // redundant declaration (definition in C++ 2014)
```

— *end example*]

D.8 Literal operator function declarations using an identifier [depr.lit]

1 A *literal-operator-id* (12.6) of the form

`operator` *unevaluated-string identifier*

is deprecated.

D.9 template keyword before qualified names [depr.template.template]

1 The use of the keyword `template` before the qualified name of a class or alias template without a template argument list is deprecated (13.3).

D.10 has_denorm members in numeric_limits [depr.numeric.limits.has.denorm]

1 The following type is defined in addition to those specified in `<limits>` (17.3.3):

```
namespace std {
  enum float_denorm_style {
    denorm_indeterminate = -1,
    denorm_absent = 0,
    denorm_present = 1
  };
}
```

2 The following members are defined in addition to those specified in 17.3.5.1:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

3 The values of `has_denorm` and `has_denorm_loss` of specializations of `numeric_limits` are unspecified.

4 The following members of the specialization `numeric_limits<bool>` are defined in addition to those specified in 17.3.5.3:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

D.11 Deprecated C macros [depr.c.macros]

1 The header `<stdalign.h>` (17.15.4) has the following macros:

```
#define __alignas_is_defined 1
#define __alignof_is_defined 1
```

2 The header `<stdbool.h>` (17.15.5) has the following macro:

```
#define __bool_true_false_are_defined 1
```

D.12 Deprecated error numbers [depr.cerrno]

1 The header `<cerrno>` (19.4.2) has the following additional macros:

```
#define ENODATA see below
#define ENOSR see below
#define ENOSTR see below
#define ETIME see below
```

2 The meaning of these macros is defined by the POSIX standard.

3 The following `enum errc` enumerators are defined in addition to those specified in 19.5.2:

```
no_message_available,              // ENODATA
no_stream_resources,               // ENOSR
not_a_stream,                      // ENOSTR
stream_timeout,                    // ETIME
```

4 The value of each `enum errc` enumerator above is the same as the value of the `<cerrno>` macro shown in the above synopsis.

D.13 Deprecated type traits [depr.meta.types]

1 The header `<type_traits>` (21.3.3) has the following addition:

```
namespace std {
  template<class T> struct is_trivial;
  template<class T> constexpr bool is_trivial_v = is_trivial<T>::value;
  template<class T> struct is_pod;
  template<class T> constexpr bool is_pod_v = is_pod<T>::value;
  template<size_t Len, size_t Align = default-alignment> // see below
    struct aligned_storage;
  template<size_t Len, size_t Align = default-alignment> // see below
    using aligned_storage_t = typename aligned_storage<Len, Align>::type;
  template<size_t Len, class... Types>
    struct aligned_union;
  template<size_t Len, class... Types>
    using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```

2 The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

3 A *trivial class* is a class that is trivially copyable and has one or more eligible default constructors, all of which are trivial.

[*Note 1*: In particular, a trivial class does not have virtual functions or virtual base classes. — *end note*]

A *trivial type* is a scalar type, a trivial class, an array of such a type, or a cv-qualified version of one of these types.

4 A *POD class* is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A *POD type* is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

```
template<class T> struct is_trivial;
```

5 *Preconditions*: `remove_all_extents_t<T>` shall be a complete type or *cv* `void`.

6 *Remarks*: `is_trivial<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a trivial type, and `false_type` otherwise.

7 [*Note 2*: It is unspecified whether a closure type (7.5.6.2) is a trivial type. — *end note*]

```
template<class T> struct is_pod;
```

8 *Preconditions*: `remove_all_extents_t<T>` shall be a complete type or *cv* `void`.

9 *Remarks*: `is_pod<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise.

10 [*Note 3*: It is unspecified whether a closure type (7.5.6.2) is a POD type. — *end note*]

```
template<size_t Len, size_t Align = default-alignment>
  struct aligned_storage;
```

11 The value of *`default-alignment`* is the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.8).

12 *Mandates*: `Len` is not zero. `Align` is equal to `alignof(T)` for some type `T` or to *`default-alignment`*.

13 The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`.

14 [*Note 4*: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`. — *end note*]

15 [*Note 5*: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
  typedef struct {
    alignas(Alignment) unsigned char __data[Len];
  } type;
};
```

— *end note*]

```
template<size_t Len, class... Types>
  struct aligned_union;
```

16 *Mandates*: At least one type is provided. Each type in the template parameter pack `Types` is a complete object type.

17 The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` is an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`.

D.14 Relational operators [depr.relops]

1 The header `<utility>` (22.2.1) has the following additions:

```
  namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
  }
```

2 To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

3 *Preconditions*: `T` meets the *Cpp17EqualityComparable* requirements (Table 28).

4 *Returns*: `!(x == y)`.

```
template<class T> bool operator>(const T& x, const T& y);
```

5 *Preconditions*: `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

6 *Returns*: `y < x`.

