5 *Type*: `Ptr::difference_type` if the *qualified-id* `Ptr::difference_type` is valid and denotes a type (13.10.3); otherwise, `ptrdiff_t`.

```
template<class U> using rebind = see below;
```

6 *Alias template*: `Ptr::rebind<U>` if the *qualified-id* `Ptr::rebind<U>` is valid and denotes a type (13.10.3); otherwise, `SomePointer<U, Args>` if `Ptr` is a class template instantiation of the form `SomePointer<T, Args>`, where `Args` is zero or more type arguments; otherwise, the instantiation of `rebind` is ill-formed.

20.2.3.3 Member functions [pointer.traits.functions]

```
static pointer pointer_traits::pointer_to(see below r);
static constexpr pointer pointer_traits<T*>::pointer_to(see below r) noexcept;
```

1 *Mandates*: For the first member function, `Ptr::pointer_to(r)` is well-formed.

2 *Preconditions*: For the first member function, `Ptr::pointer_to(r)` returns a pointer to `r` through which indirection is valid.

3 *Returns*: The first member function returns `Ptr::pointer_to(r)`. The second member function returns `addressof(r)`.

4 *Remarks*: If `element_type` is *cv* `void`, the type of `r` is unspecified; otherwise, it is `element_type&`.

20.2.3.4 Optional members [pointer.traits.optmem]

1 Specializations of `pointer_traits` may define the member declared in this subclause to customize the behavior of the standard library. A specialization generated from the `pointer_traits` primary template has no member by this name.

```
static element_type* to_address(pointer p) noexcept;
```

2 *Returns*: A pointer of type `element_type*` that references the same location as the argument `p`.

3 [*Note 1*: This function is intended to be the inverse of `pointer_to`. If defined, it customizes the behavior of the non-member function `to_address` (20.2.4). — *end note*]

20.2.4 Pointer conversion [pointer.conversion]

```
template<class T> constexpr T* to_address(T* p) noexcept;
```

1 *Mandates*: `T` is not a function type.

2 *Returns*: `p`.

```
template<class Ptr> constexpr auto to_address(const Ptr& p) noexcept;
```

3 *Returns*: `pointer_traits<Ptr>::to_address(p)` if that expression is well-formed (see 20.2.3.4), otherwise `to_address(p.operator->())`.

20.2.5 Pointer alignment [ptr.align]

```
void* align(size_t alignment, size_t size, void*& ptr, size_t& space);
```

1 *Preconditions*:

(1.1) — `alignment` is a power of two

(1.2) — `ptr` represents the address of contiguous storage of at least `space` bytes

2 *Effects*: If it is possible to fit `size` bytes of storage aligned by `alignment` into the buffer pointed to by `ptr` with length `space`, the function updates `ptr` to represent the first possible address of such storage and decreases `space` by the number of bytes used for alignment. Otherwise, the function does nothing.

3 *Returns*: A null pointer if the requested aligned buffer would not fit into the available space, otherwise the adjusted value of `ptr`.

4 [*Note 1*: The function updates its `ptr` and `space` arguments so that it can be called repeatedly with possibly different `alignment` and `size` arguments for the same buffer. — *end note*]

```
template<size_t N, class T>
  constexpr T* assume_aligned(T* ptr);
```

5 *Mandates*: `N` is a power of two.

6 *Preconditions*: `ptr` points to an object *X* of a type similar (7.3.6) to `T`, where *X* has alignment `N` (6.7.3).

7 *Returns*: `ptr`.

8 *Throws*: Nothing.

9 [*Note 2*: The alignment assumption on an object *X* expressed by a call to `assume_aligned` might result in generation of more efficient code. It is up to the program to ensure that the assumption actually holds. The call does not cause the implementation to verify or enforce this. An implementation might only make the assumption for those operations on *X* that access *X* through the pointer returned by `assume_aligned`. — *end note*]

```
template<size_t Alignment, class T>
  bool is_sufficiently_aligned(T* ptr);
```

10 *Preconditions*: `p` points to an object `X` of a type similar (7.3.6) to `T`.

11 *Returns*: `true` if `X` has alignment at least `Alignment`, otherwise `false`.

12 *Throws*: Nothing.

20.2.6 Explicit lifetime management [obj.lifetime]

```
template<class T>
  T* start_lifetime_as(void* p) noexcept;
template<class T>
  const T* start_lifetime_as(const void* p) noexcept;
template<class T>
  volatile T* start_lifetime_as(volatile void* p) noexcept;
template<class T>
  const volatile T* start_lifetime_as(const volatile void* p) noexcept;
```

1 *Mandates*: `T` is an implicit-lifetime type (6.8.1) and not an incomplete type (6.8.1).

2 *Preconditions*: [`p`, `(char*)p + sizeof(T)`) denotes a region of allocated storage that is a subset of the region of storage reachable through (6.8.4) `p` and suitably aligned for the type `T`.

3 *Effects*: Implicitly creates objects (6.7.2) within the denoted region consisting of an object *a* of type `T` whose address is `p`, and objects nested within *a*, as follows: The object representation of *a* is the contents of the storage prior to the call to `start_lifetime_as`. The value of each created object *o* of trivially copyable type (6.8.1) `U` is determined in the same manner as for a call to `bit_cast<U>(E)` (22.11.3), where `E` is an lvalue of type `U` denoting *o*, except that the storage is not accessed. The value of any other created object is unspecified.

[*Note 1*: The unspecified value can be indeterminate. — *end note*]

4 *Returns*: A pointer to the *a* defined in the *Effects* paragraph.

```
template<class T>
  T* start_lifetime_as_array(void* p, size_t n) noexcept;
template<class T>
  const T* start_lifetime_as_array(const void* p, size_t n) noexcept;
template<class T>
  volatile T* start_lifetime_as_array(volatile void* p, size_t n) noexcept;
```

```
template<class T>
  const volatile T* start_lifetime_as_array(const volatile void* p, size_t n) noexcept;
```

5 *Mandates*: `T` is a complete type.

6 *Preconditions*: `p` is suitably aligned for an array of `T` or is null. `n <= size_t(-1) / sizeof(T)` is `true`. If `n > 0` is `true`, [`(char*)p`, `(char*)p + (n * sizeof(T))`) denotes a region of allocated storage that is a subset of the region of storage reachable through (6.8.4) `p`.

7 *Effects*: If `n > 0` is `true`, equivalent to `start_lifetime_as<U>(p)` where `U` is the type "array of `n T`". Otherwise, there are no effects.

8 *Returns*: A pointer to the first element of the created array, if any; otherwise, a pointer that compares equal to `p` (7.6.10).

```
template<class T>
  T* trivially_relocate(T* first, T* last, T* result);
```

9 *Mandates*: `is_trivially_relocatable_v<T> && !is_const_v<T>` is `true`. `T` is not an array of unknown bound.

10 *Preconditions*:

(10.1) — [`first`, `last`) is a valid range.

(10.2) — [`result`, `result + (last - first)`) denotes a region of storage that is a subset of the region reachable through `result` (6.8.4) and suitably aligned for the type `T`.

(10.3) — No element in the range [`first`, `last`) is a potentially-overlapping subobject.

11 *Postconditions*: No effect if `result == first` is `true`. Otherwise, the range denoted by [`result`, `result + (last - first)`) contains objects (including subobjects) whose lifetime has begun and whose object representations are the original object representations of the corresponding objects in the source range [`first`, `last`) except for any parts of the object representations used by the implementation to represent type information (6.7.2). If any of the objects has union type, its active member is the same as that of the corresponding object in the source range. If any of the aforementioned objects has a non-static data member of reference type, that reference refers to the same entity as does the corresponding reference in the source range. The lifetimes of the original objects in the source range have ended.

12 *Returns*: `result + (last - first)`.

13 *Throws*: Nothing.

14 *Complexity*: Linear in the length of the source range.

15 *Remarks*: The destination region of storage is considered reused (6.7.4). No constructors or destructors are invoked.

[*Note 2*: Overlapping ranges are supported. — *end note*]

```
template<class T>
  constexpr T* relocate(T* first, T* last, T* result);
```

16 *Mandates*: `is_nothrow_relocatable_v<T> && !is_const_v<T>` is `true`. `T` is not an array of unknown bound.

17 *Preconditions*:

(17.1) — [`first`, `last`) is a valid range.

(17.2) — [`result`, `result + (last - first)`) denotes a region of storage that is a subset of the region reachable through `result` (6.8.4) and suitably aligned for the type `T`.

(17.3) — No element in the range [`first`, `last`) is a potentially-overlapping subobject.

18 *Effects*:

(18.1) — If `result == first` is `true`, no effect;

(18.2) — otherwise, if not called during constant evaluation and `is_trivially_relocatable_v<T>` is `true`, then has effects equivalent to: `trivially_relocate(first, last, result);`

(18.3) — otherwise, for each integer `i` in [`0`, `last - first`),

(18.3.1) — if `T` is an array type, equivalent to: `relocate(begin(first[i]), end(first[i]), *start_lifetime_as<T>(result + i));`

(18.3.2) — otherwise, equivalent to: `construct_at(result + i, std::move(first[i])); destroy_at(first + i);`

19 *Returns*: `result + (last - first)`.

20 *Throws*: Nothing.

[*Note 3*: Overlapping ranges are supported. — *end note*]

20.2.7 Allocator argument tag [allocator.tag]

```
namespace std {
  struct allocator_arg_t { explicit allocator_arg_t() = default; };
  inline constexpr allocator_arg_t allocator_arg{};
}
```

1 The `allocator_arg_t` struct is an empty class type used as a unique type to disambiguate constructor and function overloading. Specifically, several types (see `tuple` 22.4) have constructors with `allocator_arg_t` as the first argument, immediately followed by an argument of a type that meets the *Cpp17Allocator* requirements (16.4.4.6.1).

20.2.8 `uses_allocator` [allocator.uses]

20.2.8.1 `uses_allocator` trait [allocator.uses.trait]

```
template<class T, class Alloc> struct uses_allocator;
```

1 *Remarks*: Automatically detects whether `T` has a nested `allocator_type` that is convertible from `Alloc`. Meets the *Cpp17BinaryTypeTrait* requirements (21.3.2). The implementation shall provide a definition that is derived from `true_type` if the *qualified-id* `T::allocator_type` is valid and denotes a type (13.10.3) and `is_convertible_v<Alloc, T::allocator_type> != false`, otherwise it shall be derived from `false_type`. A program may specialize this template to derive from `true_type` for a program-defined type `T` that does not have a nested `allocator_type` but nonetheless can be constructed with an allocator where either:

(1.1) — the first argument of a constructor has type `allocator_arg_t` and the second argument has type `Alloc` or

(1.2) — the last argument of a constructor has type `Alloc`.

20.2.8.2 Uses-allocator construction [allocator.uses.construction]

1 *Uses-allocator construction* with allocator `alloc` and constructor arguments `args...` refers to the construction of an object of type `T` such that `alloc` is passed to the constructor of `T` if `T` uses an allocator type compatible with `alloc`. When applied to the construction of an object of type `T`, it is equivalent to initializing it with the value of the expression `make_obj_using_allocator<T>(alloc, args...)`, described below.

2 The following utility functions support three conventions for passing `alloc` to a constructor:

(2.1) — If `T` does not use an allocator compatible with `alloc`, then `alloc` is ignored.

(2.2) — Otherwise, if `T` has a constructor invocable as `T(allocator_arg, alloc, args...)` (leading-allocator convention), then uses-allocator construction chooses this constructor form.

(2.3) — Otherwise, if `T` has a constructor invocable as `T(args..., alloc)` (trailing-allocator convention), then uses-allocator construction chooses this constructor form.

3 The `uses_allocator_construction_args` function template takes an allocator and argument list and produces (as a tuple) a new argument list matching one of the above conventions. Additionally, overloads are provided that treat specializations of `pair` such that uses-allocator construction is applied individually to the `first` and `second` data members. The `make_obj_using_allocator` and `uninitialized_construct_using_allocator` function templates apply the modified constructor arguments to construct an object of type `T` as a return value or in-place, respectively.

[*Note 1*: For `uses_allocator_construction_args` and `make_obj_using_allocator`, type `T` is not deduced and must therefore be specified explicitly by the caller. — *end note*]

```
template<class T, class Alloc, class... Args>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  Args&&... args) noexcept;
```

4 *Constraints*: `remove_cv_t<T>` is not a specialization of `pair`.

5 *Returns*: A `tuple` value determined as follows:

(5.1) — If `uses_allocator_v<remove_cv_t<T>, Alloc>` is `false` and `is_constructible_v<T, Args...>` is `true`, return `forward_as_tuple(std::forward<Args>(args)...)`.

(5.2) — Otherwise, if `uses_allocator_v<remove_cv_t<T>, Alloc>` is `true` and `is_constructible_v<T, allocator_arg_t, const Alloc&, Args...>` is `true`, return

```
tuple<allocator_arg_t, const Alloc&, Args&&...>(
  allocator_arg, alloc, std::forward<Args>(args)...)
```

(5.3) — Otherwise, if `uses_allocator_v<remove_cv_t<T>, Alloc>` is `true` and `is_constructible_v<T, Args..., const Alloc&>` is `true`, return `forward_as_tuple(std::forward<Args>(args)..., alloc)`.

(5.4) — Otherwise, the program is ill-formed.

[*Note 2*: This definition prevents a silent failure to pass the allocator to a constructor of a type for which `uses_allocator_v<T, Alloc>` is `true`. — *end note*]

```
template<class T, class Alloc, class Tuple1, class Tuple2>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc, piecewise_construct_t,
                                                  Tuple1&& x, Tuple2&& y) noexcept;
```

6 Let `T1` be `T::first_type`. Let `T2` be `T::second_type`.

7 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`.

8 *Effects*: Equivalent to:

```
return make_tuple(
  piecewise_construct,
  apply([&alloc](auto&&... args1) {
          return uses_allocator_construction_args<T1>(
            alloc, std::forward<decltype(args1)>(args1)...);
        }, std::forward<Tuple1>(x)),
  apply([&alloc](auto&&... args2) {
          return uses_allocator_construction_args<T2>(
            alloc, std::forward<decltype(args2)>(args2)...);
        }, std::forward<Tuple2>(y)));
```

```
template<class T, class Alloc>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc) noexcept;
```

9 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`.

10 *Effects*: Equivalent to:

```
return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                           tuple<>{}, tuple<>{});
```

```
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  U&& u, V&& v) noexcept;
```

11 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`.

12 *Effects*: Equivalent to:

```
return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                           forward_as_tuple(std::forward<U>(u)),
                                           forward_as_tuple(std::forward<V>(v)));
```

```
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  pair<U, V>& pr) noexcept;
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  const pair<U, V>& pr) noexcept;
```

13 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`.

14 *Effects*: Equivalent to:

```
    return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                               forward_as_tuple(pr.first),
                                               forward_as_tuple(pr.second));
```

```
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  pair<U, V>&& pr) noexcept;
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  const pair<U, V>&& pr) noexcept;
```

15 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`.

16 *Effects*: Equivalent to:

```
    return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                               forward_as_tuple(get<0>(std::move(pr))),
                                               forward_as_tuple(get<1>(std::move(pr))));
```

```
template<class T, class Alloc, pair-like P>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc, P&& p) noexcept;
```

17 *Constraints*: `remove_cv_t<T>` is a specialization of `pair` and `remove_cvref_t<P>` is not a specialization of `ranges::subrange`.

18 *Effects*: Equivalent to:

```
    return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                               forward_as_tuple(get<0>(std::forward<P>(p))),
                                               forward_as_tuple(get<1>(std::forward<P>(p))));
```

```
template<class T, class Alloc, class U>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc, U&& u) noexcept;
```

19 Let *FUN* be the function template:

```
    template<class A, class B>
      void FUN(const pair<A, B>&);
```

20 *Constraints*: `remove_cv_t<T>` is a specialization of `pair`, and either:

(20.1) — `remove_cvref_t<U>` is a specialization of `ranges::subrange`, or

(20.2) — `U` does not satisfy *`pair-like`* and the expression *`FUN`*`(u)` is not well-formed when considered as an unevaluated operand.

21 Let *`pair-constructor`* be an exposition-only class defined as follows:

```
    class pair-constructor {
      using pair-type = remove_cv_t<T>;                          // exposition only

      constexpr auto do-construct(const pair-type& p) const {    // exposition only
        return make_obj_using_allocator<pair-type>(alloc_, p);
      }
      constexpr auto do-construct(pair-type&& p) const {         // exposition only
        return make_obj_using_allocator<pair-type>(alloc_, std::move(p));
      }

      const Alloc& alloc_;   // exposition only
      U& u_;                 // exposition only

    public:
      constexpr operator pair-type() const {
        return do-construct(std::forward<U>(u_));
      }
    };
```

22 *Returns*: `make_tuple(pc)`, where `pc` is a *`pair-constructor`* object whose *`alloc_`* member is initialized with `alloc` and whose *`u_`* member is initialized with `u`.

```
template<class T, class Alloc, class... Args>
  constexpr T make_obj_using_allocator(const Alloc& alloc, Args&&... args);
```

23 *Effects*: Equivalent to:

```
return make_from_tuple<T>(uses_allocator_construction_args<T>(
                            alloc, std::forward<Args>(args)...));
```

```
template<class T, class Alloc, class... Args>
  constexpr T* uninitialized_construct_using_allocator(T* p, const Alloc& alloc, Args&&... args);
```

24 *Effects*: Equivalent to:

```
return apply([&]<class... U>(U&&... xs) {
       return construct_at(p, std::forward<U>(xs)...);
     }, uses_allocator_construction_args<T>(alloc, std::forward<Args>(args)...));
```

20.2.9 Allocator traits [allocator.traits]

20.2.9.1 General [allocator.traits.general]

1 The class template `allocator_traits` supplies a uniform interface to all allocator types. An allocator cannot be a non-class type, however, even if `allocator_traits` supplies the entire required interface.

[*Note 1*: Thus, it is always possible to create a derived class from an allocator. — *end note*]

If a program declares an explicit or partial specialization of `allocator_traits`, the program is ill-formed, no diagnostic required.

```
namespace std {
  template<class Alloc> struct allocator_traits {
    using allocator_type     = Alloc;

    using value_type         = typename Alloc::value_type;

    using pointer            = see below;
    using const_pointer      = see below;
    using void_pointer       = see below;
    using const_void_pointer = see below;

    using difference_type    = see below;
    using size_type          = see below;

    using propagate_on_container_copy_assignment = see below;
    using propagate_on_container_move_assignment = see below;
    using propagate_on_container_swap            = see below;
    using is_always_equal                        = see below;

    template<class T> using rebind_alloc = see below;
    template<class T> using rebind_traits = allocator_traits<rebind_alloc<T>>;

    static constexpr pointer allocate(Alloc& a, size_type n);
    static constexpr pointer allocate(Alloc& a, size_type n, const_void_pointer hint);
    static constexpr allocation_result<pointer, size_type>
      allocate_at_least(Alloc& a, size_type n);

    static constexpr void deallocate(Alloc& a, pointer p, size_type n);

    template<class T, class... Args>
      static constexpr void construct(Alloc& a, T* p, Args&&... args);

    template<class T>
      static constexpr void destroy(Alloc& a, T* p);

    static constexpr size_type max_size(const Alloc& a) noexcept;

    static constexpr Alloc select_on_container_copy_construction(const Alloc& rhs);
  };
}
```

20.2.9.2 Member types [allocator.traits.types]

```
using pointer = see below;
```

1 *Type*: `Alloc::pointer` if the *qualified-id* `Alloc::pointer` is valid and denotes a type (13.10.3); otherwise, `value_type*`.

```
using const_pointer = see below;
```

2 *Type*: `Alloc::const_pointer` if the *qualified-id* `Alloc::const_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<const value_type>`.

```
using void_pointer = see below;
```

3 *Type*: `Alloc::void_pointer` if the *qualified-id* `Alloc::void_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<void>`.

```
using const_void_pointer = see below;
```

4 *Type*: `Alloc::const_void_pointer` if the *qualified-id* `Alloc::const_void_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<const void>`.

```
using difference_type = see below;
```

5 *Type*: `Alloc::difference_type` if the *qualified-id* `Alloc::difference_type` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::difference_type`.

```
using size_type = see below;
```

6 *Type*: `Alloc::size_type` if the *qualified-id* `Alloc::size_type` is valid and denotes a type (13.10.3); otherwise, `make_unsigned_t<difference_type>`.

```
using propagate_on_container_copy_assignment = see below;
```

7 *Type*: `Alloc::propagate_on_container_copy_assignment` if the *qualified-id* `Alloc::propagate_on_container_copy_assignment` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using propagate_on_container_move_assignment = see below;
```

8 *Type*: `Alloc::propagate_on_container_move_assignment` if the *qualified-id* `Alloc::propagate_on_container_move_assignment` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using propagate_on_container_swap = see below;
```

9 *Type*: `Alloc::propagate_on_container_swap` if the *qualified-id* `Alloc::propagate_on_container_swap` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using is_always_equal = see below;
```

10 *Type*: `Alloc::is_always_equal` if the *qualified-id* `Alloc::is_always_equal` is valid and denotes a type (13.10.3); otherwise `is_empty<Alloc>::type`.

```
template<class T> using rebind_alloc = see below;
```

11 *Alias template*: `Alloc::rebind<T>::other` if the *qualified-id* `Alloc::rebind<T>::other` is valid and denotes a type (13.10.3); otherwise, `Alloc<T, Args>` if `Alloc` is a class template instantiation of the form `Alloc<U, Args>`, where `Args` is zero or more type arguments; otherwise, the instantiation of `rebind_alloc` is ill-formed.

20.2.9.3 Static member functions [allocator.traits.members]

```
static constexpr pointer allocate(Alloc& a, size_type n);
```

1 *Returns*: `a.allocate(n)`.

```
static constexpr pointer allocate(Alloc& a, size_type n, const_void_pointer hint);
```

2 *Returns*: `a.allocate(n, hint)` if that expression is well-formed; otherwise, `a.allocate(n)`.

```
static constexpr allocation_result<pointer, size_type> allocate_at_least(Alloc& a, size_type n);
```

3 *Returns*: `a.allocate_at_least(n)` if that expression is well-formed; otherwise, `{a.allocate(n), n}`.

```
static constexpr void deallocate(Alloc& a, pointer p, size_type n);
```

4 *Effects*: Calls `a.deallocate(p, n)`.

5 *Throws*: Nothing.

```
template<class T, class... Args>
  static constexpr void construct(Alloc& a, T* p, Args&&... args);
```

6 *Effects*: Calls `a.construct(p, std::forward<Args>(args)...)` if that call is well-formed; otherwise, invokes `construct_at(p, std::forward<Args>(args)...)`.

```
template<class T>
  static constexpr void destroy(Alloc& a, T* p);
```

7 *Effects*: Calls `a.destroy(p)` if that call is well-formed; otherwise, invokes `destroy_at(p)`.

```
static constexpr size_type max_size(const Alloc& a) noexcept;
```

8 *Returns*: `a.max_size()` if that expression is well-formed; otherwise, `numeric_limits<size_type>::max() / sizeof(value_type)`.

```
static constexpr Alloc select_on_container_copy_construction(const Alloc& rhs);
```

9 *Returns*: `rhs.select_on_container_copy_construction()` if that expression is well-formed; otherwise, `rhs`.

20.2.9.4 Other [allocator.traits.other]

1 The class template `allocation_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

20.2.10 The default allocator [default.allocator]

20.2.10.1 General [default.allocator.general]

1 All specializations of the default allocator meet the allocator completeness requirements (16.4.4.6.2).

```
namespace std {
  template<class T> class allocator {
  public:
    using value_type                             = T;
    using size_type                              = size_t;
    using difference_type                        = ptrdiff_t;
    using propagate_on_container_move_assignment = true_type;

    constexpr allocator() noexcept;
    constexpr allocator(const allocator&) noexcept;
    template<class U> constexpr allocator(const allocator<U>&) noexcept;
    constexpr ~allocator();
    constexpr allocator& operator=(const allocator&) = default;

    constexpr T* allocate(size_t n);
    constexpr allocation_result<T*> allocate_at_least(size_t n);
    constexpr void deallocate(T* p, size_t n);
  };
}
```

2 `allocator_traits<allocator<T>>::is_always_equal::value` is `true` for any `T`.

20.2.10.2 Members [allocator.members]

1 Except for the destructor, member functions of the default allocator shall not introduce data races (6.9.2) as a result of concurrent calls to those member functions from different threads. Calls to these functions that allocate or deallocate a particular unit of storage shall occur in a single total order, and each such deallocation call shall happen before the next allocation (if any) in this order.

```
constexpr T* allocate(size_t n);
```

2 *Mandates*: `T` is not an incomplete type (6.8.1).

3 *Returns*: A pointer to the initial element of an array of `n` `T`.

4 *Throws*: `bad_array_new_length` if `numeric_limits<size_t>::max() / sizeof(T) < n`, or `bad_alloc` if the storage cannot be obtained.

5 *Remarks*: The storage for the array is obtained by calling `::operator new` (17.6.3), but it is unspecified when or how often this function is called. This function starts the lifetime of the array object, but not that of any of the array elements.

```
constexpr allocation_result<T*> allocate_at_least(size_t n);
```

6 *Mandates*: `T` is not an incomplete type (6.8.1).

7 *Returns*: `allocation_result<T*>{ptr, count}`, where `ptr` is a pointer to the initial element of an array of `count` `T` and `count` $\geq$ `n`.

8 *Throws*: `bad_array_new_length` if `numeric_limits<size_t>::max() / sizeof(T) < n`, or `bad_alloc` if the storage cannot be obtained.

9 *Remarks*: The storage for the array is obtained by calling `::operator new`, but it is unspecified when or how often this function is called. This function starts the lifetime of the array object, but not that of any of the array elements.

```
constexpr void deallocate(T* p, size_t n);
```

10 *Preconditions*:

(10.1) — If `p` is memory that was obtained by a call to `allocate_at_least`, let `ret` be the value returned and `req` be the value passed as the first argument to that call. `p` is equal to `ret.ptr` and `n` is a value such that `req` $\leq$ `n` $\leq$ `ret.count`.

(10.2) — Otherwise, `p` is a pointer value obtained from `allocate`. `n` equals the value passed as the first argument to the invocation of `allocate` which returned `p`.

11 *Effects*: Deallocates the storage referenced by `p`.

12 *Remarks*: Uses `::operator delete` (17.6.3), but it is unspecified when this function is called.

20.2.10.3 Operators [allocator.globals]

```
template<class T, class U>
  constexpr bool operator==(const allocator<T>&, const allocator<U>&) noexcept;
```

1 *Returns*: `true`.

20.2.11 `addressof` [specialized.addressof]

```
template<class T> constexpr T* addressof(T& r) noexcept;
```

1 *Returns*: The actual address of the object or function referenced by `r`, even in the presence of an overloaded `operator&`.

2 *Remarks*: An expression `addressof(E)` is a constant subexpression (3.15) if `E` is an lvalue constant subexpression.

20.2.12 C library memory allocation [c.malloc]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* aligned_alloc(size_t alignment, size_t size);
void* calloc(size_t nmemb, size_t size);
void* malloc(size_t size);
void* realloc(void* ptr, size_t size);
```

2 *Effects*: These functions have the semantics specified in the C standard library.

3 *Remarks*: These functions do not attempt to allocate storage by calling `::operator new()` (17.6.3).

4 These functions implicitly create objects (6.7.2) in the returned region of storage and return a pointer to a suitable created object. In the case of `calloc` and `realloc`, the objects are created before the storage is zeroed or copied, respectively.

```
void free(void* ptr);
```

5 *Effects*: This function has the semantics specified in the C standard library.

6 *Remarks*: This function does not attempt to deallocate storage by calling `::operator delete()`.

SEE ALSO: ISO/IEC 9899:2018, 7.22.3

20.3 Smart pointers [smartptr]

20.3.1 Unique-ownership pointers [unique.ptr]

20.3.1.1 General [unique.ptr.general]

1 A *unique pointer* is an object that owns another object and manages that other object through a pointer. More precisely, a unique pointer is an object *u* that stores a pointer to a second object *p* and will dispose of *p* when *u* is itself destroyed (e.g., when leaving block scope (8.9)). In this context, *u* is said to *own* `p`.

2 The mechanism by which *u* disposes of *p* is known as *p*'s associated *deleter*, a function object whose correct invocation results in *p*'s appropriate disposition (typically its deletion).

3 Let the notation *u.p* denote the pointer stored by *u*, and let *u.d* denote the associated deleter. Upon request, *u* can *reset* (replace) *u.p* and *u.d* with another pointer and deleter, but properly disposes of its owned object via the associated deleter before such replacement is considered completed.

4 Each object of a type `U` instantiated from the `unique_ptr` template specified in 20.3.1 has the strict ownership semantics, specified above, of a unique pointer. In partial satisfaction of these semantics, each such `U` is *Cpp17MoveConstructible* and *Cpp17MoveAssignable*, but is not *Cpp17CopyConstructible* nor *Cpp17CopyAssignable*. The template parameter `T` of `unique_ptr` may be an incomplete type.

5 [*Note 1*: The uses of `unique_ptr` include providing exception safety for dynamically allocated memory, passing ownership of dynamically allocated memory to a function, and returning dynamically allocated memory from a function. — *end note*]

20.3.1.2 Default deleters [unique.ptr.dltr]

20.3.1.2.1 General [unique.ptr.dltr.general]

1 The class template `default_delete` serves as the default deleter (destruction policy) for the class template `unique_ptr`.

2 The template parameter `T` of `default_delete` may be an incomplete type.

20.3.1.2.2 `default_delete` [unique.ptr.dltr.dflt]

```
namespace std {
  template<class T> struct default_delete {
    constexpr default_delete() noexcept = default;
    template<class U> constexpr default_delete(const default_delete<U>&) noexcept;
    constexpr void operator()(T*) const;
  };
}
```

```
template<class U> constexpr default_delete(const default_delete<U>& other) noexcept;
```

1 *Constraints*: `U*` is implicitly convertible to `T*`.

2 *Effects*: Constructs a `default_delete` object from another `default_delete<U>` object.

```
constexpr void operator()(T* ptr) const;
```

3 *Mandates*: `T` is a complete type.

4 *Effects*: Calls `delete` on `ptr`.

20.3.1.2.3 `default_delete<T[]>` [unique.ptr.dltr.dflt1]

```
namespace std {
  template<class T> struct default_delete<T[]> {
    constexpr default_delete() noexcept = default;
    template<class U> constexpr default_delete(const default_delete<U[]>&) noexcept;
    template<class U> constexpr void operator()(U* ptr) const;
  };
}
```

`template<class U> constexpr default_delete(const default_delete<U[]>& other) noexcept;`

1 *Constraints*: `U(*)[]` is convertible to `T(*)[]`.

2 *Effects*: Constructs a `default_delete` object from another `default_delete<U[]>` object.

`template<class U> constexpr void operator()(U* ptr) const;`

3 *Constraints*: `U(*)[]` is convertible to `T(*)[]`.

4 *Mandates*: `U` is a complete type.

5 *Effects*: Calls `delete[]` on `ptr`.

20.3.1.3 `unique_ptr` for single objects [unique.ptr.single]

20.3.1.3.1 General [unique.ptr.single.general]

```
namespace std {
  template<class T, class D = default_delete<T>> class unique_ptr {
  public:
    using pointer      = see below;
    using element_type = T;
    using deleter_type = D;

    // 20.3.1.3.2, constructors
    constexpr unique_ptr() noexcept;
    constexpr explicit unique_ptr(type_identity_t<pointer> p) noexcept;
    constexpr unique_ptr(type_identity_t<pointer> p, see below d1) noexcept;
    constexpr unique_ptr(type_identity_t<pointer> p, see below d2) noexcept;
    constexpr unique_ptr(unique_ptr&& u) noexcept;
    constexpr unique_ptr(nullptr_t) noexcept;
    template<class U, class E>
      constexpr unique_ptr(unique_ptr<U, E>&& u) noexcept;

    // 20.3.1.3.3, destructor
    constexpr ~unique_ptr();

    // 20.3.1.3.4, assignment
    constexpr unique_ptr& operator=(unique_ptr&& u) noexcept;
    template<class U, class E>
      constexpr unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
    constexpr unique_ptr& operator=(nullptr_t) noexcept;

    // 20.3.1.3.5, observers
    constexpr add_lvalue_reference_t<T> operator*() const noexcept(see below);
    constexpr pointer operator->() const noexcept;
    constexpr pointer get() const noexcept;
    constexpr deleter_type& get_deleter() noexcept;
    constexpr const deleter_type& get_deleter() const noexcept;
    constexpr explicit operator bool() const noexcept;

    // 20.3.1.3.6, modifiers
    constexpr pointer release() noexcept;
    constexpr void reset(pointer p = pointer()) noexcept;
    constexpr void swap(unique_ptr& u) noexcept;

    // disable copy from lvalue
    unique_ptr(const unique_ptr&) = delete;
    unique_ptr& operator=(const unique_ptr&) = delete;
  };
}
```

1 A program that instantiates the definition of `unique_ptr<T, D>` is ill-formed if `T*` is an invalid type.

[*Note 1*: This prevents the instantiation of specializations such as `unique_ptr<T&, D>` and `unique_ptr<int() const, D>`. — *end note*]

2 The default type for the template parameter `D` is `default_delete`. A client-supplied template argument `D` shall be a function object type (22.10), lvalue reference to function, or lvalue reference to function object type for which, given a value `d` of type `D` and a value `ptr` of type `unique_ptr<T, D>::pointer`, the expression `d(ptr)` is valid and has the effect of disposing of the pointer as appropriate for that deleter.

3 If the deleter's type `D` is not a reference type, `D` shall meet the *Cpp17Destructible* requirements (Table 35).

4 If the *qualified-id* `remove_reference_t<D>::pointer` is valid and denotes a type (13.10.3), then `unique_ptr<T, D>::pointer` shall be a synonym for `remove_reference_t<D>::pointer`. Otherwise `unique_ptr<T, D>::pointer` shall be a synonym for `element_type*`. The type `unique_ptr<T, D>::pointer` shall meet the *Cpp17NullablePointer* requirements (Table 36).

5 [*Example 1*: Given an allocator type `X` (16.4.4.6.1) and letting `A` be a synonym for `allocator_traits<X>`, the types `A::pointer`, `A::const_pointer`, `A::void_pointer`, and `A::const_void_pointer` may be used as `unique_ptr<T, D>::pointer`. — *end example*]

20.3.1.3.2 Constructors [unique.ptr.single.ctor]

```
constexpr unique_ptr() noexcept;
constexpr unique_ptr(nullptr_t) noexcept;
```

1 *Constraints*: `is_pointer_v<deleter_type>` is `false` and `is_default_constructible_v<deleter_type>` is `true`.

2 *Preconditions*: `D` meets the *Cpp17DefaultConstructible* requirements (Table 30), and that construction does not throw an exception.

3 *Effects*: Constructs a `unique_ptr` object that owns nothing, value-initializing the stored pointer and the stored deleter.

4 *Postconditions*: `get() == nullptr`. `get_deleter()` returns a reference to the stored deleter.

```
constexpr explicit unique_ptr(type_identity_t<pointer> p) noexcept;
```

5 *Constraints*: `is_pointer_v<deleter_type>` is `false` and `is_default_constructible_v<deleter_type>` is `true`.

6 *Preconditions*: `D` meets the *Cpp17DefaultConstructible* requirements (Table 30), and that construction does not throw an exception.

7 *Effects*: Constructs a `unique_ptr` which owns `p`, initializing the stored pointer with `p` and value-initializing the stored deleter.

8 *Postconditions*: `get() == p`. `get_deleter()` returns a reference to the stored deleter.

```
constexpr unique_ptr(type_identity_t<pointer> p, const D& d) noexcept;
constexpr unique_ptr(type_identity_t<pointer> p, remove_reference_t<D>&& d) noexcept;
```

9 *Constraints*: `is_constructible_v<D, decltype(d)>` is `true`.

10 *Preconditions*: For the first constructor, if `D` is not a reference type, `D` meets the *Cpp17CopyConstructible* requirements and such construction does not exit via an exception. For the second constructor, if `D` is not a reference type, `D` meets the *Cpp17MoveConstructible* requirements and such construction does not exit via an exception.

11 *Effects*: Constructs a `unique_ptr` object which owns `p`, initializing the stored pointer with `p` and initializing the deleter from `std::forward<decltype(d)>(d)`.

12 *Postconditions*: `get() == p`. `get_deleter()` returns a reference to the stored deleter. If `D` is a reference type then `get_deleter()` returns a reference to the lvalue `d`.

13 *Remarks*: If `D` is a reference type, the second constructor is defined as deleted.

14 [*Example 1*:

```
D d;
unique_ptr<int, D> p1(new int, D());          // D must be Cpp17MoveConstructible
unique_ptr<int, D> p2(new int, d);            // D must be Cpp17CopyConstructible
unique_ptr<int, D&> p3(new int, d);           // p3 holds a reference to d
unique_ptr<int, const D&> p4(new int, D()); // error: rvalue deleter object combined
                                              // with reference deleter type
```

— *end example*]

`constexpr unique_ptr(unique_ptr&& u) noexcept;`

15 *Constraints*: `is_move_constructible_v<D>` is `true`.

16 *Preconditions*: If `D` is not a reference type, `D` meets the *Cpp17MoveConstructible* requirements (Table 31). Construction of the deleter from an rvalue of type `D` does not throw an exception.

17 *Effects*: Constructs a `unique_ptr` from `u`. If `D` is a reference type, this deleter is copy constructed from `u`'s deleter; otherwise, this deleter is move constructed from `u`'s deleter.

[*Note 1*: The construction of the deleter can be implemented with `std::forward<D>`. — *end note*]

18 *Postconditions*: `get()` yields the value `u.get()` yielded before the construction. `u.get() == nullptr`. `get_deleter()` returns a reference to the stored deleter that was constructed from `u.get_deleter()`. If `D` is a reference type then `get_deleter()` and `u.get_deleter()` both reference the same lvalue deleter.

`template<class U, class E> constexpr unique_ptr(unique_ptr<U, E>&& u) noexcept;`

19 *Constraints*:

(19.1) — `unique_ptr<U, E>::pointer` is implicitly convertible to `pointer`,

(19.2) — `U` is not an array type, and

(19.3) — either `D` is a reference type and `E` is the same type as `D`, or `D` is not a reference type and `E` is implicitly convertible to `D`.

20 *Preconditions*: If `E` is not a reference type, construction of the deleter from an rvalue of type `E` is well-formed and does not throw an exception. Otherwise, `E` is a reference type and construction of the deleter from an lvalue of type `E` is well-formed and does not throw an exception.

21 *Effects*: Constructs a `unique_ptr` from `u`. If `E` is a reference type, this deleter is copy constructed from `u`'s deleter; otherwise, this deleter is move constructed from `u`'s deleter.

[*Note 2*: The deleter constructor can be implemented with `std::forward<E>`. — *end note*]

22 *Postconditions*: `get()` yields the value `u.get()` yielded before the construction. `u.get() == nullptr`. `get_deleter()` returns a reference to the stored deleter that was constructed from `u.get_deleter()`.

20.3.1.3.3 Destructor [unique.ptr.single.dtor]

`constexpr ~unique_ptr();`

1 *Effects*: Equivalent to: `if (get()) get_deleter()(get());`

[*Note 1*: The use of `default_delete` requires `T` to be a complete type. — *end note*]

2 *Remarks*: The behavior is undefined if the evaluation of `get_deleter()(get())` throws an exception.

20.3.1.3.4 Assignment [unique.ptr.single.asgn]

`constexpr unique_ptr& operator=(unique_ptr&& u) noexcept;`

1 *Constraints*: `is_move_assignable_v<D>` is `true`.

2 *Preconditions*: If `D` is not a reference type, `D` meets the *Cpp17MoveAssignable* requirements (Table 33) and assignment of the deleter from an rvalue of type `D` does not throw an exception. Otherwise, `D` is a reference type; `remove_reference_t<D>` meets the *Cpp17CopyAssignable* requirements and assignment of the deleter from an lvalue of type `D` does not throw an exception.

3 *Effects*: Calls `reset(u.release())` followed by `get_deleter() = std::forward<D>(u.get_deleter())`.

4 *Postconditions*: If `this != addressof(u)`, `u.get() == nullptr`, otherwise `u.get()` is unchanged.

5 *Returns*: `*this`.

`template<class U, class E> constexpr unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;`

6 *Constraints*:

(6.1) — `unique_ptr<U, E>::pointer` is implicitly convertible to `pointer`, and

(6.2) — `U` is not an array type, and

(6.3) — `is_assignable_v<D&, E&&>` is `true`.

7 *Preconditions*: If `E` is not a reference type, assignment of the deleter from an rvalue of type `E` is well-formed and does not throw an exception. Otherwise, `E` is a reference type and assignment of the deleter from an lvalue of type `E` is well-formed and does not throw an exception.

8 *Effects*: Calls `reset(u.release())` followed by `get_deleter() = std::forward<E>(u.get_deleter())`.

9 *Postconditions*: `u.get() == nullptr`.

10 *Returns*: `*this`.

```
constexpr unique_ptr& operator=(nullptr_t) noexcept;
```

11 *Effects*: As if by `reset()`.

12 *Postconditions*: `get() == nullptr`.

13 *Returns*: `*this`.

20.3.1.3.5 Observers [unique.ptr.single.observers]

```
constexpr add_lvalue_reference_t<T> operator*() const noexcept(noexcept(*declval<pointer>()));
```

1 *Mandates*: `reference_converts_from_temporary_v<add_lvalue_reference_t<T>, decltype(*declval<pointer>())>` is `false`.

2 *Preconditions*: `get() != nullptr` is `true`.

3 *Returns*: `*get()`.

```
constexpr pointer operator->() const noexcept;
```

4 *Preconditions*: `get() != nullptr`.

5 *Returns*: `get()`.

6 [*Note 1*: The use of this function typically requires that `T` be a complete type. — *end note*]

```
constexpr pointer get() const noexcept;
```

7 *Returns*: The stored pointer.

```
constexpr deleter_type& get_deleter() noexcept;
constexpr const deleter_type& get_deleter() const noexcept;
```

8 *Returns*: A reference to the stored deleter.

```
constexpr explicit operator bool() const noexcept;
```

9 *Returns*: `get() != nullptr`.

20.3.1.3.6 Modifiers [unique.ptr.single.modifiers]

```
constexpr pointer release() noexcept;
```

1 *Postconditions*: `get() == nullptr`.

2 *Returns*: The value `get()` had at the start of the call to `release`.

```
constexpr void reset(pointer p = pointer()) noexcept;
```

3 *Effects*: Assigns `p` to the stored pointer, and then, with the old value of the stored pointer, `old_p`, evaluates `if (old_p) get_deleter()(old_p);`

[*Note 1*: The order of these operations is significant because the call to `get_deleter()` might destroy `*this`. — *end note*]

4 *Postconditions*: `get() == p`.

[*Note 2*: The postcondition does not hold if the call to `get_deleter()` destroys `*this` since `this->get()` is no longer a valid expression. — *end note*]

5 *Remarks*: The behavior is undefined if the evaluation of `get_deleter()(old_p)` throws an exception.

```
constexpr void swap(unique_ptr& u) noexcept;
```

6 *Preconditions*: `get_deleter()` is swappable (16.4.4.3) and does not throw an exception under `swap`.

7 *Effects*: Invokes `swap` on the stored pointers and on the stored deleters of `*this` and `u`.

20.3.1.4 unique_ptr for array objects with a runtime length [unique.ptr.runtime]

20.3.1.4.1 General [unique.ptr.runtime.general]

```
namespace std {
  template<class T, class D> class unique_ptr<T[], D> {
  public:
    using pointer      = see below;
    using element_type = T;
    using deleter_type = D;

    // 20.3.1.4.2, constructors
    constexpr unique_ptr() noexcept;
    template<class U> constexpr explicit unique_ptr(U p) noexcept;
    template<class U> constexpr unique_ptr(U p, see below d) noexcept;
    template<class U> constexpr unique_ptr(U p, see below d) noexcept;
    constexpr unique_ptr(unique_ptr&& u) noexcept;
    template<class U, class E>
      constexpr unique_ptr(unique_ptr<U, E>&& u) noexcept;
    constexpr unique_ptr(nullptr_t) noexcept;

    // destructor
    constexpr ~unique_ptr();

    // assignment
    constexpr unique_ptr& operator=(unique_ptr&& u) noexcept;
    template<class U, class E>
      constexpr unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
    constexpr unique_ptr& operator=(nullptr_t) noexcept;

    // 20.3.1.4.4, observers
    constexpr T& operator[](size_t i) const;
    constexpr pointer get() const noexcept;
    constexpr deleter_type& get_deleter() noexcept;
    constexpr const deleter_type& get_deleter() const noexcept;
    constexpr explicit operator bool() const noexcept;

    // 20.3.1.4.5, modifiers
    constexpr pointer release() noexcept;
    template<class U> constexpr void reset(U p) noexcept;
    constexpr void reset(nullptr_t = nullptr) noexcept;
    constexpr void swap(unique_ptr& u) noexcept;

    // disable copy from lvalue
    unique_ptr(const unique_ptr&) = delete;
    unique_ptr& operator=(const unique_ptr&) = delete;
  };
}
```

1 A specialization for array types is provided with a slightly altered interface.

(1.1) — Conversions between different types of `unique_ptr<T[], D>` that would be disallowed for the corresponding pointer-to-array types, and conversions to or from the non-array forms of `unique_ptr`, produce an ill-formed program.

(1.2) — Pointers to types derived from `T` are rejected by the constructors, and by `reset`.

(1.3) — The observers `operator*` and `operator->` are not provided.

(1.4) — The indexing observer `operator[]` is provided.

(1.5) — The default deleter will call `delete[]`.

2 Descriptions are provided below only for members that differ from the primary template.

3 The template argument `T` shall be a complete type.

20.3.1.4.2 Constructors [unique.ptr.runtime.ctor]

```
template<class U> constexpr explicit unique_ptr(U p) noexcept;
```

1 This constructor behaves the same as the constructor in the primary template that takes a single parameter of type `pointer`.

2 *Constraints*:

(2.1) — `U` is the same type as `pointer`, or

(2.2) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

```
template<class U> constexpr unique_ptr(U p, see below d) noexcept;
template<class U> constexpr unique_ptr(U p, see below d) noexcept;
```

3 These constructors behave the same as the constructors in the primary template that take a parameter of type `pointer` and a second parameter.

4 *Constraints*:

(4.1) — `U` is the same type as `pointer`,

(4.2) — `U` is `nullptr_t`, or

(4.3) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

```
template<class U, class E> constexpr unique_ptr(unique_ptr<U, E>&& u) noexcept;
```

5 This constructor behaves the same as in the primary template.

6 *Constraints*: Where `UP` is `unique_ptr<U, E>`:

(6.1) — `U` is an array type, and

(6.2) — `pointer` is the same type as `element_type*`, and

(6.3) — `UP::pointer` is the same type as `UP::element_type*`, and

(6.4) — `UP::element_type(*)[]` is convertible to `element_type(*)[]`, and

(6.5) — either `D` is a reference type and `E` is the same type as `D`, or `D` is not a reference type and `E` is implicitly convertible to `D`.

[*Note 1*: This replaces the *Constraints*: specification of the primary template. — *end note*]

20.3.1.4.3 Assignment [unique.ptr.runtime.asgn]

```
template<class U, class E> constexpr unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
```

1 This operator behaves the same as in the primary template.

2 *Constraints*: Where `UP` is `unique_ptr<U, E>`:

(2.1) — `U` is an array type, and

(2.2) — `pointer` is the same type as `element_type*`, and

(2.3) — `UP::pointer` is the same type as `UP::element_type*`, and

(2.4) — `UP::element_type(*)[]` is convertible to `element_type(*)[]`, and

(2.5) — `is_assignable_v<D&, E&&>` is `true`.

[*Note 1*: This replaces the *Constraints*: specification of the primary template. — *end note*]

20.3.1.4.4 Observers [unique.ptr.runtime.observers]

```
constexpr T& operator[](size_t i) const;
```

1 *Preconditions*: `i` < the number of elements in the array to which the stored pointer points.

2 *Returns*: `get()[i]`.

20.3.1.4.5 Modifiers [unique.ptr.runtime.modifiers]

```
constexpr void reset(nullptr_t p = nullptr) noexcept;
```

1 *Effects*: Equivalent to `reset(pointer())`.

```
template<class U> constexpr void reset(U p) noexcept;
```

2 This function behaves the same as the `reset` member of the primary template.

3 *Constraints*:

(3.1) — `U` is the same type as `pointer`, or

(3.2) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

20.3.1.5 Creation [unique.ptr.create]

```
template<class T, class... Args> constexpr unique_ptr<T> make_unique(Args&&... args);
```

1 *Constraints*: `T` is not an array type.

2 *Returns*: `unique_ptr<T>(new T(std::forward<Args>(args)...))`.

```
template<class T> constexpr unique_ptr<T> make_unique(size_t n);
```

3 *Constraints*: `T` is an array of unknown bound.

4 *Returns*: `unique_ptr<T>(new remove_extent_t<T>[n]())`.

```
template<class T, class... Args> unspecified make_unique(Args&&...) = delete;
```

5 *Constraints*: `T` is an array of known bound.

```
template<class T> constexpr unique_ptr<T> make_unique_for_overwrite();
```

6 *Constraints*: `T` is not an array type.

7 *Returns*: `unique_ptr<T>(new T)`.

```
template<class T> constexpr unique_ptr<T> make_unique_for_overwrite(size_t n);
```

8 *Constraints*: `T` is an array of unknown bound.

9 *Returns*: `unique_ptr<T>(new remove_extent_t<T>[n])`.

```
template<class T, class... Args> unspecified make_unique_for_overwrite(Args&&...) = delete;
```

10 *Constraints*: `T` is an array of known bound.

20.3.1.6 Specialized algorithms [unique.ptr.special]

```
template<class T, class D> constexpr void swap(unique_ptr<T, D>& x, unique_ptr<T, D>& y) noexcept;
```

1 *Constraints*: `is_swappable_v<D>` is `true`.

2 *Effects*: Calls `x.swap(y)`.

```
template<class T1, class D1, class T2, class D2>
  constexpr bool operator==(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

3 *Returns*: `x.get() == y.get()`.

```
template<class T1, class D1, class T2, class D2>
  bool operator<(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

4 Let `CT` denote

```
common_type_t<typename unique_ptr<T1, D1>::pointer,
              typename unique_ptr<T2, D2>::pointer>
```

5 *Mandates*:

(5.1) — `unique_ptr<T1, D1>::pointer` is implicitly convertible to `CT` and

(5.2) — `unique_ptr<T2, D2>::pointer` is implicitly convertible to `CT`.

6 *Preconditions*: The specialization `less<CT>` is a function object type (22.10) that induces a strict weak ordering (26.8) on the pointer values.

7 *Returns*: `less<CT>()(x.get(), y.get())`.

```
template<class T1, class D1, class T2, class D2>
  bool operator>(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

8 *Returns*: `y < x`.

```
template<class T1, class D1, class T2, class D2>
  bool operator<=(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

9 *Returns*: `!(y < x)`.

```
template<class T1, class D1, class T2, class D2>
  bool operator>=(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

10 *Returns*: `!(x < y)`.

```
template<class T1, class D1, class T2, class D2>
  requires three_way_comparable_with<typename unique_ptr<T1, D1>::pointer,
                                     typename unique_ptr<T2, D2>::pointer>
  compare_three_way_result_t<typename unique_ptr<T1, D1>::pointer,
                             typename unique_ptr<T2, D2>::pointer>
    operator<=>(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

11 *Returns*: `compare_three_way()(x.get(), y.get())`.

```
template<class T, class D>
  constexpr bool operator==(const unique_ptr<T, D>& x, nullptr_t) noexcept;
```

12 *Returns*: `!x`.

```
template<class T, class D>
  constexpr bool operator<(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  constexpr bool operator<(nullptr_t, const unique_ptr<T, D>& x);
```

13 *Preconditions*: The specialization `less<unique_ptr<T, D>::pointer>` is a function object type (22.10) that induces a strict weak ordering (26.8) on the pointer values.

14 *Returns*: The first function template returns

```
less<unique_ptr<T, D>::pointer>()(x.get(), nullptr)
```

The second function template returns

```
less<unique_ptr<T, D>::pointer>()(nullptr, x.get())
```

```
template<class T, class D>
  constexpr bool operator>(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  constexpr bool operator>(nullptr_t, const unique_ptr<T, D>& x);
```

15 *Returns*: The first function template returns `nullptr < x`. The second function template returns `x < nullptr`.

```
template<class T, class D>
  constexpr bool operator<=(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  constexpr bool operator<=(nullptr_t, const unique_ptr<T, D>& x);
```

16 *Returns*: The first function template returns `!(nullptr < x)`. The second function template returns `!(x < nullptr)`.

```
template<class T, class D>
  constexpr bool operator>=(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  constexpr bool operator>=(nullptr_t, const unique_ptr<T, D>& x);
```

17 *Returns*: The first function template returns `!(x < nullptr)`. The second function template returns `!(nullptr < x)`.

```
template<class T, class D>
  requires three_way_comparable<typename unique_ptr<T, D>::pointer>
  constexpr compare_three_way_result_t<typename unique_ptr<T, D>::pointer>
    operator<=>(const unique_ptr<T, D>& x, nullptr_t);
```

18 *Returns*:

`compare_three_way()(x.get(), static_cast<typename unique_ptr<T, D>::pointer>(nullptr)).`

20.3.1.7 I/O [unique.ptr.io]

```
template<class E, class T, class Y, class D>
  basic_ostream<E, T>& operator<<(basic_ostream<E, T>& os, const unique_ptr<Y, D>& p);
```

1 *Constraints*: `os << p.get()` is a valid expression.

2 *Effects*: Equivalent to: `os << p.get();`

3 *Returns*: `os`.

20.3.2 Shared-ownership pointers [util.sharedptr]

20.3.2.1 Class `bad_weak_ptr` [util.smartptr.weak.bad]

```
namespace std {
  class bad_weak_ptr : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
  };
}
```

1 An exception of type `bad_weak_ptr` is thrown by the `shared_ptr` constructor taking a `weak_ptr`.

```
const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS.

20.3.2.2 Class template `shared_ptr` [util.smartptr.shared]

20.3.2.2.1 General [util.smartptr.shared.general]

1 The `shared_ptr` class template stores a pointer, usually obtained via `new`. `shared_ptr` implements semantics of shared ownership; the last remaining owner of the pointer is responsible for destroying the object, or otherwise releasing the resources associated with the stored pointer. A `shared_ptr` is said to be empty if it does not own a pointer.

```
namespace std {
  template<class T> class shared_ptr {
  public:
    using element_type = remove_extent_t<T>;
    using weak_type    = weak_ptr<T>;

    // 20.3.2.2.2, constructors
    constexpr shared_ptr() noexcept;
    constexpr shared_ptr(nullptr_t) noexcept : shared_ptr() { }
    template<class Y>
      explicit shared_ptr(Y* p);
    template<class Y, class D>
      shared_ptr(Y* p, D d);
    template<class Y, class D, class A>
      shared_ptr(Y* p, D d, A a);
    template<class D>
      shared_ptr(nullptr_t p, D d);
    template<class D, class A>
      shared_ptr(nullptr_t p, D d, A a);
    template<class Y>
      shared_ptr(const shared_ptr<Y>& r, element_type* p) noexcept;
    template<class Y>
      shared_ptr(shared_ptr<Y>&& r, element_type* p) noexcept;
    shared_ptr(const shared_ptr& r) noexcept;
```

```
      template<class Y>
        shared_ptr(const shared_ptr<Y>& r) noexcept;
      shared_ptr(shared_ptr&& r) noexcept;
      template<class Y>
        shared_ptr(shared_ptr<Y>&& r) noexcept;
      template<class Y>
        explicit shared_ptr(const weak_ptr<Y>& r);
      template<class Y, class D>
        shared_ptr(unique_ptr<Y, D>&& r);

      // 20.3.2.2.3, destructor
      ~shared_ptr();

      // 20.3.2.2.4, assignment
      shared_ptr& operator=(const shared_ptr& r) noexcept;
      template<class Y>
        shared_ptr& operator=(const shared_ptr<Y>& r) noexcept;
      shared_ptr& operator=(shared_ptr&& r) noexcept;
      template<class Y>
        shared_ptr& operator=(shared_ptr<Y>&& r) noexcept;
      template<class Y, class D>
        shared_ptr& operator=(unique_ptr<Y, D>&& r);

      // 20.3.2.2.5, modifiers
      void swap(shared_ptr& r) noexcept;
      void reset() noexcept;
      template<class Y>
        void reset(Y* p);
      template<class Y, class D>
        void reset(Y* p, D d);
      template<class Y, class D, class A>
        void reset(Y* p, D d, A a);

      // 20.3.2.2.6, observers
      element_type* get() const noexcept;
      T& operator*() const noexcept;
      T* operator->() const noexcept;
      element_type& operator[](ptrdiff_t i) const;
      long use_count() const noexcept;
      explicit operator bool() const noexcept;
      template<class U>
        bool owner_before(const shared_ptr<U>& b) const noexcept;
      template<class U>
        bool owner_before(const weak_ptr<U>& b) const noexcept;
      size_t owner_hash() const noexcept;
      template<class U>
        bool owner_equal(const shared_ptr<U>& b) const noexcept;
      template<class U>
        bool owner_equal(const weak_ptr<U>& b) const noexcept;
    };

    template<class T>
      shared_ptr(weak_ptr<T>) -> shared_ptr<T>;
    template<class T, class D>
      shared_ptr(unique_ptr<T, D>) -> shared_ptr<T>;
  }
```

2 Specializations of `shared_ptr` shall be *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17LessThanComparable*, allowing their use in standard containers. Specializations of `shared_ptr` shall be contextually convertible to `bool`, allowing their use in boolean expressions and declarations in conditions.

3 The template parameter `T` of `shared_ptr` may be an incomplete type.

[*Note 1*: `T` can be a function type. — *end note*]

4 [*Example 1*:

```
if (shared_ptr<X> px = dynamic_pointer_cast<X>(py)) {
  // do something with px
}
```

— *end example*]

5 For purposes of determining the presence of a data race, member functions shall access and modify only the `shared_ptr` and `weak_ptr` objects themselves and not objects they refer to. Changes in `use_count()` do not reflect modifications that can introduce data races.

6 For the purposes of 20.3, a pointer type `Y*` is said to be *compatible with* a pointer type `T*` when either `Y*` is convertible to `T*` or `Y` is `U[N]` and `T` is *cv* `U[]`.

20.3.2.2.2 Constructors [util.smartptr.shared.const]

1 In the constructor definitions below, enables `shared_from_this` with `p`, for a pointer `p` of type `Y*`, means that if `Y` has an unambiguous and accessible base class that is a specialization of `enable_shared_from_-this` (20.3.2.7), then `remove_cv_t<Y>*` shall be implicitly convertible to `T*` and the constructor evaluates the statement:

```
if (p != nullptr && p->weak-this.expired())
  p->weak-this = shared_ptr<remove_cv_t<Y>>(*this, const_cast<remove_cv_t<Y>*>(p));
```

The assignment to the *`weak-this`* member is not atomic and conflicts with any potentially concurrent access to the same object (6.9.2).

`constexpr shared_ptr() noexcept;`

2 *Postconditions*: `use_count() == 0 && get() == nullptr`.

`template<class Y> explicit shared_ptr(Y* p);`

3 *Constraints*: When `T` is an array type, the expression `delete[] p` is well-formed and either `T` is `U[N]` and `Y(*)[N]` is convertible to `T*`, or `T` is `U[]` and `Y(*)[]` is convertible to `T*`. When `T` is not an array type, the expression `delete p` is well-formed and `Y*` is convertible to `T*`.

4 *Mandates*: `Y` is a complete type.

5 *Preconditions*: The expression `delete[] p`, when `T` is an array type, or `delete p`, when `T` is not an array type, has well-defined behavior, and does not throw exceptions.

6 *Effects*: When `T` is not an array type, constructs a `shared_ptr` object that owns the pointer `p`. Otherwise, constructs a `shared_ptr` that owns `p` and a deleter of an unspecified type that calls `delete[] p`. When `T` is not an array type, enables `shared_from_this` with `p`. If an exception is thrown, `delete p` is called when `T` is not an array type, `delete[] p` otherwise.

7 *Postconditions*: `use_count() == 1 && get() == p`.

8 *Throws*: `bad_alloc`, or an implementation-defined exception when a resource other than memory cannot be obtained.

```
template<class Y, class D> shared_ptr(Y* p, D d);
template<class Y, class D, class A> shared_ptr(Y* p, D d, A a);
template<class D> shared_ptr(nullptr_t p, D d);
template<class D, class A> shared_ptr(nullptr_t p, D d, A a);
```

9 *Constraints*: `is_move_constructible_v<D>` is `true`, and `d(p)` is a well-formed expression. For the first two overloads:

(9.1) — If `T` is an array type, then either `T` is `U[N]` and `Y(*)[N]` is convertible to `T*`, or `T` is `U[]` and `Y(*)[]` is convertible to `T*`.

(9.2) — If `T` is not an array type, then `Y*` is convertible to `T*`.

10 *Preconditions*: Construction of `d` and a deleter of type `D` initialized with `std::move(d)` do not throw exceptions. The expression `d(p)` has well-defined behavior and does not throw exceptions. `A` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

11 *Effects*: Constructs a `shared_ptr` object that owns the object `p` and the deleter `d`. When `T` is not an array type, the first and second constructors enable `shared_from_this` with `p`. The second and fourth

constructors shall use a copy of `a` to allocate memory for internal use. If an exception is thrown, `d(p)` is called.

12 *Postconditions*: `use_count() == 1 && get() == p`.

13 *Throws*: `bad_alloc`, or an implementation-defined exception when a resource other than memory cannot be obtained.

```
template<class Y> shared_ptr(const shared_ptr<Y>& r, element_type* p) noexcept;
template<class Y> shared_ptr(shared_ptr<Y>&& r, element_type* p) noexcept;
```

14 *Effects*: Constructs a `shared_ptr` instance that stores `p` and shares ownership with the initial value of `r`.

15 *Postconditions*: `get() == p`. For the second overload, `r` is empty and `r.get() == nullptr`.

16 [*Note 1*: Use of this constructor leads to a dangling pointer unless `p` remains valid at least until the ownership group of `r` is destroyed. — *end note*]

17 [*Note 2*: This constructor allows creation of an empty `shared_ptr` instance with a non-null stored pointer. — *end note*]

```
shared_ptr(const shared_ptr& r) noexcept;
template<class Y> shared_ptr(const shared_ptr<Y>& r) noexcept;
```

18 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

19 *Effects*: If `r` is empty, constructs an empty `shared_ptr` object; otherwise, constructs a `shared_ptr` object that shares ownership with `r`.

20 *Postconditions*: `get() == r.get() && use_count() == r.use_count()`.

```
shared_ptr(shared_ptr&& r) noexcept;
template<class Y> shared_ptr(shared_ptr<Y>&& r) noexcept;
```

21 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

22 *Effects*: Move constructs a `shared_ptr` instance from `r`.

23 *Postconditions*: `*this` contains the old value of `r`. `r` is empty, and `r.get() == nullptr`.

```
template<class Y> explicit shared_ptr(const weak_ptr<Y>& r);
```

24 *Constraints*: `Y*` is compatible with `T*`.

25 *Effects*: Constructs a `shared_ptr` object that shares ownership with `r` and stores a copy of the pointer stored in `r`. If an exception is thrown, the constructor has no effect.

26 *Postconditions*: `use_count() == r.use_count()`.

27 *Throws*: `bad_weak_ptr` when `r.expired()`.

```
template<class Y, class D> shared_ptr(unique_ptr<Y, D>&& r);
```

28 *Constraints*: `Y*` is compatible with `T*` and `unique_ptr<Y, D>::pointer` is convertible to `element_-type*`.

29 *Effects*: If `r.get() == nullptr`, equivalent to `shared_ptr()`. Otherwise, if `D` is not a reference type, equivalent to `shared_ptr(r.release(), std::move(r.get_deleter()))`. Otherwise, equivalent to `shared_ptr(r.release(), ref(r.get_deleter()))`. If an exception is thrown, the constructor has no effect.

20.3.2.2.3 Destructor [util.smartptr.shared.dest]

```
~shared_ptr();
```

1 *Effects*:

(1.1) — If `*this` is empty or shares ownership with another `shared_ptr` instance (`use_count() > 1`), there are no side effects.

(1.2) — Otherwise, if `*this` owns an object `p` and a deleter `d`, `d(p)` is called.

(1.3) — Otherwise, `*this` owns a pointer `p`, and `delete p` is called.

2 [*Note 1*: Since the destruction of `*this` decreases the number of instances that share ownership with `*this` by one, after `*this` has been destroyed all `shared_ptr` instances that shared ownership with `*this` will report a `use_count()` that is one less than its previous value. — *end note*]

20.3.2.2.4 Assignment [util.smartptr.shared.assign]

```
shared_ptr& operator=(const shared_ptr& r) noexcept;
template<class Y> shared_ptr& operator=(const shared_ptr<Y>& r) noexcept;
```

1 *Effects*: Equivalent to `shared_ptr(r).swap(*this)`.

2 *Returns*: `*this`.

3 [*Note 1*: The use count updates caused by the temporary object construction and destruction are not observable side effects, so the implementation can meet the effects (and the implied guarantees) via different means, without creating a temporary. In particular, in the example:

```
shared_ptr<int> p(new int);
shared_ptr<void> q(p);
p = p;
q = p;
```

both assignments can be no-ops. — *end note*]

```
shared_ptr& operator=(shared_ptr&& r) noexcept;
template<class Y> shared_ptr& operator=(shared_ptr<Y>&& r) noexcept;
```

4 *Effects*: Equivalent to `shared_ptr(std::move(r)).swap(*this)`.

5 *Returns*: `*this`.

```
template<class Y, class D> shared_ptr& operator=(unique_ptr<Y, D>&& r);
```

6 *Effects*: Equivalent to `shared_ptr(std::move(r)).swap(*this)`.

7 *Returns*: `*this`.

20.3.2.2.5 Modifiers [util.smartptr.shared.mod]

```
void swap(shared_ptr& r) noexcept;
```

1 *Effects*: Exchanges the contents of `*this` and `r`.

```
void reset() noexcept;
```

2 *Effects*: Equivalent to `shared_ptr().swap(*this)`.

```
template<class Y> void reset(Y* p);
```

3 *Effects*: Equivalent to `shared_ptr(p).swap(*this)`.

```
template<class Y, class D> void reset(Y* p, D d);
```

4 *Effects*: Equivalent to `shared_ptr(p, d).swap(*this)`.

```
template<class Y, class D, class A> void reset(Y* p, D d, A a);
```

5 *Effects*: Equivalent to `shared_ptr(p, d, a).swap(*this)`.

20.3.2.2.6 Observers [util.smartptr.shared.obs]

```
element_type* get() const noexcept;
```

1 *Returns*: The stored pointer.

```
T& operator*() const noexcept;
```

2 *Preconditions*: `get() != nullptr`.

3 *Returns*: `*get()`.

4 *Remarks*: When `T` is an array type or *cv* `void`, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
T* operator->() const noexcept;
```

5 *Preconditions*: `get() != nullptr`.

6 *Returns*: `get()`.

7 *Remarks*: When `T` is an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
element_type& operator[](ptrdiff_t i) const;
```

8 *Preconditions*: `get() != nullptr && i >= 0`. If `T` is `U[N]`, `i < N`.

9 *Returns*: `get()[i]`.

10 *Throws*: Nothing.

11 *Remarks*: When `T` is not an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
long use_count() const noexcept;
```

12 *Synchronization*: None.

13 *Returns*: The number of `shared_ptr` objects, `*this` included, that share ownership with `*this`, or `0` when `*this` is empty.

14 [*Note 1*: `get() == nullptr` does not imply a specific return value of `use_count()`. — *end note*]

15 [*Note 2*: `weak_ptr<T>::lock()` can affect the return value of `use_count()`. — *end note*]

16 [*Note 3*: When multiple threads might affect the return value of `use_count()`, the result is approximate. In particular, `use_count() == 1` does not imply that accesses through a previously destroyed `shared_ptr` have in any sense completed. — *end note*]

```
explicit operator bool() const noexcept;
```

17 *Returns*: `get() != nullptr`.

```
template<class U> bool owner_before(const shared_ptr<U>& b) const noexcept;
template<class U> bool owner_before(const weak_ptr<U>& b) const noexcept;
```

18 *Returns*: An unspecified value such that

(18.1) — `owner_before(b)` defines a strict weak ordering as defined in 26.8;

(18.2) — `!owner_before(b) && !b.owner_before(*this)` is `true` if and only if `owner_equal(b)` is `true`.

```
size_t owner_hash() const noexcept;
```

19 *Returns*: An unspecified value such that, for any object `x` where `owner_equal(x)` is `true`, `owner_hash() == x.owner_hash()` is `true`.

```
template<class U>
  bool owner_equal(const shared_ptr<U>& b) const noexcept;
template<class U>
  bool owner_equal(const weak_ptr<U>& b) const noexcept;
```

20 *Returns*: `true` if and only if `*this` and `b` share ownership or are both empty. Otherwise returns `false`.

21 *Remarks*: `owner_equal` is an equivalence relation.

20.3.2.2.7 Creation [util.smartptr.shared.create]

1 The common requirements that apply to all `make_shared`, `allocate_shared`, `make_shared_for_overwrite`, and `allocate_shared_for_overwrite` overloads, unless specified otherwise, are described below.

```
template<class T, ...>
  shared_ptr<T> make_shared(args);
template<class T, class A, ...>
  shared_ptr<T> allocate_shared(const A& a, args);
template<class T, ...>
  shared_ptr<T> make_shared_for_overwrite(args);
```

```
template<class T, class A, ...>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a, args);
```

2 *Preconditions*: `A` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

3 *Effects*: Allocates memory for an object of type `T` (or `U[N]` when `T` is `U[]`, where `N` is determined from *args* as specified by the concrete overload). The object is initialized from *args* as specified by the concrete overload. The `allocate_shared` and `allocate_shared_for_overwrite` templates use a copy of `a` (rebound for an unspecified `value_type`) to allocate memory. If an exception is thrown, the functions have no effect.

4 *Postconditions*: `r.get() != nullptr && r.use_count() == 1`, where `r` is the return value.

5 *Returns*: A `shared_ptr` instance that stores and owns the address of the newly constructed object.

6 *Throws*: `bad_alloc`, or an exception thrown from `allocate` or from the initialization of the object.

7 *Remarks*:

(7.1) — Implementations should perform no more than one memory allocation.

[*Note 1*: This provides efficiency equivalent to an intrusive smart pointer. — *end note*]

(7.2) — When an object of an array type `U` is specified to have an initial value of `u` (of the same type), this shall be interpreted to mean that each array element of the object has as its initial value the corresponding element from `u`.

(7.3) — When an object of an array type is specified to have a default initial value, this shall be interpreted to mean that each array element of the object has a default initial value.

(7.4) — When a (sub)object of a non-array type `U` is specified to have an initial value of `v`, or `U(l...)`, where `l...` is a list of constructor arguments, `make_shared` shall initialize this (sub)object via the expression `::new(pv) U(v)` or `::new(pv) U(l...)` respectively, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.5) — When a (sub)object of a non-array type `U` is specified to have an initial value of `v`, or `U(l...)`, where `l...` is a list of constructor arguments, `allocate_shared` shall initialize this (sub)object via the expression

(7.5.1) — `allocator_traits<A2>::construct(a2, pu, v)` or

(7.5.2) — `allocator_traits<A2>::construct(a2, pu, l...)`

respectively, where `pu` is a pointer of type `remove_cv_t<U>*` pointing to storage suitable to hold an object of type `remove_cv_t<U>` and `a2` of type `A2` is a potentially rebound copy of the allocator `a` passed to `allocate_shared`.

(7.6) — When a (sub)object of non-array type `U` is specified to have a default initial value, `make_shared` shall initialize this (sub)object via the expression `::new(pv) U()`, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.7) — When a (sub)object of non-array type `U` is specified to have a default initial value, `allocate_shared` initializes this (sub)object via the expression `allocator_traits<A2>::construct(a2, pu)`, where `pu` is a pointer of type `remove_cv_t<U>*` pointing to storage suitable to hold an object of type `remove_cv_t<U>` and `a2` of type `A2` is a potentially rebound copy of the allocator `a` passed to `allocate_shared`.

(7.8) — When a (sub)object of non-array type `U` is initialized by `make_shared_for_overwrite` or `allocate_shared_for_overwrite`, it is initialized via the expression `::new(pv) U`, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.9) — Array elements are initialized in ascending order of their addresses.

(7.10) — When the lifetime of the object managed by the return value ends, or when the initialization of an array element throws an exception, the initialized elements are destroyed in the reverse order of their original construction.

(7.11) — When a (sub)object of non-array type `U` that was initialized by `make_shared`, `make_shared_for_overwrite`, or `allocate_shared_for_overwrite` is to be destroyed, it is destroyed via the expression `pu->~U()` where `pu` points to that object of type `U`.

(7.12) — When a (sub)object of non-array type `U` that was initialized by `allocate_shared` is to be destroyed, it is destroyed via the expression `allocator_traits<A2>::destroy(a2, pu)` where `pu` is a pointer of type `remove_cv_t<U>*` pointing to that object of type `remove_cv_t<U>` and `a2` of type `A2` is a potentially rebound copy of the allocator `a` passed to `allocate_shared`.

[*Note 2*: These functions will typically allocate more memory than `sizeof(T)` to allow for internal bookkeeping structures such as reference counts. — *end note*]

```
template<class T, class... Args>
  shared_ptr<T> make_shared(Args&&... args);                    // T is not array
template<class T, class A, class... Args>
  shared_ptr<T> allocate_shared(const A& a, Args&&... args);    // T is not array
```

8 *Constraints*: `T` is not an array type.

9 *Returns*: A `shared_ptr` to an object of type `T` with an initial value `T(std::forward<Args>(args)...)`.

10 *Remarks*: The `shared_ptr` constructors called by these functions enable `shared_from_this` with the address of the newly constructed object of type `T`.

11 [*Example 1*:

```
shared_ptr<int> p = make_shared<int>(); // shared_ptr to int()
shared_ptr<vector<int>> q = make_shared<vector<int>>(16, 1);
  // shared_ptr to vector of 16 elements with value 1
```

— *end example*]

```
template<class T> shared_ptr<T>
  make_shared(size_t N);                                        // T is U[]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a, size_t N);          // T is U[]
```

12 *Constraints*: `T` is of the form `U[]`.

13 *Returns*: A `shared_ptr` to an object of type `U[N]` with a default initial value, where `U` is `remove_-extent_t<T>`.

14 [*Example 2*:

```
shared_ptr<double[]> p = make_shared<double[]>(1024);
  // shared_ptr to a value-initialized double[1024]
shared_ptr<double[][2][2]> q = make_shared<double[][2][2]>(6);
  // shared_ptr to a value-initialized double[6][2][2]
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared();                                  // T is U[N]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a);                    // T is U[N]
```

15 *Constraints*: `T` is of the form `U[N]`.

16 *Returns*: A `shared_ptr` to an object of type `T` with a default initial value.

17 [*Example 3*:

```
shared_ptr<double[1024]> p = make_shared<double[1024]>();
  // shared_ptr to a value-initialized double[1024]
shared_ptr<double[6][2][2]> q = make_shared<double[6][2][2]>();
  // shared_ptr to a value-initialized double[6][2][2]
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared(size_t N,
                            const remove_extent_t<T>& u);       // T is U[]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a, size_t N,
                                const remove_extent_t<T>& u);   // T is U[]
```

18 *Constraints*: `T` is of the form `U[]`.

19 *Returns*: A `shared_ptr` to an object of type `U[N]`, where `U` is `remove_extent_t<T>` and each array element has an initial value of `u`.

20 [*Example 4*:

```
shared_ptr<double[]> p = make_shared<double[]>(1024, 1.0);
  // shared_ptr to a double[1024], where each element is 1.0
shared_ptr<double[][2]> q = make_shared<double[][2]>(6, {1.0, 0.0});
  // shared_ptr to a double[6][2], where each double[2] element is {1.0, 0.0}
shared_ptr<vector<int>[]> r = make_shared<vector<int>[]>(4, {1, 2});
  // shared_ptr to a vector<int>[4], where each vector has contents {1, 2}
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared(const remove_extent_t<T>& u);       // T is U[N]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a,
                                const remove_extent_t<T>& u);   // T is U[N]
```

21 *Constraints*: `T` is of the form `U[N]`.

22 *Returns*: A `shared_ptr` to an object of type `T`, where each array element of type `remove_extent_t<T>` has an initial value of `u`.

23 [*Example 5*:

```
shared_ptr<double[1024]> p = make_shared<double[1024]>(1.0);
  // shared_ptr to a double[1024], where each element is 1.0
shared_ptr<double[6][2]> q = make_shared<double[6][2]>({1.0, 0.0});
  // shared_ptr to a double[6][2], where each double[2] element is {1.0, 0.0}
shared_ptr<vector<int>[4]> r = make_shared<vector<int>[4]>({1, 2});
  // shared_ptr to a vector<int>[4], where each vector has contents {1, 2}
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared_for_overwrite();
template<class T, class A>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a);
```

24 *Constraints*: `T` is not an array of unknown bound.

25 *Returns*: A `shared_ptr` to an object of type `T`.

26 [*Example 6*:

```
struct X { double data[1024]; };
shared_ptr<X> p = make_shared_for_overwrite<X>();
  // shared_ptr to a default-initialized X, where each element in X::data has an indeterminate value

shared_ptr<double[1024]> q = make_shared_for_overwrite<double[1024]>();
  // shared_ptr to a default-initialized double[1024], where each element has an indeterminate value
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared_for_overwrite(size_t N);
template<class T, class A>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a, size_t N);
```

27 *Constraints*: `T` is an array of unknown bound.

28 *Returns*: A `shared_ptr` to an object of type `U[N]`, where `U` is `remove_extent_t<T>`.

29 [*Example 7*:

```
shared_ptr<double[]> p = make_shared_for_overwrite<double[]>(1024);
  // shared_ptr to a default-initialized double[1024], where each element has an indeterminate value
```

— *end example*]

20.3.2.2.8 Comparison [util.smartptr.shared.cmp]

```
template<class T, class U>
  bool operator==(const shared_ptr<T>& a, const shared_ptr<U>& b) noexcept;
```

1 *Returns*: `a.get() == b.get()`.

```
template<class T>
  bool operator==(const shared_ptr<T>& a, nullptr_t) noexcept;
```

2 *Returns*: `!a`.

```
template<class T, class U>
  strong_ordering operator<=>(const shared_ptr<T>& a, const shared_ptr<U>& b) noexcept;
```

3 *Returns*: `compare_three_way()(a.get(), b.get())`.

4 [*Note 1*: Defining a comparison operator function allows `shared_ptr` objects to be used as keys in associative containers. — *end note*]

```
template<class T>
  strong_ordering operator<=>(const shared_ptr<T>& a, nullptr_t) noexcept;
```

5 *Returns*:

```
compare_three_way()(a.get(), static_cast<typename shared_ptr<T>::element_type*>(nullptr))
```

20.3.2.2.9 Specialized algorithms [util.smartptr.shared.spec]

```
template<class T>
  void swap(shared_ptr<T>& a, shared_ptr<T>& b) noexcept;
```

1 *Effects*: Equivalent to `a.swap(b)`.

20.3.2.2.10 Casts [util.smartptr.shared.cast]

```
template<class T, class U>
  shared_ptr<T> static_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> static_pointer_cast(shared_ptr<U>&& r) noexcept;
```

1 *Mandates*: The expression `static_cast<T*>((U*)nullptr)` is well-formed.

2 *Returns*:

```
shared_ptr<T>(R, static_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *`R`* is `r` for the first overload, and `std::move(r)` for the second.

3 [*Note 1*: The seemingly equivalent expression `shared_ptr<T>(static_cast<T*>(r.get()))` can result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> dynamic_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> dynamic_pointer_cast(shared_ptr<U>&& r) noexcept;
```

4 *Mandates*: The expression `dynamic_cast<T*>((U*)nullptr)` is well-formed. The expression `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` is well-formed.

5 *Preconditions*: The expression `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` has well-defined behavior.

6 *Returns*:

(6.1) — When `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` returns a non-null value `p`, `shared_ptr<T>(`*`R`*`, p)`, where *`R`* is `r` for the first overload, and `std::move(r)` for the second.

(6.2) — Otherwise, `shared_ptr<T>()`.

7 [*Note 2*: The seemingly equivalent expression `shared_ptr<T>(dynamic_cast<T*>(r.get()))` can result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> const_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> const_pointer_cast(shared_ptr<U>&& r) noexcept;
```

8 *Mandates*: The expression `const_cast<T*>((U*)nullptr)` is well-formed.

9 *Returns*:

```
shared_ptr<T>(R, const_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *R* is `r` for the first overload, and `std::move(r)` for the second.

10 [*Note 3*: The seemingly equivalent expression `shared_ptr<T>(const_cast<T*>(r.get()))` can result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> reinterpret_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> reinterpret_pointer_cast(shared_ptr<U>&& r) noexcept;
```

11 *Mandates*: The expression `reinterpret_cast<T*>((U*)nullptr)` is well-formed.

12 *Returns*:

```
shared_ptr<T>(R, reinterpret_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *R* is `r` for the first overload, and `std::move(r)` for the second.

13 [*Note 4*: The seemingly equivalent expression `shared_ptr<T>(reinterpret_cast<T*>(r.get()))` can result in undefined behavior, attempting to delete the same object twice. — *end note*]

20.3.2.2.11 `get_deleter` [util.smartptr.getdeleter]

```
template<class D, class T>
  D* get_deleter(const shared_ptr<T>& p) noexcept;
```

1 *Returns*: If `p` owns a deleter `d` of type cv-unqualified `D`, returns `addressof(d)`; otherwise returns `nullptr`. The returned pointer remains valid as long as there exists a `shared_ptr` instance that owns `d`.

[*Note 1*: It is unspecified whether the pointer remains valid longer than that. This can happen if the implementation doesn't destroy the deleter until all `weak_ptr` instances that share ownership with `p` have been destroyed. — *end note*]

20.3.2.2.12 I/O [util.smartptr.shared.io]

```
template<class E, class T, class Y>
  basic_ostream<E, T>& operator<<(basic_ostream<E, T>& os, const shared_ptr<Y>& p);
```

1 *Effects*: As if by: `os << p.get();`

2 *Returns*: `os`.

20.3.2.3 Class template `weak_ptr` [util.smartptr.weak]

20.3.2.3.1 General [util.smartptr.weak.general]

1 The `weak_ptr` class template stores a weak reference to an object that is already managed by a `shared_ptr`. To access the object, a `weak_ptr` can be converted to a `shared_ptr` using the member function `lock`.

```
namespace std {
  template<class T> class weak_ptr {
  public:
    using element_type = remove_extent_t<T>;

    // 20.3.2.3.2, constructors
    constexpr weak_ptr() noexcept;
    template<class Y>
      weak_ptr(const shared_ptr<Y>& r) noexcept;
    weak_ptr(const weak_ptr& r) noexcept;
    template<class Y>
      weak_ptr(const weak_ptr<Y>& r) noexcept;
    weak_ptr(weak_ptr&& r) noexcept;
    template<class Y>
      weak_ptr(weak_ptr<Y>&& r) noexcept;

    // 20.3.2.3.3, destructor
    ~weak_ptr();
    // 20.3.2.3.4, assignment
    weak_ptr& operator=(const weak_ptr& r) noexcept;
    template<class Y>
      weak_ptr& operator=(const weak_ptr<Y>& r) noexcept;
    template<class Y>
      weak_ptr& operator=(const shared_ptr<Y>& r) noexcept;
    weak_ptr& operator=(weak_ptr&& r) noexcept;
    template<class Y>
      weak_ptr& operator=(weak_ptr<Y>&& r) noexcept;

    // 20.3.2.3.5, modifiers
    void swap(weak_ptr& r) noexcept;
    void reset() noexcept;

    // 20.3.2.3.6, observers
    long use_count() const noexcept;
    bool expired() const noexcept;
    shared_ptr<T> lock() const noexcept;
    template<class U>
      bool owner_before(const shared_ptr<U>& b) const noexcept;
    template<class U>
      bool owner_before(const weak_ptr<U>& b) const noexcept;
    size_t owner_hash() const noexcept;
    template<class U>
      bool owner_equal(const shared_ptr<U>& b) const noexcept;
    template<class U>
      bool owner_equal(const weak_ptr<U>& b) const noexcept;
  };

  template<class T>
    weak_ptr(shared_ptr<T>) -> weak_ptr<T>;
}
```

2 Specializations of `weak_ptr` shall be *Cpp17CopyConstructible* and *Cpp17CopyAssignable*, allowing their use in standard containers. The template parameter `T` of `weak_ptr` may be an incomplete type.

20.3.2.3.2 Constructors [util.smartptr.weak.const]

```
constexpr weak_ptr() noexcept;
```

1 *Effects*: Constructs an empty `weak_ptr` object that stores a null pointer value.

2 *Postconditions*: `use_count() == 0`.

```
weak_ptr(const weak_ptr& r) noexcept;
template<class Y> weak_ptr(const weak_ptr<Y>& r) noexcept;
template<class Y> weak_ptr(const shared_ptr<Y>& r) noexcept;
```

3 *Constraints*: For the second and third constructors, `Y*` is compatible with `T*`.

4 *Effects*: If `r` is empty, constructs an empty `weak_ptr` object that stores a null pointer value; otherwise, constructs a `weak_ptr` object that shares ownership with `r` and stores a copy of the pointer stored in `r`.

5 *Postconditions*: `use_count() == r.use_count()`.

```
weak_ptr(weak_ptr&& r) noexcept;
template<class Y> weak_ptr(weak_ptr<Y>&& r) noexcept;
```

6 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

7 *Effects*: Move constructs a `weak_ptr` instance from `r`.

8 *Postconditions*: `*this` contains the old value of `r`. `r` is empty, stores a null pointer value, and `r.use_count() == 0`.

20.3.2.3.3 Destructor [util.smartptr.weak.dest]

```
~weak_ptr();
```

1 *Effects*: Destroys this `weak_ptr` object but has no effect on the object its stored pointer points to.

20.3.2.3.4 Assignment [util.smartptr.weak.assign]

```
weak_ptr& operator=(const weak_ptr& r) noexcept;
template<class Y> weak_ptr& operator=(const weak_ptr<Y>& r) noexcept;
template<class Y> weak_ptr& operator=(const shared_ptr<Y>& r) noexcept;
```

1 *Effects*: Equivalent to `weak_ptr(r).swap(*this)`.

2 *Returns*: `*this`.

3 *Remarks*: The implementation may meet the effects (and the implied guarantees) via different means, without creating a temporary object.

```
weak_ptr& operator=(weak_ptr&& r) noexcept;
template<class Y> weak_ptr& operator=(weak_ptr<Y>&& r) noexcept;
```

4 *Effects*: Equivalent to `weak_ptr(std::move(r)).swap(*this)`.

5 *Returns*: `*this`.

20.3.2.3.5 Modifiers [util.smartptr.weak.mod]

```
void swap(weak_ptr& r) noexcept;
```

1 *Effects*: Exchanges the contents of `*this` and `r`.

```
void reset() noexcept;
```

2 *Effects*: Equivalent to `weak_ptr().swap(*this)`.

20.3.2.3.6 Observers [util.smartptr.weak.obs]

```
long use_count() const noexcept;
```

1 *Returns*: `0` if `*this` is empty; otherwise, the number of `shared_ptr` instances that share ownership with `*this`.

```
bool expired() const noexcept;
```

2 *Returns*: `use_count() == 0`.

```
shared_ptr<T> lock() const noexcept;
```

3 *Returns*: `expired() ? shared_ptr<T>() : shared_ptr<T>(*this)`, executed atomically.

```
template<class U> bool owner_before(const shared_ptr<U>& b) const noexcept;
template<class U> bool owner_before(const weak_ptr<U>& b) const noexcept;
```

4 *Returns*: An unspecified value such that

(4.1) — `owner_before(b)` defines a strict weak ordering as defined in 26.8;

(4.2) — `!owner_before(b) && !b.owner_before(*this)` is `true` if and only if `owner_equal(b)` is `true`.

```
size_t owner_hash() const noexcept;
```

5 *Returns*: An unspecified value such that, for any object `x` where `owner_equal(x)` is `true`, `owner_hash() == x.owner_hash()` is `true`.

```
template<class U>
  bool owner_equal(const shared_ptr<U>& b) const noexcept;
template<class U>
  bool owner_equal(const weak_ptr<U>& b) const noexcept;
```

6 *Returns*: `true` if and only if `*this` and `b` share ownership or are both empty. Otherwise returns `false`.

7 *Remarks*: `owner_equal` is an equivalence relation.

20.3.2.3.7 Specialized algorithms [util.smartptr.weak.spec]

```
template<class T>
  void swap(weak_ptr<T>& a, weak_ptr<T>& b) noexcept;
```

1 *Effects*: Equivalent to `a.swap(b)`.

20.3.2.4 Class template `owner_less` [util.smartptr.ownerless]

1 The class template `owner_less` allows ownership-based mixed comparisons of shared and weak pointers.

```
namespace std {
  template<class T = void> struct owner_less;

  template<class T> struct owner_less<shared_ptr<T>> {
    bool operator()(const shared_ptr<T>&, const shared_ptr<T>&) const noexcept;
    bool operator()(const shared_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const weak_ptr<T>&, const shared_ptr<T>&) const noexcept;
  };

  template<class T> struct owner_less<weak_ptr<T>> {
    bool operator()(const weak_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const shared_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const weak_ptr<T>&, const shared_ptr<T>&) const noexcept;
  };

  template<> struct owner_less<void> {
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const weak_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const weak_ptr<U>&) const noexcept;

    using is_transparent = unspecified;
  };
}
```

2 `operator()(x, y)` returns `x.owner_before(y)`.

[*Note 1*: Note that

(2.1) — `operator()` defines a strict weak ordering as defined in 26.8;

(2.2) — `!operator()(a, b) && !operator()(b, a)` is `true` if and only if `a.owner_equal(b)` is `true`.

— *end note*]

20.3.2.5 Struct `owner_hash` [util.smartptr.owner.hash]

1 The class `owner_hash` provides ownership-based hashing.

```
namespace std {
  struct owner_hash {
    template<class T>
      size_t operator()(const shared_ptr<T>&) const noexcept;

    template<class T>
      size_t operator()(const weak_ptr<T>&) const noexcept;

    using is_transparent = unspecified;
  };
}
```

```
template<class T>
  size_t operator()(const shared_ptr<T>& x) const noexcept;
template<class T>
  size_t operator()(const weak_ptr<T>& x) const noexcept;
```

2 *Returns*: `x.owner_hash()`.

3 [*Note 1*: For any object `y` where `x.owner_equal(y)` is `true`, `x.owner_hash() == y.owner_hash()` is `true`. — *end note*]

20.3.2.6 Struct `owner_equal` [util.smartptr.owner.equal]

1 The class `owner_equal` provides ownership-based mixed equality comparisons of shared and weak pointers.

```
namespace std {
  struct owner_equal {
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const weak_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const weak_ptr<U>&) const noexcept;

    using is_transparent = unspecified;
  };
}
```

```
template<class T, class U>
  bool operator()(const shared_ptr<T>& x, const shared_ptr<U>& y) const noexcept;
template<class T, class U>
  bool operator()(const shared_ptr<T>& x, const weak_ptr<U>& y) const noexcept;
template<class T, class U>
  bool operator()(const weak_ptr<T>& x, const shared_ptr<U>& y) const noexcept;
template<class T, class U>
  bool operator()(const weak_ptr<T>& x, const weak_ptr<U>& y) const noexcept;
```

2 *Returns*: `x.owner_equal(y)`.

3 [*Note 1*: `x.owner_equal(y)` is `true` if and only if `x` and `y` share ownership or are both empty. — *end note*]

20.3.2.7 Class template `enable_shared_from_this` [util.smartptr.enab]

1 A class `T` can inherit from `enable_shared_from_this<T>` to inherit the `shared_from_this` member functions that obtain a `shared_ptr` instance pointing to `*this`.

2 [*Example 1*:

```
struct X: public enable_shared_from_this<X> { };

int main() {
  shared_ptr<X> p(new X);
  shared_ptr<X> q = p->shared_from_this();
  assert(p == q);
  assert(p.owner_equal(q));                    // p and q share ownership
}
```

— *end example*]

```
namespace std {
  template<class T> class enable_shared_from_this {
  protected:
    constexpr enable_shared_from_this() noexcept;
    enable_shared_from_this(const enable_shared_from_this&) noexcept;
    enable_shared_from_this& operator=(const enable_shared_from_this&) noexcept;
    ~enable_shared_from_this();

  public:
    shared_ptr<T> shared_from_this();
    shared_ptr<T const> shared_from_this() const;
    weak_ptr<T> weak_from_this() noexcept;
    weak_ptr<T const> weak_from_this() const noexcept;

  private:
    mutable weak_ptr<T> weak-this;  // exposition only
  };
}
```

3 The template parameter `T` of `enable_shared_from_this` may be an incomplete type.

```
constexpr enable_shared_from_this() noexcept;
enable_shared_from_this(const enable_shared_from_this<T>&) noexcept;
```

4 *Effects*: Value-initializes *`weak-this`*.

```
enable_shared_from_this<T>& operator=(const enable_shared_from_this<T>&) noexcept;
```

5 *Returns*: `*this`.

6 [*Note 1*: *`weak-this`* is not changed. — *end note*]

```
shared_ptr<T>       shared_from_this();
shared_ptr<T const> shared_from_this() const;
```

7 *Returns*: `shared_ptr<T>(`*`weak-this`*`)`.

```
weak_ptr<T>       weak_from_this() noexcept;
weak_ptr<T const> weak_from_this() const noexcept;
```

8 *Returns*: *`weak-this`*.

20.3.3 Smart pointer hash support [util.smartptr.hash]

```
template<class T, class D> struct hash<unique_ptr<T, D>>;
```

1 Letting `UP` be `unique_ptr<T, D>`, the specialization `hash<UP>` is enabled (22.10.19) if and only if `hash<typename UP::pointer>` is enabled. When enabled, for an object `p` of type `UP`, `hash<UP>()(p)` evaluates to the same value as `hash<typename UP::pointer>()(p.get())`. The member functions are not guaranteed to be `noexcept`.

```
template<class T> struct hash<shared_ptr<T>>;
```

2 For an object `p` of type `shared_ptr<T>`, `hash<shared_ptr<T>>()(p)` evaluates to the same value as `hash<typename shared_ptr<T>::element_type*>()(p.get())`.

20.3.4 Smart pointer adaptors [smartptr.adapt]

20.3.4.1 Class template `out_ptr_t` [out.ptr.t]

1 `out_ptr_t` is a class template used to adapt types such as smart pointers (20.3) for functions that use output pointer parameters.

2 [*Example 1*:

```
#include <memory>
#include <cstdio>

int fopen_s(std::FILE** f, const char* name, const char* mode);

struct fclose_deleter {
  void operator()(std::FILE* f) const noexcept {
    std::fclose(f);
  }
};

int main(int, char*[]) {
  constexpr const char* file_name = "ow.o";
  std::unique_ptr<std::FILE, fclose_deleter> file_ptr;
  int err = fopen_s(std::out_ptr<std::FILE*>(file_ptr), file_name, "r+b");
  if (err != 0)
    return 1;
  // *file_ptr is valid
  return 0;
}
```

`unique_ptr` can be used with `out_ptr` to be passed into an output pointer-style function, without needing to hold onto an intermediate pointer value and manually delete it on error or failure. — *end example*]

```
namespace std {
  template<class Smart, class Pointer, class... Args>
  class out_ptr_t {
  public:
    explicit out_ptr_t(Smart&, Args...);
    out_ptr_t(const out_ptr_t&) = delete;

    ~out_ptr_t();

    operator Pointer*() const noexcept;
    operator void**() const noexcept;

  private:
    Smart& s;                    // exposition only
    tuple<Args...> a;            // exposition only
    Pointer p;                   // exposition only
  };
}
```

3 `Pointer` shall meet the *Cpp17NullablePointer* requirements. If `Smart` is a specialization of `shared_ptr` and `sizeof...(Args) == 0`, the program is ill-formed.

[*Note 1*: It is typically a user error to reset a `shared_ptr` without specifying a deleter, as `shared_ptr` will replace a custom deleter upon usage of `reset`, as specified in 20.3.2.2.5. — *end note*]

4 Program-defined specializations of `out_ptr_t` that depend on at least one program-defined type need not meet the requirements for the primary template.

5 Evaluations of the conversion functions on the same object may conflict (6.9.2.2).

`explicit out_ptr_t(Smart& smart, Args... args);`

6 *Effects*: Initializes `s` with `smart`, `a` with `std::forward<Args>(args)...`, and value-initializes `p`. Then, equivalent to:

(6.1) — `s.reset();`

if the expression `s.reset()` is well-formed;

(6.2) — otherwise,

`s = Smart();`

if `is_constructible_v<Smart>` is `true`;

(6.3) — otherwise, the program is ill-formed.

7 [*Note 2*: The constructor is not `noexcept` to allow for a variety of non-terminating and safe implementation strategies. For example, an implementation can allocate a `shared_ptr`'s internal node in the constructor and let implementation-defined exceptions escape safely. The destructor can then move the allocated control block in directly and avoid any other exceptions. — *end note*]

`~out_ptr_t();`

8 Let SP be *`POINTER_OF_OR`*`(Smart, Pointer)` (20.2.1).

9 *Effects*: Equivalent to:

(9.1) —
```
if (p) {
  apply([&](auto&&... args) {
    s.reset(static_cast<SP>(p), std::forward<Args>(args)...); }, std::move(a));
}
```

if the expression `s.reset(static_cast<SP>(p), std::forward<Args>(args)...)` is well-formed;

(9.2) — otherwise,

```
if (p) {
  apply([&](auto&&... args) {
    s = Smart(static_cast<SP>(p), std::forward<Args>(args)...); }, std::move(a));
}
```

if `is_constructible_v<Smart, SP, Args...>` is `true`;

(9.3) — otherwise, the program is ill-formed.

```
operator Pointer*() const noexcept;
```

10 *Preconditions*: `operator void**()` has not been called on `*this`.

11 *Returns*: `addressof(const_cast<Pointer&>(p))`.

```
operator void**() const noexcept;
```

12 *Constraints*: `is_same_v<Pointer, void*>` is `false`.

13 *Mandates*: `is_pointer_v<Pointer>` is `true`.

14 *Preconditions*: `operator Pointer*()` has not been called on `*this`.

15 *Returns*: A pointer value `v` such that:

(15.1) — the initial value `*v` is equivalent to `static_cast<void*>(p)` and

(15.2) — any modification of `*v` that is not followed by a subsequent modification of `*this` affects the value of `p` during the destruction of `*this`, such that `static_cast<void*>(p) == *v`.

16 *Remarks*: Accessing `*v` outside the lifetime of `*this` has undefined behavior.

17 [*Note 3*: `reinterpret_cast<void**>(static_cast<Pointer*>(*this))` can be a viable implementation strategy for some implementations. — *end note*]

20.3.4.2 Function template `out_ptr` [out.ptr]

```
template<class Pointer = void, class Smart, class... Args>
  auto out_ptr(Smart& s, Args&&... args);
```

1 Let `P` be `Pointer` if `is_void_v<Pointer>` is `false`, otherwise *`POINTER_OF`*`(Smart)`.

2 *Returns*: `out_ptr_t<Smart, P, Args&&...>(s, std::forward<Args>(args)...)`

20.3.4.3 Class template `inout_ptr_t` [inout.ptr.t]

1 `inout_ptr_t` is a class template used to adapt types such as smart pointers (20.3) for functions that use output pointer parameters whose dereferenced values may first be deleted before being set to another allocated value.

2 [*Example 1*:

```
#include <memory>

struct star_fish* star_fish_alloc();
int star_fish_populate(struct star_fish** ps, const char* description);

struct star_fish_deleter {
  void operator() (struct star_fish* c) const noexcept;
};

using star_fish_ptr = std::unique_ptr<star_fish, star_fish_deleter>;

int main(int, char*[]) {
  star_fish_ptr peach(star_fish_alloc());
  // ...
  // used, need to re-make
  int err = star_fish_populate(std::inout_ptr(peach), "caring clown-fish liker");
  return err;
}
```

A `unique_ptr` can be used with `inout_ptr` to be passed into an output pointer-style function. The original value will be properly deleted according to the function it is used with and a new value reset in its place. — *end example*]

```
namespace std {
  template<class Smart, class Pointer, class... Args>
  class inout_ptr_t {
  public:
    explicit inout_ptr_t(Smart&, Args...);
    inout_ptr_t(const inout_ptr_t&) = delete;
    ~inout_ptr_t();

    operator Pointer*() const noexcept;
    operator void**() const noexcept;

  private:
    Smart& s;                    // exposition only
    tuple<Args...> a;            // exposition only
    Pointer p;                   // exposition only
  };
}
```

3 `Pointer` shall meet the *Cpp17NullablePointer* requirements. If `Smart` is a specialization of `shared_ptr`, the program is ill-formed.

[*Note 1*: It is impossible to properly acquire unique ownership of the managed resource from a `shared_ptr` given its shared ownership model. — *end note*]

4 Program-defined specializations of `inout_ptr_t` that depend on at least one program-defined type need not meet the requirements for the primary template.

5 Evaluations of the conversion functions on the same object may conflict (6.9.2.2).

```
explicit inout_ptr_t(Smart& smart, Args... args);
```

6 *Effects*: Initializes `s` with `smart`, `a` with `std::forward<Args>(args)...`, and `p` to either

(6.1) — `smart` if `is_pointer_v<Smart>` is `true`,

(6.2) — otherwise, `smart.get()`.

7 *Remarks*: An implementation can call `s.release()`.

8 [*Note 2*: The constructor is not `noexcept` to allow for a variety of non-terminating and safe implementation strategies. For example, an intrusive pointer implementation with a control block can allocate in the constructor and safely fail with an exception. — *end note*]

```
~inout_ptr_t();
```

9 Let `SP` be *`POINTER_OF_OR`*`(Smart, Pointer)` (20.2.1).

10 Let *`release-statement`* be `s.release();` if an implementation does not call `s.release()` in the constructor. Otherwise, it is empty.