```
template<class T> bool operator<=(const T& x, const T& y);
```

7 *Preconditions*: `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

8 *Returns*: `!(y < x)`.

```
template<class T> bool operator>=(const T& x, const T& y);
```

9 *Preconditions*: `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

10 *Returns*: `!(x < y)`.

D.15 Tuple [depr.tuple]

1 The header `<tuple>` (22.4.2) has the following additions:

```
  namespace std {
    template<class T> struct tuple_size<volatile T>;
    template<class T> struct tuple_size<const volatile T>;

    template<size_t I, class T> struct tuple_element<I, volatile T>;
    template<size_t I, class T> struct tuple_element<I, const volatile T>;
  }
```

```
template<class T> struct tuple_size<volatile T>;
template<class T> struct tuple_size<const volatile T>;
```

2 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member `value`.

3 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

4 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

5 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

(5.1) — for the first specialization, `add_volatile_t<TE>`, and

(5.2) — for the second specialization, `add_cv_t<TE>`.

6 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

D.16 Variant [depr.variant]

1 The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
  template<class T> struct variant_size<volatile T>;
  template<class T> struct variant_size<const volatile T>;

  template<size_t I, class T> struct variant_alternative<I, volatile T>;
  template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}
```

```
template<class T> struct variant_size<volatile T>;
template<class T> struct variant_size<const volatile T>;
```

2 Let `VS` denote `variant_size<T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
```

3 Let `VA` denote `variant_alternative<I, T>` of the cv-unqualified type `T`. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

(3.1) — for the first specialization, `add_volatile_t<VA::type>`, and

(3.2) — for the second specialization, `add_cv_t<VA::type>`.

D.17 Deprecated `iterator` class template [depr.iterator]

1 The header `<iterator>` (24.2) has the following addition:

```
namespace std {
  template<class Category, class T, class Distance = ptrdiff_t,
           class Pointer = T*, class Reference = T&>
  struct iterator {
    using iterator_category = Category;
    using value_type        = T;
    using difference_type   = Distance;
    using pointer           = Pointer;
    using reference         = Reference;
  };
}
```

2 The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

3 [*Note 1*: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — *end note*]

4 [*Example 1*: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```
class MyIterator :
  public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
  // code implementing ++, etc.
};
```

— *end example*]

D.18 Deprecated `move_iterator` access [depr.move.iter.elem]

1 The following member is declared in addition to those members specified in 24.5.4.6:

```
namespace std {
  template<class Iterator>
  class move_iterator {
  public:
    constexpr pointer operator->() const;
  };
}
```

```
constexpr pointer operator->() const;
```

2 *Returns*: `current`.

D.19 Deprecated locale category facets [depr.locale.category]

1 The `ctype` locale category includes the following facets as if they were specified in Table 89 of 28.3.3.1.2.1.

```
codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>
codecvt<char16_t, char8_t, mbstate_t>
codecvt<char32_t, char8_t, mbstate_t>
```

2 The `ctype` locale category includes the following facets as if they were specified in Table 90 of 28.3.3.1.2.1.

```
codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>
codecvt_byname<char16_t, char8_t, mbstate_t>
codecvt_byname<char32_t, char8_t, mbstate_t>
```

3 The following class template specializations are required in addition to those specified in 28.3.4.2.5. The specializations `codecvt<char16_t, char, mbstate_t>` and `codecvt<char16_t, char8_t, mbstate_t>` convert between the UTF-16 and UTF-8 encoding forms, and the specializations `codecvt<char32_t, char, mbstate_t>` and `codecvt<char32_t, char8_t, mbstate_t>` convert between the UTF-32 and UTF-8 encoding forms.

D.20 Deprecated formatting [depr.format]

D.20.1 Header `<format>` synopsis [depr.format.syn]

1 The header `<format>` (28.5.1) has the following additions:

```
namespace std {
  template<class Visitor, class Context>
    decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
}
```

D.20.2 Formatting arguments [depr.format.arg]

```
template<class Visitor, class Context>
  decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

1 *Effects*: Equivalent to: `return visit(std::forward<Visitor>(vis), arg.value);`

D.21 Deprecated filesystem path factory functions [depr.fs.path.factory]

1 The header `<filesystem>` (31.12.4) has the following additions:

```
template<class Source>
  path u8path(const Source& source);
template<class InputIterator>
  path u8path(InputIterator first, InputIterator last);
```

2 *Mandates*: The value type of `Source` and `InputIterator` is `char` or `char8_t`.

3 *Preconditions*: The `source` and [`first`, `last`) sequences are UTF-8 encoded. `Source` meets the requirements specified in 31.12.6.4.

4 *Returns*:

(4.1) — If `path::value_type` is `char` and the current native narrow encoding (31.12.6.3.2) is UTF-8, return `path(source)` or `path(first, last)`; otherwise, (4.2) — if `path::value_type` is `wchar_t` and the native wide encoding is UTF-16, or if `path::value_type` is `char16_t` or `char32_t`, convert `source` or [`first`, `last`) to a temporary, `tmp`, of type `path::string_type` and return `path(tmp)`; otherwise,

(4.3) — convert `source` or [`first`, `last`) to a temporary, `tmp`, of type `u32string` and return `path(tmp)`.

5 *Remarks*: Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

6 [*Example 1*: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*]

[*Note 1*: The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`'s constructor is preferred as it is consistent with `path`'s handling of other encodings. — *end note*]

D.22 Deprecated atomic operations [depr.atomics]

D.22.1 General [depr.atomics.general]

1 The header `<atomic>` (32.5.2) has the following additions.