11 *Effects*: Equivalent to:

(11.1) —
```
apply([&](auto&&... args) {
  s = Smart(static_cast<SP>(p), std::forward<Args>(args)...); }, std::move(a));
```
if `is_pointer_v<Smart>` is `true`;

(11.2) — otherwise,
```
release-statement;
if (p) {
  apply([&](auto&&... args) {
    s.reset(static_cast<SP>(p), std::forward<Args>(args)...); }, std::move(a));
}
```
if the expression `s.reset(static_cast<SP>(p), std::forward<Args>(args)...)` is well-formed;

(11.3) — otherwise,
```
release-statement;
if (p) {
  apply([&](auto&&... args) {
    s = Smart(static_cast<SP>(p), std::forward<Args>(args)...); }, std::move(a));
}
```
if `is_constructible_v<Smart, SP, Args...>` is `true`;

(11.4) — otherwise, the program is ill-formed.

```
operator Pointer*() const noexcept;
```

12 *Preconditions*: `operator void**()` has not been called on `*this`.

13 *Returns*: `addressof(const_cast<Pointer&>(p))`.

```
operator void**() const noexcept;
```

14 *Constraints*: `is_same_v<Pointer, void*>` is `false`.

15 *Mandates*: `is_pointer_v<Pointer>` is `true`.

16 *Preconditions*: `operator Pointer*()` has not been called on `*this`.

17 *Returns*: A pointer value `v` such that:

(17.1) — the initial value `*v` is equivalent to `static_cast<void*>(p)` and

(17.2) — any modification of `*v` that is not followed by subsequent modification of `*this` affects the value of `p` during the destruction of `*this`, such that `static_cast<void*>(p) == *v`.

18 *Remarks*: Accessing `*v` outside the lifetime of `*this` has undefined behavior.

19 [*Note 3*: `reinterpret_cast<void**>(static_cast<Pointer*>(*this))` can be a viable implementation strategy for some implementations. — *end note*]

20.3.4.4 Function template `inout_ptr` [inout.ptr]

```
template<class Pointer = void, class Smart, class... Args>
  auto inout_ptr(Smart& s, Args&&... args);
```

1 Let `P` be `Pointer` if `is_void_v<Pointer>` is `false`, otherwise *`POINTER_OF`*`(Smart)`.

2 *Returns*: `inout_ptr_t<Smart, P, Args&&...>(s, std::forward<Args>(args)...)`.

20.4 Types for composite class design [mem.composite.types]

20.4.1 Class template `indirect` [indirect]

20.4.1.1 General [indirect.general]

1 An indirect object manages the lifetime of an owned object. An indirect object is *valueless* if it has no owned object. An indirect object may become valueless only after it has been moved from.

2 In every specialization `indirect<T, Allocator>`, if the type `allocator_traits<Allocator>::value_type` is not the same type as `T`, the program is ill-formed. Every object of type `indirect<T, Allocator>` uses an object of type `Allocator` to allocate and free storage for the owned object as needed.

3 Constructing an owned object with `args...` using the allocator `a` means calling `allocator_traits<Allocator>::construct(a, `*`p`*`, args...)` where `args` is an expression pack, `a` is an allocator, and *`p`* is a pointer obtained by calling `allocator_traits<Allocator>::allocate`.

4 The member *`alloc`* is used for any memory allocation and element construction performed by member functions during the lifetime of each indirect object. The allocator *`alloc`* may be replaced only via assignment or `swap()`. `Allocator` replacement is performed by copy assignment, move assignment, or swapping of the allocator only if (23.2.2.2):

(4.1) — `allocator_traits<Allocator>::propagate_on_container_copy_assignment::value`, or

(4.2) — `allocator_traits<Allocator>::propagate_on_container_move_assignment::value`, or

(4.3) — `allocator_traits<Allocator>::propagate_on_container_swap::value`

is `true` within the implementation of the corresponding `indirect` operation.

5 A program that instantiates the definition of the template `indirect<T, Allocator>` with a type for the `T` parameter that is a non-object type, an array type, `in_place_t`, a specialization of `in_place_type_t`, or a cv-qualified type is ill-formed.

6 The template parameter `T` of `indirect` may be an incomplete type.

7 The template parameter `Allocator` of `indirect` shall meet the *Cpp17Allocator* requirements.

8 If a program declares an explicit or partial specialization of `indirect`, the behavior is undefined.

20.4.1.2 Synopsis [indirect.syn]

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class indirect {
  public:
    using value_type = T;
    using allocator_type = Allocator;
    using pointer = typename allocator_traits<Allocator>::pointer;
    using const_pointer = typename allocator_traits<Allocator>::const_pointer;

    // 20.4.1.3, constructors
    constexpr explicit indirect();
    constexpr explicit indirect(allocator_arg_t, const Allocator& a);
    constexpr indirect(const indirect& other);
    constexpr indirect(allocator_arg_t, const Allocator& a, const indirect& other);
    constexpr indirect(indirect&& other) noexcept;
    constexpr indirect(allocator_arg_t, const Allocator& a, indirect&& other)
      noexcept(see below);
    template<class U = T>
      constexpr explicit indirect(U&& u);
    template<class U = T>
      constexpr explicit indirect(allocator_arg_t, const Allocator& a, U&& u);
    template<class... Us>
      constexpr explicit indirect(in_place_t, Us&&... us);
    template<class... Us>
      constexpr explicit indirect(allocator_arg_t, const Allocator& a,
                                  in_place_t, Us&&... us);
    template<class I, class... Us>
      constexpr explicit indirect(in_place_t, initializer_list<I> ilist, Us&&... us);
    template<class I, class... Us>
      constexpr explicit indirect(allocator_arg_t, const Allocator& a,
                                  in_place_t, initializer_list<I> ilist, Us&&... us);

    // 20.4.1.4, destructor
    constexpr ~indirect();

    // 20.4.1.5, assignment
    constexpr indirect& operator=(const indirect& other);
    constexpr indirect& operator=(indirect&& other) noexcept(see below);
    template<class U = T>
      constexpr indirect& operator=(U&& u);

    // 20.4.1.6, observers
    constexpr const T& operator*() const & noexcept;
    constexpr T& operator*() & noexcept;
    constexpr const T&& operator*() const && noexcept;
    constexpr T&& operator*() && noexcept;
    constexpr const_pointer operator->() const noexcept;
    constexpr pointer operator->() noexcept;
    constexpr bool valueless_after_move() const noexcept;
    constexpr allocator_type get_allocator() const noexcept;

    // 20.4.1.7, swap
    constexpr void swap(indirect& other) noexcept(see below);
    friend constexpr void swap(indirect& lhs, indirect& rhs) noexcept(see below);

    // 20.4.1.8, relational operators
    template<class U, class AA>
      friend constexpr bool operator==(const indirect& lhs, const indirect<U, AA>& rhs)
        noexcept(see below);
    template<class U, class AA>
      friend constexpr auto operator<=>(const indirect& lhs, const indirect<U, AA>& rhs)
        -> synth-three-way-result<T, U>;
    // 20.4.1.9, comparison with T
    template<class U>
      friend constexpr bool operator==(const indirect& lhs, const U& rhs) noexcept(see below);
    template<class U>
      friend constexpr auto operator<=>(const indirect& lhs, const U& rhs)
        -> synth-three-way-result<T, U>;

  private:
    pointer p;                          // exposition only
    Allocator alloc = Allocator();      // exposition only
  };
  template<class Value>
    indirect(Value) -> indirect<Value>;
  template<class Allocator, class Value>
    indirect(allocator_arg_t, Allocator, Value)
      -> indirect<Value, typename allocator_traits<Allocator>::template rebind_alloc<Value>>;
}
```

20.4.1.3 Constructors [indirect.ctor]

1 The following element applies to all functions in 20.4.1.3:

2 *Throws*: Nothing unless `allocator_traits<Allocator>::allocate` or `allocator_traits<Allocator>::construct` throws.

```
constexpr explicit indirect();
```

3 *Constraints*: `is_default_constructible_v<Allocator>` is `true`.

4 *Mandates*: `is_default_constructible_v<T>` is `true`.

5 *Effects*: Constructs an owned object of type `T` with an empty argument list, using the allocator *`alloc`*.

```
constexpr explicit indirect(allocator_arg_t, const Allocator& a);
```

6 *Mandates*: `is_default_constructible_v<T>` is `true`.

7 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `T` with an empty argument list, using the allocator *`alloc`*.

```
constexpr indirect(const indirect& other);
```

8 *Mandates*: `is_copy_constructible_v<T>` is `true`.

9 *Effects*: *`alloc`* is direct-non-list-initialized with `allocator_traits<Allocator>::select_on_container_copy_construction(other.alloc)`. If `other` is valueless, `*this` is valueless. Otherwise, constructs an owned object of type `T` with `*other`, using the allocator *`alloc`*.

```
constexpr indirect(allocator_arg_t, const Allocator& a, const indirect& other);
```

10 *Mandates*: `is_copy_constructible_v<T>` is `true`.

11 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. If `other` is valueless, `*this` is valueless. Otherwise, constructs an owned object of type `T` with `*other`, using the allocator *`alloc`*.

```
constexpr indirect(indirect&& other) noexcept;
```

12 *Effects*: *`alloc`* is direct-non-list-initialized from `std::move(other.alloc)`. If `other` is valueless, `*this` is valueless. Otherwise `*this` takes ownership of the owned object of `other`.

13 *Postconditions*: `other` is valueless.

```
constexpr indirect(allocator_arg_t, const Allocator& a, indirect&& other)
  noexcept(allocator_traits<Allocator>::is_always_equal::value);
```

14 *Mandates*: If `allocator_traits<Allocator>::is_always_equal::value` is `false` then `T` is a complete type.

15 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. If `other` is valueless, `*this` is valueless. Otherwise, if *`alloc`* `== other.`*`alloc`* is `true`, constructs an object of type `indirect` that takes ownership of the owned object of `other`. Otherwise, constructs an owned object of type `T` with `*std::move(other)`, using the allocator *`alloc`*.

16 *Postconditions*: `other` is valueless.

```
template<class U = T>
  constexpr explicit indirect(U&& u);
```

17 *Constraints*:

(17.1) — `is_same_v<remove_cvref_t<U>, indirect>` is `false`,

(17.2) — `is_same_v<remove_cvref_t<U>, in_place_t>` is `false`,

(17.3) — `is_constructible_v<T, U>` is `true`, and

(17.4) — `is_default_constructible_v<Allocator>` is `true`.

18 *Effects*: Constructs an owned object of type `T` with `std::forward<U>(u)`, using the allocator *`alloc`*.

```
template<class U = T>
  constexpr explicit indirect(allocator_arg_t, const Allocator& a, U&& u);
```

19 *Constraints*:

(19.1) — `is_same_v<remove_cvref_t<U>, indirect>` is `false`,

(19.2) — `is_same_v<remove_cvref_t<U>, in_place_t>` is `false`, and

(19.3) — `is_constructible_v<T, U>` is `true`.

20 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `T` with `std::forward<U>(u)`, using the allocator *`alloc`*.

```
template<class... Us>
  constexpr explicit indirect(in_place_t, Us&&... us);
```

21 *Constraints*:

(21.1) — `is_constructible_v<T, Us...>` is `true`, and

(21.2) — `is_default_constructible_v<Allocator>` is `true`.

22 *Effects*: Constructs an owned object of type `T` with `std::forward<Us>(us)...`, using the allocator *`alloc`*.

```
template<class... Us>
  constexpr explicit indirect(allocator_arg_t, const Allocator& a,
                              in_place_t, Us&& ...us);
```

23 *Constraints*: `is_constructible_v<T, Us...>` is `true`.

24 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `T` with `std::forward<Us>(us)...`, using the allocator *`alloc`*.

```
template<class I, class... Us>
  constexpr explicit indirect(in_place_t, initializer_list<I> ilist, Us&&... us);
```

25 *Constraints*:

(25.1) — `is_constructible_v<T, initializer_list<I>&, Us...>` is `true`, and

(25.2) — `is_default_constructible_v<Allocator>` is `true`.

26 *Effects*: Constructs an owned object of type `T` with the arguments `ilist, std::forward<Us>(us)...`, using the allocator *`alloc`*.

```
template<class I, class... Us>
  constexpr explicit indirect(allocator_arg_t, const Allocator& a,
                              in_place_t, initializer_list<I> ilist, Us&&... us);
```

27 *Constraints*: `is_constructible_v<T, initializer_list<I>&, Us...>` is `true`.

28 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `T` with the arguments `ilist, std::forward<Us>(us)...`, using the allocator *`alloc`*.

20.4.1.4 Destructor [indirect.dtor]

```
constexpr ~indirect();
```

1 *Mandates*: `T` is a complete type.

2 *Effects*: If `*this` is not valueless, destroys the owned object using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

20.4.1.5 Assignment [indirect.asgn]

```
constexpr indirect& operator=(const indirect& other);
```

1 *Mandates*:

(1.1) — `is_copy_assignable_v<T>` is `true`, and

(1.2) — `is_copy_constructible_v<T>` is `true`.

2 *Effects*: If `addressof(other) == this` is `true`, there are no effects. Otherwise:

(2.1) — The allocator needs updating if `allocator_traits<Allocator>::propagate_on_container_copy_assignment::value` is `true`.

(2.2) — If `other` is valueless, `*this` becomes valueless and the owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(2.3) — Otherwise, if `alloc == other.alloc` is `true` and `*this` is not valueless, equivalent to `**this = *other`.

(2.4) — Otherwise a new owned object is constructed in `*this` using `allocator_traits<Allocator>::construct` with the owned object from `other` as the argument, using either the allocator in `*this` or the allocator in `other` if the allocator needs updating.

(2.5) — The previously owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(2.6) — If the allocator needs updating, the allocator in `*this` is replaced with a copy of the allocator in `other`.

3 *Returns*: A reference to `*this`.

4 *Remarks*: If any exception is thrown, the result of the expression `this->valueless_after_move()` remains unchanged. If an exception is thrown during the call to `T`'s selected copy constructor, no effect. If an exception is thrown during the call to `T`'s copy assignment, the state of its contained value is as defined by the exception safety guarantee of `T`'s copy assignment.

```
constexpr indirect& operator=(indirect&& other)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

5 *Mandates*: `is_copy_constructible_t<T>` is `true`.

6 *Effects*: If `addressof(other) == this` is `true`, there are no effects. Otherwise:

(6.1) — The allocator needs updating if `allocator_traits<Allocator>::propagate_on_container_move_assignment::value` is `true`.

(6.2) — If `other` is valueless, `*this` becomes valueless and the owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(6.3) — Otherwise, if `alloc == other.alloc` is `true`, swaps the owned objects in `*this` and `other`; the owned object in `other`, if any, is then destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(6.4) — Otherwise, constructs a new owned object with the owned object of `other` as the argument as an rvalue, using either the allocator in `*this` or the allocator in `other` if the allocator needs updating.

(6.5) — The previously owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(6.6) — If the allocator needs updating, the allocator in `*this` is replaced with a copy of the allocator in `other`.

7 *Postconditions*: `other` is valueless.

8 *Returns*: A reference to `*this`.

9 *Remarks*: If any exception is thrown, there are no effects on `*this` or `other`.

```
template<class U = T>
  constexpr indirect& operator=(U&& u);
```

10 *Constraints*:

(10.1) — `is_same_v<remove_cvref_t<U>, indirect>` is `false`,

(10.2) — `is_constructible_v<T, U>` is `true`, and

(10.3) — `is_assignable_v<T&, U>` is `true`.

11 *Effects*: If `*this` is valueless then constructs an owned object of type `T` with `std::forward<U>(u)` using the allocator *`alloc`*. Otherwise, equivalent to `**this = std::forward<U>(u)`.

12 *Returns*: A reference to `*this`.

20.4.1.6 Observers [indirect.obs]

```
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

1 *Preconditions*: `*this` is not valueless.

2 *Returns*: `*`*`p`*.

```
constexpr const T&& operator*() const && noexcept;
constexpr T&& operator*() && noexcept;
```

3 *Preconditions*: `*this` is not valueless.

4 *Returns*: `std::move(*`*`p`*`)`.

```
constexpr const_pointer operator->() const noexcept;
constexpr pointer operator->() noexcept;
```

5 *Preconditions*: `*this` is not valueless.

6 *Returns*: *`p`*.

```
constexpr bool valueless_after_move() const noexcept;
```

7 *Returns*: `true` if `*this` is valueless, otherwise `false`.

```
constexpr allocator_type get_allocator() const noexcept;
```

8 *Returns*: *`alloc`*.

20.4.1.7 Swap [indirect.swap]

```
constexpr void swap(indirect& other)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions*: If `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true`, then `Allocator` meets the *Cpp17Swappable* requirements. Otherwise `get_allocator() == other.get_allocator()` is `true`.

2 *Effects*: Swaps the states of `*this` and `other`, exchanging owned objects or valueless states. If `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true`, then the allocators of `*this` and `other` are exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators are not swapped.

[*Note 1*: Does not call `swap` on the owned objects directly. — *end note*]

```
constexpr void swap(indirect& lhs, indirect& rhs) noexcept(noexcept(lhs.swap(rhs)));
```

3 *Effects*: Equivalent to `lhs.swap(rhs)`.

20.4.1.8 Relational operators [indirect.relops]

```
template<class U, class AA>
  constexpr bool operator==(const indirect& lhs, const indirect<U, AA>& rhs)
    noexcept(noexcept(*lhs == *rhs));
```

1 *Mandates*: The expression `*lhs == *rhs` is well-formed and its result is convertible to `bool`.

2 *Returns*: If `lhs` is valueless or `rhs` is valueless, `lhs.valueless_after_move() == rhs.valueless_-after_move()`; otherwise `*lhs == *rhs`.

```
template<class U, class AA>
  constexpr synth-three-way-result<T, U>
    operator<=>(const indirect& lhs, const indirect<U, AA>& rhs);
```

3 *Returns*: If `lhs` is valueless or `rhs` is valueless, `!lhs.valueless_after_move() <=> !rhs.value-less_after_move()`; otherwise *`synth-three-way`*`(*lhs, *rhs)`.

20.4.1.9 Comparison with `T` [indirect.comp.with.t]

```
template<class U>
  constexpr bool operator==(const indirect& lhs, const U& rhs) noexcept(noexcept(*lhs == rhs));
```

1 *Mandates*: The expression `*lhs == rhs` is well-formed and its result is convertible to `bool`.

2 *Returns*: If `lhs` is valueless, `false`; otherwise `*lhs == rhs`.

```
template<class U>
  constexpr synth-three-way-result<T, U>
    operator<=>(const indirect& lhs, const U& rhs);
```

3 *Returns*: If `lhs` is valueless, `strong_ordering::less`; otherwise *`synth-three-way`*`(*lhs, rhs)`.

20.4.1.10 Hash support [indirect.hash]

```
template<class T, class Allocator>
struct hash<indirect<T, Allocator>>;
```

1 The specialization `hash<indirect<T, Allocator>>` is enabled (22.10.19) if and only if `hash<T>` is enabled. When enabled for an object `i` of type `indirect<T, Allocator>`, `hash<indirect<T, Allocator>>()(i)` evaluates to either the same value as `hash<T>()(*i)`, if `i` is not valueless; otherwise to an implementation-defined value. The member functions are not guaranteed to be `noexcept`.

20.4.2 Class template `polymorphic` [polymorphic]

20.4.2.1 General [polymorphic.general]

1 A polymorphic object manages the lifetime of an owned object. A polymorphic object may own objects of different types at different points in its lifetime. A polymorphic object is *valueless* if it has no owned object. A polymorphic object may become valueless only after it has been moved from.

2 In every specialization `polymorphic<T, Allocator>`, if the type `allocator_traits<Allocator>::value_-type` is not the same type as `T`, the program is ill-formed. Every object of type `polymorphic<T, Allocator>` uses an object of type `Allocator` to allocate and free storage for the owned object as needed.

3 Constructing an owned object of type `U` with `args...` using the allocator `a` means calling `allocator_-traits<Allocator>::cop, args...)` where `args` is an expression pack, `a` is an allocator, and *`p`* points to storage suitable for an owned object of type `U`.

4 The member *`alloc`* is used for any memory allocation and element construction performed by member functions during the lifetime of each polymorphic value object, or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. `Allocator` replacement is performed by copy assignment, move assignment, or swapping of the allocator only if (23.2.2.2):

- (4.1) — `allocator_traits<Allocator>::propagate_on_container_copy_assignment::value`, or
- (4.2) — `allocator_traits<Allocator>::propagate_on_container_move_assignment::value`, or
- (4.3) — `allocator_traits<Allocator>::propagate_on_container_swap::value`

is `true` within the implementation of the corresponding `polymorphic` operation.

5 A program that instantiates the definition of `polymorphic` for a non-object type, an array type, `in_place_t`, a specialization of `in_place_type_t`, or a cv-qualified type is ill-formed.

6 The template parameter `T` of `polymorphic` may be an incomplete type.

7 The template parameter `Allocator` of `polymorphic` shall meet the requirements of Cpp17Allocator.

8 If a program declares an explicit or partial specialization of `polymorphic`, the behavior is undefined.

20.4.2.2 Synopsis [polymorphic.syn]

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class polymorphic {
  public:
    using value_type = T;
    using allocator_type = Allocator;
    using pointer = typename allocator_traits<Allocator>::pointer;
    using const_pointer = typename allocator_traits<Allocator>::const_pointer;

    // 20.4.2.3, constructors
    constexpr explicit polymorphic();
    constexpr explicit polymorphic(allocator_arg_t, const Allocator& a);
    constexpr polymorphic(const polymorphic& other);
    constexpr polymorphic(allocator_arg_t, const Allocator& a, const polymorphic& other);
    constexpr polymorphic(polymorphic&& other) noexcept;
    constexpr polymorphic(allocator_arg_t, const Allocator& a, polymorphic&& other)
      noexcept(see below);
    template<class U = T>
      constexpr explicit polymorphic(U&& u);
    template<class U = T>
      constexpr explicit polymorphic(allocator_arg_t, const Allocator& a, U&& u);
    template<class U, class... Ts>
      constexpr explicit polymorphic(in_place_type_t<U>, Ts&&... ts);
    template<class U, class... Ts>
      constexpr explicit polymorphic(allocator_arg_t, const Allocator& a,
                                     in_place_type_t<U>, Ts&&... ts);
    template<class U, class I, class... Us>
      constexpr explicit polymorphic(in_place_type_t<U>, initializer_list<I> ilist, Us&&... us);
    template<class U, class I, class... Us>
      constexpr explicit polymorphic(allocator_arg_t, const Allocator& a,
                                     in_place_type_t<U>, initializer_list<I> ilist, Us&&... us);

    // 20.4.2.4, destructor
    constexpr ~polymorphic();

    // 20.4.2.5, assignment
    constexpr polymorphic& operator=(const polymorphic& other);
    constexpr polymorphic& operator=(polymorphic&& other) noexcept(see below);

    // 20.4.2.6, observers
    constexpr const T& operator*() const noexcept;
    constexpr T& operator*() noexcept;
    constexpr const_pointer operator->() const noexcept;
    constexpr pointer operator->() noexcept;
    constexpr bool valueless_after_move() const noexcept;
    constexpr allocator_type get_allocator() const noexcept;

    // 20.4.2.7, swap
    constexpr void swap(polymorphic& other) noexcept(see below);
    friend constexpr void swap(polymorphic& lhs, polymorphic& rhs) noexcept(see below);

  private:
    Allocator alloc = Allocator();      // exposition only
  };
}
```

20.4.2.3 Constructors [polymorphic.ctor]

1 The following element applies to all functions in 20.4.2.3:

2 *Throws*: Nothing unless `allocator_traits<Allocator>::allocate` or `allocator_traits<Allocator>::construct` throws.

```
constexpr explicit polymorphic();
```

3 *Constraints*: `is_default_constructible_v<Allocator>` is `true`.

4 *Mandates*:

(4.1) — `is_default_constructible_v<T>` is `true`, and

(4.2) — `is_copy_constructible_v<T>` is `true`.

5 *Effects*: Constructs an owned object of type `T` with an empty argument list using the allocator *`alloc`*.

```
constexpr explicit polymorphic(allocator_arg_t, const Allocator& a);
```

6 *Mandates*:

(6.1) — `is_default_constructible_v<T>` is `true`, and

(6.2) — `is_copy_constructible_v<T>` is `true`.

7 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `T` with an empty argument list using the allocator *`alloc`*.

```
constexpr polymorphic(const polymorphic& other);
```

8 *Effects*: *`alloc`* is direct-non-list-initialized with `allocator_traits<Allocator>::select_on_container_copy_construction(other.`*`alloc`*`)`. If `other` is valueless, `*this` is valueless. Otherwise, constructs an owned object of type `U`, where `U` is the type of the owned object in `other`, with the owned object in `other` using the allocator *`alloc`*.

```
constexpr polymorphic(allocator_arg_t, const Allocator& a, const polymorphic& other);
```

9 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. If `other` is valueless, `*this` is valueless. Otherwise, constructs an owned object of type `U`, where `U` is the type of the owned object in `other`, with the owned object in `other` using the allocator *`alloc`*.

```
constexpr polymorphic(polymorphic&& other) noexcept;
```

10 *Effects*: *`alloc`* is direct-non-list-initialized with `std::move(other.`*`alloc`*`)`. If `other` is valueless, `*this` is valueless. Otherwise, either `*this` takes ownership of the owned object of `other` or, owns an object of the same type constructed from the owned object of `other` considering that owned object as an rvalue, using the allocator *`alloc`*.

```
constexpr polymorphic(allocator_arg_t, const Allocator& a, polymorphic&& other)
  noexcept(allocator_traits<Allocator>::is_always_equal::value);
```

11 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. If `other` is valueless, `*this` is valueless. Otherwise, if *`alloc`* `== other.`*`alloc`* is `true`, either constructs an object of type `polymorphic` that owns the owned object of `other`, making `other` valueless; or, owns an object of the same type constructed from the owned object of `other` considering that owned object as an rvalue. Otherwise, if *`alloc`* `!= other.`*`alloc`* is `true`, constructs an object of type `polymorphic`, considering the owned object in `other` as an rvalue, using the allocator *`alloc`*.

```
template<class U = T>
  constexpr explicit polymorphic(U&& u);
```

12 *Constraints*: Where `UU` is `remove_cvref_t<U>`,

(12.1) — `is_same_v<UU, polymorphic>` is `false`,

(12.2) — `derived_from<UU, T>` is `true`,

(12.3) — `is_constructible_v<UU, U>` is `true`,

(12.4) — `is_copy_constructible_v<UU>` is `true`,

(12.5) — `UU` is not a specialization of `in_place_type_t`, and

(12.6) — `is_default_constructible_v<Allocator>` is `true`.

13 *Effects*: Constructs an owned object of type `U` with `std::forward<U>(u)` using the allocator *`alloc`*.

```
template<class U = T>
  constexpr explicit polymorphic(allocator_arg_t, const Allocator& a, U&& u);
```

14 *Constraints*: Where `UU` is `remove_cvref_t<U>`,

(14.1) — `is_same_v<UU, polymorphic>` is `false`,

(14.2) — `derived_from<UU, T>` is `true`,

(14.3) — `is_constructible_v<UU, U>` is `true`,

(14.4) — `is_copy_constructible_v<UU>` is `true`, and

(14.5) — `UU` is not a specialization of `in_place_type_t`.

15 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `U` with `std::forward<U>(u)` using the allocator *`alloc`*.

```
template<class U, class... Ts>
  constexpr explicit polymorphic(in_place_type_t<U>, Ts&&... ts);
```

16 *Constraints*:

(16.1) — `is_same_v<remove_cvref_t<U>, U>` is `true`,

(16.2) — `derived_from<U, T>` is `true`,

(16.3) — `is_constructible_v<U, Ts...>` is `true`,

(16.4) — `is_copy_constructible_v<U>` is `true`, and

(16.5) — `is_default_constructible_v<Allocator>` is `true`.

17 *Effects*: Constructs an owned object of type `U` with `std::forward<Ts>(ts)...` using the allocator *`alloc`*.

```
template<class U, class... Ts>
  constexpr explicit polymorphic(allocator_arg_t, const Allocator& a,
                                 in_place_type_t<U>, Ts&&... ts);
```

18 *Constraints*:

(18.1) — `is_same_v<remove_cvref_t<U>, U>` is `true`,

(18.2) — `derived_from<U, T>` is `true`,

(18.3) — `is_constructible_v<U, Ts...>` is `true`, and

(18.4) — `is_copy_constructible_v<U>` is `true`.

19 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `U` with `std::forward<Ts>(ts)...` using the allocator *`alloc`*.

```
template<class U, class I, class... Us>
  constexpr explicit polymorphic(in_place_type_t<U>, initializer_list<I> ilist, Us&&... us);
```

20 *Constraints*:

(20.1) — `is_same_v<remove_cvref_t<U>, U>` is `true`,

(20.2) — `derived_from<U, T>` is `true`,

(20.3) — `is_constructible_v<U, initializer_list<I>&, Us...>` is `true`,

(20.4) — `is_copy_constructible_v<U>` is `true`, and

(20.5) — `is_default_constructible_v<Allocator>` is `true`.

21 *Effects*: Constructs an owned object of type `U` with the arguments `ilist, std::forward<Us>(us)...` using the allocator *`alloc`*.

```
template<class U, class I, class... Us>
  constexpr explicit polymorphic(allocator_arg_t, const Allocator& a,
                                 in_place_type_t<U>, initializer_list<I> ilist, Us&&... us);
```

22 *Constraints*:

(22.1) — `is_same_v<remove_cvref_t<U>, U>` is `true`,

(22.2) — `derived_from<U, T>` is `true`, (22.3) — `is_constructible_v<U, initializer_list<I>&, Us...>` is `true`, and

(22.4) — `is_copy_constructible_v<U>` is `true`.

23 *Effects*: *`alloc`* is direct-non-list-initialized with `a`. Constructs an owned object of type `U` with the arguments `ilist, std::forward<Us>(us)...` using the allocator *`alloc`*.

20.4.2.4 Destructor [polymorphic.dtor]

```
constexpr ~polymorphic();
```

1 *Mandates*: `T` is a complete type.

2 *Effects*: If `*this` is not valueless, destroys the owned object using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

20.4.2.5 Assignment [polymorphic.asgn]

```
constexpr polymorphic& operator=(const polymorphic& other);
```

1 *Mandates*: `T` is a complete type.

2 *Effects*: If `addressof(other) == this` is `true`, there are no effects. Otherwise:

(2.1) — The allocator needs updating if `allocator_traits<Allocator>::propagate_on_container_copy_assignment::value` is `true`.

(2.2) — If `other` is not valueless, a new owned object is constructed in `*this` using `allocator_traits<Allocator>::construct` with the owned object from `other` as the argument, using either the allocator in `*this` or the allocator in `other` if the allocator needs updating.

(2.3) — The previously owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(2.4) — If the allocator needs updating, the allocator in `*this` is replaced with a copy of the allocator in `other`.

3 *Returns*: A reference to `*this`.

4 *Remarks*: If any exception is thrown, there are no effects on `*this`.

```
constexpr polymorphic& operator=(polymorphic&& other)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

5 *Mandates*: If `allocator_traits<Allocator>::is_always_equal::value>` is `false`, `T` is a complete type.

6 *Effects*: If `addressof(other) == this` is `true`, there are no effects. Otherwise:

(6.1) — The allocator needs updating if `allocator_traits<Allocator>::propagate_on_container_move_assignment::value` is `true`.

(6.2) — If *`alloc`* `== other.`*`alloc`* is `true`, swaps the owned objects in `*this` and `other`; the owned object in `other`, if any, is then destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(6.3) — Otherwise, if *`alloc`* `!= other.`*`alloc`* is `true`; if `other` is not valueless, a new owned object is constructed in `*this` using `allocator_traits<Allocator>::construct` with the owned object from `other` as the argument as an rvalue, using either the allocator in `*this` or the allocator in `other` if the allocator needs updating.

(6.4) — The previously owned object in `*this`, if any, is destroyed using `allocator_traits<Allocator>::destroy` and then the storage is deallocated.

(6.5) — If the allocator needs updating, the allocator in `*this` is replaced with a copy of the allocator in `other`.

7 *Returns*: A reference to `*this`.

8 *Remarks*: If any exception is thrown, there are no effects on `*this` or `other`.

20.4.2.6 Observers [polymorphic.obs]

```
constexpr const T& operator*() const noexcept;
constexpr T& operator*() noexcept;
```

1 *Preconditions*: `*this` is not valueless.

2 *Returns*: A reference to the owned object.

```
constexpr const_pointer operator->() const noexcept;
constexpr pointer operator->() noexcept;
```

3 *Preconditions*: `*this` is not valueless.

4 *Returns*: A pointer to the owned object.

```
constexpr bool valueless_after_move() const noexcept;
```

5 *Returns*: `true` if `*this` is valueless, otherwise `false`.

```
constexpr allocator_type get_allocator() const noexcept;
```

6 *Returns*: *`alloc`*.

20.4.2.7 Swap [polymorphic.swap]

```
constexpr void swap(polymorphic& other)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions*: If `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true`, then `Allocator` meets the *Cpp17Swappable* requirements. Otherwise `get_allocator() == other.get_allocator()` is `true`.

2 *Effects*: Swaps the states of `*this` and `other`, exchanging owned objects or valueless states. If `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true`, then the allocators of `*this` and `other` are exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators are not swapped.

[*Note 1*: Does not call `swap` on the owned objects directly. — *end note*]

```
constexpr void swap(polymorphic& lhs, polymorphic& rhs) noexcept(noexcept(lhs.swap(rhs)));
```

3 *Effects*: Equivalent to `lhs.swap(rhs)`.

20.5 Memory resources [mem.res]

20.5.1 Header `<memory_resource>` synopsis [mem.res.syn]

```
namespace std::pmr {
  // 20.5.2, class memory_resource
  class memory_resource;

  bool operator==(const memory_resource& a, const memory_resource& b) noexcept;

  // 20.5.3, class template polymorphic_allocator
  template<class Tp = byte> class polymorphic_allocator;

  template<class T1, class T2>
    bool operator==(const polymorphic_allocator<T1>& a,
                    const polymorphic_allocator<T2>& b) noexcept;

  // 20.5.4, global memory resources
  memory_resource* new_delete_resource() noexcept;
  memory_resource* null_memory_resource() noexcept;
  memory_resource* set_default_resource(memory_resource* r) noexcept;
  memory_resource* get_default_resource() noexcept;

  // 20.5.5, pool resource classes
  struct pool_options;
  class synchronized_pool_resource;
  class unsynchronized_pool_resource;
  class monotonic_buffer_resource;
}
```

20.5.2 Class `memory_resource` [mem.res.class]

20.5.2.1 General [mem.res.class.general]

1 The `memory_resource` class is an abstract interface to an unbounded set of classes encapsulating memory resources.

```
namespace std::pmr {
  class memory_resource {
    static constexpr size_t max_align = alignof(max_align_t);   // exposition only

  public:
    memory_resource() = default;
    memory_resource(const memory_resource&) = default;
    virtual ~memory_resource();

    memory_resource& operator=(const memory_resource&) = default;

    void* allocate(size_t bytes, size_t alignment = max_align);
    void deallocate(void* p, size_t bytes, size_t alignment = max_align);

    bool is_equal(const memory_resource& other) const noexcept;

  private:
    virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
    virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;

    virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
  };
}
```

20.5.2.2 Public member functions [mem.res.public]

`~memory_resource();`

1 *Effects*: Destroys this `memory_resource`.

`void* allocate(size_t bytes, size_t alignment = max_align);`

2 *Effects*: Allocates storage by calling `do_allocate(bytes, alignment)` and implicitly creates objects within the allocated region of storage.

3 *Returns*: A pointer to a suitable created object (6.7.2) in the allocated region of storage.

4 *Throws*: What and when the call to `do_allocate` throws.

`void deallocate(void* p, size_t bytes, size_t alignment = max_align);`

5 *Effects*: Equivalent to `do_deallocate(p, bytes, alignment)`.

`bool is_equal(const memory_resource& other) const noexcept;`

6 *Effects*: Equivalent to: `return do_is_equal(other);`

20.5.2.3 Private virtual member functions [mem.res.private]

`virtual void* do_allocate(size_t bytes, size_t alignment) = 0;`

1 *Preconditions*: `alignment` is a power of two.

2 *Returns*: A derived class shall implement this function to return a pointer to allocated storage (6.7.6.5.2) with a size of at least `bytes`, aligned to the specified `alignment`.

3 *Throws*: A derived class implementation shall throw an appropriate exception if it is unable to allocate memory with the requested size and alignment.

`virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;`

4 *Preconditions*: `p` was returned from a prior call to `allocate(bytes, alignment)` on a memory resource equal to `*this`, and the storage at `p` has not yet been deallocated.

5 *Effects*: A derived class shall implement this function to dispose of allocated storage.

6 *Throws*: Nothing.

```
virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
```

7 *Returns*: A derived class shall implement this function to return `true` if memory allocated from `*this` can be deallocated from `other` and vice-versa, otherwise `false`.

[*Note 1*: It is possible that the most-derived type of `other` does not match the type of `*this`. For a derived class `D`, an implementation of this function can immediately return `false` if `dynamic_cast<const D*>(&other) == nullptr`. —*end note*]

20.5.2.4 Equality [mem.res.eq]

```
bool operator==(const memory_resource& a, const memory_resource& b) noexcept;
```

1 *Returns*: `&a == &b || a.is_equal(b)`.

20.5.3 Class template `polymorphic_allocator` [mem.poly.allocator.class]

20.5.3.1 General [mem.poly.allocator.class.general]

1 A specialization of class template `pmr::polymorphic_allocator` meets the *Cpp17Allocator* requirements (16.4.4.6.1) if its template argument is a *cv*-unqualified object type. Constructed with different memory resources, different instances of the same specialization of `pmr::polymorphic_allocator` can exhibit entirely different allocation behavior. This runtime polymorphism allows objects that use `polymorphic_allocator` to behave as if they used different allocator types at run time even though they use the same static allocator type.

2 A specialization of class template `pmr::polymorphic_allocator` meets the allocator completeness requirements (16.4.4.6.2) if its template argument is a *cv*-unqualified object type.

```
namespace std::pmr {
  template<class Tp = byte> class polymorphic_allocator {
    memory_resource* memory_rsrc;        // exposition only

  public:
    using value_type = Tp;

    // 20.5.3.2, constructors
    polymorphic_allocator() noexcept;
    polymorphic_allocator(memory_resource* r);

    polymorphic_allocator(const polymorphic_allocator& other) = default;

    template<class U>
      polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;

    polymorphic_allocator& operator=(const polymorphic_allocator&) = delete;

    // 20.5.3.3, member functions
    Tp* allocate(size_t n);
    void deallocate(Tp* p, size_t n);

    void* allocate_bytes(size_t nbytes, size_t alignment = alignof(max_align_t));
    void deallocate_bytes(void* p, size_t nbytes, size_t alignment = alignof(max_align_t));
    template<class T> T* allocate_object(size_t n = 1);
    template<class T> void deallocate_object(T* p, size_t n = 1);
    template<class T, class... CtorArgs> T* new_object(CtorArgs&&... ctor_args);
    template<class T> void delete_object(T* p);

    template<class T, class... Args>
      void construct(T* p, Args&&... args);

    template<class T>
      void destroy(T* p);

    polymorphic_allocator select_on_container_copy_construction() const;
```

```
      memory_resource* resource() const;

      // friends
      friend bool operator==(const polymorphic_allocator& a,
                             const polymorphic_allocator& b) noexcept {
        return *a.resource() == *b.resource();
      }
    };
  }
```

20.5.3.2 Constructors [mem.poly.allocator.ctor]

```
polymorphic_allocator() noexcept;
```

1 *Effects*: Sets `memory_rsrc` to `get_default_resource()`.

```
polymorphic_allocator(memory_resource* r);
```

2 *Preconditions*: `r` is non-null.

3 *Effects*: Sets `memory_rsrc` to `r`.

4 *Throws*: Nothing.

5 [*Note 1*: This constructor provides an implicit conversion from `memory_resource*`. — *end note*]

```
template<class U> polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;
```

6 *Effects*: Sets `memory_rsrc` to `other.resource()`.

20.5.3.3 Member functions [mem.poly.allocator.mem]

```
Tp* allocate(size_t n);
```

1 *Effects*: If `numeric_limits<size_t>::max() / sizeof(Tp) < n`, throws `bad_array_new_length`. Otherwise equivalent to:

```
  return static_cast<Tp*>(memory_rsrc->allocate(n * sizeof(Tp), alignof(Tp)));
```

```
void deallocate(Tp* p, size_t n);
```

2 *Preconditions*: `p` was allocated from a memory resource `x`, equal to `*memory_rsrc`, using `x.allocate(n * sizeof(Tp), alignof(Tp))`.

3 *Effects*: Equivalent to `memory_rsrc->deallocate(p, n * sizeof(Tp), alignof(Tp))`.

4 *Throws*: Nothing.

```
void* allocate_bytes(size_t nbytes, size_t alignment = alignof(max_align_t));
```

5 *Effects*: Equivalent to: `return memory_rsrc->allocate(nbytes, alignment);`

6 [*Note 1*: The return type is `void*` (rather than, e.g., `byte*`) to support conversion to an arbitrary pointer type `U*` by `static_cast<U*>`, thus facilitating construction of a `U` object in the allocated memory. — *end note*]

```
void deallocate_bytes(void* p, size_t nbytes, size_t alignment = alignof(max_align_t));
```

7 *Effects*: Equivalent to `memory_rsrc->deallocate(p, nbytes, alignment)`.

```
template<class T>
  T* allocate_object(size_t n = 1);
```

8 *Effects*: Allocates memory suitable for holding an array of `n` objects of type `T`, as follows:

(8.1) — if `numeric_limits<size_t>::max() / sizeof(T) < n`, throws `bad_array_new_length`,

(8.2) — otherwise equivalent to:

```
    return static_cast<T*>(allocate_bytes(n*sizeof(T), alignof(T)));
```

9 [*Note 2*: `T` is not deduced and must therefore be provided as a template argument. — *end note*]

```
template<class T>
  void deallocate_object(T* p, size_t n = 1);
```

10 *Effects*: Equivalent to `deallocate_bytes(p, n*sizeof(T), alignof(T))`.

```
template<class T, class... CtorArgs>
  T* new_object(CtorArgs&&... ctor_args);
```

11 *Effects*: Allocates and constructs an object of type `T`, as follows.
Equivalent to:

```
T* p = allocate_object<T>();
try {
  construct(p, std::forward<CtorArgs>(ctor_args)...);
} catch (...) {
  deallocate_object(p);
  throw;
}
return p;
```

12 [*Note 3*: `T` is not deduced and must therefore be provided as a template argument. — *end note*]

```
template<class T>
  void delete_object(T* p);
```

13 *Effects*: Equivalent to:

```
destroy(p);
deallocate_object(p);
```

```
template<class T, class... Args>
  void construct(T* p, Args&&... args);
```

14 *Mandates*: Uses-allocator construction of `T` with allocator `*this` (see 20.2.8.2) and constructor arguments `std::forward<Args>(args)...` is well-formed.

15 *Effects*: Construct a `T` object in the storage whose address is represented by `p` by uses-allocator construction with allocator `*this` and constructor arguments `std::forward<Args>(args)...`.

16 *Throws*: Nothing unless the constructor for `T` throws.

```
template<class T>
  void destroy(T* p);
```

17 *Effects*: Equivalent to `p->~T()`.

```
polymorphic_allocator select_on_container_copy_construction() const;
```

18 *Returns*: `polymorphic_allocator()`.

19 [*Note 4*: The memory resource is not propagated. — *end note*]

```
memory_resource* resource() const;
```

20 *Returns*: `memory_rsrc`.

20.5.3.4 Equality [mem.poly.allocator.eq]

```
template<class T1, class T2>
  bool operator==(const polymorphic_allocator<T1>& a,
                  const polymorphic_allocator<T2>& b) noexcept;
```

1 *Returns*: `*a.resource() == *b.resource()`.

20.5.4 Access to program-wide `memory_resource` objects [mem.res.global]

```
memory_resource* new_delete_resource() noexcept;
```

1 *Returns*: A pointer to a static-duration object of a type derived from `memory_resource` that can serve as a resource for allocating memory using `::operator new` and `::operator delete`. The same value is returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_equal(r)` returns `&r == p`.

```
memory_resource* null_memory_resource() noexcept;
```

2 *Returns*: A pointer to a static-duration object of a type derived from `memory_resource` for which `allocate()` always throws `bad_alloc` and for which `deallocate()` has no effect. The same value is

returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_-equal(r)` returns `&r == p`.

3 The *default memory resource pointer* is a pointer to a memory resource that is used by certain facilities when an explicit memory resource is not supplied through the interface. Its initial value is the return value of `new_delete_resource()`.

```
memory_resource* set_default_resource(memory_resource* r) noexcept;
```

4 *Effects*: If `r` is non-null, sets the value of the default memory resource pointer to `r`, otherwise sets the default memory resource pointer to `new_delete_resource()`.

5 *Returns*: The previous value of the default memory resource pointer.

6 *Remarks*: Calling the `set_default_resource` and `get_default_resource` functions shall not incur a data race. A call to the `set_default_resource` function shall synchronize with subsequent calls to the `set_default_resource` and `get_default_resource` functions.

```
memory_resource* get_default_resource() noexcept;
```

7 *Returns*: The current value of the default memory resource pointer.

20.5.5 Pool resource classes [mem.res.pool]

20.5.5.1 Classes `synchronized_pool_resource` and `unsynchronized_pool_resource` [mem.res.pool.overview]

1 The `synchronized_pool_resource` and `unsynchronized_pool_resource` classes (collectively called *pool resource classes*) are general-purpose memory resources having the following qualities:

(1.1) — Each resource frees its allocated memory on destruction, even if `deallocate` has not been called for some of the allocated blocks.

(1.2) — A pool resource consists of a collection of *pools*, serving requests for different block sizes. Each individual pool manages a collection of *chunks* that are in turn divided into blocks of uniform size, returned via calls to `do_allocate`. Each call to `do_allocate(size, alignment)` is dispatched to the pool serving the smallest blocks accommodating at least `size` bytes.

(1.3) — When a particular pool is exhausted, allocating a block from that pool results in the allocation of an additional chunk of memory from the *upstream allocator* (supplied at construction), thus replenishing the pool. With each successive replenishment, the chunk size obtained increases geometrically.

[*Note 1*: By allocating memory in chunks, the pooling strategy increases the chance that consecutive allocations will be close together in memory. — *end note*]

(1.4) — Allocation requests that exceed the largest block size of any pool are fulfilled directly from the upstream allocator.

(1.5) — A `pool_options` struct may be passed to the pool resource constructors to tune the largest block size and the maximum chunk size.

2 A `synchronized_pool_resource` may be accessed from multiple threads without external synchronization and may have thread-specific pools to reduce synchronization costs. An `unsynchronized_pool_resource` class may not be accessed from multiple threads simultaneously and thus avoids the cost of synchronization entirely in single-threaded applications.

```
namespace std::pmr {
  struct pool_options {
    size_t max_blocks_per_chunk = 0;
    size_t largest_required_pool_block = 0;
  };

  class synchronized_pool_resource : public memory_resource {
  public:
    synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    synchronized_pool_resource()
        : synchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit synchronized_pool_resource(memory_resource* upstream)
        : synchronized_pool_resource(pool_options(), upstream) {}
    explicit synchronized_pool_resource(const pool_options& opts)
        : synchronized_pool_resource(opts, get_default_resource()) {}

    synchronized_pool_resource(const synchronized_pool_resource&) = delete;
    virtual ~synchronized_pool_resource();

    synchronized_pool_resource& operator=(const synchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;

  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };

  class unsynchronized_pool_resource : public memory_resource {
  public:
    unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    unsynchronized_pool_resource()
        : unsynchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit unsynchronized_pool_resource(memory_resource* upstream)
        : unsynchronized_pool_resource(pool_options(), upstream) {}
    explicit unsynchronized_pool_resource(const pool_options& opts)
        : unsynchronized_pool_resource(opts, get_default_resource()) {}

    unsynchronized_pool_resource(const unsynchronized_pool_resource&) = delete;
    virtual ~unsynchronized_pool_resource();

    unsynchronized_pool_resource& operator=(const unsynchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;

  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };
}
```

20.5.5.2 pool_options data members [mem.res.pool.options]

1 The members of `pool_options` comprise a set of constructor options for pool resources. The effect of each option on the pool resource behavior is described below:

```
size_t max_blocks_per_chunk;
```

2 The maximum number of blocks that will be allocated at once from the upstream memory resource (20.5.6) to replenish a pool. If the value of `max_blocks_per_chunk` is zero or is greater than an implementation-defined limit, that limit is used instead. The implementation may choose to use a smaller value than is specified in this member and may use different values for different pools.

```
size_t largest_required_pool_block;
```

3 The largest allocation size that is required to be fulfilled using the pooling mechanism. Attempts to allocate a single block larger than this threshold will be allocated directly from the upstream memory resource. If `largest_required_pool_block` is zero or is greater than an implementation-defined limit,

that limit is used instead. The implementation may choose a pass-through threshold larger than specified in this member.

20.5.5.3 Constructors and destructors [mem.res.pool.ctor]

```
synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
```

1 *Preconditions*: `upstream` is the address of a valid memory resource.

2 *Effects*: Constructs a pool resource object that will obtain memory from `upstream` whenever the pool resource is unable to satisfy a memory request from its own internal data structures. The resulting object will hold a copy of `upstream`, but will not own the resource to which `upstream` points.

[*Note 1*: The intention is that calls to `upstream->allocate()` will be substantially fewer than calls to `this->allocate()` in most cases. — *end note*]

The behavior of the pooling mechanism is tuned according to the value of the `opts` argument.

3 *Throws*: Nothing unless `upstream->allocate()` throws. It is unspecified if, or under what conditions, this constructor calls `upstream->allocate()`.

```
virtual ~synchronized_pool_resource();
virtual ~unsynchronized_pool_resource();
```

4 *Effects*: Calls `release()`.

20.5.5.4 Members [mem.res.pool.mem]

```
void release();
```

1 *Effects*: Calls `upstream_resource()->deallocate()` as necessary to release all allocated memory.

[*Note 1*: The memory is released back to `upstream_resource()` even if `deallocate` has not been called for some of the allocated blocks. — *end note*]

```
memory_resource* upstream_resource() const;
```

2 *Returns*: The value of the `upstream` argument provided to the constructor of this object.

```
pool_options options() const;
```

3 *Returns*: The options that control the pooling behavior of this resource. The values in the returned struct may differ from those supplied to the pool resource constructor in that values of zero will be replaced with implementation-defined defaults, and sizes may be rounded to unspecified granularity.

```
void* do_allocate(size_t bytes, size_t alignment) override;
```

4 *Effects*: If the pool selected for a block of size `bytes` is unable to satisfy the memory request from its own internal data structures, it will call `upstream_resource()->allocate()` to obtain more memory. If `bytes` is larger than that which the largest pool can handle, then memory will be allocated using `upstream_resource()->allocate()`.

5 *Returns*: A pointer to allocated storage (6.7.6.5.2) with a size of at least `bytes`. The size and alignment of the allocated memory shall meet the requirements for a class derived from `memory_resource` (20.5.2).

6 *Throws*: Nothing unless `upstream_resource()->allocate()` throws.

```
void do_deallocate(void* p, size_t bytes, size_t alignment) override;
```

7 *Effects*: Returns the memory at `p` to the pool. It is unspecified if, or under what circumstances, this operation will result in a call to `upstream_resource()->deallocate()`.

8 *Throws*: Nothing.

```
bool do_is_equal(const memory_resource& other) const noexcept override;
```

9 *Returns*: `this == &other`.

20.5.6 Class `monotonic_buffer_resource` [mem.res.monotonic.buffer]

20.5.6.1 General [mem.res.monotonic.buffer.general]

1 A `monotonic_buffer_resource` is a special-purpose memory resource intended for very fast memory allocations in situations where memory is used to build up a few objects and then is released all at once when the memory resource object is destroyed.

```
namespace std::pmr {
  class monotonic_buffer_resource : public memory_resource {
    memory_resource* upstream_rsrc;     // exposition only
    void* current_buffer;               // exposition only
    size_t next_buffer_size;            // exposition only

  public:
    explicit monotonic_buffer_resource(memory_resource* upstream);
    monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
    monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);

    monotonic_buffer_resource()
      : monotonic_buffer_resource(get_default_resource()) {}
    explicit monotonic_buffer_resource(size_t initial_size)
      : monotonic_buffer_resource(initial_size, get_default_resource()) {}
    monotonic_buffer_resource(void* buffer, size_t buffer_size)
      : monotonic_buffer_resource(buffer, buffer_size, get_default_resource()) {}

    monotonic_buffer_resource(const monotonic_buffer_resource&) = delete;

    virtual ~monotonic_buffer_resource();

    monotonic_buffer_resource& operator=(const monotonic_buffer_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;

  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };
}
```

20.5.6.2 Constructors and destructor [mem.res.monotonic.buffer.ctor]

```
explicit monotonic_buffer_resource(memory_resource* upstream);
monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
```

1 *Preconditions*: `upstream` is the address of a valid memory resource. `initial_size`, if specified, is greater than zero.

2 *Effects*: Sets `upstream_rsrc` to `upstream` and `current_buffer` to `nullptr`. If `initial_size` is specified, sets `next_buffer_size` to at least `initial_size`; otherwise sets `next_buffer_size` to an implementation-defined size.

```
monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);
```

3 *Preconditions*: `upstream` is the address of a valid memory resource. `buffer_size` is no larger than the number of bytes in `buffer`.

4 *Effects*: Sets `upstream_rsrc` to `upstream`, `current_buffer` to `buffer`, and `next_buffer_size` to `buffer_size` (but not less than 1), then increases `next_buffer_size` by an implementation-defined growth factor (which need not be integral).

```
~monotonic_buffer_resource();
```

5 *Effects*: Calls `release()`.

20.5.6.3 Members [mem.res.monotonic.buffer.mem]

```
void release();
```

1 *Effects*: Calls `upstream_rsrc->deallocate()` as necessary to release all allocated memory. Resets `current_buffer` and `next_buffer_size` to their initial values at construction.

2 [*Note 1*: The memory is released back to `upstream_rsrc` even if some blocks that were allocated from `*this` have not been deallocated from `*this`. — *end note*]

```
memory_resource* upstream_resource() const;
```

3 *Returns*: The value of `upstream_rsrc`.

```
void* do_allocate(size_t bytes, size_t alignment) override;
```

4 *Effects*: If the unused space in `current_buffer` can fit a block with the specified `bytes` and `alignment`, then allocate the return block from `current_buffer`; otherwise set `current_buffer` to `upstream_-rsrc->allocate(n, m)`, where `n` is not less than `max(bytes, next_buffer_size)` and `m` is not less than `alignment`, and increase `next_buffer_size` by an implementation-defined growth factor (which need not be integral), then allocate the return block from the newly-allocated `current_buffer`.

5 *Returns*: A pointer to allocated storage (6.7.6.5.2) with a size of at least `bytes`. The size and alignment of the allocated memory shall meet the requirements for a class derived from `memory_resource` (20.5.2).

6 *Throws*: Nothing unless `upstream_rsrc->allocate()` throws.

```
void do_deallocate(void* p, size_t bytes, size_t alignment) override;
```

7 *Effects*: None.

8 *Throws*: Nothing.

9 *Remarks*: Memory used by this resource increases monotonically until its destruction.

```
bool do_is_equal(const memory_resource& other) const noexcept override;
```

10 *Returns*: `this == &other`.

20.6 Class template `scoped_allocator_adaptor` [allocator.adaptor]

20.6.1 Header `<scoped_allocator>` synopsis [allocator.adaptor.syn]

```
namespace std {
  // class template scoped_allocator_adaptor
  template<class OuterAlloc, class... InnerAlloc>
    class scoped_allocator_adaptor;

  // 20.6.5, scoped allocator operators
  template<class OuterA1, class OuterA2, class... InnerAllocs>
    bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                    const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
}
```

1 The class template `scoped_allocator_adaptor` is an allocator template that specifies an allocator resource (the outer allocator) to be used by a container (as any other allocator does) and also specifies an inner allocator resource to be passed to the constructor of every element within the container. This adaptor is instantiated with one outer and zero or more inner allocator types. If instantiated with only one allocator type, the inner allocator becomes the `scoped_allocator_adaptor` itself, thus using the same allocator resource for the container and every element within the container and, if the elements themselves are containers, each of their elements recursively. If instantiated with more than one allocator, the first allocator is the outer allocator for use by the container, the second allocator is passed to the constructors of the container's elements, and, if the elements themselves are containers, the third allocator is passed to the elements' elements, and so on. If containers are nested to a depth greater than the number of allocators, the last allocator is used repeatedly, as in the single-allocator case, for any remaining recursions.

[*Note 1*: The `scoped_allocator_adaptor` is derived from the outer allocator type so it can be substituted for the outer allocator type in most expressions. — *end note*]

```
namespace std {
  template<class OuterAlloc, class... InnerAllocs>
  class scoped_allocator_adaptor : public OuterAlloc {
  private:
    using OuterTraits = allocator_traits<OuterAlloc>;    // exposition only
    scoped_allocator_adaptor<InnerAllocs...> inner;      // exposition only

  public:
    using outer_allocator_type = OuterAlloc;
    using inner_allocator_type = see below;

    using value_type           = typename OuterTraits::value_type;
    using size_type            = typename OuterTraits::size_type;
    using difference_type      = typename OuterTraits::difference_type;
    using pointer              = typename OuterTraits::pointer;
    using const_pointer        = typename OuterTraits::const_pointer;
    using void_pointer         = typename OuterTraits::void_pointer;
    using const_void_pointer   = typename OuterTraits::const_void_pointer;

    using propagate_on_container_copy_assignment = see below;
    using propagate_on_container_move_assignment = see below;
    using propagate_on_container_swap            = see below;
    using is_always_equal                        = see below;

    template<class Tp> struct rebind {
      using other = scoped_allocator_adaptor<
        OuterTraits::template rebind_alloc<Tp>, InnerAllocs...>;
    };

    scoped_allocator_adaptor();
    template<class OuterA2>
      scoped_allocator_adaptor(OuterA2&& outerAlloc,
                               const InnerAllocs&... innerAllocs) noexcept;

    scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;
    scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;

    template<class OuterA2>
      scoped_allocator_adaptor(
        const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& other) noexcept;
    template<class OuterA2>
      scoped_allocator_adaptor(
        scoped_allocator_adaptor<OuterA2, InnerAllocs...>&& other) noexcept;

    scoped_allocator_adaptor& operator=(const scoped_allocator_adaptor&) = default;
    scoped_allocator_adaptor& operator=(scoped_allocator_adaptor&&) = default;

    ~scoped_allocator_adaptor();

    inner_allocator_type& inner_allocator() noexcept;
    const inner_allocator_type& inner_allocator() const noexcept;
    outer_allocator_type& outer_allocator() noexcept;
    const outer_allocator_type& outer_allocator() const noexcept;

    pointer allocate(size_type n);
    pointer allocate(size_type n, const_void_pointer hint);
    void deallocate(pointer p, size_type n);
    size_type max_size() const;

    template<class T, class... Args>
      void construct(T* p, Args&&... args);

    template<class T>
      void destroy(T* p);
    scoped_allocator_adaptor select_on_container_copy_construction() const;
  };

  template<class OuterAlloc, class... InnerAllocs>
    scoped_allocator_adaptor(OuterAlloc, InnerAllocs...)
      -> scoped_allocator_adaptor<OuterAlloc, InnerAllocs...>;
}
```

20.6.2 Member types [allocator.adaptor.types]

`using inner_allocator_type = see below;`

1 *Type*: `scoped_allocator_adaptor<OuterAlloc>` if `sizeof...(InnerAllocs)` is zero; otherwise, `scoped_allocator_adaptor<InnerAllocs...>`.

`using propagate_on_container_copy_assignment = see below;`

2 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_copy_assignment::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

`using propagate_on_container_move_assignment = see below;`

3 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_move_assignment::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

`using propagate_on_container_swap = see below;`

4 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_swap::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

`using is_always_equal = see below;`

5 *Type*: `true_type` if `allocator_traits<A>::is_always_equal::value` is `true` for every `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

20.6.3 Constructors [allocator.adaptor.cnstr]

`scoped_allocator_adaptor();`

1 *Effects*: Value-initializes the `OuterAlloc` base class and the `inner` allocator object.

```
template<class OuterA2>
  scoped_allocator_adaptor(OuterA2&& outerAlloc, const InnerAllocs&... innerAllocs) noexcept;
```

2 *Constraints*: `is_constructible_v<OuterAlloc, OuterA2>` is `true`.

3 *Effects*: Initializes the `OuterAlloc` base class with `std::forward<OuterA2>(outerAlloc)` and `inner` with `innerAllocs...` (hence recursively initializing each allocator within the adaptor with the corresponding allocator from the argument list).

`scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;`

4 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator from `other`.

`scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;`

5 *Effects*: Move constructs each allocator within the adaptor with the corresponding allocator from `other`.

```
template<class OuterA2>
  scoped_allocator_adaptor(
    const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& other) noexcept;
```

6 *Constraints*: `is_constructible_v<OuterAlloc, const OuterA2&>` is `true`.

7 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator from `other`.

```
template<class OuterA2>
  scoped_allocator_adaptor(scoped_allocator_adaptor<OuterA2, InnerAllocs...>&& other) noexcept;
```

8 *Constraints*: `is_constructible_v<OuterAlloc, OuterA2>` is `true`.

9 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator rvalue from `other`.

20.6.4 Members [allocator.adaptor.members]

1 In the `construct` member functions, `OUTERMOST(x)` is `OUTERMOST(x.outer_allocator())` if the expression `x.outer_allocator()` is valid (13.10.3) and `x` otherwise; `OUTERMOST_ALLOC_TRAITS(x)` is `allocator_traits<remove_reference_t<decltype(OUTERMOST(x))>>`.

[*Note 1*: `OUTERMOST(x)` and `OUTERMOST_ALLOC_TRAITS(x)` are recursive operations. It is incumbent upon the definition of `outer_allocator()` to ensure that the recursion terminates. It will terminate for all instantiations of `scoped_allocator_adaptor`. — *end note*]

```
inner_allocator_type& inner_allocator() noexcept;
const inner_allocator_type& inner_allocator() const noexcept;
```

2 *Returns*: `*this` if `sizeof...(InnerAllocs)` is zero; otherwise, `inner`.

```
outer_allocator_type& outer_allocator() noexcept;
```

3 *Returns*: `static_cast<OuterAlloc&>(*this)`.

```
const outer_allocator_type& outer_allocator() const noexcept;
```

4 *Returns*: `static_cast<const OuterAlloc&>(*this)`.

```
pointer allocate(size_type n);
```

5 *Returns*: `allocator_traits<OuterAlloc>::allocate(outer_allocator(), n)`.

```
pointer allocate(size_type n, const_void_pointer hint);
```

6 *Returns*: `allocator_traits<OuterAlloc>::allocate(outer_allocator(), n, hint)`.

```
void deallocate(pointer p, size_type n) noexcept;
```

7 *Effects*: As if by: `allocator_traits<OuterAlloc>::deallocate(outer_allocator(), p, n);`

```
size_type max_size() const;
```

8 *Returns*: `allocator_traits<OuterAlloc>::max_size(outer_allocator())`.

```
template<class T, class... Args>
  void construct(T* p, Args&&... args);
```

9 *Effects*: Equivalent to:

```
apply([p, this](auto&&... newargs) {
        OUTERMOST_ALLOC_TRAITS(*this)::construct(
          OUTERMOST(*this), p,
          std::forward<decltype(newargs)>(newargs)...);
      },
      uses_allocator_construction_args<T>(inner_allocator(),
                                          std::forward<Args>(args)...));
```

```
template<class T>
  void destroy(T* p);
```

10 *Effects*: Calls `OUTERMOST_ALLOC_TRAITS(*this)::destroy(OUTERMOST(*this), p)`.

```
scoped_allocator_adaptor select_on_container_copy_construction() const;
```

11 *Returns*: A new `scoped_allocator_adaptor` object where each allocator `a1` within the adaptor is initialized with `allocator_traits<A1>::select_on_container_copy_construction(a2)`, where `A1` is the type of `a1` and `a2` is the corresponding allocator in `*this`.

20.6.5 Operators [scoped.adaptor.operators]

```
template<class OuterA1, class OuterA2, class... InnerAllocs>
  bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                  const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
```

1 *Returns*: If `sizeof...(InnerAllocs)` is zero,

```
a.outer_allocator() == b.outer_allocator()
```

otherwise

```
a.outer_allocator() == b.outer_allocator() && a.inner_allocator() == b.inner_allocator()
```

21 Metaprogramming library [meta]

21.1 General [meta.general]

1 This Clause describes metaprogramming facilities. These facilities are summarized in Table 51.

Table 51 — Metaprogramming library summary [tab:meta.summary]

	Subclause	Header
21.2	Integer sequences	`<utility>`
21.3	Type traits	`<type_traits>`
21.4	Rational arithmetic	`<ratio>`

21.2 Compile-time integer sequences [intseq]

21.2.1 General [intseq.general]

1 The library provides a class template that can represent an integer sequence. When used as an argument to a function template the template parameter pack defining the sequence can be deduced and used in a pack expansion.

[*Note 1*: The `index_sequence` alias template is provided for the common case of an integer sequence of type `size_t`; see also 22.4.6. — *end note*]

21.2.2 Class template `integer_sequence` [intseq.intseq]

```
namespace std {
  template<class T, T... I> struct integer_sequence {
    using value_type = T;
    static constexpr size_t size() noexcept { return sizeof...(I); }
  };
}
```

1 *Mandates*: `T` is an integer type.

21.2.3 Alias template `make_integer_sequence` [intseq.make]

```
template<class T, T N>
  using make_integer_sequence = integer_sequence<T, see below>;
```

1 *Mandates*: $N \geq 0$.

2 The alias template `make_integer_sequence` denotes a specialization of `integer_sequence` with `N` constant template arguments. The type `make_integer_sequence<T, N>` is an alias for the type `integer_sequence<T, 0, 1, ..., N - 1>`.

[*Note 1*: `make_integer_sequence<int, 0>` is an alias for the type `integer_sequence<int>`. — *end note*]

21.3 Metaprogramming and type traits [type.traits]

21.3.1 General [type.traits.general]

1 Subclause 21.3 describes components used by C++ programs, particularly in templates, to support the widest possible range of types, optimize template code usage, detect type related user errors, and perform type inference and transformation at compile time. It includes type classification traits, type property inspection traits, and type transformations. The type classification traits describe a complete taxonomy of all possible C++ types, and state where in that taxonomy a given type belongs. The type property inspection traits allow important characteristics of types or of combinations of types to be inspected. The type transformations allow certain properties of types to be manipulated.

2 All functions specified in 21.3 are signal-safe (17.14.5).

21.3.2 Requirements [meta.rqmts]

1 A *Cpp17UnaryTypeTrait* describes a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the property being described. It shall be *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and publicly and unambiguously derived, directly or indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (21.3.4), with the arguments to the template `integral_constant` determined by the requirements for the particular property being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the *Cpp17UnaryTypeTrait*.

2 A *Cpp17BinaryTypeTrait* describes a relationship between two types. It shall be a class template that takes two template type arguments and, optionally, additional arguments that help define the relationship being described. It shall be *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and publicly and unambiguously derived, directly or indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (21.3.4), with the arguments to the template `integral_constant` determined by the requirements for the particular relationship being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the *Cpp17BinaryTypeTrait*.

3 A *Cpp17TransformationTrait* modifies a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the modification. It shall define a publicly accessible nested type named `type`, which shall be a synonym for the modified type.

4 Unless otherwise specified, the behavior of a program that adds specializations for any of the templates specified in 21.3 is undefined.

5 Unless otherwise specified, an incomplete type may be used to instantiate a template specified in 21.3. The behavior of a program is undefined if

(5.1) — an instantiation of a template specified in 21.3 directly or indirectly depends on an incompletely-defined object type `T`, and

(5.2) — that instantiation could yield a different result were `T` hypothetically completed.

21.3.3 Header `<type_traits>` synopsis [meta.type.synop]

```
// all freestanding

  constexpr bool is_constant_evaluated() noexcept;
  consteval bool is_within_lifetime(const auto*) noexcept;
}
```

21.3.4 Helper classes [meta.help]

```
namespace std {
  template<class T, T v> struct integral_constant {
    static constexpr T value = v;

    using value_type = T;
    using type = integral_constant<T, v>;

    constexpr operator value_type() const noexcept { return value; }
    constexpr value_type operator()() const noexcept { return value; }
  };
}
```

1 The class template `integral_constant`, alias template `bool_constant`, and its associated *typedef-name*s `true_type` and `false_type` are used as base classes to define the interface for various type traits.

21.3.5 Unary type traits [meta.unary]

21.3.5.1 General [meta.unary.general]

1 Subclause 21.3.5 contains templates that may be used to query the properties of a type at compile time.

2 Each of these templates shall be a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if the corresponding condition is `true`, otherwise `false_type`.

21.3.5.2 Primary type categories [meta.unary.cat]

1 The primary type categories specified in Table 52 correspond to the descriptions given in subclause 6.8 of the C++ standard.

2 For any given type `T`, the result of applying one of these templates to `T` and to *cv* `T` shall yield the same result.

3 [*Note 1*: For any given type `T`, exactly one of the primary type categories has a `value` member that evaluates to `true`. — *end note*]

Table 52 — Primary type category predicates [tab:meta.unary.cat]

Template	Condition	Comments
`template<class T>` `struct is_void;`	`T` is `void`	

Table 52 — Primary type category predicates (continued)

Template	Condition	Comments
`template<class T>` `struct is_null_pointer;`	`T` is `nullptr_t` (6.8.2)	
`template<class T>` `struct is_integral;`	`T` is an integral type (6.8.2)	
`template<class T>` `struct is_floating_point;`	`T` is a floating-point type (6.8.2)	
`template<class T>` `struct is_array;`	`T` is an array type (6.8.4) of known or unknown extent	Class template `array` (23.3.3) is not an array type.
`template<class T>` `struct is_pointer;`	`T` is a pointer type (6.8.4)	Includes pointers to functions but not pointers to non-static members.
`template<class T>` `struct is_lvalue_reference;`	`T` is an lvalue reference type (9.3.4.3)	
`template<class T>` `struct is_rvalue_reference;`	`T` is an rvalue reference type (9.3.4.3)	
`template<class T>` `struct is_member_object_pointer;`	`T` is a pointer to data member	
`template<class T>` `struct` `is_member_function_pointer;`	`T` is a pointer to member function	
`template<class T>` `struct is_enum;`	`T` is an enumeration type (6.8.4)	
`template<class T>` `struct is_union;`	`T` is a union type (6.8.4)	
`template<class T>` `struct is_class;`	`T` is a non-union class type (6.8.4)	
`template<class T>` `struct is_function;`	`T` is a function type (6.8.4)	

21.3.5.3 Composite type traits [meta.unary.comp]

1 The templates specified in Table 53 provide convenient compositions of the primary type categories, corresponding to the descriptions given in subclause 6.8.

2 For any given type `T`, the result of applying one of these templates to `T` and to *cv* `T` shall yield the same result.

Table 53 — Composite type category predicates [tab:meta.unary.comp]

Template	Condition	Comments
`template<class T>` `struct is_reference;`	`T` is an lvalue reference or an rvalue reference	
`template<class T>` `struct is_arithmetic;`	`T` is an arithmetic type (6.8.2)	

Table 53 — Composite type category predicates (continued)

Template	Condition	Comments

`template<class T>`
`struct is_fundamental;`
	`T` is a fundamental type (6.8.2)	

`template<class T>`
`struct is_object;`
	`T` is an object type (6.8.1)	

`template<class T>`
`struct is_scalar;`
	`T` is a scalar type (6.8.1)	

`template<class T>`
`struct is_compound;`
	`T` is a compound type (6.8.4)	

`template<class T>`
`struct is_member_pointer;`
	`T` is a pointer-to-member type (6.8.4)	

21.3.5.4 Type properties [meta.unary.prop]

1 The templates specified in Table 54 provide access to some of the more important properties of types.

2 It is unspecified whether the library defines any full or partial specializations of any of these templates.

3 For all of the class templates `X` declared in this subclause, instantiating that template with a template-argument that is a class template specialization may result in the implicit instantiation of the template argument if and only if the semantics of `X` require that the argument is a complete type.

4 For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type `T` is considered to be a trivial (D.13, 11.4.4) function call that is not an odr-use (6.3) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 22.2.6.

5 For the purpose of defining the templates in this subclause, let *`VAL`*`<T>` for some type `T` be an expression defined as follows:

(5.1) — If `T` is a reference or function type, *`VAL`*`<T>` is an expression with the same type and value category as `declval<T>()`.

(5.2) — Otherwise, *`VAL`*`<T>` is a prvalue that initially has type `T`.

[*Note 1*: If `T` is cv-qualified, the cv-qualification is subject to adjustment (7.2.2). — *end note*]

Table 54 — Type property predicates [tab:meta.unary.prop]

Template	Condition	Preconditions

`template<class T>`
`struct is_const;`
	`T` is const-qualified (6.8.5)	

`template<class T>`
`struct is_volatile;`
	`T` is volatile-qualified (6.8.5)	

`template<class T>`
`struct is_trivially_copyable;`
	`T` is a trivially copyable type (6.8.1)	`remove_all_extents_-t<T>` shall be a complete type or *cv* `void`.

`template<class T>`
`struct is_trivially_relocatable;`
	`T` is a trivially relocatable type (6.8.1)	`remove_all_extents_-t<T>` shall be a complete type or *cv* `void`,

`template<class T>`
`struct is_replaceable;`
	`T` is a replaceable type (6.8.1)	`remove_all_extents_-t<T>` shall be a complete type or *cv* `void`,

`template<class T>`
`struct is_standard_layout;`
	`T` is a standard-layout type (6.8.1)	`remove_all_extents_-t<T>` shall be a complete type or *cv* `void`.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T>` `struct is_empty;`	`T` is a class type, but not a union type, with no non-static data members other than subobjects of zero size, no virtual member functions, no virtual base classes, and no base class `B` for which `is_empty_v<B>` is `false`.	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct is_polymorphic;`	`T` is a polymorphic class (11.7.3)	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct is_abstract;`	`T` is an abstract class (11.7.4)	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct is_final;`	`T` is a class type marked with the *class-property-specifier* `final` (11.1). [*Note 2*: A union is a class type that can be marked with `final`. — *end note*]	If `T` is a class type, `T` shall be a complete type.
`template<class T>` `struct is_aggregate;`	`T` is an aggregate type (9.5.2)	`T` shall be an array type, a complete type, or *cv* `void`.
`template<class T>` `struct is_signed;`	If `is_arithmetic_v<T>` is `true`, the same result as `T(-1) < T(0)`; otherwise, `false`	
`template<class T>` `struct is_unsigned;`	If `is_arithmetic_v<T>` is `true`, the same result as `T(0) < T(-1)`; otherwise, `false`	
`template<class T>` `struct is_bounded_array;`	`T` is an array type of known bound (9.3.4.5)	
`template<class T>` `struct is_unbounded_array;`	`T` is an array type of unknown bound (9.3.4.5)	
`template<class T>` `struct is_scoped_enum;`	`T` is a scoped enumeration (9.8.1)	
`template<class T, class... Args>` `struct is_constructible;`	For a function type `T` or for a *cv* `void` type `T`, `is_constructible_v<T, Args...>` is `false`, otherwise *see below*	`T` and all types in the template parameter pack `Args` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_default_constructible;`	`is_constructible_v<T>` is `true`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_copy_constructible;`	For a referenceable type `T` (3.45), the same result as `is_constructible_v<T, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T>` `struct is_move_constructible;`	For a referenceable type `T`, the same result as `is_constructible_v<T, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class U>` `struct is_assignable;`	The expression `declval<T>() = declval<U>()` is well-formed when treated as an unevaluated operand (7.2.3). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the assignment expression is considered. [*Note 3*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_copy_assignable;`	For a referenceable type `T`, the same result as `is_assignable_v<T&, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_move_assignable;`	For a referenceable type `T`, the same result as `is_assignable_v<T&, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U>` `struct is_swappable_with;`	The expressions `swap(declval<T>(), declval<U>())` and `swap(declval<U>(), declval<T>())` are each well-formed when treated as an unevaluated operand (7.2.3) in an overload-resolution context for swappable values (16.4.4.3). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the `swap` expressions is considered. [*Note 4*: The compilation of the expressions can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_swappable;`	For a referenceable type `T`, the same result as `is_swappable_with_v<T&, T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_destructible;`	Either `T` is a reference type, or `T` is a complete object type for which the expression `declval<U&>().~U()` is well-formed when treated as an unevaluated operand (7.2.3), where `U` is `remove_all_extents_t<T>`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class... Args>` `struct is_trivially_constructible;`	`is_constructible_v<T, Args...>` is `true` and the variable definition for `is_constructible`, as defined below, is known to call no operation that is not trivial (D.13, 11.4.4).	`T` and all types in the template parameter pack `Args` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_trivially_default_constructible;`	`is_trivially_constructible_v<T>` is `true`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T>` `struct` `is_trivially_copy_constructible;`	For a referenceable type `T`, the same result as `is_trivially_constructible_v<T, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct` `is_trivially_move_constructible;`	For a referenceable type `T`, the same result as `is_trivially_constructible_v<T, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class U>` `struct is_trivially_assignable;`	`is_assignable_v<T, U>` is `true` and the assignment, as defined by `is_assignable`, is known to call no operation that is not trivial (D.13, 11.4.4).	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct` `is_trivially_copy_assignable;`	For a referenceable type `T`, the same result as `is_trivially_assignable_v<T&, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct` `is_trivially_move_assignable;`	For a referenceable type `T`, the same result as `is_trivially_assignable_v<T&, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_trivially_destructible;`	`is_destructible_v<T>` is `true` and `remove_all_extents_t<T>` is either a non-class type or a class type with a trivial destructor.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class... Args>` `struct is_nothrow_constructible;`	`is_constructible_v<T, Args...>` is `true` and the variable definition for `is_constructible`, as defined below, is known not to throw any exceptions (7.6.2.7).	`T` and all types in the template parameter pack `Args` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct` `is_nothrow_default_constructible;`	`is_nothrow_constructible_v<T>` is `true`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct` `is_nothrow_copy_constructible;`	For a referenceable type `T`, the same result as `is_nothrow_constructible_v<T, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct` `is_nothrow_move_constructible;`	For a referenceable type `T`, the same result as `is_nothrow_constructible_v<T, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U>` `struct is_nothrow_assignable;`	`is_assignable_v<T, U>` is `true` and the assignment is known not to throw any exceptions (7.6.2.7).	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_nothrow_copy_assignable;`	For a referenceable type `T`, the same result as `is_nothrow_assignable_v<T&, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_nothrow_move_assignable;`	For a referenceable type `T`, the same result as `is_nothrow_assignable_v<T&, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class U>` `struct is_nothrow_swappable_with;`	`is_swappable_with_v<T, U>` is `true` and each `swap` expression of the definition of `is_swappable_with<T, U>` is known not to throw any exceptions (7.6.2.7).	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T>` `struct is_nothrow_swappable;`	For a referenceable type `T`, the same result as `is_nothrow_swappable_with_v<T&, T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_nothrow_destructible;`	`is_destructible_v<T>` is `true` and the indicated destructor is known not to throw any exceptions (7.6.2.7).	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T>` `struct is_nothrow_relocatable;`	`is_trivially_relocatable_v<T> || (is_nothrow_move_constructible_v< remove_all_extents_t<T>> && is_nothrow_destructible_v< remove_all_extents_t<T>>)`	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`,
`template<class T>` `struct is_implicit_lifetime;`	`T` is an implicit-lifetime type (6.8.1).	`T` shall be an array type, a complete type, or *cv* `void`.
`template<class T>` `struct has_virtual_destructor;`	`T` has a virtual destructor (11.4.7)	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct has_unique_object_representations;`	For an array type `T`, the same result as `has_unique_object_representations_v<remove_all_extents_t<T>>`, otherwise *`see below`*.	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`.

Table 54 — Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U>` `struct reference_constructs_from_-` `temporary;`	`T` is a reference type, and the initialization `T t(`*`VAL`*`<U>);` is well-formed and binds `t` to a temporary object whose lifetime is extended (6.7.7). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the variable initialization is considered. [*Note 5*: The initialization can result in effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T, class U>` `struct` `reference_converts_from_temporary;`	`T` is a reference type, and the initialization `T t =` *`VAL`*`<U>;` is well-formed and binds `t` to a temporary object whose lifetime is extended (6.7.7). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the variable initialization is considered. [*Note 6*: The initialization can result in effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.

6 [*Example 1*:

```
is_const_v<const volatile int>      // true
is_const_v<const int*>              // false
is_const_v<const int&>              // false
```

```
is_const_v<int[3]>                // false
is_const_v<const int[3]>          // true
```

— *end example*]

7 [*Example 2*:

```
remove_const_t<const volatile int>  // volatile int
remove_const_t<const int* const>    // const int*
remove_const_t<const int&>          // const int&
remove_const_t<const int[3]>        // int[3]
```

— *end example*]

8 [*Example 3*:

```
// Given:
struct P final { };
union U1 { };
union U2 final { };

// the following assertions hold:
static_assert(!is_final_v<int>);
static_assert(is_final_v<P>);
static_assert(!is_final_v<U1>);
static_assert(is_final_v<U2>);
```

— *end example*]

9 The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```
T t(declval<Args>()...);
```

[*Note 7*: These tokens are never interpreted as a function declaration. — *end note*]

Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered.

[*Note 8*: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]

10 The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if

(10.1) — `T` is trivially copyable, and

(10.2) — any two objects of type `T` with the same value have the same object representation, where

(10.2.1) — two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and

(10.2.2) — two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined.

[*Note 9*: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types. — *end note*]

21.3.6 Type property queries [meta.unary.prop.query]

1 The templates specified in Table 55 may be used to query properties of types at compile time.

Table 55 — Type property queries [tab:meta.unary.prop.query]

Template	Value
`template<class T>` `struct alignment_of;`	`alignof(T)`. *Mandates*: `alignof(T)` is a valid expression (7.6.2.6)
`template<class T>` `struct rank;`	If `T` is an array type, an integer value representing the number of dimensions of `T`; otherwise, 0.

Table 55 — Type property queries (continued)

Template	Value
`template<class T, unsigned I = 0> struct extent;`	If `T` is not an array type, or if it has rank less than or equal to `I`, or if `I` is 0 and `T` has type "array of unknown bound of `U`", then 0; otherwise, the bound (9.3.4.5) of the `I`th dimension of `T`, where indexing of `I` is zero-based

2 Each of these templates shall be a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `integral_constant<size_t, Value>`.

3 [*Example 1*:

```
// the following assertions hold:
static_assert(rank_v<int> == 0);
static_assert(rank_v<int[2]> == 1);
static_assert(rank_v<int[][4]> == 2);
```

— *end example*]

4 [*Example 2*:

```
// the following assertions hold:
static_assert(extent_v<int> == 0);
static_assert(extent_v<int[2]> == 2);
static_assert(extent_v<int[2][4]> == 2);
static_assert(extent_v<int[][4]> == 0);
static_assert(extent_v<int, 1> == 0);
static_assert(extent_v<int[2], 1> == 0);
static_assert(extent_v<int[2][4], 1> == 4);
static_assert(extent_v<int[][4], 1> == 4);
```

— *end example*]

21.3.7 Relationships between types [meta.rel]

1 The templates specified in Table 56 may be used to query relationships between types at compile time.

2 Each of these templates shall be a *Cpp17BinaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if the corresponding condition is true, otherwise `false_type`.

Table 56 — Type relationship predicates [tab:meta.rel]

Template	Condition	Comments
`template<class T, class U> struct is_same;`	`T` and `U` name the same type with the same cv-qualifications	
`template<class Base, class Derived> struct is_base_of;`	`Base` is a base class of `Derived` (11.7) without regard to cv-qualifiers or `Base` and `Derived` are not unions and name the same class type without regard to cv-qualifiers	If `Base` and `Derived` are non-union class types and are not (possibly cv-qualified versions of) the same type, `Derived` shall be a complete type. [*Note 1*: Base classes that are private, protected, or ambiguous are, nonetheless, base classes. — *end note*]

Table 56 — Type relationship predicates (continued)

Template	Condition	Comments
`template<class Base, class Derived>` `struct is_virtual_base_of;`	`Base` is a virtual base class of `Derived` (11.7.2) without regard to cv-qualifiers.	If `Base` and `Derived` are non-union class types, `Derived` shall be a complete type. [*Note 2*: Virtual base classes that are private, protected, or ambiguous are, nonetheless, virtual base classes. — *end note*] [*Note 3*: A class is never a virtual base class of itself. — *end note*]
`template<class From, class To>` `struct is_convertible;`	*see below*	`From` and `To` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class From, class To>` `struct is_nothrow_convertible;`	`is_convertible_v<From, To>` is `true` and the conversion, as defined by `is_convertible`, is known not to throw any exceptions (7.6.2.7)	`From` and `To` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T, class U>` `struct is_layout_compatible;`	`T` and `U` are layout-compatible (6.8.1)	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class Base, class Derived>` `struct is_pointer_-interconvertible_base_of;`	`Derived` is unambiguously derived from `Base` without regard to cv-qualifiers, and each object of type `Derived` is pointer-interconvertible (6.8.4) with its `Base` subobject, or `Base` and `Derived` are not unions and name the same class type without regard to cv-qualifiers.	If `Base` and `Derived` are non-union class types and are not (possibly cv-qualified versions of) the same type, `Derived` shall be a complete type.
`template<class Fn, class... ArgTypes>` `struct is_invocable;`	The expression *`INVOKE`*`(declval<Fn>(), declval<ArgTypes>()...)` (22.10.4) is well-formed when treated as an unevaluated operand (7.2.3)	`Fn` and all types in the template parameter pack `ArgTypes` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class R, class Fn, class... ArgTypes>` `struct is_invocable_r;`	The expression *`INVOKE`*`<R>(declval<Fn>(), declval<ArgTypes>()...)` is well-formed when treated as an unevaluated operand	`Fn`, `R`, and all types in the template parameter pack `ArgTypes` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class Fn, class... ArgTypes>` `struct is_nothrow_invocable;`	`is_invocable_v< Fn, ArgTypes...>` is `true` and the expression *`INVOKE`*`(declval<Fn>(), declval<ArgTypes>()...)` is known not to throw any exceptions (7.6.2.7)	`Fn` and all types in the template parameter pack `ArgTypes` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class R, class Fn, class... ArgTypes>` `struct is_nothrow_invocable_r;`	`is_invocable_r_v< R, Fn, ArgTypes...>` is `true` and the expression *`INVOKE`*`<R>(declval<Fn>(), declval<ArgTypes>()...)` is known not to throw any exceptions (7.6.2.7)	`Fn`, `R`, and all types in the template parameter pack `ArgTypes` shall be complete types, *cv* `void`, or arrays of unknown bound.

3 For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type `T` is considered to be a trivial (D.13, 11.4.4) function call that is not an odr-use (6.3) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 22.2.6.

4 [*Example 1*:

```
struct B {};
struct B1 : B {};
struct B2 : B {};
struct D : private B1, private B2 {};

is_base_of_v<B, D>                // true
is_base_of_v<const B, D>          // true
is_base_of_v<B, const D>          // true
is_base_of_v<B, const B>          // true
is_base_of_v<D, B>                // false
is_base_of_v<B&, D&>              // false
is_base_of_v<B[3], D[3]>          // false
is_base_of_v<int, int>            // false
```

— *end example*]

5 The predicate condition for a template specialization `is_convertible<From, To>` shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```
To test() {
  return declval<From>();
}
```

[*Note 4*: This requirement gives well-defined results for reference types, array types, function types, and *cv* `void`. — *end note*]

Access checking is performed in a context unrelated to `To` and `From`. Only the validity of the immediate context of the *expression* of the `return` statement (8.7.4) (including initialization of the returned object or reference) is considered.

[*Note 5*: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]

21.3.8 Transformations between types [meta.trans]

21.3.8.1 General [meta.trans.general]

1 Subclause 21.3.8 contains templates that may be used to transform one type to another following some predefined rule.

2 Each of the templates in 21.3.8 shall be a *Cpp17TransformationTrait* (21.3.2).

21.3.8.2 Const-volatile modifications [meta.trans.cv]

1 The templates specified in Table 57 add or remove cv-qualifications (6.8.5).

Table 57 — Const-volatile modifications [tab:meta.trans.cv]

Template	Comments
`template<class T>` `struct remove_const;`	The member typedef `type` denotes the type formed by removing any top-level const-qualifier from `T`. [*Example 1*: `remove_const_t<const volatile int>` evaluates to `volatile int`, whereas `remove_const_t<const int*>` evaluates to `const int*`. — *end example*]

Table 57 — Const-volatile modifications (continued)

Template	Comments
`template<class T>` `struct remove_volatile;`	The member typedef `type` denotes the type formed by removing any top-level volatile-qualifier from `T`. [*Example 2*: `remove_volatile_t<const volatile int>` evaluates to `const int`, whereas `remove_volatile_t<volatile int*>` evaluates to `volatile int*`. — *end example*]
`template<class T>` `struct remove_cv;`	The member typedef `type` denotes the type formed by removing any top-level cv-qualifiers from `T`. [*Example 3*: `remove_cv_t<const volatile int>` evaluates to `int`, whereas `remove_cv_t<const volatile int*>` evaluates to `const volatile int*`. — *end example*]
`template<class T>` `struct add_const;`	If `T` is a reference, function, or top-level const-qualified type, then `type` denotes `T`, otherwise `T const`.
`template<class T>` `struct add_volatile;`	If `T` is a reference, function, or top-level volatile-qualified type, then `type` denotes `T`, otherwise `T volatile`.
`template<class T>` `struct add_cv;`	The member typedef `type` denotes `add_const_t<add_volatile_t<T>>`.

21.3.8.3 Reference modifications [meta.trans.ref]

1 The templates specified in Table 58 add or remove references.

Table 58 — Reference modifications [tab:meta.trans.ref]

Template	Comments
`template<class T>` `struct remove_reference;`	If `T` has type "reference to `T1`" then the member typedef `type` denotes `T1`; otherwise, `type` denotes `T`.
`template<class T>` `struct` `add_lvalue_reference;`	If `T` is a referenceable type (3.45) then the member typedef `type` denotes `T&`; otherwise, `type` denotes `T`. [*Note 1*: This rule reflects the semantics of reference collapsing (9.3.4.3). — *end note*]
`template<class T>` `struct` `add_rvalue_reference;`	If `T` is a referenceable type then the member typedef `type` denotes `T&&`; otherwise, `type` denotes `T`. [*Note 2*: This rule reflects the semantics of reference collapsing (9.3.4.3). For example, when a type `T` is a reference type `T1&`, the type `add_rvalue_reference_t<T>` is not an rvalue reference. — *end note*]

21.3.8.4 Sign modifications [meta.trans.sign]

1 The templates specified in Table 59 convert an integer type to its corresponding signed or unsigned type.

Table 59 — Sign modifications [tab:meta.trans.sign]

Template	Comments
`template<class T>` `struct make_signed;`	If `T` is a (possibly cv-qualified) signed integer type (6.8.2) then the member typedef `type` denotes `T`; otherwise, if `T` is a (possibly cv-qualified) unsigned integer type then `type` denotes the corresponding signed integer type, with the same cv-qualifiers as `T`; otherwise, `type` denotes the signed integer type with smallest rank (6.8.6) for which `sizeof(T) == sizeof(type)`, with the same cv-qualifiers as `T`. *Mandates*: `T` is an integral or enumeration type other than *cv* `bool`.

Table 59 — Sign modifications (continued)

Template	Comments
`template<class T>` `struct make_unsigned;`	If `T` is a (possibly cv-qualified) unsigned integer type (6.8.2) then the member typedef `type` denotes `T`; otherwise, if `T` is a (possibly cv-qualified) signed integer type then `type` denotes the corresponding unsigned integer type, with the same cv-qualifiers as `T`; otherwise, `type` denotes the unsigned integer type with smallest rank (6.8.6) for which `sizeof(T) == sizeof(type)`, with the same cv-qualifiers as `T`. *Mandates*: `T` is an integral or enumeration type other than *cv* `bool`.

21.3.8.5 Array modifications [meta.trans.arr]

1 The templates specified in Table 60 modify array types.

Table 60 — Array modifications [tab:meta.trans.arr]

Template	Comments
`template<class T>` `struct remove_extent;`	If `T` is a type "array of `U`", the member typedef `type` denotes `U`, otherwise `T`. [*Note 1*: For multidimensional arrays, only the first array dimension is removed. For a type "array of `const U`", the resulting type is `const U`. — *end note*]
`template<class T>` `struct remove_all_extents;`	If `T` is "multidimensional array of `U`", the resulting member typedef `type` denotes `U`, otherwise `T`.

2 [*Example 1*:

```
// the following assertions hold:
static_assert(is_same_v<remove_extent_t<int>, int>);
static_assert(is_same_v<remove_extent_t<int[2]>, int>);
static_assert(is_same_v<remove_extent_t<int[2][3]>, int[3]>);
static_assert(is_same_v<remove_extent_t<int[][3]>, int[3]>);
```

— *end example*]

3 [*Example 2*:

```
// the following assertions hold:
static_assert(is_same_v<remove_all_extents_t<int>, int>);
static_assert(is_same_v<remove_all_extents_t<int[2]>, int>);
static_assert(is_same_v<remove_all_extents_t<int[2][3]>, int>);
static_assert(is_same_v<remove_all_extents_t<int[][3]>, int>);
```

— *end example*]

21.3.8.6 Pointer modifications [meta.trans.ptr]

1 The templates specified in Table 61 add or remove pointers.

Table 61 — Pointer modifications [tab:meta.trans.ptr]

Template	Comments
`template<class T>` `struct remove_pointer;`	If `T` has type "(possibly cv-qualified) pointer to `T1`" then the member typedef `type` denotes `T1`; otherwise, it denotes `T`.
`template<class T>` `struct add_pointer;`	If `T` is a referenceable type (3.45) or a *cv* `void` type then the member typedef `type` denotes `remove_reference_t<T>*`; otherwise, `type` denotes `T`.

21.3.8.7 Other transformations [meta.trans.other]

1 The templates specified in Table 62 perform other modifications of a type.

Table 62 — Other transformations [tab:meta.trans.other]

Template	Comments
`template<class T>` `struct type_identity;`	The member typedef `type` denotes `T`.
`template<class T>` `struct remove_cvref;`	The member typedef `type` denotes `remove_cv_t<remove_reference_t<T>>`.
`template<class T>` `struct decay;`	Let `U` be `remove_reference_t<T>`. If `is_array_v<U>` is `true`, the member typedef `type` denotes `remove_extent_t<U>*`. If `is_function_v<U>` is `true`, the member typedef `type` denotes `add_pointer_t<U>`. Otherwise the member typedef `type` denotes `remove_cv_t<U>`. [*Note 1*: This behavior is similar to the lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) conversions applied when an lvalue is used as an rvalue, but also strips cv-qualifiers from class types in order to more closely model by-value argument passing. — *end note*]
`template<bool B, class T = void> struct enable_if;`	If `B` is `true`, the member typedef `type` denotes `T`; otherwise, there shall be no member `type`.
`template<bool B, class T, class F>` `struct conditional;`	If `B` is `true`, the member typedef `type` denotes `T`. If `B` is `false`, the member typedef `type` denotes `F`.
`template<class... T> struct common_type;`	Unless this trait is specialized, the member `type` is defined or omitted as specified below. If it is omitted, there shall be no member `type`. Each type in the template parameter pack `T` shall be complete, *cv* `void`, or an array of unknown bound.
`template<class, class,` `template<class> class,` `template<class> class>` `struct` `basic_common_reference;`	Unless this trait is specialized, there shall be no member `type`.
`template<class... T> struct common_reference;`	The member *typedef-name* `type` is defined or omitted as specified below. Each type in the parameter pack `T` shall be complete or *cv* `void`.
`template<class T>` `struct underlying_type;`	If `T` is an enumeration type, the member typedef `type` denotes the underlying type of `T` (9.8.1); otherwise, there is no member `type`. *Mandates*: `T` is not an incomplete enumeration type.
`template<class Fn,` `class... ArgTypes>` `struct invoke_result;`	If the expression `*INVOKE*(declval<Fn>(), declval<ArgTypes>()...)` (22.10.4) is well-formed when treated as an unevaluated operand (7.2.3), the member typedef `type` denotes the type `decltype(*INVOKE*(declval<Fn>(), declval<ArgTypes>()...))`; otherwise, there shall be no member `type`. Access checking is performed as if in a context unrelated to `Fn` and `ArgTypes`. Only the validity of the immediate context of the expression is considered. [*Note 2*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*] *Preconditions*: `Fn` and all types in the template parameter pack `ArgTypes` are complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct unwrap_reference;`	If `T` is a specialization `reference_wrapper<X>` for some type `X`, the member typedef `type` of `unwrap_reference<T>` denotes `X&`, otherwise `type` denotes `T`.

Table 62 — Other transformations (continued)

Template	Comments
`template<class T>` `unwrap_ref_decay;`	The member typedef `type` of `unwrap_ref_decay<T>` denotes the type `unwrap_reference_t<decay_t<T>>`.

2 In addition to being available via inclusion of the `<type_traits>` header, the templates `unwrap_reference`, `unwrap_ref_decay`, `unwrap_reference_t`, and `unwrap_ref_decay_t` are available when the header `<functional>` (22.10.2) is included.

3 Let:

(3.1) — *CREF*(`A`) be `add_lvalue_reference_t<const remove_reference_t<A>>`,

(3.2) — *XREF*(`A`) denote a unary alias template `T` such that `T<U>` denotes the same type as `U` with the addition of `A`'s cv and reference qualifiers, for a non-reference cv-unqualified type `U`,

(3.3) — *COPYCV*(`FROM, TO`) be an alias for type `TO` with the addition of `FROM`'s top-level cv-qualifiers,

[*Example 1*: *COPYCV*(`const int, volatile short`) is an alias for `const volatile short`. — *end example*]

(3.4) — *COND-RES*(`X, Y`) be `decltype(false ? declval<X(&)()>()() : declval<Y(&)()>()())`.

Given types `A` and `B`, let `X` be `remove_reference_t<A>`, let `Y` be `remove_reference_t<B>`, and let *COMMON-REF*(`A, B`) be:

(3.5) — If `A` and `B` are both lvalue reference types, *COMMON-REF*(`A, B`) is *COND-RES*(*COPYCV*(`X, Y`) `&`, *COPYCV*(`Y, X`) `&`) if that type exists and is a reference type.

(3.6) — Otherwise, let `C` be `remove_reference_t<`*COMMON-REF*`(X&, Y&)>&&`. If `A` and `B` are both rvalue reference types, `C` is well-formed, and `is_convertible_v<A, C> && is_convertible_v<B, C>` is `true`, then *COMMON-REF*(`A, B`) is `C`.

(3.7) — Otherwise, let `D` be *COMMON-REF*(`const X&, Y&`). If `A` is an rvalue reference and `B` is an lvalue reference and `D` is well-formed and `is_convertible_v<A, D>` is `true`, then *COMMON-REF*(`A, B`) is `D`.

(3.8) — Otherwise, if `A` is an lvalue reference and `B` is an rvalue reference, then *COMMON-REF*(`A, B`) is *COMMON-REF*(`B, A`).

(3.9) — Otherwise, *COMMON-REF*(`A, B`) is ill-formed.

If any of the types computed above is ill-formed, then *COMMON-REF*(`A, B`) is ill-formed.

4 For the `common_type` trait applied to a template parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

(4.1) — If `sizeof...(T)` is zero, there shall be no member `type`.

(4.2) — If `sizeof...(T)` is one, let `T0` denote the sole type constituting the pack `T`. The member *typedef-name* `type` shall denote the same type, if any, as `common_type_t<T0, T0>`; otherwise there shall be no member `type`.

(4.3) — If `sizeof...(T)` is two, let the first and second types constituting `T` be denoted by `T1` and `T2`, respectively, and let `D1` and `D2` denote the same types as `decay_t<T1>` and `decay_t<T2>`, respectively.

(4.3.1) — If `is_same_v<T1, D1>` is `false` or `is_same_v<T2, D2>` is `false`, let `C` denote the same type, if any, as `common_type_t<D1, D2>`.

(4.3.2) — [*Note 3*: None of the following will apply if there is a specialization `common_type<D1, D2>`. — *end note*]

(4.3.3) — Otherwise, if

```
decay_t<decltype(false ? declval<D1>() : declval<D2>())>
```

denotes a valid type, let `C` denote that type.

(4.3.4) — Otherwise, if *COND-RES*(*CREF*(`D1`), *CREF*(`D2`)) denotes a type, let `C` denote the type `decay_t<`*COND-RES*(*CREF*(`D1`), *CREF*(`D2`))`>`.

In either case, the member *typedef-name* `type` shall denote the same type, if any, as `C`. Otherwise, there shall be no member `type`.

(4.4) — If `sizeof...(T)` is greater than two, let `T1`, `T2`, and `R`, respectively, denote the first, second, and (pack of) remaining types constituting `T`. Let `C` denote the same type, if any, as `common_type_t<T1,`

`T2>`. If there is such a type `C`, the member *typedef-name* `type` shall denote the same type, if any, as `common_type_t<C, R...>`. Otherwise, there shall be no member `type`.

5 Notwithstanding the provisions of 21.3.3, and pursuant to 16.4.5.2.1, a program may specialize `common_type<T1, T2>` for types `T1` and `T2` such that `is_same_v<T1, decay_t<T1>>` and `is_same_v<T2, decay_t<T2>>` are each `true`.

[*Note 4*: Such specializations are needed when only explicit conversions are desired between the template arguments. — *end note*]

Such a specialization need not have a member named `type`, but if it does, the *qualified-id* `common_type<T1, T2>::type` shall denote a cv-unqualified non-reference type to which each of the types `T1` and `T2` is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type, if any, as does `common_type_t<T2, T1>`. No diagnostic is required for a violation of this Note's rules.

6 For the `common_reference` trait applied to a parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

(6.1) — If `sizeof...(T)` is zero, there shall be no member `type`.

(6.2) — Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member typedef `type` shall denote the same type as `T0`.

(6.3) — Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then

(6.3.1) — Let `R` be `*COMMON-REF*(T1, T2)`. If `T1` and `T2` are reference types, `R` is well-formed, and `is_convertible_v<add_pointer_t<T1>, add_pointer_t<R>> && is_convertible_v<add_pointer_t<T2>, add_pointer_t<R>>` is `true`, then the member typedef `type` denotes `R`.

(6.3.2) — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, *XREF*(T1), *XREF*(T2)>::type` is well-formed, then the member typedef `type` denotes that type.

(6.3.3) — Otherwise, if `*COND-RES*(T1, T2)` is well-formed, then the member typedef `type` denotes that type.

(6.3.4) — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member typedef `type` denotes that type.

(6.3.5) — Otherwise, there shall be no member `type`.

(6.4) — Otherwise, if `sizeof...(T)` is greater than two, let `T1`, `T2`, and `Rest`, respectively, denote the first, second, and (pack of) remaining types comprising `T`. Let `C` be the type `common_reference_t<T1, T2>`. Then:

(6.4.1) — If there is such a type `C`, the member typedef `type` shall denote the same type, if any, as `common_reference_t<C, Rest...>`.

(6.4.2) — Otherwise, there shall be no member `type`.

7 Notwithstanding the provisions of 21.3.3, and pursuant to 16.4.5.2.1, a program may partially specialize `basic_common_reference<T, U, TQual, UQual>` for types `T` and `U` such that `is_same_v<T, decay_t<T>>` and `is_same_v<U, decay_t<U>>` are each `true`.

[*Note 5*: Such specializations can be used to influence the result of `common_reference`, and are needed when only explicit conversions are desired between the template arguments. — *end note*]

Such a specialization need not have a member named `type`, but if it does, the *qualified-id* `basic_common_reference<T, U, TQual, UQual>::type` shall denote a type to which each of the types `TQual<T>` and `UQual<U>` is convertible. Moreover, `basic_common_reference<T, U, TQual, UQual>::type` shall denote the same type, if any, as does `basic_common_reference<U, T, UQual, TQual>::type`. No diagnostic is required for a violation of these rules.

8 [*Example 2*: Given these definitions:

```
using PF1 = bool  (&)();
using PF2 = short (*)(long);

struct S {
  operator PF2() const;
  double operator()(char, int&);
  void fn(long) const;
  char data;
};
```

```
using PMF = void (S::*)(long) const;
using PMD = char  S::*;
```

the following assertions will hold:

```
static_assert(is_same_v<invoke_result_t<S, int>, short>);
static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
static_assert(is_same_v<invoke_result_t<PF1>, bool>);
static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int>, void>);
static_assert(is_same_v<invoke_result_t<PMD, S>, char&&>);
static_assert(is_same_v<invoke_result_t<PMD, const S*>, const char&>);
```

— *end example*]

21.3.9 Logical operator traits [meta.logical]

1 This subclause describes type traits for applying logical operators to other type traits.

`template<class... B> struct conjunction : `*`see below`*` { };`

2 The class template `conjunction` forms the logical conjunction of its template type arguments.

3 For a specialization `conjunction<`B_1`, ..., `B_N`>`, if there is a template type argument B_i for which `bool(`B_i`::value)` is `false`, then instantiating `conjunction<`B_1`, ..., `B_N`>::value` does not require the instantiation of B_j`::value` for $j > i$.

[*Note 1*: This is analogous to the short-circuiting behavior of the built-in operator `&&`. — *end note*]

4 Every template type argument for which B_i`::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

5 The specialization `conjunction<`B_1`, ..., `B_N`>` has a public and unambiguous base that is either

(5.1) — the first type B_i in the list `true_type, `B_1`, ..., `B_N for which `bool(`B_i`::value)` is `false`, or

(5.2) — if there is no such B_i, the last type in the list.

[*Note 2*: This means a specialization of `conjunction` does not necessarily inherit from either `true_type` or `false_type`. — *end note*]

6 The member names of the base class, other than `conjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `conjunction`.

`template<class... B> struct disjunction : `*`see below`*` { };`

7 The class template `disjunction` forms the logical disjunction of its template type arguments.

8 For a specialization `disjunction<`B_1`, ..., `B_N`>`, if there is a template type argument B_i for which `bool(`B_i`::value)` is `true`, then instantiating `disjunction<`B_1`, ..., `B_N`>::value` does not require the instantiation of B_j`::value` for $j > i$.

[*Note 3*: This is analogous to the short-circuiting behavior of the built-in operator `||`. — *end note*]

9 Every template type argument for which B_i`::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

10 The specialization `disjunction<`B_1`, ..., `B_N`>` has a public and unambiguous base that is either

(10.1) — the first type B_i in the list `false_type, `B_1`, ..., `B_N for which `bool(`B_i`::value)` is `true`, or

(10.2) — if there is no such B_i, the last type in the list.

[*Note 4*: This means a specialization of `disjunction` does not necessarily inherit from either `true_type` or `false_type`. — *end note*]

11 The member names of the base class, other than `disjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `disjunction`.

`template<class B> struct negation : `*`see below`*` { };`

12 The class template `negation` forms the logical negation of its template type argument. The type `negation<B>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `bool_constant<!bool(B::value)>`.

21.3.10 Member relationships [meta.member]

```
template<class S, class M>
  constexpr bool is_pointer_interconvertible_with_class(M S::*m) noexcept;
```

1 *Mandates*: `S` is a complete type.

2 *Returns*: `true` if and only if `S` is a standard-layout type, `M` is an object type, `m` is not null, and each object `s` of type `S` is pointer-interconvertible (6.8.4) with its subobject `s.*m`.