```
namespace std {
  template<class T>
    void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
  template<class T>
    void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;
  template<class T>
    constexpr T kill_dependency(T y) noexcept;                                // freestanding
  inline constexpr memory_order memory_order_consume = memory_order::consume;   // freestanding

  #define ATOMIC_VAR_INIT(value) see below
}
```

D.22.2 Volatile access [depr.atomics.volatile]

1 If an `atomic` (32.5.8) specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is `false`:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
```

D.22.3 Non-member functions [depr.atomics.nonmembers]

```
template<class T>
  void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
  void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

1 *Effects*: Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);`

D.22.4 Operations on atomic types [depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

1 The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

[*Note 1*: This operation possibly needs to initialize locks. — *end note*]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[*Example 1*:

```
atomic<int> v = ATOMIC_VAR_INIT(5);
```

— *end example*]

D.22.5 `memory_order::consume` [depr.atomics.order]

1 The memory_order enumeration contains an additional enumerator:

```
consume = 1
```

The `memory_order::consume` enumerator is allowed wherever `memory_order::acquire` is allowed, and it has the same meaning.

```
template<class T> constexpr T kill_dependency(T y) noexcept;
```

2 *Returns*: `y`.

Annex E (informative)

Conformance with UAX #31 [uaxid]

E.1 General [uaxid.general]

1 This Annex describes the choices made in application of UAX #31 ("Unicode Identifier and Pattern Syntax") to C++ in terms of the requirements from UAX #31 and how they do or do not apply to this document. In terms of UAX #31, this document conforms by meeting the requirements R1 "Default Identifiers" and R4 "Equivalent Normalized Identifiers" from UAX #31. The other requirements from UAX #31, also listed below, are either alternatives not taken or do not apply to this document.

E.2 R1 Default identifiers [uaxid.def]

E.2.1 General [uaxid.def.general]

1 UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

```
<Identifier> := <Start> <Continue>* (<Medial> <Continue>+)*
```

where `<Start>` has the XID_Start property, `<Continue>` has the XID_Continue property, and `<Medial>` is a list of characters permitted between continue characters. For C++ we add the character U+005F LOW LINE, or `_`, to the set of permitted `<Start>` characters, the `<Medial>` set is empty, and the `<Continue>` characters are unmodified. In the grammar used in UAX #31, this is

```
<Identifier> := <Start> <Continue>*
<Start> := XID_Start + U+005F
<Continue> := <Start> + XID_Continue
```

2 This is described in the C++ grammar in 5.11, where *identifier* is formed from *identifier-start* or *identifier* followed by *identifier-continue*.

E.2.2 R1a Restricted format characters [uaxid.def.rfmt]

1 If an implementation of UAX #31 wishes to allow format characters such as U+200D ZERO WIDTH JOINER or U+200C ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.

2 C++ does not allow format characters in identifiers, so this does not apply.

E.2.3 R1b Stable identifiers [uaxid.def.stable]

1 An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.

2 C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID_Start and XID_Continue properties.

E.3 R2 Immutable identifiers [uaxid.immutable]

1 An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.

2 C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

E.4 R3 Pattern_White_Space and Pattern_Syntax characters [uaxid.pattern]

1 UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.

2 This document does not claim conformance with this requirement from UAX #31.

E.5 R4 Equivalent normalized identifiers [uaxid.eqn]

1 UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.

2 This document requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.11.

E.6 R5 Equivalent case-insensitive identifiers [uaxid.eqci]

1 This document considers case to be significant in identifier comparison, and does not do any case folding. This requirement from UAX #31 does not apply to this document.

E.7 R6 Filtered normalized identifiers [uaxid.filter]

1 If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.

2 This document does not make any such exclusions.

E.8 R7 Filtered case-insensitive identifiers [uaxid.filterci]

1 C++ identifiers are case sensitive, and therefore this requirement from UAX #31 does not apply.

E.9 R8 Hashtag identifiers [uaxid.hashtag]

1 There are no hashtags in C++, so this requirement from UAX #31 does not apply.

Index

Constructions whose name appears in *`monospaced italics`* are for exposition only.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

Index of library headers

The bold page number for each entry refers to the page where the synopsis of the header is shown.

Index of library names

Constructions whose name appears in *italics* are for exposition only.

Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in *italics* are for exposition only.

Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.