```
template<class S1, class S2, class M1, class M2>
  constexpr bool is_corresponding_member(M1 S1::*m1, M2 S2::*m2) noexcept;
```

3 *Mandates*: `S1` and `S2` are complete types.

4 *Returns*: `true` if and only if `S1` and `S2` are standard-layout struct (11.2) types, `M1` and `M2` are object types, `m1` and `m2` are not null, and `m1` and `m2` point to corresponding members of the common initial sequence (11.4) of `S1` and `S2`.

5 [*Note 1*: The type of a pointer-to-member expression `&C::b` is not always a pointer to member of `C`, leading to potentially surprising results when using these functions in conjunction with inheritance.

[*Example 1*:

```
struct A { int a; };                    // a standard-layout class
struct B { int b; };                    // a standard-layout class
struct C: public A, public B { };       // not a standard-layout class

static_assert( is_pointer_interconvertible_with_class( &C::b ) );
  // Succeeds because, despite its appearance, &C::b has type
  // "pointer to member of B of type int".
static_assert( is_pointer_interconvertible_with_class<C>( &C::b ) );
  // Forces the use of class C, and fails.

static_assert( is_corresponding_member( &C::a, &C::b ) );
  // Succeeds because, despite its appearance, &C::a and &C::b have types
  // "pointer to member of A of type int" and
  // "pointer to member of B of type int", respectively.
static_assert( is_corresponding_member<C, C>( &C::a, &C::b ) );
  // Forces the use of class C, and fails.
```

— *end example*]

— *end note*]

21.3.11 Constant evaluation context [meta.const.eval]

```
constexpr bool is_constant_evaluated() noexcept;
```

1 *Effects*: Equivalent to:

```
if consteval {
  return true;
} else {
  return false;
}
```

2 [*Example 1*:

```
constexpr void f(unsigned char *p, int n) {
  if (std::is_constant_evaluated()) {           // should not be a constexpr if statement
    for (int k = 0; k<n; ++k) p[k] = 0;
  } else {
    memset(p, 0, n);                            // not a core constant expression
  }
}
```

— *end example*]

```
consteval bool is_within_lifetime(const auto* p) noexcept;
```

3 *Returns*: `true` if `p` is a pointer to an object that is within its lifetime (6.7.4); otherwise, `false`.

4 *Remarks*: During the evaluation of an expression `E` as a core constant expression, a call to this function is ill-formed unless `p` points to an object that is usable in constant expressions or whose complete object's lifetime began within `E`.

5 [*Example 2*:

```
struct OptBool {
  union { bool b; char c; };

  // note: this assumes common implementation properties for bool and char:
  // * sizeof(bool) == sizeof(char), and
  // * the value representations for true and false are distinct
  // from the value representation for 2
  constexpr OptBool() : c(2) { }
  constexpr OptBool(bool b) : b(b) { }

  constexpr auto has_value() const -> bool {
    if consteval {
      return std::is_within_lifetime(&b);        // during constant evaluation, cannot read from c
    } else {
      return c != 2;                              // during runtime, must read from c
    }
  }

  constexpr auto operator*() const -> const bool& {
    return b;
  }
};

constexpr OptBool disengaged;
constexpr OptBool engaged(true);
static_assert(!disengaged.has_value());
static_assert(engaged.has_value());
static_assert(*engaged);
```

— *end example*]

21.4 Compile-time rational arithmetic [ratio]

21.4.1 General [ratio.general]

1 Subclause 21.4 describes the ratio library. It provides a class template `ratio` which exactly represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`.

2 Throughout subclause 21.4, the names of template parameters are used to express type requirements. If a template parameter is named `R1` or `R2`, and the template argument is not a specialization of the `ratio` template, the program is ill-formed.

21.4.2 Header `<ratio>` synopsis [ratio.syn]

```
// all freestanding
namespace std {
  // 21.4.3, class template ratio
  template<intmax_t N, intmax_t D = 1> class ratio;

  // 21.4.4, ratio arithmetic
  template<class R1, class R2> using ratio_add = see below;
  template<class R1, class R2> using ratio_subtract = see below;
  template<class R1, class R2> using ratio_multiply = see below;
  template<class R1, class R2> using ratio_divide = see below;

  // 21.4.5, ratio comparison
  template<class R1, class R2> struct ratio_equal;
  template<class R1, class R2> struct ratio_not_equal;
  template<class R1, class R2> struct ratio_less;
  template<class R1, class R2> struct ratio_less_equal;
  template<class R1, class R2> struct ratio_greater;
  template<class R1, class R2> struct ratio_greater_equal;

  template<class R1, class R2>
    constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
  template<class R1, class R2>
    constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
  template<class R1, class R2>
    constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
  template<class R1, class R2>
    constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
  template<class R1, class R2>
    constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
  template<class R1, class R2>
    constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

  // 21.4.6, convenience SI typedefs
  using quecto = ratio<1, 1'000'000'000'000'000'000'000'000'000'000>;     // see below
  using ronto  = ratio<1,     1'000'000'000'000'000'000'000'000'000>;     // see below
  using yocto  = ratio<1,         1'000'000'000'000'000'000'000'000>;     // see below
  using zepto  = ratio<1,             1'000'000'000'000'000'000'000>;     // see below
  using atto   = ratio<1,                 1'000'000'000'000'000'000>;
  using femto  = ratio<1,                     1'000'000'000'000'000>;
  using pico   = ratio<1,                         1'000'000'000'000>;
  using nano   = ratio<1,                             1'000'000'000>;
  using micro  = ratio<1,                                 1'000'000>;
  using milli  = ratio<1,                                     1'000>;
  using centi  = ratio<1,                                       100>;
  using deci   = ratio<1,                                        10>;
  using deca   = ratio<                                      10, 1>;
  using hecto  = ratio<                                     100, 1>;
  using kilo   = ratio<                                   1'000, 1>;
  using mega   = ratio<                               1'000'000, 1>;
  using giga   = ratio<                           1'000'000'000, 1>;
  using tera   = ratio<                       1'000'000'000'000, 1>;
  using peta   = ratio<                   1'000'000'000'000'000, 1>;
  using exa    = ratio<               1'000'000'000'000'000'000, 1>;
  using zetta  = ratio<           1'000'000'000'000'000'000'000, 1>;     // see below
  using yotta  = ratio<       1'000'000'000'000'000'000'000'000, 1>;     // see below
  using ronna  = ratio<   1'000'000'000'000'000'000'000'000'000, 1>;     // see below
  using quetta = ratio<1'000'000'000'000'000'000'000'000'000'000, 1>;     // see below
}
```

21.4.3 Class template ratio [ratio.ratio]

```
namespace std {
  template<intmax_t N, intmax_t D = 1> class ratio {
  public:
    static constexpr intmax_t num;
    static constexpr intmax_t den;
    using type = ratio<num, den>;
  };
}
```

1 If the template argument `D` is zero or the absolute values of either of the template arguments `N` and `D` is not representable by type `intmax_t`, the program is ill-formed.

[*Note 1*: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. — *end note*]

2 The static data members `num` and `den` shall have the following values, where `gcd` represents the greatest common divisor of the absolute values of `N` and `D`:

(2.1) — `num` shall have the value sgn(`N`) `*` sgn(`D`) `* abs(N) / gcd`.

(2.2) — `den` shall have the value `abs(D) / gcd`.

21.4.4 Arithmetic on ratios [ratio.arithmetic]

1 Each of the alias templates `ratio_add`, `ratio_subtract`, `ratio_multiply`, and `ratio_divide` denotes the result of an arithmetic computation on two `ratio`s `R1` and `R2`. With `X` and `Y` computed (in the absence of arithmetic overflow) as specified by Table 63, each alias denotes a `ratio<U, V>` such that `U` is the same as `ratio<X, Y>::num` and `V` is the same as `ratio<X, Y>::den`.

2 If it is not possible to represent `U` or `V` with `intmax_t`, the program is ill-formed. Otherwise, an implementation should yield correct values of `U` and `V`. If it is not possible to represent `X` or `Y` with `intmax_t`, the program is ill-formed unless the implementation yields correct values of `U` and `V`.

Table 63 — Expressions used to perform ratio arithmetic [tab:ratio.arithmetic]

Type	Value of `X`	Value of `Y`
`ratio_add<R1, R2>`	`R1::num * R2::den + R2::num * R1::den`	`R1::den * R2::den`
`ratio_subtract<R1, R2>`	`R1::num * R2::den - R2::num * R1::den`	`R1::den * R2::den`
`ratio_multiply<R1, R2>`	`R1::num * R2::num`	`R1::den * R2::den`
`ratio_divide<R1, R2>`	`R1::num * R2::den`	`R1::den * R2::num`

3 [*Example 1*:

```
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::num == 1, "1/3+1/6 == 1/2");
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::den == 2, "1/3+1/6 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::num == 1, "1/3*3/2 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::den == 2, "1/3*3/2 == 1/2");

// The following cases may cause the program to be ill-formed under some implementations
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::num == 2,
  "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::den == INT_MAX,
  "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::num == 1,
  "1/MAX * MAX/2 == 1/2");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::den == 2,
  "1/MAX * MAX/2 == 1/2");
```

— *end example*]

21.4.5 Comparison of ratios [ratio.comparison]

```
template<class R1, class R2>
  struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };

template<class R1, class R2>
  struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { };

template<class R1, class R2>
  struct ratio_less : bool_constant<see below> { };
```

1 If `R1::num` × `R2::den` is less than `R2::num` × `R1::den`, `ratio_less<R1, R2>` shall be derived from `bool_constant<true>`; otherwise it shall be derived from `bool_constant<false>`. Implementations may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

```
template<class R1, class R2>
  struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };

template<class R1, class R2>
  struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };

template<class R1, class R2>
  struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };
```

21.4.6 SI types for `ratio` [ratio.si]

1 For each of the *typedef-name*s `quecto`, `ronto`, `yocto`, `zepto`, `zetta`, `yotta`, `ronna`, and `quetta`, if both of the constants used in its specification are representable by `intmax_t`, the typedef is defined; if either of the constants is not representable by `intmax_t`, the typedef is not defined.

22 General utilities library [utilities]

22.1 General [utilities.general]

1 This Clause describes utilities that are generally useful in C++ programs; some of these utilities are used by other elements of the C++ standard library. These utilities are summarized in Table 64.

Table 64 — General utilities library summary [tab:utilities.summary]

	Subclause	Header
22.2	Utility components	`<utility>`
22.3	Pairs	
22.4	Tuples	`<tuple>`
22.5	Optional objects	`<optional>`
22.6	Variants	`<variant>`
22.7	Storage for any type	`<any>`
22.8	Expected objects	`<expected>`
22.9	Fixed-size sequences of bits	`<bitset>`
22.10	Function objects	`<functional>`
22.11	Bit manipulation	`<bit>`

22.2 Utility components [utility]

22.2.1 Header `<utility>` synopsis [utility.syn]

1 The header `<utility>` contains some basic function and class templates that are used throughout the rest of the library.

```
// all freestanding
#include <compare>                // see 17.12.1
#include <initializer_list>       // see 17.11.2

namespace std {
  // 22.2.2, swap
  template<class T>
    constexpr void swap(T& a, T& b) noexcept(see below);
  template<class T, size_t N>
    constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);

  // 22.2.3, exchange
  template<class T, class U = T>
    constexpr T exchange(T& obj, U&& new_val) noexcept(see below);

  // 22.2.4, forward/move
  template<class T>
    constexpr T&& forward(remove_reference_t<T>& t) noexcept;
  template<class T>
    constexpr T&& forward(remove_reference_t<T>&& t) noexcept;
  template<class T, class U>
    constexpr auto forward_like(U&& x) noexcept -> see below;
  template<class T>
    constexpr remove_reference_t<T>&& move(T&&) noexcept;
  template<class T>
    constexpr conditional_t<
        !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&&>
      move_if_noexcept(T& x) noexcept;
```

```
// 22.2.5, as_const
template<class T>

template<class T2, class T1>
  constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
  constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;

// 22.3.5, pair piecewise construction
struct piecewise_construct_t {
  explicit piecewise_construct_t() = default;
};
inline constexpr piecewise_construct_t piecewise_construct{};
template<class... Types> class tuple;         // defined in <tuple> (22.4.2)
```

```
  // in-place construction
  struct in_place_t {
    explicit in_place_t() = default;
  };
  inline constexpr in_place_t in_place{};

  template<class T>
    struct in_place_type_t {
      explicit in_place_type_t() = default;
    };
  template<class T> constexpr in_place_type_t<T> in_place_type{};

  template<size_t I>
    struct in_place_index_t {
      explicit in_place_index_t() = default;
    };
  template<size_t I> constexpr in_place_index_t<I> in_place_index{};

  // nontype argument tag
  template<auto V>
    struct nontype_t {
      explicit nontype_t() = default;
    };
  template<auto V> constexpr nontype_t<V> nontype{};

  // 22.6.8, class monostate
  struct monostate;

  // 22.6.9, monostate relational operators
  constexpr bool operator==(monostate, monostate) noexcept;
  constexpr strong_ordering operator<=>(monostate, monostate) noexcept;

  // 22.6.12, hash support
  template<class T> struct hash;
  template<> struct hash<monostate>;
}
```

22.2.2 `swap` [utility.swap]

```
template<class T>
  constexpr void swap(T& a, T& b) noexcept(see below);
```

1 *Constraints*: `is_move_constructible_v<T>` is `true` and `is_move_assignable_v<T>` is `true`.

2 *Preconditions*: Type `T` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Exchanges values stored in two locations.

4 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_move_assignable_v<T>
```

```
template<class T, size_t N>
  constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);
```

5 *Constraints*: `is_swappable_v<T>` is `true`.

6 *Preconditions*: `a[i]` is swappable with (16.4.4.3) `b[i]` for all `i` in the range $[0, N)$.

7 *Effects*: As if by `swap_ranges(a, a + N, b)`.

22.2.3 `exchange` [utility.exchange]

```
template<class T, class U = T>
  constexpr T exchange(T& obj, U&& new_val) noexcept(see below);
```

1 *Effects*: Equivalent to:

```
T old_val = std::move(obj);
```

```
obj = std::forward<U>(new_val);
return old_val;
```

2 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_assignable_v<T&, U>
```

22.2.4 Forward/move helpers [forward]

1 The library provides templated helper functions to simplify applying move semantics to an lvalue and to simplify the implementation of forwarding functions. All functions specified in this subclause are signal-safe (17.14.5).

```
template<class T> constexpr T&& forward(remove_reference_t<T>& t) noexcept;
template<class T> constexpr T&& forward(remove_reference_t<T>&& t) noexcept;
```

2 *Mandates*: For the second overload, `is_lvalue_reference_v<T>` is `false`.

3 *Returns*: `static_cast<T&&>(t)`.

4 [*Example 1*:

```
template<class T, class A1, class A2>
shared_ptr<T> factory(A1&& a1, A2&& a2) {
  return shared_ptr<T>(new T(std::forward<A1>(a1), std::forward<A2>(a2)));
}

struct A {
  A(int&, const double&);
};

void g() {
  shared_ptr<A> sp1 = factory<A>(2, 1.414); // error: 2 will not bind to int&
  int i = 2;
  shared_ptr<A> sp2 = factory<A>(i, 1.414); // OK
}
```

In the first call to `factory`, `A1` is deduced as `int`, so 2 is forwarded to `A`'s constructor as an rvalue. In the second call to `factory`, `A1` is deduced as `int&`, so `i` is forwarded to `A`'s constructor as an lvalue. In both cases, `A2` is deduced as `double`, so 1.414 is forwarded to `A`'s constructor as an rvalue. — *end example*]

```
template<class T, class U>
  constexpr auto forward_like(U&& x) noexcept -> see below;
```

5 *Mandates*: `T` is a referenceable type (3.45).

(5.1) — Let *`COPY_CONST`*`(A, B)` be `const B` if `A` is a const type, otherwise `B`.

(5.2) — Let *`OVERRIDE_REF`*`(A, B)` be `remove_reference_t<B>&&` if `A` is an rvalue reference type, otherwise `B&`.

(5.3) — Let `V` be

`OVERRIDE_REF``(T&&,` *`COPY_CONST`*`(remove_reference_t<T>, remove_reference_t<U>))`

6 *Returns*: `static_cast<V>(x)`.

7 *Remarks*: The return type is `V`.

8 [*Example 2*:

```
struct accessor {
  vector<string>* container;
  decltype(auto) operator[](this auto&& self, size_t i) {
    return std::forward_like<decltype(self)>((*container)[i]);
  }
};
void g() {
  vector v{"a"s, "b"s};
  accessor a{&v};
  string& x = a[0];                            // OK, binds to lvalue reference
  string&& y = std::move(a)[0];                // OK, is rvalue reference
  string const&& z = std::move(as_const(a))[1]; // OK, is const&&
  string& w = as_const(a)[1];                    // error: will not bind to non-const
}
```

— *end example*]

```
template<class T> constexpr remove_reference_t<T>&& move(T&& t) noexcept;
```

9 *Returns*: `static_cast<remove_reference_t<T>&&>(t)`.

10 [*Example 3*:

```
template<class T, class A1>
shared_ptr<T> factory(A1&& a1) {
  return shared_ptr<T>(new T(std::forward<A1>(a1)));
}

struct A {
  A();
  A(const A&);        // copies from lvalues
  A(A&&);             // moves from rvalues
};

void g() {
  A a;
  shared_ptr<A> sp1 = factory<A>(a);                 // "a" binds to A(const A&)
  shared_ptr<A> sp2 = factory<A>(std::move(a));      // "a" binds to A(A&&)
}
```

In the first call to `factory`, `A1` is deduced as `A&`, so `a` is forwarded as a non-const lvalue. This binds to the constructor `A(const A&)`, which copies the value from `a`. In the second call to `factory`, because of the call `std::move(a)`, `A1` is deduced as `A`, so `a` is forwarded as an rvalue. This binds to the constructor `A(A&&)`, which moves the value from `a`. — *end example*]

```
template<class T> constexpr conditional_t<
    !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&&>
  move_if_noexcept(T& x) noexcept;
```

11 *Returns*: `std::move(x)`.

22.2.5 Function template `as_const` [utility.as.const]

```
template<class T> constexpr add_const_t<T>& as_const(T& t) noexcept;
```

1 *Returns*: `t`.

22.2.6 Function template `declval` [declval]

1 The library provides the function template `declval` to simplify the definition of expressions which occur as unevaluated operands (7.2.3).

```
template<class T> add_rvalue_reference_t<T> declval() noexcept;    // as unevaluated operand
```

2 *Mandates*: This function is not odr-used (6.3).

3 *Remarks*: The template parameter `T` of `declval` may be an incomplete type.

4 [*Example 1*:

```
template<class To, class From> decltype(static_cast<To>(declval<From>())) convert(From&&);
```

declares a function template `convert` which only participates in overload resolution if the type `From` can be explicitly converted to type `To`. For another example see class template `common_type` (21.3.8.7). — *end example*]

22.2.7 Integer comparison functions [utility.intcmp]

```
template<class T, class U>
  constexpr bool cmp_equal(T t, U u) noexcept;
```

1 *Mandates*: Both `T` and `U` are standard integer types or extended integer types (6.8.2).

2 *Effects*: Equivalent to:

```
using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
```

```
    if constexpr (is_signed_v<T> == is_signed_v<U>)
      return t == u;
    else if constexpr (is_signed_v<T>)
      return t < 0 ? false : UT(t) == u;
    else
      return u < 0 ? false : t == UU(u);
```

```
template<class T, class U>
  constexpr bool cmp_not_equal(T t, U u) noexcept;
```

3 *Effects*: Equivalent to: `return !cmp_equal(t, u);`

```
template<class T, class U>
  constexpr bool cmp_less(T t, U u) noexcept;
```

4 *Mandates*: Both `T` and `U` are standard integer types or extended integer types (6.8.2).

5 *Effects*: Equivalent to:

```
using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
if constexpr (is_signed_v<T> == is_signed_v<U>)
  return t < u;
else if constexpr (is_signed_v<T>)
  return t < 0 ? true : UT(t) < u;
else
  return u < 0 ? false : t < UU(u);
```

```
template<class T, class U>
  constexpr bool cmp_greater(T t, U u) noexcept;
```

6 *Effects*: Equivalent to: `return cmp_less(u, t);`

```
template<class T, class U>
  constexpr bool cmp_less_equal(T t, U u) noexcept;
```

7 *Effects*: Equivalent to: `return !cmp_greater(t, u);`

```
template<class T, class U>
  constexpr bool cmp_greater_equal(T t, U u) noexcept;
```

8 *Effects*: Equivalent to: `return !cmp_less(t, u);`

```
template<class R, class T>
  constexpr bool in_range(T t) noexcept;
```

9 *Mandates*: Both `T` and `R` are standard integer types or extended integer types (6.8.2).

10 *Effects*: Equivalent to:

```
return cmp_greater_equal(t, numeric_limits<R>::min()) &&
       cmp_less_equal(t, numeric_limits<R>::max());
```

11 [*Note 1*: These function templates cannot be used to compare `byte`, `char`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and `bool`. — *end note*]

22.2.8 Function template `to_underlying` [utility.underlying]

```
template<class T>
  constexpr underlying_type_t<T> to_underlying(T value) noexcept;
```

1 *Returns*: `static_cast<underlying_type_t<T>>(value)`.

22.2.9 Undefined behavior [utility.undefined]

```
[[noreturn]] void unreachable();
```

1 *Preconditions*: `false` is `true`.

[*Note 1*: This precondition cannot be satisfied, thus the behavior of calling `unreachable` is undefined. — *end note*]

2 [*Example 1*:

```
int f(int x) {
  switch (x) {
  case 0:
  case 1:
    return x;
  default:
    std::unreachable();
  }
}
int a = f(1);           // OK, a has value 1
int b = f(3);           // undefined behavior
```

— *end example*]

```
void observable() noexcept;
```

3 *Effects*: Establishes an observable checkpoint (4.1.2).

22.3 Pairs [pairs]

22.3.1 General [pairs.general]

1 The library provides a template for heterogeneous pairs of values. The library also provides a matching function template to simplify their construction and several templates that provide access to `pair` objects as if they were `tuple` objects (see 22.4.7 and 22.4.8).

22.3.2 Class template pair [pairs.pair]

```
namespace std {
  template<class T1, class T2>
  struct pair {
    using first_type  = T1;
    using second_type = T2;

    T1 first;
    T2 second;

    pair(const pair&) = default;
    pair(pair&&) = default;
    constexpr explicit(see below) pair();
    constexpr explicit(see below) pair(const T1& x, const T2& y);
    template<class U1 = T1, class U2 = T2>
      constexpr explicit(see below) pair(U1&& x, U2&& y);
    template<class U1, class U2>
      constexpr explicit(see below) pair(pair<U1, U2>& p);
    template<class U1, class U2>
      constexpr explicit(see below) pair(const pair<U1, U2>& p);
    template<class U1, class U2>
      constexpr explicit(see below) pair(pair<U1, U2>&& p);
    template<class U1, class U2>
      constexpr explicit(see below) pair(const pair<U1, U2>&& p);
    template<pair-like P>
      constexpr explicit(see below) pair(P&& p);
    template<class... Args1, class... Args2>
      constexpr pair(piecewise_construct_t,
                     tuple<Args1...> first_args, tuple<Args2...> second_args);

    constexpr pair& operator=(const pair& p);
    constexpr const pair& operator=(const pair& p) const;
    template<class U1, class U2>
      constexpr pair& operator=(const pair<U1, U2>& p);
    template<class U1, class U2>
      constexpr const pair& operator=(const pair<U1, U2>& p) const;
    constexpr pair& operator=(pair&& p) noexcept(see below);
    constexpr const pair& operator=(pair&& p) const;
    template<class U1, class U2>
      constexpr pair& operator=(pair<U1, U2>&& p);
    template<class U1, class U2>
      constexpr const pair& operator=(pair<U1, U2>&& p) const;
    template<pair-like P>
      constexpr pair& operator=(P&& p);
    template<pair-like P>
      constexpr const pair& operator=(P&& p) const;

    constexpr void swap(pair& p) noexcept(see below);
    constexpr void swap(const pair& p) const noexcept(see below);
  };

  template<class T1, class T2>
    pair(T1, T2) -> pair<T1, T2>;
}
```

1 Constructors and member functions of `pair` do not throw exceptions unless one of the element-wise operations specified to be called for that operation throws an exception.

2 The defaulted move and copy constructor, respectively, of `pair` is a constexpr function if and only if all required element-wise initializations for move and copy, respectively, would be constexpr-suitable (9.2.6).

3 If `(is_trivially_destructible_v<T1> && is_trivially_destructible_v<T2>)` is `true`, then the destructor of `pair` is trivial.

4 `pair<T, U>` is a structural type (13.2) if `T` and `U` are both structural types. Two values `p1` and `p2` of type `pair<T, U>` are template-argument-equivalent (13.6) if and only if `p1.first` and `p2.first` are template-argument-equivalent and `p1.second` and `p2.second` are template-argument-equivalent.

```
constexpr explicit(see below) pair();
```

5 *Constraints*:

(5.1) — `is_default_constructible_v<T1>` is `true` and

(5.2) — `is_default_constructible_v<T2>` is `true`.

6 *Effects*: Value-initializes `first` and `second`.

7 *Remarks*: The expression inside `explicit` evaluates to `true` if and only if either `T1` or `T2` is not implicitly default-constructible.

[*Note 1*: This behavior can be implemented with a trait that checks whether a `const T1&` or a `const T2&` can be initialized with `{}`. — *end note*]

```
constexpr explicit(see below) pair(const T1& x, const T2& y);
```

8 *Constraints*:

(8.1) — `is_copy_constructible_v<T1>` is `true` and

(8.2) — `is_copy_constructible_v<T2>` is `true`.

9 *Effects*: Initializes `first` with `x` and `second` with `y`.

10 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const T1&, T1> || !is_convertible_v<const T2&, T2>
```

```
template<class U1 = T1, class U2 = T2> constexpr explicit(see below) pair(U1&& x, U2&& y);
```

11 *Constraints*:

(11.1) — `is_constructible_v<T1, U1>` is `true` and

(11.2) — `is_constructible_v<T2, U2>` is `true`.

12 *Effects*: Initializes `first` with `std::forward<U1>(x)` and `second` with `std::forward<U2>(y)`.

13 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U1, T1> || !is_convertible_v<U2, T2>
```

This constructor is defined as deleted if `reference_constructs_from_temporary_v<first_type, U1&&>` is `true` or `reference_constructs_from_temporary_v<second_type, U2&&>` is `true`.

```
template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2>& p);
template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2>& p);
template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2>&& p);
template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2>&& p);
template<pair-like P> constexpr explicit(see below) pair(P&& p);
```

14 Let *FWD*`(u)` be `static_cast<decltype(u)>(u)`.

15 *Constraints*:

(15.1) — For the last overload, `remove_cvref_t<P>` is not a specialization of `ranges::subrange`,

(15.2) — `is_constructible_v<T1, decltype(get<0>(FWD(p)))>` is `true`, and

(15.3) — `is_constructible_v<T2, decltype(get<1>(FWD(p)))>` is `true`.

16 *Effects*: Initializes `first` with `get<0>(FWD(p))` and `second` with `get<1>(FWD(p))`.

17 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<decltype(get<0>(FWD(p))), T1> ||
!is_convertible_v<decltype(get<1>(FWD(p))), T2>
```

The constructor is defined as deleted if

```
reference_constructs_from_temporary_v<first_type, decltype(get<0>(FWD(p)))> ||
reference_constructs_from_temporary_v<second_type, decltype(get<1>(FWD(p)))>
```

is `true`.

```
template<class... Args1, class... Args2>
  constexpr pair(piecewise_construct_t,
                 tuple<Args1...> first_args, tuple<Args2...> second_args);
```

18 *Mandates*:

(18.1) — `is_constructible_v<T1, Args1...>` is `true` and

(18.2) — `is_constructible_v<T2, Args2...>` is `true`.

19 *Effects*: Initializes `first` with arguments of types `Args1...` obtained by forwarding the elements of `first_args` and initializes `second` with arguments of types `Args2...` obtained by forwarding the elements of `second_args`. (Here, forwarding an element `x` of type `U` within a `tuple` object means calling `std::forward<U>(x)`.) This form of construction, whereby constructor arguments for `first` and `second` are each provided in a separate `tuple` object, is called *piecewise construction*.

[*Note 2*: If a data member of `pair` is of reference type and its initialization binds it to a temporary object, the program is ill-formed (11.9.3). — *end note*]

```
constexpr pair& operator=(const pair& p);
```

20 *Effects*: Assigns `p.first` to `first` and `p.second` to `second`.

21 *Returns*: `*this`.

22 *Remarks*: This operator is defined as deleted unless `is_copy_assignable_v<T1>` is `true` and `is_copy_assignable_v<T2>` is `true`.

```
constexpr const pair& operator=(const pair& p) const;
```

23 *Constraints*:

(23.1) — `is_copy_assignable_v<const T1>` is `true` and

(23.2) — `is_copy_assignable_v<const T2>` is `true`.

24 *Effects*: Assigns `p.first` to `first` and `p.second` to `second`.

25 *Returns*: `*this`.

```
template<class U1, class U2> constexpr pair& operator=(const pair<U1, U2>& p);
```

26 *Constraints*:

(26.1) — `is_assignable_v<T1&, const U1&>` is `true` and

(26.2) — `is_assignable_v<T2&, const U2&>` is `true`.

27 *Effects*: Assigns `p.first` to `first` and `p.second` to `second`.

28 *Returns*: `*this`.

```
template<class U1, class U2> constexpr const pair& operator=(const pair<U1, U2>& p) const;
```

29 *Constraints*:

(29.1) — `is_assignable_v<const T1&, const U1&>` is `true`, and

(29.2) — `is_assignable_v<const T2&, const U2&>` is `true`.

30 *Effects*: Assigns `p.first` to `first` and `p.second` to `second`.

31 *Returns*: `*this`.

```
constexpr pair& operator=(pair&& p) noexcept(see below);
```

32 *Constraints*:

(32.1) — `is_move_assignable_v<T1>` is `true` and

(32.2) — `is_move_assignable_v<T2>` is `true`.

33 *Effects*: Assigns `std::forward<T1>(p.first)` to `first` and `std::forward<T2>(p.second)` to `second`.

34 *Returns*: `*this`.

35 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T1> && is_nothrow_move_assignable_v<T2>
```

```
constexpr const pair& operator=(pair&& p) const;
```

36 *Constraints*:

(36.1) — `is_assignable_v<const T1&, T1>` is `true` and

(36.2) — `is_assignable_v<const T2&, T2>` is `true`.

37 *Effects*: Assigns `std::forward<T1>(p.first)` to `first` and `std::forward<T2>(p.second)` to `second`.

38 *Returns*: `*this`.

```
template<class U1, class U2> constexpr pair& operator=(pair<U1, U2>&& p);
```

39 *Constraints*:

(39.1) — `is_assignable_v<T1&, U1>` is `true` and

(39.2) — `is_assignable_v<T2&, U2>` is `true`.

40 *Effects*: Assigns `std::forward<U1>(p.first) first` and `std::forward<U2>(p.second)` to `second`.

41 *Returns*: `*this`.

```
template<pair-like P> constexpr pair& operator=(P&& p);
```

42 *Constraints*:

(42.1) — *`different-from`*`<P, pair>` (25.5.2) is `true`,

(42.2) — `remove_cvref_t<P>` is not a specialization of `ranges::subrange`,

(42.3) — `is_assignable_v<T1&, decltype(get<0>(std::forward<P>(p)))>` is `true`, and

(42.4) — `is_assignable_v<T2&, decltype(get<1>(std::forward<P>(p)))>` is `true`.

43 *Effects*: Assigns `get<0>(std::forward<P>(p))` to `first` and `get<1>(std::forward<P>(p))` to `second`.

44 *Returns*: `*this`.

```
template<pair-like P> constexpr const pair& operator=(P&& p) const;
```

45 *Constraints*:

(45.1) — *`different-from`*`<P, pair>` (25.5.2) is `true`,

(45.2) — `remove_cvref_t<P>` is not a specialization of `ranges::subrange`,

(45.3) — `is_assignable_v<const T1&, decltype(get<0>(std::forward<P>(p)))>` is `true`, and

(45.4) — `is_assignable_v<const T2&, decltype(get<1>(std::forward<P>(p)))>` is `true`.

46 *Effects*: Assigns `get<0>(std::forward<P>(p))` to `first` and `get<1>(std::forward<P>(p))` to `second`.

47 *Returns*: `*this`.

```
template<class U1, class U2> constexpr const pair& operator=(pair<U1, U2>&& p) const;
```

48 *Constraints*:

(48.1) — `is_assignable_v<const T1&, U1>` is `true`, and

(48.2) — `is_assignable_v<const T2&, U2>` is `true`.

49 *Effects*: Assigns `std::forward<U1>(p.first)` to `first` and `std::forward<U2>(u.second)` to `second`.

50 *Returns*: `*this`.

```
constexpr void swap(pair& p) noexcept(see below);
constexpr void swap(const pair& p) const noexcept(see below);
```

51 *Mandates*:

(51.1) — For the first overload, `is_swappable_v<T1>` is `true` and `is_swappable_v<T2>` is `true`.

(51.2) — For the second overload, `is_swappable_v<const T1>` is `true` and `is_swappable_v<const T2>` is `true`.

52 *Preconditions*: `first` is swappable with (16.4.4.3) `p.first` and `second` is swappable with `p.second`.

53 *Effects*: Swaps `first` with `p.first` and `second` with `p.second`.

54 *Remarks*: The exception specification is equivalent to:

(54.1) — `is_nothrow_swappable_v<T1> && is_nothrow_swappable_v<T2>` for the first overload, and

(54.2) — `is_nothrow_swappable_v<const T1> && is_nothrow_swappable_v<const T2>` for the second overload.

22.3.3 Specialized algorithms [pairs.spec]

```
template<class T1, class T2, class U1, class U2>
  constexpr bool operator==(const pair<T1, T2>& x, const pair<U1, U2>& y);
```

1 *Constraints*: `x.first == y.first` and `x.second == y.second` are valid expressions and each of `decltype(x.first == y.first)` and `decltype(x.second == y.second)` models *`boolean-testable`*.

2 *Returns*: `x.first == y.first && x.second == y.second`.

```
template<class T1, class T2, class U1, class U2>
  constexpr common_comparison_category_t<synth-three-way-result<T1, U1>,
                                         synth-three-way-result<T2, U2>>
    operator<=>(const pair<T1, T2>& x, const pair<U1, U2>& y);
```

3 *Effects*: Equivalent to:

```
if (auto c = synth-three-way(x.first, y.first); c != 0) return c;
return synth-three-way(x.second, y.second);
```

```
template<class T1, class T2>
  constexpr void swap(pair<T1, T2>& x, pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
template<class T1, class T2>
  constexpr void swap(const pair<T1, T2>& x, const pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
```

4 *Constraints*:

(4.1) — For the first overload, `is_swappable_v<T1>` is `true` and `is_swappable_v<T2>` is `true`.

(4.2) — For the second overload, `is_swappable_v<const T1>` is `true` and `is_swappable_v<const T2>` is `true`.

5 *Effects*: Equivalent to `x.swap(y)`.

```
template<class T1, class T2>
  constexpr pair<unwrap_ref_decay_t<T1>, unwrap_ref_decay_t<T2>> make_pair(T1&& x, T2&& y);
```

6 *Returns*:

```
pair<unwrap_ref_decay_t<T1>,
     unwrap_ref_decay_t<T2>>(std::forward<T1>(x), std::forward<T2>(y))
```

7 [*Example 1*: In place of:

```
return pair<int, double>(5, 3.1415926);      // explicit types
```

a C++ program may contain:

```
return make_pair(5, 3.1415926);              // types are deduced
```

— *end example*]

22.3.4 Tuple-like access to pair [pair.astuple]

```
template<class T1, class T2>
  struct tuple_size<pair<T1, T2>> : integral_constant<size_t, 2> { };

template<size_t I, class T1, class T2>
  struct tuple_element<I, pair<T1, T2>> {
    using type = see below ;
  };
```

1 *Mandates*: `I` $<$ 2.

2 *Type*: The type `T1` if `I` is 0, otherwise the type `T2`.

```
template<size_t I, class T1, class T2>
  constexpr tuple_element_t<I, pair<T1, T2>>& get(pair<T1, T2>& p) noexcept;
template<size_t I, class T1, class T2>
  constexpr const tuple_element_t<I, pair<T1, T2>>& get(const pair<T1, T2>& p) noexcept;
template<size_t I, class T1, class T2>
  constexpr tuple_element_t<I, pair<T1, T2>>&& get(pair<T1, T2>&& p) noexcept;
template<size_t I, class T1, class T2>
  constexpr const tuple_element_t<I, pair<T1, T2>>&& get(const pair<T1, T2>&& p) noexcept;
```

3 *Mandates*: `I` $<$ 2.

4 *Returns*:

(4.1) — If `I` is 0, returns a reference to `p.first`.

(4.2) — If `I` is 1, returns a reference to `p.second`.

```
template<class T1, class T2>
  constexpr T1& get(pair<T1, T2>& p) noexcept;
template<class T1, class T2>
  constexpr const T1& get(const pair<T1, T2>& p) noexcept;
template<class T1, class T2>
  constexpr T1&& get(pair<T1, T2>&& p) noexcept;
template<class T1, class T2>
  constexpr const T1&& get(const pair<T1, T2>&& p) noexcept;
```

5 *Mandates*: `T1` and `T2` are distinct types.

6 *Returns*: A reference to `p.first`.

```
template<class T2, class T1>
  constexpr T2& get(pair<T1, T2>& p) noexcept;
template<class T2, class T1>
  constexpr const T2& get(const pair<T1, T2>& p) noexcept;
template<class T2, class T1>
  constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
  constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;
```

7 *Mandates*: `T1` and `T2` are distinct types.

8 *Returns*: A reference to `p.second`.

22.3.5 Piecewise construction [pair.piecewise]

```
struct piecewise_construct_t {
  explicit piecewise_construct_t() = default;
};
inline constexpr piecewise_construct_t piecewise_construct{};
```

1 The `struct piecewise_construct_t` is an empty class type used as a unique type to disambiguate constructor and function overloading. Specifically, `pair` has a constructor with `piecewise_construct_t` as the first argument, immediately followed by two `tuple` (22.4) arguments used for piecewise construction of the elements of the `pair` object.

22.4 Tuples [tuple]

22.4.1 General [tuple.general]

1 Subclause 22.4 describes the tuple library that provides a tuple type as the class template `tuple` that can be instantiated with any number of arguments. Each template argument specifies the type of an element in the `tuple`. Consequently, tuples are heterogeneous, fixed-size collections of values. An instantiation of `tuple` with two arguments is similar to an instantiation of `pair` with the same two arguments. See 22.3.

2 In addition to being available via inclusion of the `<tuple>` header, `ignore` (22.4.2) is available when `<utility>` (22.2) is included.

22.4.2 Header `<tuple>` synopsis [tuple.syn]

```
// all freestanding
#include <compare>              // see 17.12.1

namespace std {
  // 22.4.4, class template tuple
  template<class... Types>
    class tuple;

  // 22.4.3, concept tuple-like
  template<class T>
    concept tuple-like = see below;           // exposition only
  template<class T>
    concept pair-like =                       // exposition only
      tuple-like<T> && tuple_size_v<remove_cvref_t<T>> == 2;

  // 22.4.10, common_reference related specializations
  template<tuple-like TTuple, tuple-like UTuple,
           template<class> class TQual, template<class> class UQual>
    struct basic_common_reference<TTuple, UTuple, TQual, UQual>;
  template<tuple-like TTuple, tuple-like UTuple>
    struct common_type<TTuple, UTuple>;

  // ignore
  struct ignore-type {                        // exposition only
    constexpr const ignore-type
      operator=(const auto &) const noexcept { return *this; }
  };
  inline constexpr ignore-type ignore;

  // 22.4.5, tuple creation functions
  template<class... TTypes>
    constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&...);

  template<class... TTypes>
    constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&...) noexcept;

  template<class... TTypes>
    constexpr tuple<TTypes&...> tie(TTypes&...) noexcept;
```

```
template<tuple-like... Tuples>
  constexpr tuple<CTypes...> tuple_cat(Tuples&&...);

// 22.4.6, calling a function with a tuple of arguments
template<class F, tuple-like Tuple>
  constexpr decltype(auto) apply(F&& f, Tuple&& t) noexcept(see below);

template<class T, tuple-like Tuple>
  constexpr T make_from_tuple(Tuple&& t);

// 22.4.7, tuple helper classes
template<class T> struct tuple_size;                  // not defined
template<class T> struct tuple_size<const T>;

template<class... Types> struct tuple_size<tuple<Types...>>;

template<size_t I, class T> struct tuple_element;     // not defined
template<size_t I, class T> struct tuple_element<I, const T>;

template<size_t I, class... Types>
  struct tuple_element<I, tuple<Types...>>;

template<size_t I, class T>
  using tuple_element_t = typename tuple_element<I, T>::type;

// 22.4.8, element access
template<size_t I, class... Types>
  constexpr tuple_element_t<I, tuple<Types...>>& get(tuple<Types...>&) noexcept;
template<size_t I, class... Types>
  constexpr tuple_element_t<I, tuple<Types...>>&& get(tuple<Types...>&&) noexcept;
template<size_t I, class... Types>
  constexpr const tuple_element_t<I, tuple<Types...>>& get(const tuple<Types...>&) noexcept;
template<size_t I, class... Types>
  constexpr const tuple_element_t<I, tuple<Types...>>&& get(const tuple<Types...>&&) noexcept;
template<class T, class... Types>
  constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
  constexpr T&& get(tuple<Types...>&& t) noexcept;
template<class T, class... Types>
  constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
  constexpr const T&& get(const tuple<Types...>&& t) noexcept;

// 22.4.9, relational operators
template<class... TTypes, class... UTypes>
  constexpr bool operator==(const tuple<TTypes...>&, const tuple<UTypes...>&);
template<class... TTypes, tuple-like UTuple>
  constexpr bool operator==(const tuple<TTypes...>&, const UTuple&);
template<class... TTypes, class... UTypes>
  constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
    operator<=>(const tuple<TTypes...>&, const tuple<UTypes...>&);
template<class... TTypes, tuple-like UTuple>
  constexpr see below operator<=>(const tuple<TTypes...>&, const UTuple&);

// 22.4.11, allocator-related traits
template<class... Types, class Alloc>
  struct uses_allocator<tuple<Types...>, Alloc>;

// 22.4.12, specialized algorithms
template<class... Types>
  constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
  constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);
```

```
    // 22.4.7, tuple helper classes
    template<class T>
      constexpr size_t tuple_size_v = tuple_size<T>::value;
  }
```

22.4.3 Concept *tuple-like* [tuple.like]

```
template<class T>
  concept tuple-like = see below;               // exposition only
```

1 A type T models and satisfies the exposition-only concept *tuple-like* if `remove_cvref_t<T>` is a specialization of `array`, `complex`, `pair`, `tuple`, or `ranges::subrange`.

22.4.4 Class template tuple [tuple.tuple]

22.4.4.1 General [tuple.tuple.general]

```
namespace std {
  template<class... Types>
  class tuple {
  public:
    // 22.4.4.2, tuple construction
    constexpr explicit(see below) tuple();
    constexpr explicit(see below) tuple(const Types&...);         // only if sizeof...(Types) >= 1
    template<class... UTypes>
      constexpr explicit(see below) tuple(UTypes&&...);           // only if sizeof...(Types) >= 1

    tuple(const tuple&) = default;
    tuple(tuple&&) = default;

    template<class... UTypes>
      constexpr explicit(see below) tuple(tuple<UTypes...>&);
    template<class... UTypes>
      constexpr explicit(see below) tuple(const tuple<UTypes...>&);
    template<class... UTypes>
      constexpr explicit(see below) tuple(tuple<UTypes...>&&);
    template<class... UTypes>
      constexpr explicit(see below) tuple(const tuple<UTypes...>&&);

    template<class U1, class U2>
      constexpr explicit(see below) tuple(pair<U1, U2>&);         // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr explicit(see below) tuple(const pair<U1, U2>&);   // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr explicit(see below) tuple(pair<U1, U2>&&);        // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr explicit(see below) tuple(const pair<U1, U2>&&);  // only if sizeof...(Types) == 2

    template<tuple-like UTuple>
      constexpr explicit(see below) tuple(UTuple&&);

    // allocator-extended constructors
    template<class Alloc>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a);
    template<class Alloc>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const Types&...);
    template<class Alloc, class... UTypes>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, UTypes&&...);
    template<class Alloc>
      constexpr tuple(allocator_arg_t, const Alloc& a, const tuple&);
    template<class Alloc>
      constexpr tuple(allocator_arg_t, const Alloc& a, tuple&&);
    template<class Alloc, class... UTypes>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&);
    template<class Alloc, class... UTypes>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&);
    template<class Alloc, class... UTypes>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&&);
    template<class Alloc, class... UTypes>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&&);
    template<class Alloc, class U1, class U2>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&);
    template<class Alloc, class U1, class U2>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&);
    template<class Alloc, class U1, class U2>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&&);
    template<class Alloc, class U1, class U2>
      constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&&);

    template<class Alloc, tuple-like UTuple>
      constexpr explicit(see below) tuple(allocator_arg_t, const Alloc& a, UTuple&&);

    // 22.4.4.3, tuple assignment
    constexpr tuple& operator=(const tuple&);
    constexpr const tuple& operator=(const tuple&) const;
    constexpr tuple& operator=(tuple&&) noexcept(see below);
    constexpr const tuple& operator=(tuple&&) const;

    template<class... UTypes>
      constexpr tuple& operator=(const tuple<UTypes...>&);
    template<class... UTypes>
      constexpr const tuple& operator=(const tuple<UTypes...>&) const;
    template<class... UTypes>
      constexpr tuple& operator=(tuple<UTypes...>&&);
    template<class... UTypes>
      constexpr const tuple& operator=(tuple<UTypes...>&&) const;

    template<class U1, class U2>
      constexpr tuple& operator=(const pair<U1, U2>&);          // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr const tuple& operator=(const pair<U1, U2>&) const;
                                                                // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr tuple& operator=(pair<U1, U2>&&);               // only if sizeof...(Types) == 2
    template<class U1, class U2>
      constexpr const tuple& operator=(pair<U1, U2>&&) const;   // only if sizeof...(Types) == 2

    template<tuple-like UTuple>
      constexpr tuple& operator=(UTuple&&);
    template<tuple-like UTuple>
      constexpr const tuple& operator=(UTuple&&) const;

    // 22.4.4.4, tuple swap
    constexpr void swap(tuple&) noexcept(see below);
    constexpr void swap(const tuple&) const noexcept(see below);
  };
```

```
  template<class... UTypes>
    tuple(UTypes...) -> tuple<UTypes...>;
  template<class T1, class T2>
    tuple(pair<T1, T2>) -> tuple<T1, T2>;
  template<class Alloc, class... UTypes>
    tuple(allocator_arg_t, Alloc, UTypes...) -> tuple<UTypes...>;
  template<class Alloc, class T1, class T2>
    tuple(allocator_arg_t, Alloc, pair<T1, T2>) -> tuple<T1, T2>;
  template<class Alloc, class... UTypes>
    tuple(allocator_arg_t, Alloc, tuple<UTypes...>) -> tuple<UTypes...>;
}
```

1 If a program declares an explicit or partial specialization of `tuple`, the program is ill-formed, no diagnostic required.

22.4.4.2 Construction [tuple.cnstr]

1 In the descriptions that follow, let i be in the range $[$`0`$,$ `sizeof...(Types)`$)$ in order, `T`$_i$ be the i^{th} type in `Types`, and `U`$_i$ be the i^{th} type in a template parameter pack named `UTypes`, where indexing is zero-based.

2 For each `tuple` constructor, an exception is thrown only if the construction of one of the types in `Types` throws an exception.

3 The defaulted move and copy constructor, respectively, of `tuple` is a constexpr function if and only if all required element-wise initializations for move and copy, respectively, would be constexpr-suitable (9.2.6). The defaulted move and copy constructor of `tuple<>` are constexpr functions.

4 If `is_trivially_destructible_v<T`$_i$`>` is `true` for all `T`$_i$, then the destructor of `tuple` is trivial.

5 The default constructor of `tuple<>` is trivial.

`constexpr explicit(`*`see below`*`) tuple();`

6 *Constraints*: `is_default_constructible_v<T`$_i$`>` is `true` for all i.

7 *Effects*: Value-initializes each element.

8 *Remarks*: The expression inside `explicit` evaluates to `true` if and only if `T`$_i$ is not copy-list-initializable from an empty list for at least one i.

[*Note 1*: This behavior can be implemented with a trait that checks whether a `const T`$_i$`&` can be initialized with `{}`. — *end note*]

`constexpr explicit(`*`see below`*`) tuple(const Types&...);`

9 *Constraints*: `sizeof...(Types)` ≥ 1 and `is_copy_constructible_v<T`$_i$`>` is `true` for all i.

10 *Effects*: Initializes each element with the value of the corresponding parameter.

11 *Remarks*: The expression inside `explicit` is equivalent to:

```
!conjunction_v<is_convertible<const Types&, Types>...>
```

`template<class... UTypes> constexpr explicit(`*`see below`*`) tuple(UTypes&&... u);`

12 Let *`disambiguating-constraint`* be:

(12.1) — `negation<is_same<remove_cvref_t<U`$_0$`>, tuple>>` if `sizeof...(Types)` is 1;

(12.2) — otherwise, `bool_constant<!is_same_v<remove_cvref_t<U`$_0$`>, allocator_arg_t> || is_-same_v<remove_cvref_t<T`$_0$`>, allocator_arg_t>>` if `sizeof...(Types)` is 2 or 3;

(12.3) — otherwise, `true_type`.

13 *Constraints*:

(13.1) — `sizeof...(Types)` equals `sizeof...(UTypes)`,

(13.2) — `sizeof...(Types)` ≥ 1, and

(13.3) — `conjunction_v<`*`disambiguating-constraint`*`, is_constructible<Types, UTypes>...>` is `true`.

14 *Effects*: Initializes the elements in the tuple with the corresponding value in `std::forward<UTypes>(u)`.

15 *Remarks*: The expression inside `explicit` is equivalent to:

```
!conjunction_v<is_convertible<UTypes, Types>...>
```

This constructor is defined as deleted if

```
(reference_constructs_from_temporary_v<Types, UTypes&&> || ...)
```

is `true`.

```
tuple(const tuple& u) = default;
```

16 *Mandates*: `is_copy_constructible_v<T`$_i$`>` is `true` for all i.

17 *Effects*: Initializes each element of `*this` with the corresponding element of `u`.

```
tuple(tuple&& u) = default;
```

18 *Constraints*: `is_move_constructible_v<T`$_i$`>` is `true` for all i.

19 *Effects*: For all i, initializes the i^{th} element of `*this` with `std::forward<T`$_i$`>(get<`i`>(u))`.

```
template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...>& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...>& u);
template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...>&& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...>&& u);
```

20 Let `I` be the pack `0, 1, ..., (sizeof...(Types) - 1)`.
Let *`FWD`*`(u)` be `static_cast<decltype(u)>(u)`.

21 *Constraints*:

(21.1) — `sizeof...(Types)` equals `sizeof...(UTypes)`, and

(21.2) — `(is_constructible_v<Types, decltype(get<I>(`*`FWD`*`(u)))> && ...)` is `true`, and

(21.3) — either `sizeof...(Types)` is not 1, or (when `Types...` expands to `T` and `UTypes...` expands to `U`) `is_convertible_v<decltype(u), T>`, `is_constructible_v<T, decltype(u)>`, and `is_same_v<T, U>` are all `false`.

22 *Effects*: For all i, initializes the i^{th} element of `*this` with `get<`i`>(`*`FWD`*`(u))`.

23 *Remarks*: The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<decltype(get<I>(FWD(u))), Types> && ...)
```

The constructor is defined as deleted if

```
(reference_constructs_from_temporary_v<Types, decltype(get<I>(FWD(u)))> || ...)
```

is `true`.

```
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>&& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>&& u);
```

24 Let *`FWD`*`(u)` be `static_cast<decltype(u)>(u)`.

25 *Constraints*:

(25.1) — `sizeof...(Types)` is 2,

(25.2) — `is_constructible_v<T`$_0$`, decltype(get<0>(`*`FWD`*`(u)))>` is `true`, and

(25.3) — `is_constructible_v<T`$_1$`, decltype(get<1>(`*`FWD`*`(u)))>` is `true`.

26 *Effects*: Initializes the first element with `get<0>(`*`FWD`*`(u))` and the second element with `get<1>(`*`FWD`*`(u))`.

27 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<decltype(get<0>(FWD(u))), T0> ||
!is_convertible_v<decltype(get<1>(FWD(u))), T1>
```

The constructor is defined as deleted if

```
reference_constructs_from_temporary_v<T0, decltype(get<0>(FWD(u)))> ||
reference_constructs_from_temporary_v<T1, decltype(get<1>(FWD(u)))>
```

is `true`.

```
template<tuple-like UTuple>
  constexpr explicit(see below) tuple(UTuple&& u);
```

28 Let `I` be the pack `0, 1, ..., (sizeof...(Types) - 1)`.

29 *Constraints*:

(29.1) — *`different-from`*`<UTuple, tuple>` (25.5.2) is `true`,

(29.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(29.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`,

(29.4) — `(is_constructible_v<Types, decltype(get<I>(std::forward<UTuple>(u)))> && ...)` is `true`, and

(29.5) — either `sizeof...(Types)` is not 1, or (when `Types...` expands to `T`) `is_convertible_v<UTuple, T>` and `is_constructible_v<T, UTuple>` are both `false`.

30 *Effects*: For all i, initializes the i^{th} element of `*this` with `get<`i`>(std::forward<UTuple>(u))`.

31 *Remarks*: The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<decltype(get<I>(std::forward<UTuple>(u))), Types> && ...)
```

The constructor is defined as deleted if

```
(reference_constructs_from_temporary_v<Types, decltype(get<I>(std::forward<UTuple>(u)))>
 || ...)
```

is `true`.

```
template<class Alloc>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a);
template<class Alloc>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const Types&...);
template<class Alloc, class... UTypes>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, UTypes&&...);
template<class Alloc>
  constexpr tuple(allocator_arg_t, const Alloc& a, const tuple&);
template<class Alloc>
  constexpr tuple(allocator_arg_t, const Alloc& a, tuple&&);
template<class Alloc, class... UTypes>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&);
template<class Alloc, class... UTypes>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&);
template<class Alloc, class... UTypes>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&&);
template<class Alloc, class... UTypes>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&&);
template<class Alloc, class U1, class U2>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&);
template<class Alloc, class U1, class U2>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&);
template<class Alloc, class U1, class U2>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&&);
template<class Alloc, class U1, class U2>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&&);
```

```
template<class Alloc, tuple-like UTuple>
  constexpr explicit(see below)
    tuple(allocator_arg_t, const Alloc& a, UTuple&&);
```

32 *Preconditions*: `Alloc` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

33 *Effects*: Equivalent to the preceding constructors except that each element is constructed with uses-allocator construction (20.2.8.2).

22.4.4.3 Assignment [tuple.assign]

1 For each `tuple` assignment operator, an exception is thrown only if the assignment of one of the types in `Types` throws an exception. In the function descriptions that follow, let i be in the range [`0`, `sizeof...(Types)`) in order, $\texttt{T}_i$ be the i^{th} type in `Types`, and $\texttt{U}_i$ be the i^{th} type in a template parameter pack named `UTypes`, where indexing is zero-based.

```
constexpr tuple& operator=(const tuple& u);
```

2 *Effects*: Assigns each element of `u` to the corresponding element of `*this`.

3 *Returns*: `*this`.

4 *Remarks*: This operator is defined as deleted unless $\texttt{is\_copy\_assignable\_v<T}_i\texttt{>}$ is `true` for all i.

```
constexpr const tuple& operator=(const tuple& u) const;
```

5 *Constraints*: `(is_copy_assignable_v<const Types> && ...)` is `true`.

6 *Effects*: Assigns each element of `u` to the corresponding element of `*this`.

7 *Returns*: `*this`.

```
constexpr tuple& operator=(tuple&& u) noexcept(see below);
```

8 *Constraints*: $\texttt{is\_move\_assignable\_v<T}_i\texttt{>}$ is `true` for all i.

9 *Effects*: For all i, assigns $\texttt{std::forward<T}_i\texttt{>(get<}i\texttt{>(u))}$ to $\texttt{get<}i\texttt{>(*this)}$.

10 *Returns*: `*this`.

11 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

$\texttt{is\_nothrow\_move\_assignable\_v<T}_i\texttt{>}$

where $\texttt{T}_i$ is the i^{th} type in `Types`.

```
constexpr const tuple& operator=(tuple&& u) const;
```

12 *Constraints*: `(is_assignable_v<const Types&, Types> && ...)` is `true`.

13 *Effects*: For all i, assigns $\texttt{std::forward<T}_i\texttt{>(get<}i\texttt{>(u))}$ to $\texttt{get<}i\texttt{>(*this)}$.

14 *Returns*: `*this`.

```
template<class... UTypes> constexpr tuple& operator=(const tuple<UTypes...>& u);
```

15 *Constraints*:

(15.1) — `sizeof...(Types)` equals `sizeof...(UTypes)` and

(15.2) — $\texttt{is\_assignable\_v<T}_i\texttt{\&, const U}_i\texttt{\&>}$ is `true` for all i.

16 *Effects*: Assigns each element of `u` to the corresponding element of `*this`.

17 *Returns*: `*this`.

```
template<class... UTypes> constexpr const tuple& operator=(const tuple<UTypes...>& u) const;
```

18 *Constraints*:

(18.1) — `sizeof...(Types)` equals `sizeof...(UTypes)` and

(18.2) — `(is_assignable_v<const Types&, const UTypes&> && ...)` is `true`.

19 *Effects*: Assigns each element of `u` to the corresponding element of `*this`.

20 *Returns*: `*this`.

```
template<class... UTypes> constexpr tuple& operator=(tuple<UTypes...>&& u);
```

21 *Constraints*:

(21.1) — `sizeof...(Types)` equals `sizeof...(UTypes)` and

(21.2) — `is_assignable_v<`T_i`&, `U_i`>` is `true` for all i.

22 *Effects*: For all i, assigns `std::forward<`U_i`>(get<`i`>(u))` to `get<`i`>(*this)`.

23 *Returns*: `*this`.

```
template<class... UTypes> constexpr const tuple& operator=(tuple<UTypes...>&& u) const;
```

24 *Constraints*:

(24.1) — `sizeof...(Types)` equals `sizeof...(UTypes)` and

(24.2) — `(is_assignable_v<const Types&, UTypes> && ...)` is `true`.

25 *Effects*: For all i, assigns `std::forward<`U_i`>(get<`i`>(u))` to `get<`i`>(*this)`.

26 *Returns*: `*this`.

```
template<class U1, class U2> constexpr tuple& operator=(const pair<U1, U2>& u);
```

27 *Constraints*:

(27.1) — `sizeof...(Types)` is 2 and

(27.2) — `is_assignable_v<`T_0`&, const U1&>` is `true`, and

(27.3) — `is_assignable_v<`T_1`&, const U2&>` is `true`.

28 *Effects*: Assigns `u.first` to the first element of `*this` and `u.second` to the second element of `*this`.

29 *Returns*: `*this`.

```
template<class U1, class U2> constexpr const tuple& operator=(const pair<U1, U2>& u) const;
```

30 *Constraints*:

(30.1) — `sizeof...(Types)` is 2,

(30.2) — `is_assignable_v<const `T_0`&, const U1&>` is `true`, and

(30.3) — `is_assignable_v<const `T_1`&, const U2&>` is `true`.

31 *Effects*: Assigns `u.first` to the first element and `u.second` to the second element.

32 *Returns*: `*this`.

```
template<class U1, class U2> constexpr tuple& operator=(pair<U1, U2>&& u);
```

33 *Constraints*:

(33.1) — `sizeof...(Types)` is 2 and

(33.2) — `is_assignable_v<`T_0`&, U1>` is `true`, and

(33.3) — `is_assignable_v<`T_1`&, U2>` is `true`.

34 *Effects*: Assigns `std::forward<U1>(u.first)` to the first element of `*this` and `std::forward<U2>(u.second)` to the second element of `*this`.

35 *Returns*: `*this`.

```
template<class U1, class U2> constexpr const tuple& operator=(pair<U1, U2>&& u) const;
```

36 *Constraints*:

(36.1) — `sizeof...(Types)` is 2,

(36.2) — `is_assignable_v<const `T_0`&, U1>` is `true`, and

(36.3) — `is_assignable_v<const `T_1`&, U2>` is `true`.

37 *Effects*: Assigns `std::forward<U1>(u.first)` to the first element and `std::forward<U2>(u.second)` to the second element.

38 *Returns*: `*this`.

```
template<tuple-like UTuple>
  constexpr tuple& operator=(UTuple&& u);
```

39 *Constraints*:

(39.1) — *`different-from`*`<UTuple, tuple>` (25.5.2) is `true`,

(39.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(39.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`, and

(39.4) — `is_assignable_v<`T_i`&, decltype(get<`i`>(std::forward<UTuple>(u)))>` is `true` for all i.

40 *Effects*: For all i, assigns `get<`i`>(std::forward<UTuple>(u))` to `get<`i`>(*this)`.

41 *Returns*: `*this`.

```
template<tuple-like UTuple>
  constexpr const tuple& operator=(UTuple&& u) const;
```

42 *Constraints*:

(42.1) — *`different-from`*`<UTuple, tuple>` (25.5.2) is `true`,

(42.2) — `remove_cvref_t<UTuple>` is not a specialization of `ranges::subrange`,

(42.3) — `sizeof...(Types)` equals `tuple_size_v<remove_cvref_t<UTuple>>`, and

(42.4) — `is_assignable_v<const `T_i`&, decltype(get<`i`>(std::forward<UTuple>(u)))>` is `true` for all i.

43 *Effects*: For all i, assigns `get<`i`>(std::forward<UTuple>(u))` to `get<`i`>(*this)`.

44 *Returns*: `*this`.

22.4.4.4 `swap` [tuple.swap]

```
constexpr void swap(tuple& rhs) noexcept(see below);
constexpr void swap(const tuple& rhs) const noexcept(see below);
```

1 Let i be in the range `[0, sizeof...(Types))` in order.

2 *Mandates*:

(2.1) — For the first overload, `(is_swappable_v<Types> && ...)` is `true`.

(2.2) — For the second overload, `(is_swappable_v<const Types> && ...)` is `true`.

3 *Preconditions*: For all i, `get<`i`>(*this)` is swappable with (16.4.4.3) `get<`i`>(rhs)`.

4 *Effects*: For each i, calls `swap` for `get<`i`>(*this)` and `get<`i`>(rhs)`.

5 *Throws*: Nothing unless one of the element-wise `swap` calls throws an exception.

6 *Remarks*: The exception specification is equivalent to

(6.1) — `(is_nothrow_swappable_v<Types> && ...)` for the first overload and

(6.2) — `(is_nothrow_swappable_v<const Types> && ...)` for the second overload.

22.4.5 Tuple creation functions [tuple.creation]

```
template<class... TTypes>
  constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&... t);
```

1 *Returns*: `tuple<unwrap_ref_decay_t<TTypes>...>(std::forward<TTypes>(t)...)`.

2 [*Example 1*:

```
int i; float j;
make_tuple(1, ref(i), cref(j));
```

creates a tuple of type `tuple<int, int&, const float&>`. — *end example*]

```
template<class... TTypes>
  constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&... t) noexcept;
```

3 *Effects*: Constructs a tuple of references to the arguments in `t` suitable for forwarding as arguments to a function. Because the result may contain references to temporary objects, a program shall ensure

that the return value of this function does not outlive any of its arguments (e.g., the program should typically not store the result in a named variable).

4 *Returns*: `tuple<TTypes&&...>(std::forward<TTypes>(t)...)`.

```
template<class... TTypes>
  constexpr tuple<TTypes&...> tie(TTypes&... t) noexcept;
```

5 *Returns*: `tuple<TTypes&...>(t...)`.

6 [*Example 2*: `tie` functions allow one to create tuples that unpack tuples into variables. `ignore` can be used for elements that are not needed:

```
int i; std::string s;
tie(i, ignore, s) = make_tuple(42, 3.14, "C++");
// i == 42, s == "C++"
```

— *end example*]

```
template<tuple-like... Tuples>
  constexpr tuple<CTypes...> tuple_cat(Tuples&&... tpls);
```

7 Let n be `sizeof...(Tuples)`. For every integer $0 \leq i < n$:

(7.1) — Let $\texttt{T}_i$ be the i^{th} type in `Tuples`.

(7.2) — Let $\texttt{U}_i$ be `remove_cvref_t<`$\texttt{T}_i$`>`.

(7.3) — Let $\texttt{tp}_i$ be the i^{th} element in the function parameter pack `tpls`.

(7.4) — Let S_i be `tuple_size_v<`$\texttt{U}_i$`>`.

(7.5) — Let E_i^k be `tuple_element_t<`k`, `$\texttt{U}_i$`>`.

(7.6) — Let e_i^k be `get<`k`>(std::forward<`$\texttt{T}_i$`>(`$\texttt{tp}_i$`))`.

(7.7) — Let $Elems_i$ be a pack of the types $E_i^0, \ldots, E_i^{S_{i-1}}$.

(7.8) — Let $elems_i$ be a pack of the expressions $e_i^0, \ldots, e_i^{S_{i-1}}$.

The types in `CTypes` are equal to the ordered sequence of the expanded packs of types $Elems_0\ldots$, $Elems_1\ldots$, ..., $Elems_{n-1}\ldots$. Let `celems` be the ordered sequence of the expanded packs of expressions $elems_0\ldots$, ..., $elems_{n-1}\ldots$.

8 *Mandates*: `(is_constructible_v<CTypes, decltype(celems)> && ...)` is `true`.

9 *Returns*: `tuple<CTypes...>(celems...)`.

22.4.6 Calling a function with a tuple of arguments [tuple.apply]

```
template<class F, tuple-like Tuple>
  constexpr decltype(auto) apply(F&& f, Tuple&& t) noexcept(see below);
```

1 *Effects*: Given the exposition-only function template:

```
namespace std {
  template<class F, tuple-like Tuple, size_t... I>
  constexpr decltype(auto) apply-impl(F&& f, Tuple&& t, index_sequence<I...>) {
                                                                         // exposition only
    return INVOKE(std::forward<F>(f), get<I>(std::forward<Tuple>(t))...);     // see 22.10.4
  }
}
```

Equivalent to:

```
return apply-impl(std::forward<F>(f), std::forward<Tuple>(t),
                  make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});
```

2 *Remarks*: Let `I` be the pack `0, 1, ..., (tuple_size_v<remove_reference_t<Tuple>> - 1)`. The exception specification is equivalent to:

```
noexcept(invoke(std::forward<F>(f), get<I>(std::forward<Tuple>(t))...))
```

```
template<class T, tuple-like Tuple>
  constexpr T make_from_tuple(Tuple&& t);
```

3 *Mandates*: If `tuple_size_v<remove_reference_t<Tuple>>` is 1, then `reference_constructs_from_-temporary_v<T, decltype(get<0>(declval<Tuple>()))>` is `false`.

4 *Effects*: Given the exposition-only function template:

```
namespace std {
  template<class T, tuple-like Tuple, size_t... I>
    requires is_constructible_v<T, decltype(get<I>(declval<Tuple>()))...>
  constexpr T make-from-tuple-impl(Tuple&& t, index_sequence<I...>) {    // exposition only
    return T(get<I>(std::forward<Tuple>(t))...);
  }
}
```

Equivalent to:

```
return make-from-tuple-impl<T>(
           std::forward<Tuple>(t),
           make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});
```

[*Note 1*: The type of `T` must be supplied as an explicit template parameter, as it cannot be deduced from the argument list. — *end note*]

22.4.7 Tuple helper classes [tuple.helper]

```
template<class T> struct tuple_size;
```

1 Except where specified otherwise, all specializations of `tuple_size` meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some `N`.

```
template<class... Types>
  struct tuple_size<tuple<Types...>> : integral_constant<size_t, sizeof...(Types)> { };

template<size_t I, class... Types>
  struct tuple_element<I, tuple<Types...>> {
    using type = TI;
  };
```

2 *Mandates*: $I < $ `sizeof...(Types)`.

3 *Type*: `TI` is the type of the I^{th} element of `Types`, where indexing is zero-based.

```
template<class T> struct tuple_size<const T>;
```

4 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of

```
integral_constant<size_t, TS::value>
```

Otherwise, it has no member `value`.

5 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

[*Note 1*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — *end note*]

6 In addition to being available via inclusion of the `<tuple>` header, the template is available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, const T>;
```

7 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<TE>`.

8 In addition to being available via inclusion of the `<tuple>` header, the template is available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

22.4.8 Element access [tuple.elem]

```
template<size_t I, class... Types>
  constexpr tuple_element_t<I, tuple<Types...>>&
    get(tuple<Types...>& t) noexcept;
template<size_t I, class... Types>
  constexpr tuple_element_t<I, tuple<Types...>>&&
    get(tuple<Types...>&& t) noexcept;        // #1
template<size_t I, class... Types>
  constexpr const tuple_element_t<I, tuple<Types...>>&
    get(const tuple<Types...>& t) noexcept;   // #2
template<size_t I, class... Types>
  constexpr const tuple_element_t<I, tuple<Types...>>&& get(const tuple<Types...>&& t) noexcept;
```

1 *Mandates*: `I` < `sizeof...(Types)`.

2 *Returns*: A reference to the `I`th element of `t`, where indexing is zero-based.

3 [*Note 1*: For the overload marked #1, if a type `T` in `Types` is some reference type `X&`, the return type is `X&`, not `X&&`. However, if the element type is a non-reference type `T`, the return type is `T&&`. — *end note*]

4 [*Note 2*: Constness is shallow. For the overload marked #2, if a type `T` in `Types` is some reference type `X&`, the return type is `X&`, not `const X&`. However, if the element type is a non-reference type `T`, the return type is `const T&`. This is consistent with how constness is defined to work for non-static data members of reference type. — *end note*]

```
template<class T, class... Types>
  constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
  constexpr T&& get(tuple<Types...>&& t) noexcept;
template<class T, class... Types>
  constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
  constexpr const T&& get(const tuple<Types...>&& t) noexcept;
```

5 *Mandates*: The type `T` occurs exactly once in `Types`.

6 *Returns*: A reference to the element of `t` corresponding to the type `T` in `Types`.

7 [*Example 1*:

```
const tuple<int, const int, double, double> t(1, 2, 3.4, 5.6);
const int& i1 = get<int>(t);                    // OK, i1 has value 1
const int& i2 = get<const int>(t);              // OK, i2 has value 2
const double& d = get<double>(t);               // error: type double is not unique within t
```

— *end example*]

8 [*Note 3*: The reason `get` is a non-member function is that if this functionality had been provided as a member function, code where the type depended on a template parameter would have required using the `template` keyword. — *end note*]

22.4.9 Relational operators [tuple.rel]

```
template<class... TTypes, class... UTypes>
  constexpr bool operator==(const tuple<TTypes...>& t, const tuple<UTypes...>& u);
template<class... TTypes, tuple-like UTuple>
  constexpr bool operator==(const tuple<TTypes...>& t, const UTuple& u);
```

1 For the first overload let `UTuple` be `tuple<UTypes...>`.

2 *Constraints*: For all `i`, where $0 \leq$ `i` < `sizeof...(TTypes)`, `get<i>(t) == get<i>(u)` is a valid expression and `decltype(get<i>(t) == get<i>(u))` models *`boolean-testable`*. `sizeof...(TTypes)` equals `tuple_size_v<UTuple>`.

3 *Returns*: `true` if `get<i>(t) == get<i>(u)` for all `i`, otherwise `false`.

[*Note 1*: If `sizeof...(TTypes)` equals zero, returns `true`. — *end note*]

4 *Remarks*:

(4.1) — The elementary comparisons are performed in order from the zeroth index upwards. No comparisons or element accesses are performed after the first equality comparison that evaluates to `false`.

(4.2) — The second overload is to be found via argument-dependent lookup (6.5.4) only.

```
template<class... TTypes, class... UTypes>
  constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
    operator<=>(const tuple<TTypes...>& t, const tuple<UTypes...>& u);
template<class... TTypes, tuple-like UTuple>
  constexpr common_comparison_category_t<synth-three-way-result<TTypes, Elems>...>
    operator<=>(const tuple<TTypes...>& t, const UTuple& u);
```

5 For the second overload, `Elems` denotes the pack of types `tuple_element_t<0, UTuple>`, `tuple_element_t<1, UTuple>`, ..., `tuple_element_t<tuple_size_v<UTuple> - 1, UTuple>`.

6 *Effects*: Performs a lexicographical comparison between `t` and `u`. If `sizeof...(TTypes)` equals zero, returns `strong_ordering::equal`. Otherwise, equivalent to:

```
if (auto c = synth-three-way(get<0>(t), get<0>(u)); c != 0) return c;
return ttail <=> utail;
```

where $\texttt{r}_{\text{tail}}$ for some `r` is a tuple containing all but the first element of `r`.

7 *Remarks*: The second overload is to be found via argument-dependent lookup (6.5.4) only.

8 [*Note 2*: The above definition does not require $\texttt{t}_{\text{tail}}$ (or $\texttt{u}_{\text{tail}}$) to be constructed. It might not even be possible, as `t` and `u` are not required to be copy constructible. Also, all comparison operator functions are short circuited; they do not perform element accesses beyond what is needed to determine the result of the comparison. — *end note*]

22.4.10 `common_reference` related specializations [tuple.common.ref]

1 In the descriptions that follow:

(1.1) — Let `TTypes` be a pack formed by the sequence of `tuple_element_t<`i`, TTuple>` for every integer $0 \le i <$ `tuple_size_v<TTuple>`.

(1.2) — Let `UTypes` be a pack formed by the sequence of `tuple_element_t<`i`, UTuple>` for every integer $0 \le i <$ `tuple_size_v<UTuple>`.

```
template<tuple-like TTuple, tuple-like UTuple,
         template<class> class TQual, template<class> class UQual>
struct basic_common_reference<TTuple, UTuple, TQual, UQual> {
  using type = see below;
};
```

2 *Constraints*:

(2.1) — `TTuple` is a specialization of `tuple` or `UTuple` is a specialization of `tuple`.

(2.2) — `is_same_v<TTuple, decay_t<TTuple>>` is `true`.

(2.3) — `is_same_v<UTuple, decay_t<UTuple>>` is `true`.

(2.4) — `tuple_size_v<TTuple>` equals `tuple_size_v<UTuple>`.

(2.5) — `tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>` denotes a type.

The member *typedef-name* `type` denotes the type `tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>`.

```
template<tuple-like TTuple, tuple-like UTuple>
struct common_type<TTuple, UTuple> {
  using type = see below;
};
```

3 *Constraints*:

(3.1) — `TTuple` is a specialization of `tuple` or `UTuple` is a specialization of `tuple`.

(3.2) — `is_same_v<TTuple, decay_t<TTuple>>` is `true`.

(3.3) — `is_same_v<UTuple, decay_t<UTuple>>` is `true`.

(3.4) — `tuple_size_v<TTuple>` equals `tuple_size_v<UTuple>`.

(3.5) — `tuple<common_type_t<TTypes, UTypes>...>` denotes a type.

The member *typedef-name* `type` denotes the type `tuple<common_type_t<TTypes, UTypes>...>`.

22.4.11 Tuple traits [tuple.traits]

```
template<class... Types, class Alloc>
  struct uses_allocator<tuple<Types...>, Alloc> : true_type { };
```

1 *Preconditions*: `Alloc` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

2 [*Note 1*: Specialization of this trait informs other library components that `tuple` can be constructed with an allocator, even though it does not have a nested `allocator_type`. — *end note*]

22.4.12 Tuple specialized algorithms [tuple.special]

```
template<class... Types>
  constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
  constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);
```

1 *Constraints*:

(1.1) — For the first overload, `(is_swappable_v<Types> && ...)` is `true`.

(1.2) — For the second overload, `(is_swappable_v<const Types> && ...)` is `true`.

2 *Effects*: As if by `x.swap(y)`.

3 *Remarks*: The exception specification is equivalent to:

```
noexcept(x.swap(y))
```

22.5 Optional objects [optional]

22.5.1 General [optional.general]

1 Subclause 22.5 describes class template `optional` that represents optional objects. An *optional object* is an object that contains the storage for another object and manages the lifetime of this contained object, if any. The contained object may be initialized after the optional object has been initialized, and may be destroyed before the optional object has been destroyed. The initialization state of the contained object is tracked by the optional object.

22.5.2 Header `<optional>` synopsis [optional.syn]

```
// mostly freestanding
#include <compare>              // see 17.12.1

namespace std {
  // 22.5.3, class template optional
  template<class T>
    class optional;                                               // partially freestanding

  template<class T>
    constexpr bool ranges::enable_view<optional<T>> = true;
  template<class T>
    constexpr auto format_kind<optional<T>> = range_format::disabled;

  template<class T>
    concept is-derived-from-optional = requires(const T& t) {       // exposition only
      []<class U>(const optional<U>&){ }(t);
    };

  // 22.5.4, no-value state indicator
  struct nullopt_t{see below};
  inline constexpr nullopt_t nullopt(unspecified);

  // 22.5.5, class bad_optional_access
  class bad_optional_access;

  // 22.5.6, relational operators
  template<class T, class U>
    constexpr bool operator==(const optional<T>&, const optional<U>&);
  template<class T, class U>
    constexpr bool operator!=(const optional<T>&, const optional<U>&);
  template<class T, class U>
    constexpr bool operator<(const optional<T>&, const optional<U>&);
  template<class T, class U>
    constexpr bool operator>(const optional<T>&, const optional<U>&);
  template<class T, class U>
    constexpr bool operator<=(const optional<T>&, const optional<U>&);
  template<class T, class U>
    constexpr bool operator>=(const optional<T>&, const optional<U>&);
  template<class T, three_way_comparable_with<T> U>
    constexpr compare_three_way_result_t<T, U>
      operator<=>(const optional<T>&, const optional<U>&);

  // 22.5.7, comparison with nullopt
  template<class T> constexpr bool operator==(const optional<T>&, nullopt_t) noexcept;
  template<class T>
    constexpr strong_ordering operator<=>(const optional<T>&, nullopt_t) noexcept;

  // 22.5.8, comparison with T
  template<class T, class U> constexpr bool operator==(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator==(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator!=(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator!=(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator<(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator<(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator>(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator>(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator<=(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator<=(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator>=(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator>=(const T&, const optional<U>&);
  template<class T, class U>
      requires (!is-derived-from-optional<U>) && three_way_comparable_with<T, U>
    constexpr compare_three_way_result_t<T, U>
      operator<=>(const optional<T>&, const U&);

  // 22.5.9, specialized algorithms
  template<class T>
    constexpr void swap(optional<T>&, optional<T>&) noexcept(see below);

  template<class T>
    constexpr optional<decay_t<T>> make_optional(T&&);
  template<class T, class... Args>
    constexpr optional<T> make_optional(Args&&... args);
  template<class T, class U, class... Args>
    constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

  // 22.5.10, hash support
  template<class T> struct hash;
  template<class T> struct hash<optional<T>>;
}
```

22.5.3 Class template optional [optional.optional]

22.5.3.1 General [optional.optional.general]

```
namespace std {
  template<class T>
  class optional {
  public:
    using value_type     = T;
    using iterator       = implementation-defined;              // see 22.5.3.6
    using const_iterator = implementation-defined;              // see 22.5.3.6
```

```
// 22.5.3.2, constructors
constexpr optional() noexcept;
constexpr optional(nullopt_t) noexcept;
constexpr optional(const optional&);
constexpr optional(optional&&) noexcept(see below);
template<class... Args>
  constexpr explicit optional(in_place_t, Args&&...);
template<class U, class... Args>
  constexpr explicit optional(in_place_t, initializer_list<U>, Args&&...);
template<class U = remove_cv_t<T>>
  constexpr explicit(see below) optional(U&&);
template<class U>
  constexpr explicit(see below) optional(const optional<U>&);
template<class U>
  constexpr explicit(see below) optional(optional<U>&&);

// 22.5.3.3, destructor
constexpr ~optional();

// 22.5.3.4, assignment
constexpr optional& operator=(nullopt_t) noexcept;
constexpr optional& operator=(const optional&);
constexpr optional& operator=(optional&&) noexcept(see below);
template<class U = remove_cv_t<T>> constexpr optional& operator=(U&&);
template<class U> constexpr optional& operator=(const optional<U>&);
template<class U> constexpr optional& operator=(optional<U>&&);
template<class... Args> constexpr T& emplace(Args&&...);
template<class U, class... Args> constexpr T& emplace(initializer_list<U>, Args&&...);

// 22.5.3.5, swap
constexpr void swap(optional&) noexcept(see below);

// 22.5.3.6, iterator support
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;

// 22.5.3.7, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;                                  // freestanding-deleted
constexpr T& value() &;                                              // freestanding-deleted
constexpr T&& value() &&;                                            // freestanding-deleted
constexpr const T&& value() const &&;                                // freestanding-deleted
template<class U = remove_cv_t<T>> constexpr T value_or(U&&) const &;
template<class U = remove_cv_t<T>> constexpr T value_or(U&&) &&;

// 22.5.3.8, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;
template<class F> constexpr optional or_else(F&& f) &&;
```

```
      template<class F> constexpr optional or_else(F&& f) const &;

      // 22.5.3.9, modifiers
      constexpr void reset() noexcept;

    private:
      T* val;         // exposition only
    };

    template<class T>
      optional(T) -> optional<T>;
  }
```

1 Any instance of `optional<T>` at any given time either contains a value or does not contain a value. When an instance of `optional<T>` *contains a value*, it means that an object of type `T`, referred to as the optional object's *contained value*, is nested within (6.7.2) the optional object. When an object of type `optional<T>` is contextually converted to `bool`, the conversion returns `true` if the object contains a value; otherwise the conversion returns `false`.

2 When an `optional<T>` object contains a value, member `val` points to the contained value.

3 `T` shall be a type other than *cv* `in_place_t` or *cv* `nullopt_t` that meets the *Cpp17Destructible* requirements (Table 35).

22.5.3.2 Constructors [optional.ctor]

1 The exposition-only variable template *`converts-from-any-cvref`* is used by some constructors for `optional`.

```
  template<class T, class W>
  constexpr bool converts-from-any-cvref =  // exposition only
    disjunction_v<is_constructible<T, W&>, is_convertible<W&, T>,
                  is_constructible<T, W>, is_convertible<W, T>,
                  is_constructible<T, const W&>, is_convertible<const W&, T>,
                  is_constructible<T, const W>, is_convertible<const W, T>>;
```

```
constexpr optional() noexcept;
constexpr optional(nullopt_t) noexcept;
```

2 *Postconditions*: `*this` does not contain a value.

3 *Remarks*: No contained value is initialized. For every object type `T` these constructors are constexpr constructors (9.2.6).

```
constexpr optional(const optional& rhs);
```

4 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `*rhs`.

5 *Postconditions*: `rhs.has_value() == this->has_value()`.

6 *Throws*: Any exception thrown by the selected constructor of `T`.

7 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<T>` is `true`. If `is_trivially_copy_constructible_v<T>` is `true`, this constructor is trivial.

```
constexpr optional(optional&& rhs) noexcept(see below);
```

8 *Constraints*: `is_move_constructible_v<T>` is `true`.

9 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`. `rhs.has_value()` is unchanged.

10 *Postconditions*: `rhs.has_value() == this->has_value()`.

11 *Throws*: Any exception thrown by the selected constructor of `T`.

12 *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<T>`. If `is_trivially_move_constructible_v<T>` is `true`, this constructor is trivial.

```
template<class... Args> constexpr explicit optional(in_place_t, Args&&... args);
```

13 *Constraints*: `is_constructible_v<T, Args...>` is `true`.

14 *Effects*: Direct-non-list-initializes the contained value with `std::forward<Args>(args)...`.

15 *Postconditions*: `*this` contains a value.

16 *Throws*: Any exception thrown by the selected constructor of `T`.

17 *Remarks*: If `T`'s constructor selected for the initialization is a constexpr constructor, this constructor is a constexpr constructor.

```
template<class U, class... Args>
  constexpr explicit optional(in_place_t, initializer_list<U> il, Args&&... args);
```

18 *Constraints*: `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

19 *Effects*: Direct-non-list-initializes the contained value with `il, std::forward<Args>(args)...`.

20 *Postconditions*: `*this` contains a value.

21 *Throws*: Any exception thrown by the selected constructor of `T`.

22 *Remarks*: If `T`'s constructor selected for the initialization is a constexpr constructor, this constructor is a constexpr constructor.

```
template<class U = remove_cv_t<T>> constexpr explicit(see below) optional(U&& v);
```

23 *Constraints*:

(23.1) — `is_constructible_v<T, U>` is `true`,

(23.2) — `is_same_v<remove_cvref_t<U>, in_place_t>` is `false`,

(23.3) — `is_same_v<remove_cvref_t<U>, optional>` is `false`, and

(23.4) — if `T` is *cv* `bool`, `remove_cvref_t<U>` is not a specialization of `optional`.

24 *Effects*: Direct-non-list-initializes the contained value with `std::forward<U>(v)`.

25 *Postconditions*: `*this` contains a value.

26 *Throws*: Any exception thrown by the selected constructor of `T`.

27 *Remarks*: If `T`'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor. The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

```
template<class U> constexpr explicit(see below) optional(const optional<U>& rhs);
```

28 *Constraints*:

(28.1) — `is_constructible_v<T, const U&>` is `true`, and

(28.2) — if `T` is not *cv* `bool`, *`converts-from-any-cvref`*`<T, optional<U>>` is `false`.

29 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `*rhs`.

30 *Postconditions*: `rhs.has_value() == this->has_value()`.

31 *Throws*: Any exception thrown by the selected constructor of `T`.

32 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const U&, T>
```

```
template<class U> constexpr explicit(see below) optional(optional<U>&& rhs);
```

33 *Constraints*:

(33.1) — `is_constructible_v<T, U>` is `true`, and

(33.2) — if `T` is not *cv* `bool`, *`converts-from-any-cvref`*`<T, optional<U>>` is `false`.

34 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`. `rhs.has_value()` is unchanged.

35 *Postconditions*: `rhs.has_value() == this->has_value()`.

36 *Throws*: Any exception thrown by the selected constructor of `T`.

37 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

22.5.3.3 Destructor [optional.dtor]

```
constexpr ~optional();
```

1 *Effects*: If `is_trivially_destructible_v<T> != true` and `*this` contains a value, calls

```
val->T::~T()
```

2 *Remarks*: If `is_trivially_destructible_v<T>` is `true`, then this destructor is trivial.

22.5.3.4 Assignment [optional.assign]

```
constexpr optional<T>& operator=(nullopt_t) noexcept;
```

1 *Effects*: If `*this` contains a value, calls `val->T::~T()` to destroy the contained value; otherwise no effect.

2 *Postconditions*: `*this` does not contain a value.

3 *Returns*: `*this`.

```
constexpr optional<T>& operator=(const optional& rhs);
```

4 *Effects*: See Table 65.

Table 65 — `optional::operator=(const optional&)` effects [tab:optional.assign.copy]

	`*this` contains a value	**`*this` does not contain a value**
`rhs` contains a value	assigns `*rhs` to the contained value	direct-non-list-initializes the contained value with `*rhs`
`rhs` does not contain a value	destroys the contained value by calling `val->T::~T()`	no effect

5 *Postconditions*: `rhs.has_value() == this->has_value()`.

6 *Returns*: `*this`.

7 *Remarks*: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s copy constructor, no effect. If an exception is thrown during the call to `T`'s copy assignment, the state of its contained value is as defined by the exception safety guarantee of `T`'s copy assignment. This operator is defined as deleted unless `is_copy_constructible_v<T>` is `true` and `is_copy_assignable_v<T>` is `true`. If `is_trivially_copy_constructible_v<T> && is_trivially_copy_assignable_v<T> && is_trivially_destructible_v<T>` is `true`, this assignment operator is trivial.

```
constexpr optional& operator=(optional&& rhs) noexcept(see below);
```

8 *Constraints*: `is_move_constructible_v<T>` is `true` and `is_move_assignable_v<T>` is `true`.

9 *Effects*: See Table 66. The result of the expression `rhs.has_value()` remains unchanged.

Table 66 — `optional::operator=(optional&&)` effects [tab:optional.assign.move]

	`*this` contains a value	**`*this` does not contain a value**
`rhs` contains a value	assigns `std::move(*rhs)` to the contained value	direct-non-list-initializes the contained value with `std::move(*rhs)`
`rhs` does not contain a value	destroys the contained value by calling `val->T::~T()`	no effect

10 *Postconditions*: `rhs.has_value() == this->has_value()`.

11 *Returns*: `*this`.

12 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T>
```

13 If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s move constructor, the state of `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor. If an exception is thrown during the call to `T`'s move assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move assignment. If `is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> && is_trivially_destructible_v<T>` is `true`, this assignment operator is trivial.

```
template<class U = remove_cv_t<T>> constexpr optional& operator=(U&& v);
```

14 *Constraints*:

(14.1) — `is_same_v<remove_cvref_t<U>, optional>` is `false`,

(14.2) — `conjunction_v<is_scalar<T>, is_same<T, decay_t<U>>>` is `false`,

(14.3) — `is_constructible_v<T, U>` is `true`, and

(14.4) — `is_assignable_v<T&, U>` is `true`.

15 *Effects*: If `*this` contains a value, assigns `std::forward<U>(v)` to the contained value; otherwise direct-non-list-initializes the contained value with `std::forward<U>(v)`.

16 *Postconditions*: `*this` contains a value.

17 *Returns*: `*this`.

18 *Remarks*: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `v` is determined by the exception safety guarantee of `T`'s constructor. If an exception is thrown during the call to `T`'s assignment, the state of `*val` and `v` is determined by the exception safety guarantee of `T`'s assignment.

```
template<class U> constexpr optional<T>& operator=(const optional<U>& rhs);
```

19 *Constraints*:

(19.1) — `is_constructible_v<T, const U&>` is `true`,

(19.2) — `is_assignable_v<T&, const U&>` is `true`,

(19.3) — *`converts-from-any-cvref`*`<T, optional<U>>` is `false`,

(19.4) — `is_assignable_v<T&, optional<U>&>` is `false`,

(19.5) — `is_assignable_v<T&, optional<U>&&>` is `false`,

(19.6) — `is_assignable_v<T&, const optional<U>&>` is `false`, and

(19.7) — `is_assignable_v<T&, const optional<U>&&>` is `false`.

20 *Effects*: See Table 67.

Table 67 — `optional::operator=(const optional<U>&)` effects [tab:optional.assign.copy.templ]

	`*this` contains a value	**`*this` does not contain a value**
`rhs` contains a value	assigns `*rhs` to the contained value	direct-non-list-initializes the contained value with `*rhs`
`rhs` does not contain a value	destroys the contained value by calling `val->T::~T()`	no effect

21 *Postconditions*: `rhs.has_value() == this->has_value()`.

22 *Returns*: `*this`.

23 *Remarks*: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `*rhs.val` is determined by the exception safety guarantee of `T`'s constructor. If an exception is thrown during the call to `T`'s

assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s assignment.

`template<class U> constexpr optional<T>& operator=(optional<U>&& rhs);`

24 *Constraints*:

(24.1) — `is_constructible_v<T, U>` is `true`,

(24.2) — `is_assignable_v<T&, U>` is `true`,

(24.3) — *`converts-from-any-cvref`*`<T, optional<U>>` is `false`,

(24.4) — `is_assignable_v<T&, optional<U>&>` is `false`,

(24.5) — `is_assignable_v<T&, optional<U>&&>` is `false`,

(24.6) — `is_assignable_v<T&, const optional<U>&>` is `false`, and

(24.7) — `is_assignable_v<T&, const optional<U>&&>` is `false`.

25 *Effects*: See Table 68. The result of the expression `rhs.has_value()` remains unchanged.

Table 68 — `optional::operator=(optional<U>&&)` effects [tab:optional.assign.move.templ]

	`*this` contains a value	**`*this` does not contain a value**
`rhs` contains a value	assigns `std::move(*rhs)` to the contained value	direct-non-list-initializes the contained value with `std::move(*rhs)`
`rhs` does not contain a value	destroys the contained value by calling `val->T::~T()`	no effect

26 *Postconditions*: `rhs.has_value() == this->has_value()`.

27 *Returns*: `*this`.

28 *Remarks*: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `*rhs.val` is determined by the exception safety guarantee of `T`'s constructor. If an exception is thrown during the call to `T`'s assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s assignment.

`template<class... Args> constexpr T& emplace(Args&&... args);`

29 *Mandates*: `is_constructible_v<T, Args...>` is `true`.

30 *Effects*: Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `std::forward<Args>(args)...`.

31 *Postconditions*: `*this` contains a value.

32 *Returns*: A reference to the new contained value.

33 *Throws*: Any exception thrown by the selected constructor of `T`.

34 *Remarks*: If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

`template<class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);`

35 *Constraints*: `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

36 *Effects*: Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `il, std::forward<Args>(args)...`.

37 *Postconditions*: `*this` contains a value.

38 *Returns*: A reference to the new contained value.

39 *Throws*: Any exception thrown by the selected constructor of `T`.

40 *Remarks*: If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

22.5.3.5 Swap [optional.swap]

```
constexpr void swap(optional& rhs) noexcept(see below);
```

1 *Mandates*: `is_move_constructible_v<T>` is `true`.

2 *Preconditions*: `T` meets the *Cpp17Swappable* requirements (16.4.4.3).

3 *Effects*: See Table 69.

Table 69 — `optional::swap(optional&)` effects [tab:optional.swap]

	`*this` contains a value	**`*this` does not contain a value**
`rhs` contains a value	calls `swap(*(*this), *rhs)`	direct-non-list-initializes the contained value of `*this` with `std::move(*rhs)`, followed by `rhs.val->T::~T()`; postcondition is that `*this` contains a value and `rhs` does not contain a value
`rhs` does not contain a value	direct-non-list-initializes the contained value of `rhs` with `std::move(*(*this))`, followed by `val->T::~T()`; postcondition is that `*this` does not contain a value and `rhs` contains a value	no effect

4 *Throws*: Any exceptions thrown by the operations in the relevant part of Table 69.

5 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T>
```

6 If any exception is thrown, the results of the expressions `this->has_value()` and `rhs.has_value()` remain unchanged. If an exception is thrown during the call to function `swap`, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `swap` for lvalues of `T`. If an exception is thrown during the call to `T`'s move constructor, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor.

22.5.3.6 Iterator support [optional.iterators]

```
using iterator       = implementation-defined;
using const_iterator = implementation-defined;
```

1 These types model `contiguous_iterator` (24.3.4.14), meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7), and meet the requirements for constexpr iterators (24.3.1), with value type `remove_cv_t<T>`. The reference type is `T&` for `iterator` and `const T&` for `const_iterator`.

2 All requirements on container iterators (23.2.2.2) apply to `optional::iterator` and `optional::const_iterator` as well.

3 Any operation that initializes or destroys the contained value of an optional object invalidates all iterators into that object.

```
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
```

4 *Returns*: If `has_value()` is `true`, an iterator referring to the contained value. Otherwise, a past-the-end iterator value.

```
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
```

5 *Returns*: `begin() + has_value()`.

22.5.3.7 Observers [optional.observe]

```
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

1 *Hardened preconditions*: `has_value()` is `true`.

2 *Returns*: `val`.

3 *Remarks*: These functions are constexpr functions.

```
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

4 *Hardened preconditions*: `has_value()` is `true`.

5 *Returns*: `*val`.

6 *Remarks*: These functions are constexpr functions.

```
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

7 *Hardened preconditions*: `has_value()` is `true`.

8 *Effects*: Equivalent to: `return std::move(*val);`

```
constexpr explicit operator bool() const noexcept;
```

9 *Returns*: `true` if and only if `*this` contains a value.

10 *Remarks*: This function is a constexpr function.

```
constexpr bool has_value() const noexcept;
```

11 *Returns*: `true` if and only if `*this` contains a value.

12 *Remarks*: This function is a constexpr function.

```
constexpr const T& value() const &;
constexpr T& value() &;
```

13 *Effects*: Equivalent to:

```
return has_value() ? *val : throw bad_optional_access();
```

```
constexpr T&& value() &&;
constexpr const T&& value() const &&;
```

14 *Effects*: Equivalent to:

```
return has_value() ? std::move(*val) : throw bad_optional_access();
```

```
template<class U = remove_cv_t<T>> constexpr T value_or(U&& v) const &;
```

15 *Mandates*: `is_copy_constructible_v<T> && is_convertible_v<U&&, T>` is `true`.

16 *Effects*: Equivalent to:

```
return has_value() ? **this : static_cast<T>(std::forward<U>(v));
```

```
template<class U = remove_cv_t<T>> constexpr T value_or(U&& v) &&;
```

17 *Mandates*: `is_move_constructible_v<T> && is_convertible_v<U&&, T>` is `true`.

18 *Effects*: Equivalent to:

```
return has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v));
```

22.5.3.8 Monadic operations [optional.monadic]

```
template<class F> constexpr auto and_then(F&& f) &;
```

```
template<class F> constexpr auto and_then(F&& f) const &;
```

1 Let `U` be `invoke_result_t<F, decltype(*val)>`.

2 *Mandates*: `remove_cvref_t<U>` is a specialization of `optional`.

3 *Effects*: Equivalent to:

```
if (*this) {
  return invoke(std::forward<F>(f), *val);
} else {
  return remove_cvref_t<U>();
}
```

```
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
```

4 Let `U` be `invoke_result_t<F, decltype(std::move(*val))>`.

5 *Mandates*: `remove_cvref_t<U>` is a specialization of `optional`.

6 *Effects*: Equivalent to:

```
if (*this) {
  return invoke(std::forward<F>(f), std::move(*val));
} else {
  return remove_cvref_t<U>();
}
```

```
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;
```

7 Let `U` be `remove_cv_t<invoke_result_t<F, decltype(*val)>>`.

8 *Mandates*: `U` is a non-array object type other than `in_place_t` or `nullopt_t`. The declaration

```
U u(invoke(std::forward<F>(f), *val));
```

is well-formed for some invented variable `u`.

[*Note 1*: There is no requirement that `U` is movable (9.5.1). — *end note*]

9 *Returns*: If `*this` contains a value, an `optional<U>` object whose contained value is direct-non-list-initialized with `invoke(std::forward<F>(f), *val)`; otherwise, `optional<U>()`.

```
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;
```

10 Let `U` be `remove_cv_t<invoke_result_t<F, decltype(std::move(*val))>>`.

11 *Mandates*: `U` is a non-array object type other than `in_place_t` or `nullopt_t`. The declaration

```
U u(invoke(std::forward<F>(f), std::move(*val)));
```

is well-formed for some invented variable `u`.

[*Note 2*: There is no requirement that `U` is movable (9.5.1). — *end note*]

12 *Returns*: If `*this` contains a value, an `optional<U>` object whose contained value is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(*val))`; otherwise, `optional<U>()`.

```
template<class F> constexpr optional or_else(F&& f) const &;
```

13 *Constraints*: `F` models `invocable<>` and `T` models `copy_constructible`.

14 *Mandates*: `is_same_v<remove_cvref_t<invoke_result_t<F>>, optional>` is `true`.

15 *Effects*: Equivalent to:

```
if (*this) {
  return *this;
} else {
  return std::forward<F>(f)();
}
```

```
template<class F> constexpr optional or_else(F&& f) &&;
```

16 *Constraints*: `F` models `invocable<>` and `T` models `move_constructible`.

17 *Mandates*: `is_same_v<remove_cvref_t<invoke_result_t<F>>, optional>` is `true`.

18 *Effects*: Equivalent to:

```
if (*this) {
  return std::move(*this);
} else {
  return std::forward<F>(f)();
}
```

22.5.3.9 Modifiers [optional.mod]

`constexpr void reset() noexcept;`

1 *Effects*: If `*this` contains a value, calls `val->T::~T()` to destroy the contained value; otherwise no effect.

2 *Postconditions*: `*this` does not contain a value.

22.5.4 No-value state indicator [optional.nullopt]

```
struct nullopt_t{see below};
inline constexpr nullopt_t nullopt(unspecified);
```

1 The struct `nullopt_t` is an empty class type used as a unique type to indicate the state of not containing a value for `optional` objects. In particular, `optional<T>` has a constructor with `nullopt_t` as a single argument; this indicates that an optional object not containing a value shall be constructed.

2 Type `nullopt_t` shall not have a default constructor or an initializer-list constructor, and shall not be an aggregate.

22.5.5 Class `bad_optional_access` [optional.bad.access]

```
namespace std {
  class bad_optional_access : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    constexpr const char* what() const noexcept override;
  };
}
```

1 The class `bad_optional_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

`constexpr const char* what() const noexcept override;`

2 *Returns*: An implementation-defined NTBS, which during constant evaluation is encoded with the ordinary literal encoding (5.13.3).

22.5.6 Relational operators [optional.relops]

`template<class T, class U> constexpr bool operator==(const optional<T>& x, const optional<U>& y);`

1 *Constraints*: The expression `*x == *y` is well-formed and its result is convertible to `bool`.

[*Note 1*: `T` need not be *Cpp17EqualityComparable*. — *end note*]

2 *Returns*: If `x.has_value() != y.has_value()`, `false`; otherwise if `x.has_value() == false`, `true`; otherwise `*x == *y`.

3 *Remarks*: Specializations of this function template for which `*x == *y` is a core constant expression are constexpr functions.

`template<class T, class U> constexpr bool operator!=(const optional<T>& x, const optional<U>& y);`

4 *Constraints*: The expression `*x != *y` is well-formed and its result is convertible to `bool`.

5 *Returns*: If `x.has_value() != y.has_value()`, `true`; otherwise, if `x.has_value() == false`, `false`; otherwise `*x != *y`.

6 *Remarks*: Specializations of this function template for which `*x != *y` is a core constant expression are constexpr functions.

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const optional<U>& y);
```

7 *Constraints*: `*x < *y` is well-formed and its result is convertible to `bool`.

8 *Returns*: If `!y`, `false`; otherwise, if `!x`, `true`; otherwise `*x < *y`.

9 *Remarks*: Specializations of this function template for which `*x < *y` is a core constant expression are constexpr functions.

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const optional<U>& y);
```

10 *Constraints*: The expression `*x > *y` is well-formed and its result is convertible to `bool`.

11 *Returns*: If `!x`, `false`; otherwise, if `!y`, `true`; otherwise `*x > *y`.

12 *Remarks*: Specializations of this function template for which `*x > *y` is a core constant expression are constexpr functions.

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const optional<U>& y);
```

13 *Constraints*: The expression `*x <= *y` is well-formed and its result is convertible to `bool`.

14 *Returns*: If `!x`, `true`; otherwise, if `!y`, `false`; otherwise `*x <= *y`.

15 *Remarks*: Specializations of this function template for which `*x <= *y` is a core constant expression are constexpr functions.

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const optional<U>& y);
```

16 *Constraints*: The expression `*x >= *y` is well-formed and its result is convertible to `bool`.

17 *Returns*: If `!y`, `true`; otherwise, if `!x`, `false`; otherwise `*x >= *y`.

18 *Remarks*: Specializations of this function template for which `*x >= *y` is a core constant expression are constexpr functions.

```
template<class T, three_way_comparable_with<T> U>
  constexpr compare_three_way_result_t<T, U>
    operator<=>(const optional<T>& x, const optional<U>& y);
```

19 *Returns*: If `x && y`, `*x <=> *y`; otherwise `x.has_value() <=> y.has_value()`.

20 *Remarks*: Specializations of this function template for which `*x <=> *y` is a core constant expression are constexpr functions.

22.5.7 Comparison with `nullopt` [optional.nullops]

```
template<class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;
```

1 *Returns*: `!x`.

```
template<class T> constexpr strong_ordering operator<=>(const optional<T>& x, nullopt_t) noexcept;
```

2 *Returns*: `x.has_value() <=> false`.

22.5.8 Comparison with `T` [optional.comp.with.t]

```
template<class T, class U> constexpr bool operator==(const optional<T>& x, const U& v);
```

1 *Constraints*: `U` is not a specialization of `optional`. The expression `*x == v` is well-formed and its result is convertible to `bool`.

[*Note 1*: `T` need not be *Cpp17EqualityComparable*. — *end note*]

2 *Effects*: Equivalent to: `return x.has_value() ? *x == v : false;`

```
template<class T, class U> constexpr bool operator==(const T& v, const optional<U>& x);
```

3 *Constraints*: `T` is not a specialization of `optional`. The expression `v == *x` is well-formed and its result is convertible to `bool`.

4 *Effects*: Equivalent to: `return x.has_value() ? v == *x : false;`

```
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const U& v);
```

5 *Constraints*: `U` is not a specialization of `optional`. The expression `*x != v` is well-formed and its result is convertible to `bool`.

6 *Effects*: Equivalent to: `return x.has_value() ? *x != v : true;`

```
template<class T, class U> constexpr bool operator!=(const T& v, const optional<U>& x);
```

7 *Constraints*: `T` is not a specialization of `optional`. The expression `v != *x` is well-formed and its result is convertible to `bool`.

8 *Effects*: Equivalent to: `return x.has_value() ? v != *x : true;`

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const U& v);
```

9 *Constraints*: `U` is not a specialization of `optional`. The expression `*x < v` is well-formed and its result is convertible to `bool`.

10 *Effects*: Equivalent to: `return x.has_value() ? *x < v : true;`

```
template<class T, class U> constexpr bool operator<(const T& v, const optional<U>& x);
```

11 *Constraints*: `T` is not a specialization of `optional`. The expression `v < *x` is well-formed and its result is convertible to `bool`.

12 *Effects*: Equivalent to: `return x.has_value() ? v < *x : false;`

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const U& v);
```

13 *Constraints*: `U` is not a specialization of `optional`. The expression `*x > v` is well-formed and its result is convertible to `bool`.

14 *Effects*: Equivalent to: `return x.has_value() ? *x > v : false;`

```
template<class T, class U> constexpr bool operator>(const T& v, const optional<U>& x);
```

15 *Constraints*: `T` is not a specialization of `optional`. The expression `v > *x` is well-formed and its result is convertible to `bool`.

16 *Effects*: Equivalent to: `return x.has_value() ? v > *x : true;`

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);
```

17 *Constraints*: `U` is not a specialization of `optional`. The expression `*x <= v` is well-formed and its result is convertible to `bool`.

18 *Effects*: Equivalent to: `return x.has_value() ? *x <= v : true;`

```
template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);
```

19 *Constraints*: `T` is not a specialization of `optional`. The expression `v <= *x` is well-formed and its result is convertible to `bool`.

20 *Effects*: Equivalent to: `return x.has_value() ? v <= *x : false;`

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const U& v);
```

21 *Constraints*: `U` is not a specialization of `optional`. The expression `*x >= v` is well-formed and its result is convertible to `bool`.

22 *Effects*: Equivalent to: `return x.has_value() ? *x >= v : false;`

```
template<class T, class U> constexpr bool operator>=(const T& v, const optional<U>& x);
```

23 *Constraints*: `T` is not a specialization of `optional`. The expression `v >= *x` is well-formed and its result is convertible to `bool`.

24 *Effects*: Equivalent to: `return x.has_value() ? v >= *x : true;`

```
template<class T, class U>
    requires (!is-derived-from-optional<U>) && three_way_comparable_with<T, U>
  constexpr compare_three_way_result_t<T, U>
    operator<=>(const optional<T>& x, const U& v);
```

25 *Effects*: Equivalent to: `return x.has_value() ? *x <=> v : strong_ordering::less;`

22.5.9 Specialized algorithms [optional.specalg]

```
template<class T>
  constexpr void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_move_constructible_v<T>` is `true` and `is_swappable_v<T>` is `true`.

2 *Effects*: Calls `x.swap(y)`.

```
template<class T> constexpr optional<decay_t<T>> make_optional(T&& v);
```

3 *Returns*: `optional<decay_t<T>>(std::forward<T>(v))`.

```
template<class T, class...Args>
  constexpr optional<T> make_optional(Args&&... args);
```

4 *Effects*: Equivalent to: `return optional<T>(in_place, std::forward<Args>(args)...);`

```
template<class T, class U, class... Args>
  constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);
```

5 *Effects*: Equivalent to: `return optional<T>(in_place, il, std::forward<Args>(args)...);`

22.5.10 Hash support [optional.hash]

```
template<class T> struct hash<optional<T>>;
```

1 The specialization `hash<optional<T>>` is enabled (22.10.19) if and only if `hash<remove_const_t<T>>` is enabled. When enabled, for an object `o` of type `optional<T>`, if `o.has_value() == true`, then `hash<optional<T>>()(o)` evaluates to the same value as `hash<remove_const_t<T>>()(*o)`; otherwise it evaluates to an unspecified value. The member functions are not guaranteed to be `noexcept`.

22.6 Variants [variant]

22.6.1 General [variant.general]

1 A variant object holds and manages the lifetime of a value. If the `variant` holds a value, that value's type has to be one of the template argument types given to `variant`. These template arguments are called alternatives.

2 In 22.6, *`GET`* denotes a set of exposition-only function templates (22.6.5).

22.6.2 Header `<variant>` synopsis [variant.syn]

```
// mostly freestanding
#include <compare>              // see 17.12.1

namespace std {
  // 22.6.3, class template variant
  template<class... Types>
    class variant;

  // 22.6.4, variant helper classes
  template<class T> struct variant_size;                        // not defined
  template<class T> struct variant_size<const T>;
  template<class T>
    constexpr size_t variant_size_v = variant_size<T>::value;

  template<class... Types>
    struct variant_size<variant<Types...>>;

  template<size_t I, class T> struct variant_alternative;       // not defined
  template<size_t I, class T> struct variant_alternative<I, const T>;
  template<size_t I, class T>
    using variant_alternative_t = typename variant_alternative<I, T>::type;

  template<size_t I, class... Types>
    struct variant_alternative<I, variant<Types...>>;

  inline constexpr size_t variant_npos = -1;
```

```
// 22.6.5, value access
template<class T, class... Types>
  constexpr bool holds_alternative(const variant<Types...>&) noexcept;

template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>&
    get(variant<Types...>&);                                       // freestanding-deleted
template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>&&
    get(variant<Types...>&&);                                      // freestanding-deleted
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>&
    get(const variant<Types...>&);                                 // freestanding-deleted
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>&&
    get(const variant<Types...>&&);                                // freestanding-deleted

    template<class... Types> struct hash<variant<Types...>>;
    template<> struct hash<monostate>;
  }
```

22.6.3 Class template variant [variant.variant]

22.6.3.1 General [variant.variant.general]

```
  namespace std {
    template<class... Types>
    class variant {
    public:
      // 22.6.3.2, constructors
      constexpr variant() noexcept(see below);
      constexpr variant(const variant&);
      constexpr variant(variant&&) noexcept(see below);

      template<class T>
        constexpr variant(T&&) noexcept(see below);

      template<class T, class... Args>
        constexpr explicit variant(in_place_type_t<T>, Args&&...);
      template<class T, class U, class... Args>
        constexpr explicit variant(in_place_type_t<T>, initializer_list<U>, Args&&...);

      template<size_t I, class... Args>
        constexpr explicit variant(in_place_index_t<I>, Args&&...);
      template<size_t I, class U, class... Args>
        constexpr explicit variant(in_place_index_t<I>, initializer_list<U>, Args&&...);

      // 22.6.3.3, destructor
      constexpr ~variant();

      // 22.6.3.4, assignment
      constexpr variant& operator=(const variant&);
      constexpr variant& operator=(variant&&) noexcept(see below);

      template<class T> constexpr variant& operator=(T&&) noexcept(see below);

      // 22.6.3.5, modifiers
      template<class T, class... Args>
        constexpr T& emplace(Args&&...);
      template<class T, class U, class... Args>
        constexpr T& emplace(initializer_list<U>, Args&&...);
      template<size_t I, class... Args>
        constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&...);
      template<size_t I, class U, class... Args>
        constexpr variant_alternative_t<I, variant<Types...>>&
          emplace(initializer_list<U>, Args&&...);
      // 22.6.3.6, value status
      constexpr bool valueless_by_exception() const noexcept;
      constexpr size_t index() const noexcept;

      // 22.6.3.7, swap
      constexpr void swap(variant&) noexcept(see below);

      // 22.6.7, visitation
      template<class Self, class Visitor>
        constexpr decltype(auto) visit(this Self&&, Visitor&&);
      template<class R, class Self, class Visitor>
        constexpr R visit(this Self&&, Visitor&&);
    };
  }
```

1 Any instance of `variant` at any given time either holds a value of one of its alternative types or holds no value. When an instance of `variant` holds a value of alternative type `T`, it means that a value of type `T`, referred to as the `variant` object's *contained value*, is nested within (6.7.2) the `variant` object.

2 All types in `Types` shall meet the *Cpp17Destructible* requirements (Table 35).

3 A program that instantiates the definition of `variant` with no template arguments is ill-formed.

4 If a program declares an explicit or partial specialization of `variant`, the program is ill-formed, no diagnostic required.

22.6.3.2 Constructors [variant.ctor]

1 In the descriptions that follow, let i be in the range [`0`, `sizeof...(Types)`), and $\texttt{T}_i$ be the i^{th} type in `Types`.

```
constexpr variant() noexcept(see below);
```

2 *Constraints*: `is_default_constructible_v<`$\texttt{T}_0$`>` is `true`.

3 *Effects*: Constructs a `variant` holding a value-initialized value of type $\texttt{T}_0$.

4 *Postconditions*: `valueless_by_exception()` is `false` and `index()` is `0`.

5 *Throws*: Any exception thrown by the value-initialization of $\texttt{T}_0$.

6 *Remarks*: This function is `constexpr` if and only if the value-initialization of the alternative type $\texttt{T}_0$ would be constexpr-suitable (9.2.6). The exception specification is equivalent to `is_nothrow_default_constructible_v<`$\texttt{T}_0$`>`.

[*Note 1*: See also class `monostate`. — *end note*]

```
constexpr variant(const variant& w);
```

7 *Effects*: If `w` holds a value, initializes the `variant` to hold the same alternative as `w` and direct-initializes the contained value with *`GET`*`<j>(w)`, where `j` is `w.index()`. Otherwise, initializes the `variant` to not hold a value.

8 *Throws*: Any exception thrown by direct-initializing any $\texttt{T}_i$ for all i.

9 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<`$\texttt{T}_i$`>` is `true` for all i. If `is_trivially_copy_constructible_v<`$\texttt{T}_i$`>` is `true` for all i, this constructor is trivial.

```
constexpr variant(variant&& w) noexcept(see below);
```

10 *Constraints*: `is_move_constructible_v<`$\texttt{T}_i$`>` is `true` for all i.

11 *Effects*: If `w` holds a value, initializes the `variant` to hold the same alternative as `w` and direct-initializes the contained value with *`GET`*`<j>(std::move(w))`, where `j` is `w.index()`. Otherwise, initializes the `variant` to not hold a value.

12 *Throws*: Any exception thrown by move-constructing any $\texttt{T}_i$ for all i.

13 *Remarks*: The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<`$\texttt{T}_i$`>` for all i. If `is_trivially_move_constructible_v<`$\texttt{T}_i$`>` is `true` for all i, this constructor is trivial.

```
template<class T> constexpr variant(T&& t) noexcept(see below);
```

14 Let $\texttt{T}_j$ be a type that is determined as follows: build an imaginary function *FUN*($\texttt{T}_i$) for each alternative type $\texttt{T}_i$ for which $\texttt{T}_i$ `x[] = {std::forward<T>(t)};` is well-formed for some invented variable `x`. The overload *FUN*($\texttt{T}_j$) selected by overload resolution for the expression *FUN*(`std::forward<T>(t)`) defines the alternative $\texttt{T}_j$ which is the type of the contained value after construction.

15 *Constraints*:

(15.1) — `sizeof...(Types)` is nonzero,

(15.2) — `is_same_v<remove_cvref_t<T>, variant>` is `false`,

(15.3) — `remove_cvref_t<T>` is neither a specialization of `in_place_type_t` nor a specialization of `in_place_index_t`,

(15.4) — `is_constructible_v<`$\texttt{T}_j$`, T>` is `true`, and

(15.5) — the expression *FUN*(`std::forward<T>(t)`) (with *FUN* being the above-mentioned set of imaginary functions) is well-formed.

[*Note 2*:

```
variant<string, string> v("abc");
```

is ill-formed, as both alternative types have an equally viable constructor for the argument. — *end note*]

16 *Effects*: Initializes `*this` to hold the alternative type $\texttt{T}_j$ and direct-non-list-initializes the contained value with `std::forward<T>(t)`.

17 *Postconditions*: `holds_alternative<`$\texttt{T}_j$`>(*this)` is `true`.

18 *Throws*: Any exception thrown by the initialization of the selected alternative $\texttt{T}_j$.

19 *Remarks*: The exception specification is equivalent to `is_nothrow_constructible_v<`$\texttt{T}_j$`, T>`. If $\texttt{T}_j$'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<class T, class... Args> constexpr explicit variant(in_place_type_t<T>, Args&&... args);
```

20 *Constraints*:

(20.1) — There is exactly one occurrence of `T` in `Types...` and

(20.2) — `is_constructible_v<T, Args...>` is `true`.

21 *Effects*: Direct-non-list-initializes the contained value of type `T` with `std::forward<Args>(args)...`.

22 *Postconditions*: `holds_alternative<T>(*this)` is `true`.

23 *Throws*: Any exception thrown by calling the selected constructor of `T`.

24 *Remarks*: If `T`'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<class T, class U, class... Args>
  constexpr explicit variant(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

25 *Constraints*:

(25.1) — There is exactly one occurrence of `T` in `Types...` and

(25.2) — `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

26 *Effects*: Direct-non-list-initializes the contained value of type `T` with `il, std::forward<Args>(args)...`.

27 *Postconditions*: `holds_alternative<T>(*this)` is `true`.

28 *Throws*: Any exception thrown by calling the selected constructor of `T`.

29 *Remarks*: If `T`'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<size_t I, class... Args> constexpr explicit variant(in_place_index_t<I>, Args&&... args);
```

30 *Constraints*:

(30.1) — `I` is less than `sizeof...(Types)` and

(30.2) — `is_constructible_v<`$\texttt{T}_I$`, Args...>` is `true`.

31 *Effects*: Direct-non-list-initializes the contained value of type `T`$_I$ with `std::forward<Args>(args)...`.

32 *Postconditions*: `index()` is `I`.

33 *Throws*: Any exception thrown by calling the selected constructor of `T`$_I$.

34 *Remarks*: If `T`$_I$'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<size_t I, class U, class... Args>
  constexpr explicit variant(in_place_index_t<I>, initializer_list<U> il, Args&&... args);
```

35 *Constraints*:

(35.1) — `I` is less than `sizeof...(Types)` and

(35.2) — `is_constructible_v<T`$_I$`, initializer_list<U>&, Args...>` is `true`.

36 *Effects*: Direct-non-list-initializes the contained value of type `T`$_I$ with `il, std::forward<Args>(args)...`.

37 *Postconditions*: `index()` is `I`.

38 *Remarks*: If `T`$_I$'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

22.6.3.3 Destructor [variant.dtor]

```
constexpr ~variant();
```

1 *Effects*: If `valueless_by_exception()` is `false`, destroys the currently contained value.

2 *Remarks*: If `is_trivially_destructible_v<T`$_i$`>` is `true` for all `T`$_i$, then this destructor is trivial.

22.6.3.4 Assignment [variant.assign]

```
constexpr variant& operator=(const variant& rhs);
```

1 Let j be `rhs.index()`.

2 *Effects*:

(2.1) — If neither `*this` nor `rhs` holds a value, there is no effect.

(2.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.

(2.3) — Otherwise, if `index() ==` j, assigns the value contained in `rhs` to the value contained in `*this`.

(2.4) — Otherwise, if either `is_nothrow_copy_constructible_v<T`$_j$`>` is `true` or `is_nothrow_move_constructible_v<T`$_j$`>` is `false`, equivalent to `emplace<`j`>(`*`GET`*`<`j`>(rhs))`.

(2.5) — Otherwise, equivalent to `operator=(variant(rhs))`.

3 *Postconditions*: `index() == rhs.index()`.

4 *Returns*: `*this`.

5 *Remarks*: This operator is defined as deleted unless `is_copy_constructible_v<T`$_i$`> && is_copy_assignable_v<T`$_i$`>` is `true` for all i. If `is_trivially_copy_constructible_v<T`$_i$`> && is_trivially_copy_assignable_v<T`$_i$`> && is_trivially_destructible_v<T`$_i$`>` is `true` for all i, this assignment operator is trivial.

```
constexpr variant& operator=(variant&& rhs) noexcept(see below);
```

6 Let j be `rhs.index()`.

7 *Constraints*: `is_move_constructible_v<T`$_i$`> && is_move_assignable_v<T`$_i$`>` is `true` for all i.

8 *Effects*:

(8.1) — If neither `*this` nor `rhs` holds a value, there is no effect.

(8.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.

(8.3) — Otherwise, if `index() ==` j, assigns *`GET`*`<`j`>(std::move(rhs))` to the value contained in `*this`.

(8.4) — Otherwise, equivalent to `emplace<`j`>(`*`GET`*`<`j`>(std::move(rhs)))`.

9 *Returns*: `*this`.

10 *Remarks*: If `is_trivially_move_constructible_v<T`$_i$`> && is_trivially_move_assignable_v<T`$_i$`> && is_trivially_destructible_v<T`$_i$`>` is `true` for all i, this assignment operator is trivial. The exception specification is equivalent to `is_nothrow_move_constructible_v<T`$_i$`> && is_nothrow_move_assignable_v<T`$_i$`>` for all i.

(10.1) — If an exception is thrown during the call to `T`$_j$'s move construction (with j being `rhs.index()`), the `variant` will hold no value.

(10.2) — If an exception is thrown during the call to `T`$_j$'s move assignment, the state of the contained value is as defined by the exception safety guarantee of `T`$_j$'s move assignment; `index()` will be j.

```
template<class T> constexpr variant& operator=(T&& t) noexcept(see below);
```

11 Let `T`$_j$ be a type that is determined as follows: build an imaginary function *`FUN`*`(T`$_i$`)` for each alternative type `T`$_i$ for which `T`$_i$ `x[] = {std::forward<T>(t)};` is well-formed for some invented variable `x`. The overload *`FUN`*`(T`$_j$`)` selected by overload resolution for the expression *`FUN`*`(std::forward<T>(t))` defines the alternative `T`$_j$ which is the type of the contained value after assignment.

12 *Constraints*:

(12.1) — `is_same_v<remove_cvref_t<T>, variant>` is `false`,

(12.2) — `is_assignable_v<T`$_j$`&, T> && is_constructible_v<T`$_j$`, T>` is `true`, and

(12.3) — the expression *`FUN`*`(std::forward<T>(t))` (with *`FUN`* being the above-mentioned set of imaginary functions) is well-formed.

[*Note 1*:

```
variant<string, string> v;
v = "abc";
```

is ill-formed, as both alternative types have an equally viable constructor for the argument. — *end note*]

13 *Effects*:

(13.1) — If `*this` holds a `T`$_j$, assigns `std::forward<T>(t)` to the value contained in `*this`.

(13.2) — Otherwise, if `is_nothrow_constructible_v<T`$_j$`, T> || !is_nothrow_move_constructible_v<T`$_j$`>` is `true`, equivalent to `emplace<`j`>(std::forward<T>(t))`.

(13.3) — Otherwise, equivalent to `emplace<`j`>(T`$_j$`(std::forward<T>(t)))`.

14 *Postconditions*: `holds_alternative<T`$_j$`>(*this)` is `true`, with `T`$_j$ selected by the imaginary function overload resolution described above.

15 *Returns*: `*this`.

16 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_assignable_v<Tj&, T> && is_nothrow_constructible_v<Tj, T>
```

(16.1) — If an exception is thrown during the assignment of `std::forward<T>(t)` to the value contained in `*this`, the state of the contained value and `t` are as defined by the exception safety guarantee of the assignment expression; `valueless_by_exception()` will be `false`.

(16.2) — If an exception is thrown during the initialization of the contained value, the `variant` object is permitted to not hold a value.

22.6.3.5 Modifiers [variant.mod]

```
template<class T, class... Args> constexpr T& emplace(Args&&... args);
```

1 *Constraints*: `is_constructible_v<T, Args...>` is `true`, and `T` occurs exactly once in `Types`.

2 *Effects*: Equivalent to:

```
return emplace<I>(std::forward<Args>(args)...);
```

where I is the zero-based index of `T` in `Types`.

```
template<class T, class U, class... Args>
  constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

3 *Constraints*: `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`, and `T` occurs exactly once in `Types`.

4 *Effects*: Equivalent to:

```
return emplace<I>(il, std::forward<Args>(args)...);
```

where I is the zero-based index of `T` in `Types`.

```
template<size_t I, class... Args>
  constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&... args);
```

5 *Mandates*: `I` $<$ `sizeof...(Types)`.

6 *Constraints*: `is_constructible_v<T`$_I$`, Args...>` is `true`.

7 *Effects*: Destroys the currently contained value if `valueless_by_exception()` is `false`. Then direct-non-list-initializes the contained value of type `T`$_I$ with the arguments `std::forward<Args>(args)...`.

8 *Postconditions*: `index()` is `I`.

9 *Returns*: A reference to the new contained value.

10 *Throws*: Any exception thrown during the initialization of the contained value.

11 *Remarks*: If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

```
template<size_t I, class U, class... Args>
  constexpr variant_alternative_t<I, variant<Types...>>&
    emplace(initializer_list<U> il, Args&&... args);
```

12 *Mandates*: `I` $<$ `sizeof...(Types)`.

13 *Constraints*: `is_constructible_v<T`$_I$`, initializer_list<U>&, Args...>` is `true`.

14 *Effects*: Destroys the currently contained value if `valueless_by_exception()` is `false`. Then direct-non-list-initializes the contained value of type `T`$_I$ with `il, std::forward<Args>(args)...`.

15 *Postconditions*: `index()` is `I`.

16 *Returns*: A reference to the new contained value.

17 *Throws*: Any exception thrown during the initialization of the contained value.

18 *Remarks*: If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

22.6.3.6 Value status [variant.status]

```
constexpr bool valueless_by_exception() const noexcept;
```

1 *Effects*: Returns `false` if and only if the `variant` holds a value.

2 [*Note 1*: It is possible for a `variant` to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a `variant<float, int>` can become `valueless_by_exception()`, for instance by

```
struct S { operator int() { throw 42; }};
variant<float, int> v{12.f};
v.emplace<1>(S());
```

— *end note*]

```
constexpr size_t index() const noexcept;
```

3 *Effects*: If `valueless_by_exception()` is `true`, returns `variant_npos`. Otherwise, returns the zero-based index of the alternative of the contained value.

22.6.3.7 Swap [variant.swap]

```
constexpr void swap(variant& rhs) noexcept(see below);
```

1 *Mandates*: `is_move_constructible_v<T`$_i$`>` is `true` for all i.

2 *Preconditions*: Each T_i meets the *Cpp17Swappable* requirements (16.4.4.3).

3 *Effects*:

(3.1) — If `valueless_by_exception() && rhs.valueless_by_exception()` no effect.

(3.2) — Otherwise, if `index() == rhs.index()`, calls `swap(`*`GET`*`<`*i*`>(*this), `*`GET`*`<`*i*`>(rhs))` where *i* is `index()`.

(3.3) — Otherwise, exchanges values of `rhs` and `*this`.

4 *Throws*: If `index() == rhs.index()`, any exception thrown by `swap(`*`GET`*`<`*i*`>(*this), `*`GET`*`<`*i*`>(rhs))` with *i* being `index()`. Otherwise, any exception thrown by the move constructor of T_i or T_j with *i* being `index()` and *j* being `rhs.index()`.

5 *Remarks*: If an exception is thrown during the call to function `swap(`*`GET`*`<`*i*`>(*this), `*`GET`*`<`*i*`>(rhs))`, the states of the contained values of `*this` and of `rhs` are determined by the exception safety guarantee of `swap` for lvalues of T_i with *i* being `index()`. If an exception is thrown during the exchange of the values of `*this` and `rhs`, the states of the values of `*this` and of `rhs` are determined by the exception safety guarantee of `variant`'s move constructor. The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<`T_i`> && is_nothrow_swappable_v<`T_i`>` for all *i*.

22.6.4 variant helper classes [variant.helper]

```
template<class T> struct variant_size;
```

1 All specializations of `variant_size` meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some `N`.

```
template<class T> struct variant_size<const T>;
```

2 Let `VS` denote `variant_size<T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<class... Types>
  struct variant_size<variant<Types...>> : integral_constant<size_t, sizeof...(Types)> { };
```

```
template<size_t I, class T> struct variant_alternative<I, const T>;
```

3 Let `VA` denote `variant_alternative<I, T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<VA::type>`.

```
variant_alternative<I, variant<Types...>>::type
```

4 *Mandates*: $I <$ `sizeof...(Types)`.

5 *Type*: The type T_I.

22.6.5 Value access [variant.get]

```
template<class T, class... Types>
  constexpr bool holds_alternative(const variant<Types...>& v) noexcept;
```

1 *Mandates*: The type `T` occurs exactly once in `Types`.

2 *Returns*: `true` if `index()` is equal to the zero-based index of `T` in `Types`.

```
template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>&
    GET(variant<Types...>& v);                              // exposition only
template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>&&
    GET(variant<Types...>&& v);                             // exposition only
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>&
    GET(const variant<Types...>& v);                        // exposition only
```

```
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>&&
    GET(const variant<Types...>&& v);                              // exposition only
```

3 *Mandates*: `I` < `sizeof...(Types)`.

4 *Preconditions*: `v.index()` is `I`.

5 *Returns*: A reference to the object stored in the `variant`.

```
template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>& get(variant<Types...>& v);
template<size_t I, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>>&& get(variant<Types...>&& v);
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>& get(const variant<Types...>& v);
template<size_t I, class... Types>
  constexpr const variant_alternative_t<I, variant<Types...>>&& get(const variant<Types...>&& v);
```

6 *Mandates*: `I` < `sizeof...(Types)`.

7 *Effects*: If `v.index()` is `I`, returns a reference to the object stored in the `variant`. Otherwise, throws an exception of type `bad_variant_access`.

```
template<class T, class... Types> constexpr T& get(variant<Types...>& v);
template<class T, class... Types> constexpr T&& get(variant<Types...>&& v);
template<class T, class... Types> constexpr const T& get(const variant<Types...>& v);
template<class T, class... Types> constexpr const T&& get(const variant<Types...>&& v);
```

8 *Mandates*: The type `T` occurs exactly once in `Types`.

9 *Effects*: If `v` holds a value of type `T`, returns a reference to that value. Otherwise, throws an exception of type `bad_variant_access`.

```
template<size_t I, class... Types>
  constexpr add_pointer_t<variant_alternative_t<I, variant<Types...>>>
    get_if(variant<Types...>* v) noexcept;
template<size_t I, class... Types>
  constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>>
    get_if(const variant<Types...>* v) noexcept;
```

10 *Mandates*: `I` < `sizeof...(Types)`.

11 *Returns*: A pointer to the value stored in the `variant`, if `v != nullptr` and `v->index() == I`. Otherwise, returns `nullptr`.

```
template<class T, class... Types>
  constexpr add_pointer_t<T>
    get_if(variant<Types...>* v) noexcept;
template<class T, class... Types>
  constexpr add_pointer_t<const T>
    get_if(const variant<Types...>* v) noexcept;
```

12 *Mandates*: The type `T` occurs exactly once in `Types`.

13 *Effects*: Equivalent to: `return get_if<`*i*`>(v);` with *i* being the zero-based index of `T` in `Types`.

22.6.6 Relational operators [variant.relops]

```
template<class... Types>
  constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);
```

1 *Constraints*: *`GET`*`<`*i*`>(v) ==` *`GET`*`<`*i*`>(w)` is a valid expression that is convertible to `bool`, for all *i*.

2 *Returns*: If `v.index() != w.index()`, `false`; otherwise if `v.valueless_by_exception()`, `true`; otherwise *`GET`*`<`*i*`>(v) ==` *`GET`*`<`*i*`>(w)` with *i* being `v.index()`.

```
template<class... Types>
  constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);
```

3 *Constraints*: *`GET`*`<`*i*`>(v) !=` *`GET`*`<`*i*`>(w)` is a valid expression that is convertible to `bool`, for all *i*.

4 *Returns*: If `v.index() != w.index()`, `true`; otherwise if `v.valueless_by_exception()`, `false`; otherwise *`GET<i>`*`(v) !=` *`GET<i>`*`(w)` with i being `v.index()`.

```
template<class... Types>
  constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);
```

5 *Constraints*: *`GET<i>`*`(v) <` *`GET<i>`*`(w)` is a valid expression that is convertible to `bool`, for all i.

6 *Returns*: If `w.valueless_by_exception()`, `false`; otherwise if `v.valueless_by_exception()`, `true`; otherwise, if `v.index() < w.index()`, `true`; otherwise if `v.index() > w.index()`, `false`; otherwise *`GET<i>`*`(v) <` *`GET<i>`*`(w)` with i being `v.index()`.

```
template<class... Types>
  constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);
```

7 *Constraints*: *`GET<i>`*`(v) >` *`GET<i>`*`(w)` is a valid expression that is convertible to `bool`, for all i.

8 *Returns*: If `v.valueless_by_exception()`, `false`; otherwise if `w.valueless_by_exception()`, `true`; otherwise, if `v.index() > w.index()`, `true`; otherwise if `v.index() < w.index()`, `false`; otherwise *`GET<i>`*`(v) >` *`GET<i>`*`(w)` with i being `v.index()`.

```
template<class... Types>
  constexpr bool operator<=(const variant<Types...>& v, const variant<Types...>& w);
```

9 *Constraints*: *`GET<i>`*`(v) <=` *`GET<i>`*`(w)` is a valid expression that is convertible to `bool`, for all i.

10 *Returns*: If `v.valueless_by_exception()`, `true`; otherwise if `w.valueless_by_exception()`, `false`; otherwise, if `v.index() < w.index()`, `true`; otherwise if `v.index() > w.index()`, `false`; otherwise *`GET<i>`*`(v) <=` *`GET<i>`*`(w)` with i being `v.index()`.

```
template<class... Types>
  constexpr bool operator>=(const variant<Types...>& v, const variant<Types...>& w);
```

11 *Constraints*: *`GET<i>`*`(v) >=` *`GET<i>`*`(w)` is a valid expression that is convertible to `bool`, for all i.

12 *Returns*: If `w.valueless_by_exception()`, `true`; otherwise if `v.valueless_by_exception()`, `false`; otherwise, if `v.index() > w.index()`, `true`; otherwise if `v.index() < w.index()`, `false`; otherwise *`GET<i>`*`(v) >=` *`GET<i>`*`(w)` with i being `v.index()`.

```
template<class... Types> requires (three_way_comparable<Types> && ...)
  constexpr common_comparison_category_t<compare_three_way_result_t<Types>...>
    operator<=>(const variant<Types...>& v, const variant<Types...>& w);
```

13 *Effects*: Equivalent to:

```
if (v.valueless_by_exception() && w.valueless_by_exception())
  return strong_ordering::equal;
if (v.valueless_by_exception()) return strong_ordering::less;
if (w.valueless_by_exception()) return strong_ordering::greater;
if (auto c = v.index() <=> w.index(); c != 0) return c;
return GET<i>(v) <=> GET<i>(w);
```

with i being `v.index()`.

22.6.7 Visitation [variant.visit]

```
template<class Visitor, class... Variants>
  constexpr see below visit(Visitor&& vis, Variants&&... vars);
template<class R, class Visitor, class... Variants>
  constexpr R visit(Visitor&& vis, Variants&&... vars);
```

1 Let *`as-variant`* denote the following exposition-only function templates:

```
template<class... Ts>
  constexpr auto&& as-variant(variant<Ts...>& var) { return var; }
template<class... Ts>
  constexpr auto&& as-variant(const variant<Ts...>& var) { return var; }
template<class... Ts>
  constexpr auto&& as-variant(variant<Ts...>&& var) { return std::move(var); }
template<class... Ts>
  constexpr auto&& as-variant(const variant<Ts...>&& var) { return std::move(var); }
```

Let n be `sizeof...(Variants)`. For each $0 \le i < n$, let $\texttt{V}_i$ denote the type `decltype(`*`as-variant`*`(std::forward<Variants`$_i$`>(vars`$_i$`)))`.

2 *Constraints*: $\texttt{V}_i$ is a valid type for all $0 \le i < n$.

3 Let `V` denote the pack of types $\texttt{V}_i$.

4 Let m be a pack of n values of type `size_t`. Such a pack is valid if $0 \le m_i <$ `variant_size_v<remove_reference_t<V`$_i$`>>` for all $0 \le i < n$. For each valid pack m, let $e(m)$ denote the expression:

```
INVOKE(std::forward<Visitor>(vis), GET<m>(std::forward<V>(vars))...)   // see 22.10.4
```

for the first form and

```
INVOKE<R>(std::forward<Visitor>(vis), GET<m>(std::forward<V>(vars))...)   // see 22.10.4
```

for the second form.

5 *Mandates*: For each valid pack m, $e(m)$ is a valid expression. All such expressions are of the same type and value category.

6 *Returns*: $e(m)$, where m is the pack for which m_i is *`as-variant`*`(vars`$_i$`).index()` for all $0 \le i < n$. The return type is `decltype(`$e(m)$`)` for the first form.

7 *Throws*: `bad_variant_access` if `(`*`as-variant`*`(vars).valueless_by_exception() || ...)` is `true`.

8 *Complexity*: For $n \le 1$, the invocation of the callable object is implemented in constant time, i.e., for $n = 1$, it does not depend on the number of alternative types of $\texttt{V}_0$. For $n > 1$, the invocation of the callable object has no complexity requirements.

```
template<class Self, class Visitor>
  constexpr decltype(auto) visit(this Self&& self, Visitor&& vis);
```

9 Let `V` be *`OVERRIDE_REF`*`(Self&&, `*`COPY_CONST`*`(remove_reference_t<Self>, variant))` (22.2.4).

10 *Constraints*: The call to `visit` does not use an explicit *template-argument-list* that begins with a type *template-argument*.

11 *Effects*: Equivalent to: `return std::visit(std::forward<Visitor>(vis), (V)self);`

```
template<class R, class Self, class Visitor>
  constexpr R visit(this Self&& self, Visitor&& vis);
```

12 Let `V` be *`OVERRIDE_REF`*`(Self&&, `*`COPY_CONST`*`(remove_reference_t<Self>, variant))` (22.2.4).

13 *Effects*: Equivalent to: `return std::visit<R>(std::forward<Visitor>(vis), (V)self);`

22.6.8 Class `monostate` [variant.monostate]

```
struct monostate{};
```

1 The class `monostate` can serve as a first alternative type for a `variant` to make the `variant` type default constructible.

22.6.9 `monostate` relational operators [variant.monostate.relops]

```
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=>(monostate, monostate) noexcept
{ return strong_ordering::equal; }
```

1 [*Note 1*: `monostate` objects have only a single state; they thus always compare equal. — *end note*]

22.6.10 Specialized algorithms [variant.specalg]

```
template<class... Types>
  constexpr void swap(variant<Types...>& v, variant<Types...>& w) noexcept(see below);
```

1 *Constraints*: `is_move_constructible_v<T`$_i$`> && is_swappable_v<T`$_i$`>` is `true` for all i.

2 *Effects*: Equivalent to `v.swap(w)`.

3 *Remarks*: The exception specification is equivalent to `noexcept(v.swap(w))`.

22.6.11 Class bad_variant_access [variant.bad.access]

```
namespace std {
  class bad_variant_access : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    constexpr const char* what() const noexcept override;
  };
}
```

1 Objects of type `bad_variant_access` are thrown to report invalid accesses to the value of a `variant` object.

```
constexpr const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS, which during constant evaluation is encoded with the ordinary literal encoding (5.13.3).

22.6.12 Hash support [variant.hash]

```
template<class... Types> struct hash<variant<Types...>>;
```

1 The specialization `hash<variant<Types...>>` is enabled (22.10.19) if and only if every specialization in `hash<remove_const_t<Types>>...` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<monostate>;
```

2 The specialization is enabled (22.10.19).

22.7 Storage for any type [any]

22.7.1 General [any.general]

1 Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.

2 [*Note 1*: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., `5` is held strictly as an `int` and is not implicitly convertible either to `"5"` or to `5.0`. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. — *end note*]

22.7.2 Header <any> synopsis [any.synop]

```
namespace std {
  // 22.7.3, class bad_any_cast
  class bad_any_cast;

  // 22.7.4, class any
  class any;

  // 22.7.5, non-member functions
  void swap(any& x, any& y) noexcept;

  template<class T, class... Args>
    any make_any(Args&&... args);
  template<class T, class U, class... Args>
    any make_any(initializer_list<U> il, Args&&... args);

  template<class T>
    T any_cast(const any& operand);
  template<class T>
    T any_cast(any& operand);
  template<class T>
    T any_cast(any&& operand);

  template<class T>
    const T* any_cast(const any* operand) noexcept;
  template<class T>
    T* any_cast(any* operand) noexcept;
}
```

22.7.3 Class bad_any_cast [any.bad.any.cast]

```
namespace std {
  class bad_any_cast : public bad_cast {
  public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
  };
}
```

1 Objects of type `bad_any_cast` are thrown by a failed `any_cast` (22.7.5).

```
const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS.

22.7.4 Class any [any.class]

22.7.4.1 General [any.class.general]

```
namespace std {
  class any {
  public:
    // 22.7.4.2, construction and destruction
    constexpr any() noexcept;

    any(const any& other);
    any(any&& other) noexcept;

    template<class T>
      any(T&& value);

    template<class T, class... Args>
      explicit any(in_place_type_t<T>, Args&&...);
    template<class T, class U, class... Args>
      explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);

    ~any();

    // 22.7.4.3, assignments
    any& operator=(const any& rhs);
    any& operator=(any&& rhs) noexcept;

    template<class T>
      any& operator=(T&& rhs);

    // 22.7.4.4, modifiers
    template<class T, class... Args>
      decay_t<T>& emplace(Args&&...);
    template<class T, class U, class... Args>
      decay_t<T>& emplace(initializer_list<U>, Args&&...);
    void reset() noexcept;
    void swap(any& rhs) noexcept;

    // 22.7.4.5, observers
    bool has_value() const noexcept;
    const type_info& type() const noexcept;
  };
}
```

1 An object of class `any` stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the *state* of the class `any` object. The stored instance is called the *contained value*. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.

2 The non-member `any_cast` functions provide type-safe access to the contained value.

3 Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types `T` for which `is_nothrow_move_constructible_v<T>` is `true`.

[*Example 1*: A contained value of type `int` could be stored in an internal buffer, not in separately-allocated memory. — *end example*]

22.7.4.2 Construction and destruction [any.cons]

```
constexpr any() noexcept;
```

1 *Postconditions*: `has_value()` is `false`.

```
any(const any& other);
```

2 *Effects*: If `other.has_value()` is `false`, constructs an object that has no value. Otherwise, equivalent to `any(in_place_type<T>, any_cast<const T&>(other))` where `T` is the type of the contained value.

3 *Throws*: Any exceptions arising from calling the selected constructor for the contained value.

```
any(any&& other) noexcept;
```

4 *Effects*: If `other.has_value()` is `false`, constructs an object that has no value. Otherwise, constructs an object of type `any` that contains either the contained value of `other`, or contains an object of the same type constructed from the contained value of `other` considering that contained value as an rvalue.

```
template<class T>
  any(T&& value);
```

5 Let `VT` be `decay_t<T>`.

6 *Constraints*: `VT` is not the same type as `any`, `VT` is not a specialization of `in_place_type_t`, and `is_copy_constructible_v<VT>` is `true`.

7 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

8 *Effects*: Constructs an object of type `any` that contains an object of type `VT` direct-initialized with `std::forward<T>(value)`.

9 *Throws*: Any exception thrown by the selected constructor of `VT`.

```
template<class T, class... Args>
  explicit any(in_place_type_t<T>, Args&&... args);
```

10 Let `VT` be `decay_t<T>`.

11 *Constraints*: `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, Args...>` is `true`.

12 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

13 *Effects*: Direct-non-list-initializes the contained value of type `VT` with `std::forward<Args>(args)...`.

14 *Postconditions*: `*this` contains a value of type `VT`.

15 *Throws*: Any exception thrown by the selected constructor of `VT`.

```
template<class T, class U, class... Args>
  explicit any(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

16 Let `VT` be `decay_t<T>`.

17 *Constraints*: `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, initializer_list<U>&, Args...>` is `true`.

18 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

19 *Effects*: Direct-non-list-initializes the contained value of type `VT` with `il, std::forward<Args>(args)...`.

20 *Postconditions*: `*this` contains a value.

21 *Throws*: Any exception thrown by the selected constructor of `VT`.

```
~any();
```

22 *Effects*: As if by `reset()`.

22.7.4.3 Assignment [any.assign]

```
any& operator=(const any& rhs);
```

1 *Effects*: As if by `any(rhs).swap(*this)`. No effects if an exception is thrown.

2 *Returns*: `*this`.

3 *Throws*: Any exceptions arising from the copy constructor for the contained value.

```
any& operator=(any&& rhs) noexcept;
```

4 *Effects*: As if by `any(std::move(rhs)).swap(*this)`.

5 *Postconditions*: The state of `*this` is equivalent to the original state of `rhs`.

6 *Returns*: `*this`.

```
template<class T>
  any& operator=(T&& rhs);
```

7 Let `VT` be `decay_t<T>`.

8 *Constraints*: `VT` is not the same type as `any` and `is_copy_constructible_v<VT>` is `true`.

9 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

10 *Effects*: Constructs an object `tmp` of type `any` that contains an object of type `VT` direct-initialized with `std::forward<T>(rhs)`, and `tmp.swap(*this)`. No effects if an exception is thrown.

11 *Returns*: `*this`.

12 *Throws*: Any exception thrown by the selected constructor of `VT`.

22.7.4.4 Modifiers [any.modifiers]

```
template<class T, class... Args>
  decay_t<T>& emplace(Args&&... args);
```

1 Let `VT` be `decay_t<T>`.

2 *Constraints*: `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, Args...>` is `true`.

3 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

4 *Effects*: Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `std::forward<Args>(args)...`.

5 *Postconditions*: `*this` contains a value.

6 *Returns*: A reference to the new contained value.

7 *Throws*: Any exception thrown by the selected constructor of `VT`.

8 *Remarks*: If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
template<class T, class U, class... Args>
  decay_t<T>& emplace(initializer_list<U> il, Args&&... args);
```

9 Let `VT` be `decay_t<T>`.

10 *Constraints*: `is_copy_constructible_v<VT>` is `true` and `is_constructible_v<VT, initializer_list<U>&, Args...>` is `true`.

11 *Preconditions*: `VT` meets the *Cpp17CopyConstructible* requirements.

12 *Effects*: Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `il, std::forward<Args>(args)...`.

13 *Postconditions*: `*this` contains a value.

14 *Returns*: A reference to the new contained value.

15 *Throws*: Any exception thrown by the selected constructor of `VT`.

16 *Remarks*: If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
void reset() noexcept;
```

17 *Effects*: If `has_value()` is `true`, destroys the contained value.

18 *Postconditions*: `has_value()` is `false`.

```
void swap(any& rhs) noexcept;
```

19 *Effects*: Exchanges the states of `*this` and `rhs`.

22.7.4.5 Observers [any.observers]

```
bool has_value() const noexcept;
```

1 *Returns*: `true` if `*this` contains an object, otherwise `false`.

```
const type_info& type() const noexcept;
```

2 *Returns*: `typeid(T)` if `*this` has a contained value of type `T`, otherwise `typeid(void)`.

3 [*Note 1*: Useful for querying against types known either at compile time or only at runtime. — *end note*]

22.7.5 Non-member functions [any.nonmembers]

```
void swap(any& x, any& y) noexcept;
```

1 *Effects*: Equivalent to `x.swap(y)`.

```
template<class T, class... Args>
  any make_any(Args&&... args);
```

2 *Effects*: Equivalent to: `return any(in_place_type<T>, std::forward<Args>(args)...);`

```
template<class T, class U, class... Args>
  any make_any(initializer_list<U> il, Args&&... args);
```

3 *Effects*: Equivalent to: `return any(in_place_type<T>, il, std::forward<Args>(args)...);`

```
template<class T>
  T any_cast(const any& operand);
template<class T>
  T any_cast(any& operand);
template<class T>
  T any_cast(any&& operand);
```

4 Let `U` be the type `remove_cvref_t<T>`.

5 *Mandates*: For the first overload, `is_constructible_v<T, const U&>` is `true`. For the second overload, `is_constructible_v<T, U&>` is `true`. For the third overload, `is_constructible_v<T, U>` is `true`.

6 *Returns*: For the first and second overload, `static_cast<T>(*any_cast<U>(&operand))`. For the third overload, `static_cast<T>(std::move(*any_cast<U>(&operand)))`.

7 *Throws*: `bad_any_cast` if `operand.type() != typeid(remove_reference_t<T>)`.

8 [*Example 1*:

```
any x(5);                                   // x holds int
assert(any_cast<int>(x) == 5);              // cast to value
any_cast<int&>(x) = 10;                     // cast to reference
assert(any_cast<int>(x) == 10);

x = "Meow";                                 // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char*&>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

x = string("Meow");                         // x holds string
string s, s2("Jane");
s = move(any_cast<string&>(x));             // move from any
assert(s == "Meow");
any_cast<string&>(x) = move(s2);            // move to any
assert(any_cast<const string&>(x) == "Jane");
```

```
string cat("Meow");
const any y(cat);                           // const y holds string
assert(any_cast<const string&>(y) == cat);

any_cast<string&>(y);                       // error: cannot any_cast away const
```

— *end example*]

```
template<class T>
  const T* any_cast(const any* operand) noexcept;
template<class T>
  T* any_cast(any* operand) noexcept;
```

9 *Mandates*: `is_void_v<T>` is `false`.

10 *Returns*: If `operand != nullptr && operand->type() == typeid(T)` is `true`, a pointer to the object contained by `operand`; otherwise, `nullptr`.

11 [*Example 2*:

```
bool is_string(const any& operand) {
  return any_cast<string>(&operand) != nullptr;
}
```

— *end example*]

22.8 Expected objects [expected]

22.8.1 General [expected.general]

1 Subclause 22.8 describes the class template `expected` that represents expected objects. An `expected<T, E>` object holds an object of type `T` or an object of type `E` and manages the lifetime of the contained objects.

22.8.2 Header `<expected>` synopsis [expected.syn]

```
// mostly freestanding
namespace std {
  // 22.8.3, class template unexpected
  template<class E> class unexpected;

  // 22.8.4, class template bad_expected_access
  template<class E> class bad_expected_access;

  // 22.8.5, specialization for void
  template<> class bad_expected_access<void>;

  // in-place construction of unexpected values
  struct unexpect_t {
    explicit unexpect_t() = default;
  };
  inline constexpr unexpect_t unexpect{};

  // 22.8.6, class template expected
  template<class T, class E> class expected;                          // partially freestanding

  // 22.8.7, partial specialization of expected for void types
  template<class T, class E> requires is_void_v<T> class expected<T, E>;    // partially freestanding
}
```

22.8.3 Class template `unexpected` [expected.unexpected]

22.8.3.1 General [expected.un.general]

1 Subclause 22.8.3 describes the class template `unexpected` that represents unexpected objects stored in `expected` objects.

```
namespace std {
  template<class E>
  class unexpected {
  public:
    // 22.8.3.2, constructors
```

```
      constexpr unexpected(const unexpected&) = default;
      constexpr unexpected(unexpected&&) = default;
      template<class Err = E>
        constexpr explicit unexpected(Err&&);
      template<class... Args>
        constexpr explicit unexpected(in_place_t, Args&&...);
      template<class U, class... Args>
        constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);

      constexpr unexpected& operator=(const unexpected&) = default;
      constexpr unexpected& operator=(unexpected&&) = default;

      constexpr const E& error() const & noexcept;
      constexpr E& error() & noexcept;
      constexpr const E&& error() const && noexcept;
      constexpr E&& error() && noexcept;

      constexpr void swap(unexpected& other) noexcept(see below);

      template<class E2>
        friend constexpr bool operator==(const unexpected&, const unexpected<E2>&);

      friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));

    private:
      E unex;             // exposition only
    };

    template<class E> unexpected(E) -> unexpected<E>;
  }
```

2 A program that instantiates the definition of `unexpected` for a non-object type, an array type, a specialization of `unexpected`, or a cv-qualified type is ill-formed.

22.8.3.2 Constructors [expected.un.cons]

```
template<class Err = E>
  constexpr explicit unexpected(Err&& e);
```

1 *Constraints*:

(1.1) — `is_same_v<remove_cvref_t<Err>, unexpected>` is `false`; and

(1.2) — `is_same_v<remove_cvref_t<Err>, in_place_t>` is `false`; and

(1.3) — `is_constructible_v<E, Err>` is `true`.

2 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<Err>(e)`.

3 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class... Args>
  constexpr explicit unexpected(in_place_t, Args&&... args);
```

4 *Constraints*: `is_constructible_v<E, Args...>` is `true`.

5 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<Args>(args)...`.

6 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class U, class... Args>
  constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);
```

7 *Constraints*: `is_constructible_v<E, initializer_list<U>&, Args...>` is `true`.

8 *Effects*: Direct-non-list-initializes *`unex`* with `il, std::forward<Args>(args)...`.

9 *Throws*: Any exception thrown by the initialization of *`unex`*.

22.8.3.3 Observers [expected.un.obs]

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

1 *Returns*: *unex*.

```
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

2 *Returns*: `std::move(unex)`.

22.8.3.4 Swap [expected.un.swap]

```
constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);
```

1 *Mandates*: `is_swappable_v<E>` is `true`.

2 *Effects*: Equivalent to: `using std::swap; swap(unex, other.unex);`

```
friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
```

3 *Constraints*: `is_swappable_v<E>` is `true`.

4 *Effects*: Equivalent to `x.swap(y)`.

22.8.3.5 Equality operator [expected.un.eq]

```
template<class E2>
  friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);
```

1 *Mandates*: The expression `x.error() == y.error()` is well-formed and its result is convertible to `bool`.

2 *Returns*: `x.error() == y.error()`.

22.8.4 Class template bad_expected_access [expected.bad]

```
  namespace std {
    template<class E>
    class bad_expected_access : public bad_expected_access<void> {
    public:
      constexpr explicit bad_expected_access(E);
      constexpr const char* what() const noexcept override;
      constexpr E& error() & noexcept;
      constexpr const E& error() const & noexcept;
      constexpr E&& error() && noexcept;
      constexpr const E&& error() const && noexcept;

    private:
      E unex;                 // exposition only
    };
  }
```

1 The class template `bad_expected_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an `expected<T, E>` object for which `has_value()` is `false`.

```
constexpr explicit bad_expected_access(E e);
```

2 *Effects*: Initializes *unex* with `std::move(e)`.

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

3 *Returns*: *unex*.

```
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

4 *Returns*: `std::move(unex)`.

```
constexpr const char* what() const noexcept override;
```

5 *Returns*: An implementation-defined NTBS, which during constant evaluation is encoded with the ordinary literal encoding (5.13.3).

22.8.5 Class template specialization `bad_expected_access<void>` [expected.bad.void]

```
namespace std {
  template<>
  class bad_expected_access<void> : public exception {
  protected:
    constexpr bad_expected_access() noexcept;
    constexpr bad_expected_access(const bad_expected_access&) noexcept;
    constexpr bad_expected_access(bad_expected_access&&) noexcept;
    constexpr bad_expected_access& operator=(const bad_expected_access&) noexcept;
    constexpr bad_expected_access& operator=(bad_expected_access&&) noexcept;
    constexpr ~bad_expected_access();

  public:
    constexpr const char* what() const noexcept override;
  };
}
```

`constexpr const char* what() const noexcept override;`

1 *Returns*: An implementation-defined NTBS, which during constant evaluation is encoded with the ordinary literal encoding (5.13.3).

22.8.6 Class template `expected` [expected.expected]

22.8.6.1 General [expected.object.general]

```
namespace std {
  template<class T, class E>
  class expected {
  public:
    using value_type = T;
    using error_type = E;
    using unexpected_type = unexpected<E>;

    template<class U>
    using rebind = expected<U, error_type>;

    // 22.8.6.2, constructors
    constexpr expected();
    constexpr expected(const expected&);
    constexpr expected(expected&&) noexcept(see below);
    template<class U, class G>
      constexpr explicit(see below) expected(const expected<U, G>&);
    template<class U, class G>
      constexpr explicit(see below) expected(expected<U, G>&&);

    template<class U = remove_cv_t<T>>
      constexpr explicit(see below) expected(U&& v);

    template<class G>
      constexpr explicit(see below) expected(const unexpected<G>&);
    template<class G>
      constexpr explicit(see below) expected(unexpected<G>&&);

    template<class... Args>
      constexpr explicit expected(in_place_t, Args&&...);
    template<class U, class... Args>
      constexpr explicit expected(in_place_t, initializer_list<U>, Args&&...);
    template<class... Args>
      constexpr explicit expected(unexpect_t, Args&&...);
    template<class U, class... Args>
      constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);

    // 22.8.6.3, destructor
    constexpr ~expected();
```

```
// 22.8.6.4, assignment
constexpr expected& operator=(const expected&);
constexpr expected& operator=(expected&&) noexcept(see below);
template<class U = remove_cv_t<T>> constexpr expected& operator=(U&&);
template<class G>
  constexpr expected& operator=(const unexpected<G>&);
template<class G>
  constexpr expected& operator=(unexpected<G>&&);

template<class... Args>
  constexpr T& emplace(Args&&...) noexcept;
template<class U, class... Args>
  constexpr T& emplace(initializer_list<U>, Args&&...) noexcept;

// 22.8.6.5, swap
constexpr void swap(expected&) noexcept(see below);
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

// 22.8.6.6, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr T&& operator*() && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;                                    // freestanding-deleted
constexpr T& value() &;                                                // freestanding-deleted
constexpr const T&& value() const &&;                                  // freestanding-deleted
constexpr T&& value() &&;                                              // freestanding-deleted
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
constexpr const E&& error() const && noexcept;
constexpr E&& error() && noexcept;
template<class U = remove_cv_t<T>> constexpr T value_or(U&&) const &;
template<class U = remove_cv_t<T>> constexpr T value_or(U&&) &&;
template<class G = E> constexpr E error_or(G&&) const &;
template<class G = E> constexpr E error_or(G&&) &&;

// 22.8.6.7, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &;
template<class F> constexpr auto or_else(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &;
template<class F> constexpr auto transform_error(F&& f) const &&;

// 22.8.6.8, equality operators
template<class T2, class E2> requires (!is_void_v<T2>)
  friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
template<class T2>
  friend constexpr bool operator==(const expected&, const T2&);
```

```
    template<class E2>
      friend constexpr bool operator==(const expected&, const unexpected<E2>&);

  private:
    bool has_val;         // exposition only
    union {
      T val;              // exposition only
      E unex;             // exposition only
    };
  };
}
```

1 Any object of type `expected<T, E>` either contains a value of type `T` or a value of type `E` nested within (6.7.2) it. Member *`has_val`* indicates whether the `expected<T, E>` object contains an object of type `T`.

2 A type `T` is a *valid value type for `expected`*, if `remove_cv_t<T>` is `void` or a complete non-array object type that is not `in_place_t`, `unexpect_t`, or a specialization of `unexpected`. A program which instantiates class template `expected<T, E>` with an argument `T` that is not a valid value type for `expected` is ill-formed. A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.

3 When `T` is not *cv* `void`, it shall meet the *Cpp17Destructible* requirements (Table 35). `E` shall meet the *Cpp17Destructible* requirements.

22.8.6.2 Constructors [expected.object.cons]

1 The exposition-only variable template *`converts-from-any-cvref`* defined in 22.5.3.2 is used by some constructors for `expected`.

```
constexpr expected();
```

2 *Constraints*: `is_default_constructible_v<T>` is `true`.

3 *Effects*: Value-initializes *`val`*.

4 *Postconditions*: `has_value()` is `true`.

5 *Throws*: Any exception thrown by the initialization of *`val`*.

```
constexpr expected(const expected& rhs);
```

6 *Effects*: If `rhs.has_value()` is `true`, direct-non-list-initializes *`val`* with `*rhs`. Otherwise, direct-non-list-initializes *`unex`* with `rhs.error()`.

7 *Postconditions*: `rhs.has_value() == this->has_value()`.

8 *Throws*: Any exception thrown by the initialization of *`val`* or *`unex`*.

9 *Remarks*: This constructor is defined as deleted unless

(9.1) — `is_copy_constructible_v<T>` is `true` and

(9.2) — `is_copy_constructible_v<E>` is `true`.

10 This constructor is trivial if

(10.1) — `is_trivially_copy_constructible_v<T>` is `true` and

(10.2) — `is_trivially_copy_constructible_v<E>` is `true`.

```
constexpr expected(expected&& rhs) noexcept(see below);
```

11 *Constraints*:

(11.1) — `is_move_constructible_v<T>` is `true` and

(11.2) — `is_move_constructible_v<E>` is `true`.

12 *Effects*: If `rhs.has_value()` is `true`, direct-non-list-initializes *`val`* with `std::move(*rhs)`. Otherwise, direct-non-list-initializes *`unex`* with `std::move(rhs.error())`.

13 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is `true`.

14 *Throws*: Any exception thrown by the initialization of *`val`* or *`unex`*.

15 *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<T> && is_nothrow_move_constructible_v<E>`.

16 This constructor is trivial if

(16.1) — `is_trivially_move_constructible_v<T>` is `true` and

(16.2) — `is_trivially_move_constructible_v<E>` is `true`.

```
template<class U, class G>
  constexpr explicit(see below) expected(const expected<U, G>& rhs);
template<class U, class G>
  constexpr explicit(see below) expected(expected<U, G>&& rhs);
```

17 Let:

(17.1) — `UF` be `const U&` for the first overload and `U` for the second overload.

(17.2) — `GF` be `const G&` for the first overload and `G` for the second overload.

18 *Constraints*:

(18.1) — `is_constructible_v<T, UF>` is `true`; and

(18.2) — `is_constructible_v<E, GF>` is `true`; and

(18.3) — if `T` is not *cv* `bool`, *`converts-from-any-cvref`*`<T, expected<U, G>>` is `false`; and

(18.4) — `is_constructible_v<unexpected<E>, expected<U, G>&>` is `false`; and

(18.5) — `is_constructible_v<unexpected<E>, expected<U, G>>` is `false`; and

(18.6) — `is_constructible_v<unexpected<E>, const expected<U, G>&>` is `false`; and

(18.7) — `is_constructible_v<unexpected<E>, const expected<U, G>>` is `false`.

19 *Effects*: If `rhs.has_value()`, direct-non-list-initializes *`val`* with `std::forward<UF>(*rhs)`. Otherwise, direct-non-list-initializes *`unex`* with `std::forward<GF>(rhs.error())`.

20 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is `true`.

21 *Throws*: Any exception thrown by the initialization of *`val`* or *`unex`*.

22 *Remarks*: The expression inside `explicit` is equivalent to `!is_convertible_v<UF, T> || !is_convertible_v<GF, E>`.

```
template<class U = remove_cv_t<T>>
  constexpr explicit(!is_convertible_v<U, T>) expected(U&& v);
```

23 *Constraints*:

(23.1) — `is_same_v<remove_cvref_t<U>, in_place_t>` is `false`; and

(23.2) — `is_same_v<expected, remove_cvref_t<U>>` is `false`; and

(23.3) — `remove_cvref_t<U>` is not a specialization of `unexpected`; and

(23.4) — `is_constructible_v<T, U>` is `true`; and

(23.5) — if `T` is *cv* `bool`, `remove_cvref_t<U>` is not a specialization of `expected`.

24 *Effects*: Direct-non-list-initializes *`val`* with `std::forward<U>(v)`.

25 *Postconditions*: `has_value()` is `true`.

26 *Throws*: Any exception thrown by the initialization of *`val`*.

```
template<class G>
  constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
template<class G>
  constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);
```

27 Let `GF` be `const G&` for the first overload and `G` for the second overload.

28 *Constraints*: `is_constructible_v<E, GF>` is `true`.

29 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<GF>(e.error())`.

30 *Postconditions*: `has_value()` is `false`.

31 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class... Args>
  constexpr explicit expected(in_place_t, Args&&... args);
```

32 *Constraints*: `is_constructible_v<T, Args...>` is `true`.

33 *Effects*: Direct-non-list-initializes *`val`* with `std::forward<Args>(args)...`.

34 *Postconditions*: `has_value()` is `true`.

35 *Throws*: Any exception thrown by the initialization of *`val`*.

```
template<class U, class... Args>
  constexpr explicit expected(in_place_t, initializer_list<U> il, Args&&... args);
```

36 *Constraints*: `is_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

37 *Effects*: Direct-non-list-initializes *`val`* with `il, std::forward<Args>(args)...`.

38 *Postconditions*: `has_value()` is `true`.

39 *Throws*: Any exception thrown by the initialization of *`val`*.

```
template<class... Args>
  constexpr explicit expected(unexpect_t, Args&&... args);
```

40 *Constraints*: `is_constructible_v<E, Args...>` is `true`.

41 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<Args>(args)...`.

42 *Postconditions*: `has_value()` is `false`.

43 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class U, class... Args>
  constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);
```

44 *Constraints*: `is_constructible_v<E, initializer_list<U>&, Args...>` is `true`.

45 *Effects*: Direct-non-list-initializes *`unex`* with `il, std::forward<Args>(args)...`.

46 *Postconditions*: `has_value()` is `false`.

47 *Throws*: Any exception thrown by the initialization of *`unex`*.

22.8.6.3 Destructor [expected.object.dtor]

```
constexpr ~expected();
```

1 *Effects*: If `has_value()` is `true`, destroys *`val`*, otherwise destroys *`unex`*.

2 *Remarks*: If `is_trivially_destructible_v<T>` is `true`, and `is_trivially_destructible_v<E>` is `true`, then this destructor is a trivial destructor.

22.8.6.4 Assignment [expected.object.assign]

1 This subclause makes use of the following exposition-only function template:

```
  template<class T, class U, class... Args>
  constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) {   // exposition only
    if constexpr (is_nothrow_constructible_v<T, Args...>) {
      destroy_at(addressof(oldval));
      construct_at(addressof(newval), std::forward<Args>(args)...);
    } else if constexpr (is_nothrow_move_constructible_v<T>) {
      T tmp(std::forward<Args>(args)...);
      destroy_at(addressof(oldval));
      construct_at(addressof(newval), std::move(tmp));
    } else {
      U tmp(std::move(oldval));
      destroy_at(addressof(oldval));
      try {
        construct_at(addressof(newval), std::forward<Args>(args)...);
      } catch (...) {
        construct_at(addressof(oldval), std::move(tmp));
        throw;
      }
    }
  }
```

```
constexpr expected& operator=(const expected& rhs);
```

2 *Effects*:

(2.1) — If `this->has_value() && rhs.has_value()` is `true`, equivalent to *`val`* `= *rhs`.

(2.2) — Otherwise, if `this->has_value()` is `true`, equivalent to:

    reinit-expected(*unex*, *val*, rhs.error())

(2.3) — Otherwise, if `rhs.has_value()` is `true`, equivalent to:

    reinit-expected(*val*, *unex*, *rhs)

(2.4) — Otherwise, equivalent to *`unex`* `= rhs.error()`.

Then, if no exception was thrown, equivalent to: *`has_val`* `= rhs.has_value(); return *this;`

3 *Returns*: `*this`.

4 *Remarks*: This operator is defined as deleted unless:

(4.1) — `is_copy_assignable_v<T>` is `true` and

(4.2) — `is_copy_constructible_v<T>` is `true` and

(4.3) — `is_copy_assignable_v<E>` is `true` and

(4.4) — `is_copy_constructible_v<E>` is `true` and

(4.5) — `is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is `true`.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

5 *Constraints*:

(5.1) — `is_move_constructible_v<T>` is `true` and

(5.2) — `is_move_assignable_v<T>` is `true` and

(5.3) — `is_move_constructible_v<E>` is `true` and

(5.4) — `is_move_assignable_v<E>` is `true` and

(5.5) — `is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is `true`.

6 *Effects*:

(6.1) — If `this->has_value() && rhs.has_value()` is `true`, equivalent to *`val`* `= std::move(*rhs)`.

(6.2) — Otherwise, if `this->has_value()` is `true`, equivalent to:

    reinit-expected(*unex*, *val*, std::move(rhs.error()))

(6.3) — Otherwise, if `rhs.has_value()` is `true`, equivalent to:

    reinit-expected(*val*, *unex*, std::move(*rhs))

(6.4) — Otherwise, equivalent to *`unex`* `= std::move(rhs.error())`.

Then, if no exception was thrown, equivalent to: `has_val = rhs.has_value(); return *this;`

7 *Returns*: `*this`.

8 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T> &&
is_nothrow_move_assignable_v<E> && is_nothrow_move_constructible_v<E>
```

```
template<class U = remove_cv_t<T>>
  constexpr expected& operator=(U&& v);
```

9 *Constraints*:

(9.1) — `is_same_v<expected, remove_cvref_t<U>>` is `false`; and

(9.2) — `remove_cvref_t<U>` is not a specialization of `unexpected`; and

(9.3) — `is_constructible_v<T, U>` is `true`; and

(9.4) — `is_assignable_v<T&, U>` is `true`; and

(9.5) — `is_nothrow_constructible_v<T, U> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is `true`.

10 *Effects*:

(10.1) — If `has_value()` is `true`, equivalent to: `val = std::forward<U>(v);`

(10.2) — Otherwise, equivalent to:

```
reinit-expected(val, unex, std::forward<U>(v));
has_val = true;
```

11 *Returns*: `*this`.

```
template<class G>
  constexpr expected& operator=(const unexpected<G>& e);
template<class G>
  constexpr expected& operator=(unexpected<G>&& e);
```

12 Let `GF` be `const G&` for the first overload and `G` for the second overload.

13 *Constraints*:

(13.1) — `is_constructible_v<E, GF>` is `true`; and

(13.2) — `is_assignable_v<E&, GF>` is `true`; and

(13.3) — `is_nothrow_constructible_v<E, GF> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is `true`.

14 *Effects*:

(14.1) — If `has_value()` is `true`, equivalent to:

```
reinit-expected(unex, val, std::forward<GF>(e.error()));
has_val = false;
```

(14.2) — Otherwise, equivalent to: `unex = std::forward<GF>(e.error());`

15 *Returns*: `*this`.

```
template<class... Args>
  constexpr T& emplace(Args&&... args) noexcept;
```

16 *Constraints*: `is_nothrow_constructible_v<T, Args...>` is `true`.

17 *Effects*: Equivalent to:

```
if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), std::forward<Args>(args)...);
```

```
template<class U, class... Args>
  constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;
```

18 *Constraints*: `is_nothrow_constructible_v<T, initializer_list<U>&, Args...>` is `true`.

19 *Effects*: Equivalent to:

```
if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), il, std::forward<Args>(args)...);
```

22.8.6.5 Swap [expected.object.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 *Constraints*:

(1.1) — `is_swappable_v<T>` is `true` and

(1.2) — `is_swappable_v<E>` is `true` and

(1.3) — `is_move_constructible_v<T> && is_move_constructible_v<E>` is `true`, and

(1.4) — `is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is `true`.

2 *Effects*: See Table 70.

Table 70 — `swap(expected&)` effects [tab:expected.object.swap]

	`this->has_value()`	**`!this->has_value()`**
`rhs.has_value()`	equivalent to: `using std::swap; swap(`*`val`*`, rhs.`*`val`*`);`	calls `rhs.swap(*this)`
`!rhs.has_value()`	*see below*	equivalent to: `using std::swap; swap(`*`unex`*`, rhs.`*`unex`*`);`

For the case where `rhs.has_value()` is `false` and `this->has_value()` is `true`, equivalent to:

```
if constexpr (is_nothrow_move_constructible_v<E>) {
  E tmp(std::move(rhs.unex));
  destroy_at(addressof(rhs.unex));
  try {
    construct_at(addressof(rhs.val), std::move(val));
    destroy_at(addressof(val));
    construct_at(addressof(unex), std::move(tmp));
  } catch(...) {
    construct_at(addressof(rhs.unex), std::move(tmp));
    throw;
  }
} else {
  T tmp(std::move(val));
  destroy_at(addressof(val));
  try {
    construct_at(addressof(unex), std::move(rhs.unex));
    destroy_at(addressof(rhs.unex));
    construct_at(addressof(rhs.val), std::move(tmp));
  } catch (...) {
    construct_at(addressof(val), std::move(tmp));
    throw;
  }
}
has_val = false;
rhs.has_val = true;
```

3 *Throws*: Any exception thrown by the expressions in the *Effects*.

4 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T> &&
is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>
```

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 *Effects*: Equivalent to `x.swap(y)`.

22.8.6.6 Observers [expected.object.obs]

```
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

1 *Hardened preconditions*: `has_value()` is `true`.

2 *Returns*: `addressof(`*`val`*`)`.

```
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

3 *Hardened preconditions*: `has_value()` is `true`.

4 *Returns*: *`val`*.

```
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

5 *Hardened preconditions*: `has_value()` is `true`.

6 *Returns*: `std::move(`*`val`*`)`.

```
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

7 *Returns*: *`has_val`*.

```
constexpr const T& value() const &;
constexpr T& value() &;
```

8 *Mandates*: `is_copy_constructible_v<E>` is `true`.

9 *Returns*: *`val`*, if `has_value()` is `true`.

10 *Throws*: `bad_expected_access(as_const(error()))` if `has_value()` is `false`.

```
constexpr T&& value() &&;
constexpr const T&& value() const &&;
```

11 *Mandates*: `is_copy_constructible_v<E>` is `true` and `is_constructible_v<E, decltype(std::move(error()))>` is `true`.

12 *Returns*: `std::move(`*`val`*`)`, if `has_value()` is `true`.

13 *Throws*: `bad_expected_access(std::move(error()))` if `has_value()` is `false`.

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

14 *Hardened preconditions*: `has_value()` is `false`.

15 *Returns*: *`unex`*.

```
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

16 *Hardened preconditions*: `has_value()` is `false`.

17 *Returns*: `std::move(`*`unex`*`)`.

```
template<class U = remove_cv_t<T>> constexpr T value_or(U&& v) const &;
```

18 *Mandates*: `is_copy_constructible_v<T>` is `true` and `is_convertible_v<U, T>` is `true`.

19 *Returns*: `has_value() ? **this : static_cast<T>(std::forward<U>(v))`.

```
template<class U = remove_cv_t<T>> constexpr T value_or(U&& v) &&;
```

20 *Mandates*: `is_move_constructible_v<T>` is `true` and `is_convertible_v<U, T>` is `true`.

21 *Returns*: `has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v))`.

```
template<class G = E> constexpr E error_or(G&& e) const &;
```

22 *Mandates*: `is_copy_constructible_v<E>` is `true` and `is_convertible_v<G, E>` is `true`.

23 *Returns*: `std::forward<G>(e)` if `has_value()` is `true`, `error()` otherwise.

```
template<class G = E> constexpr E error_or(G&& e) &&;
```

24 *Mandates*: `is_move_constructible_v<E>` is `true` and `is_convertible_v<G, E>` is `true`.

25 *Returns*: `std::forward<G>(e)` if `has_value()` is `true`, `std::move(error())` otherwise.

22.8.6.7 Monadic operations [expected.object.monadic]

```
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
```

1 Let `U` be `remove_cvref_t<invoke_result_t<F, decltype((val))>>`.

2 *Constraints*: `is_constructible_v<E, decltype(error())>` is `true`.

3 *Mandates*: `U` is a specialization of `expected` and `is_same_v<U::error_type, E>` is `true`.

4 *Effects*: Equivalent to:

```
if (has_value())
  return invoke(std::forward<F>(f), val);
else
  return U(unexpect, error());
```

```
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
```

5 Let `U` be `remove_cvref_t<invoke_result_t<F, decltype(std::move(val))>>`.

6 *Constraints*: `is_constructible_v<E, decltype(std::move(error()))>` is `true`.

7 *Mandates*: `U` is a specialization of `expected` and `is_same_v<U::error_type, E>` is `true`.

8 *Effects*: Equivalent to:

```
if (has_value())
  return invoke(std::forward<F>(f), std::move(val));
else
  return U(unexpect, std::move(error()));
```

```
template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) const &;
```

9 Let `G` be `remove_cvref_t<invoke_result_t<F, decltype(error())>>`.

10 *Constraints*: `is_constructible_v<T, decltype((val))>` is `true`.

11 *Mandates*: `G` is a specialization of `expected` and `is_same_v<G::value_type, T>` is `true`.

12 *Effects*: Equivalent to:

```
if (has_value())
  return G(in_place, val);
else
  return invoke(std::forward<F>(f), error());
```

```
template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &&;
```

13 Let `G` be `remove_cvref_t<invoke_result_t<F, decltype(std::move(error()))>>`.

14 *Constraints*: `is_constructible_v<T, decltype(std::move(val))>` is `true`.

15 *Mandates*: `G` is a specialization of `expected` and `is_same_v<G::value_type, T>` is `true`.

16 *Effects*: Equivalent to:

```
if (has_value())
  return G(in_place, std::move(val));
else
  return invoke(std::forward<F>(f), std::move(error()));
```

```
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;
```

17 Let `U` be `remove_cv_t<invoke_result_t<F, decltype((val))>>`.

18 *Constraints*: `is_constructible_v<E, decltype(error())>` is `true`.

19 *Mandates*: `U` is a valid value type for `expected`. If `is_void_v<U>` is `false`, the declaration

```
U u(invoke(std::forward<F>(f), val));
```

is well-formed.

20 *Effects*:

(20.1) — If `has_value()` is `false`, returns `expected<U, E>(unexpect, error())`.

(20.2) — Otherwise, if `is_void_v<U>` is `false`, returns an `expected<U, E>` object whose *`has_val`* member is `true` and *`val`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), val)`.

(20.3) — Otherwise, evaluates `invoke(std::forward<F>(f), val)` and then returns `expected<U, E>()`.

```
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;
```

21 Let `U` be `remove_cv_t<invoke_result_t<F, decltype(std::move(val))>>`.

22 *Constraints*: `is_constructible_v<E, decltype(std::move(error()))>` is `true`.

23 *Mandates*: `U` is a valid value type for `expected`. If `is_void_v<U>` is `false`, the declaration

```
U u(invoke(std::forward<F>(f), std::move(val)));
```

is well-formed.

24 *Effects*:

(24.1) — If `has_value()` is `false`, returns `expected<U, E>(unexpect, std::move(error()))`.

(24.2) — Otherwise, if `is_void_v<U>` is `false`, returns an `expected<U, E>` object whose *`has_val`* member is `true` and *`val`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(val))`.

(24.3) — Otherwise, evaluates `invoke(std::forward<F>(f), std::move(val))` and then returns `expected<U, E>()`.

```
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;
```

25 Let `G` be `remove_cv_t<invoke_result_t<F, decltype(error())>>`.

26 *Constraints*: `is_constructible_v<T, decltype((val))>` is `true`.

27 *Mandates*: `G` is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```
G g(invoke(std::forward<F>(f), error()));
```

is well-formed.

28 *Returns*: If `has_value()` is `true`, `expected<T, G>(in_place, val)`; otherwise, an `expected<T, G>` object whose *`has_val`* member is `false` and *`unex`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), error())`.

```
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &&;
```

29 Let `G` be `remove_cv_t<invoke_result_t<F, decltype(std::move(error()))>>`.

30 *Constraints*: `is_constructible_v<T, decltype(std::move(val))>` is `true`.

31 *Mandates*: `G` is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```
G g(invoke(std::forward<F>(f), std::move(error())));
```

is well-formed.

32 *Returns*: If `has_value()` is `true`, `expected<T, G>(in_place, std::move(val))`; otherwise, an `expected<T, G>` object whose *`has_val`* member is `false` and *`unex`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(error()))`.

22.8.6.8 Equality operators [expected.object.eq]

```
template<class T2, class E2> requires (!is_void_v<T2>)
  friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Constraints*: The expressions `*x == *y` and `x.error() == y.error()` are well-formed and their results are convertible to `bool`.

2 *Returns*: If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise if `x.has_value()` is `true`, `*x == *y`; otherwise `x.error() == y.error()`.

```
template<class T2> friend constexpr bool operator==(const expected& x, const T2& v);
```

3 *Constraints*: `T2` is not a specialization of `expected`. The expression `*x == v` is well-formed and its result is convertible to `bool`.

[*Note 1*: `T` need not be *Cpp17EqualityComparable*. — *end note*]

4 *Returns*: `x.has_value() && static_cast<bool>(*x == v)`.

```
template<class E2> friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

5 *Constraints*: The expression `x.error() == e.error()` is well-formed and its result is convertible to `bool`.

6 *Returns*: `!x.has_value() && static_cast<bool>(x.error() == e.error())`.

22.8.7 Partial specialization of `expected` for void types [expected.void]

22.8.7.1 General [expected.void.general]

```
template<class T, class E> requires is_void_v<T>
class expected<T, E> {
public:
  using value_type = T;
  using error_type = E;
  using unexpected_type = unexpected<E>;

  template<class U>
  using rebind = expected<U, error_type>;

  // 22.8.7.2, constructors
  constexpr expected() noexcept;
  constexpr expected(const expected&);
  constexpr expected(expected&&) noexcept(see below);
  template<class U, class G>
    constexpr explicit(see below) expected(const expected<U, G>&);
  template<class U, class G>
    constexpr explicit(see below) expected(expected<U, G>&&);

  template<class G>
    constexpr explicit(see below) expected(const unexpected<G>&);
  template<class G>
    constexpr explicit(see below) expected(unexpected<G>&&);

  constexpr explicit expected(in_place_t) noexcept;
  template<class... Args>
    constexpr explicit expected(unexpect_t, Args&&...);
  template<class U, class... Args>
    constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);

  // 22.8.7.3, destructor
  constexpr ~expected();

  // 22.8.7.4, assignment
  constexpr expected& operator=(const expected&);
  constexpr expected& operator=(expected&&) noexcept(see below);
  template<class G>
    constexpr expected& operator=(const unexpected<G>&);
  template<class G>
    constexpr expected& operator=(unexpected<G>&&);
  constexpr void emplace() noexcept;

  // 22.8.7.5, swap
  constexpr void swap(expected&) noexcept(see below);
  friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

```
    // 22.8.7.6, observers
    constexpr explicit operator bool() const noexcept;
    constexpr bool has_value() const noexcept;
    constexpr void operator*() const noexcept;
    constexpr void value() const &;                                     // freestanding-deleted
    constexpr void value() &&;                                          // freestanding-deleted
    constexpr const E& error() const & noexcept;
    constexpr E& error() & noexcept;
    constexpr const E&& error() const && noexcept;
    constexpr E&& error() && noexcept;
    template<class G = E> constexpr E error_or(G&&) const &;
    template<class G = E> constexpr E error_or(G&&) &&;

    // 22.8.7.7, monadic operations
    template<class F> constexpr auto and_then(F&& f) &;
    template<class F> constexpr auto and_then(F&& f) &&;
    template<class F> constexpr auto and_then(F&& f) const &;
    template<class F> constexpr auto and_then(F&& f) const &&;
    template<class F> constexpr auto or_else(F&& f) &;
    template<class F> constexpr auto or_else(F&& f) &&;
    template<class F> constexpr auto or_else(F&& f) const &;
    template<class F> constexpr auto or_else(F&& f) const &&;
    template<class F> constexpr auto transform(F&& f) &;
    template<class F> constexpr auto transform(F&& f) &&;
    template<class F> constexpr auto transform(F&& f) const &;
    template<class F> constexpr auto transform(F&& f) const &&;
    template<class F> constexpr auto transform_error(F&& f) &;
    template<class F> constexpr auto transform_error(F&& f) &&;
    template<class F> constexpr auto transform_error(F&& f) const &;
    template<class F> constexpr auto transform_error(F&& f) const &&;

    // 22.8.7.8, equality operators
    template<class T2, class E2> requires is_void_v<T2>
      friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
    template<class E2>
      friend constexpr bool operator==(const expected&, const unexpected<E2>&);

  private:
    bool has_val;           // exposition only
    union {
      E unex;               // exposition only
    };
  };
```

1 Any object of type `expected<T, E>` either represents a value of type `T`, or contains a value of type `E` nested within (6.7.2) it. Member *`has_val`* indicates whether the `expected<T, E>` object represents a value of type `T`.

2 A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.

3 `E` shall meet the requirements of *Cpp17Destructible* (Table 35).

22.8.7.2 Constructors [expected.void.cons]

`constexpr expected() noexcept;`

1 *Postconditions*: `has_value()` is `true`.

`constexpr expected(const expected& rhs);`

2 *Effects*: If `rhs.has_value()` is `false`, direct-non-list-initializes *`unex`* with `rhs.error()`.

3 *Postconditions*: `rhs.has_value() == this->has_value()`.

4 *Throws*: Any exception thrown by the initialization of *`unex`*.

5 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<E>` is `true`.

6 This constructor is trivial if `is_trivially_copy_constructible_v<E>` is `true`.

```
constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);
```

7 *Constraints*: `is_move_constructible_v<E>` is `true`.

8 *Effects*: If `rhs.has_value()` is `false`, direct-non-list-initializes *`unex`* with `std::move(rhs.error())`.

9 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is `true`.

10 *Throws*: Any exception thrown by the initialization of *`unex`*.

11 *Remarks*: This constructor is trivial if `is_trivially_move_constructible_v<E>` is `true`.

```
template<class U, class G>
  constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);
template<class U, class G>
  constexpr explicit(!is_convertible_v<G, E>) expected(expected<U, G>&& rhs);
```

12 Let `GF` be `const G&` for the first overload and `G` for the second overload.

13 *Constraints*:

(13.1) — `is_void_v<U>` is `true`; and

(13.2) — `is_constructible_v<E, GF>` is `true`; and

(13.3) — `is_constructible_v<unexpected<E>, expected<U, G>&>` is `false`; and

(13.4) — `is_constructible_v<unexpected<E>, expected<U, G>>` is `false`; and

(13.5) — `is_constructible_v<unexpected<E>, const expected<U, G>&>` is `false`; and

(13.6) — `is_constructible_v<unexpected<E>, const expected<U, G>>` is `false`.

14 *Effects*: If `rhs.has_value()` is `false`, direct-non-list-initializes *`unex`* with `std::forward<GF>(rhs.error())`.

15 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is `true`.

16 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class G>
  constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
template<class G>
  constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);
```

17 Let `GF` be `const G&` for the first overload and `G` for the second overload.

18 *Constraints*: `is_constructible_v<E, GF>` is `true`.

19 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<GF>(e.error())`.

20 *Postconditions*: `has_value()` is `false`.

21 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
constexpr explicit expected(in_place_t) noexcept;
```

22 *Postconditions*: `has_value()` is `true`.

```
template<class... Args>
  constexpr explicit expected(unexpect_t, Args&&... args);
```

23 *Constraints*: `is_constructible_v<E, Args...>` is `true`.

24 *Effects*: Direct-non-list-initializes *`unex`* with `std::forward<Args>(args)...`.

25 *Postconditions*: `has_value()` is `false`.

26 *Throws*: Any exception thrown by the initialization of *`unex`*.

```
template<class U, class... Args>
    constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);
```

27 *Constraints*: `is_constructible_v<E, initializer_list<U>&, Args...>` is `true`.

28 *Effects*: Direct-non-list-initializes *`unex`* with `il, std::forward<Args>(args)...`.

29 *Postconditions*: `has_value()` is `false`.

30 *Throws*: Any exception thrown by the initialization of *unex*.

22.8.7.3 Destructor [expected.void.dtor]

```
constexpr ~expected();
```

1 *Effects*: If `has_value()` is `false`, destroys *unex*.

2 *Remarks*: If `is_trivially_destructible_v<E>` is `true`, then this destructor is a trivial destructor.

22.8.7.4 Assignment [expected.void.assign]

```
constexpr expected& operator=(const expected& rhs);
```

1 *Effects*:

(1.1) — If `this->has_value() && rhs.has_value()` is `true`, no effects.

(1.2) — Otherwise, if `this->has_value()` is `true`, equivalent to: `construct_at(addressof(`*unex*`), rhs.`*unex*`); `*has_val*` = false;`

(1.3) — Otherwise, if `rhs.has_value()` is `true`, destroys *unex* and sets *has_val* to `true`.

(1.4) — Otherwise, equivalent to *unex* `= rhs.error()`.

2 *Returns*: `*this`.

3 *Remarks*: This operator is defined as deleted unless `is_copy_assignable_v<E>` is `true` and `is_copy_constructible_v<E>` is `true`.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

4 *Constraints*: `is_move_constructible_v<E>` is `true` and `is_move_assignable_v<E>` is `true`.

5 *Effects*:

(5.1) — If `this->has_value() && rhs.has_value()` is `true`, no effects.

(5.2) — Otherwise, if `this->has_value()` is `true`, equivalent to:

```
construct_at(addressof(unex), std::move(rhs.unex));
has_val = false;
```

(5.3) — Otherwise, if `rhs.has_value()` is `true`, destroys *unex* and sets *has_val* to `true`.

(5.4) — Otherwise, equivalent to *unex* `= std::move(rhs.error())`.

6 *Returns*: `*this`.

7 *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_move_assignable_v<E>`.

```
template<class G>
  constexpr expected& operator=(const unexpected<G>& e);
template<class G>
  constexpr expected& operator=(unexpected<G>&& e);
```

8 Let `GF` be `const G&` for the first overload and `G` for the second overload.

9 *Constraints*: `is_constructible_v<E, GF>` is `true` and `is_assignable_v<E&, GF>` is `true`.

10 *Effects*:

(10.1) — If `has_value()` is `true`, equivalent to:

```
construct_at(addressof(unex), std::forward<GF>(e.error()));
has_val = false;
```

(10.2) — Otherwise, equivalent to: *unex* `= std::forward<GF>(e.error());`

11 *Returns*: `*this`.

```
constexpr void emplace() noexcept;
```

12 *Effects*: If `has_value()` is `false`, destroys *unex* and sets *has_val* to `true`.

22.8.7.5 Swap [expected.void.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 *Constraints*: `is_swappable_v<E>` is `true` and `is_move_constructible_v<E>` is `true`.

2 *Effects*: See Table 71.

Table 71 — `swap(expected&)` effects [tab:expected.void.swap]

	`this->has_value()`	`!this->has_value()`
`rhs.has_value()`	no effects	calls `rhs.swap(*this)`
`!rhs.has_value()`	*see below*	equivalent to: `using std::swap; swap(unex, rhs.unex);`

For the case where `rhs.has_value()` is `false` and `this->has_value()` is `true`, equivalent to:

```
construct_at(addressof(unex), std::move(rhs.unex));
destroy_at(addressof(rhs.unex));
has_val = false;
rhs.has_val = true;
```

3 *Throws*: Any exception thrown by the expressions in the *Effects*.

4 *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>`.

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 *Effects*: Equivalent to `x.swap(y)`.

22.8.7.6 Observers [expected.void.obs]

```
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

1 *Returns*: `has_val`.

```
constexpr void operator*() const noexcept;
```

2 *Hardened preconditions*: `has_value()` is `true`.

```
constexpr void value() const &;
```

3 *Mandates*: `is_copy_constructible_v<E>` is `true`.

4 *Throws*: `bad_expected_access(error())` if `has_value()` is `false`.

```
constexpr void value() &&;
```

5 *Mandates*: `is_copy_constructible_v<E>` is `true` and `is_move_constructible_v<E>` is `true`.

6 *Throws*: `bad_expected_access(std::move(error()))` if `has_value()` is `false`.

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

7 *Hardened preconditions*: `has_value()` is `false`.

8 *Returns*: `unex`.

```
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

9 *Hardened preconditions*: `has_value()` is `false`.

10 *Returns*: `std::move(unex)`.

```
template<class G = E> constexpr E error_or(G&& e) const &;
```

11 *Mandates*: `is_copy_constructible_v<E>` is `true` and `is_convertible_v<G, E>` is `true`.

12 *Returns*: `std::forward<G>(e)` if `has_value()` is `true`, `error()` otherwise.

```
template<class G = E> constexpr E error_or(G&& e) &&;
```

13 *Mandates*: `is_move_constructible_v<E>` is `true` and `is_convertible_v<G, E>` is `true`.

14 *Returns*: `std::forward<G>(e)` if `has_value()` is `true`, `std::move(error())` otherwise.

22.8.7.7 Monadic operations [expected.void.monadic]

```
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
```

1 Let `U` be `remove_cvref_t<invoke_result_t<F>>`.

2 *Constraints*: `is_constructible_v<E, decltype(error())>>` is `true`.

3 *Mandates*: `U` is a specialization of `expected` and `is_same_v<U::error_type, E>` is `true`.

4 *Effects*: Equivalent to:

```
if (has_value())
  return invoke(std::forward<F>(f));
else
  return U(unexpect, error());
```

```
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
```

5 Let `U` be `remove_cvref_t<invoke_result_t<F>>`.

6 *Constraints*: `is_constructible_v<E, decltype(std::move(error()))>` is `true`.

7 *Mandates*: `U` is a specialization of `expected` and `is_same_v<U::error_type, E>` is `true`.

8 *Effects*: Equivalent to:

```
if (has_value())
  return invoke(std::forward<F>(f));
else
  return U(unexpect, std::move(error()));
```

```
template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) const &;
```

9 Let `G` be `remove_cvref_t<invoke_result_t<F, decltype(error())>>`.

10 *Mandates*: `G` is a specialization of `expected` and `is_same_v<G::value_type, T>` is `true`.

11 *Effects*: Equivalent to:

```
if (has_value())
  return G();
else
  return invoke(std::forward<F>(f), error());
```

```
template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &&;
```

12 Let `G` be `remove_cvref_t<invoke_result_t<F, decltype(std::move(error()))>>`.

13 *Mandates*: `G` is a specialization of `expected` and `is_same_v<G::value_type, T>` is `true`.

14 *Effects*: Equivalent to:

```
if (has_value())
  return G();
else
  return invoke(std::forward<F>(f), std::move(error()));
```

```
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;
```

15 Let `U` be `remove_cv_t<invoke_result_t<F>>`.

16 *Constraints*: `is_constructible_v<E, decltype(error())>` is `true`.

17 *Mandates*: `U` is a valid value type for `expected`. If `is_void_v<U>` is `false`, the declaration

```
U u(invoke(std::forward<F>(f)));
```

is well-formed.

18 *Effects*:

(18.1) — If `has_value()` is `false`, returns `expected<U, E>(unexpect, error())`.

(18.2) — Otherwise, if `is_void_v<U>` is `false`, returns an `expected<U, E>` object whose *`has_val`* member is `true` and *`val`* member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.

(18.3) — Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected<U, E>()`.

```
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;
```

19 Let `U` be `remove_cv_t<invoke_result_t<F>>`.

20 *Constraints*: `is_constructible_v<E, decltype(std::move(error()))>` is `true`.

21 *Mandates*: `U` is a valid value type for `expected`. If `is_void_v<U>` is `false`, the declaration

```
U u(invoke(std::forward<F>(f)));
```

is well-formed.

22 *Effects*:

(22.1) — If `has_value()` is `false`, returns `expected<U, E>(unexpect, std::move(error()))`.

(22.2) — Otherwise, if `is_void_v<U>` is `false`, returns an `expected<U, E>` object whose *`has_val`* member is `true` and *`val`* member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.

(22.3) — Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected<U, E>()`.

```
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;
```

23 Let `G` be `remove_cv_t<invoke_result_t<F, decltype(error())>>`.

24 *Mandates*: `G` is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```
G g(invoke(std::forward<F>(f), error()));
```

is well-formed.

25 *Returns*: If `has_value()` is `true`, `expected<T, G>()`; otherwise, an `expected<T, G>` object whose *`has_val`* member is `false` and *`unex`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), error())`.

```
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &&;
```

26 Let `G` be `remove_cv_t<invoke_result_t<F, decltype(std::move(error()))>>`.

27 *Mandates*: `G` is a valid template argument for `unexpected` (22.8.3.1) and the declaration

```
G g(invoke(std::forward<F>(f), std::move(error())));
```

is well-formed.

28 *Returns*: If `has_value()` is `true`, `expected<T, G>()`; otherwise, an `expected<T, G>` object whose *`has_val`* member is `false` and *`unex`* member is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(error()))`.

22.8.7.8 Equality operators [expected.void.eq]

```
template<class T2, class E2> requires is_void_v<T2>
  friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Constraints*: The expression `x.error() == y.error()` is well-formed and its result is convertible to `bool`.

2 *Returns*: If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise `x.has_value() || static_cast<bool>(x.error() == y.error())`.

```
template<class E2>
  friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

3 *Constraints*: The expression `x.error() == e.error()` is well-formed and its result is convertible to `bool`.

4 *Returns*: `!x.has_value() && static_cast<bool>(x.error() == e.error())`.

22.9 Bitsets [bitset]

22.9.1 Header `<bitset>` synopsis [bitset.syn]

1 The header `<bitset>` defines a class template and several related functions for representing and manipulating fixed-size sequences of bits.

```
#include <string>    // see 27.4.2
#include <iosfwd>    // for istream (31.7.1), ostream (31.7.2), see 31.3.1

namespace std {
  template<size_t N> class bitset;

  // 22.9.4, bitset operators
  template<size_t N>
    constexpr bitset<N> operator&(const bitset<N>&, const bitset<N>&) noexcept;
  template<size_t N>
    constexpr bitset<N> operator|(const bitset<N>&, const bitset<N>&) noexcept;
  template<size_t N>
    constexpr bitset<N> operator^(const bitset<N>&, const bitset<N>&) noexcept;
  template<class charT, class traits, size_t N>
    basic_istream<charT, traits>&
      operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
  template<class charT, class traits, size_t N>
    basic_ostream<charT, traits>&
      operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
}
```

22.9.2 Class template `bitset` [template.bitset]

22.9.2.1 General [template.bitset.general]

```
namespace std {
  template<size_t N> class bitset {
  public:
    // bit reference
    class reference {
    public:
      constexpr reference(const reference&) = default;
      constexpr ~reference();
      constexpr reference& operator=(bool x) noexcept;              // for b[i] = x;
      constexpr reference& operator=(const reference&) noexcept;    // for b[i] = b[j];
      constexpr bool operator~() const noexcept;                    // flips the bit
      constexpr operator bool() const noexcept;                     // for x = b[i];
      constexpr reference& flip() noexcept;                         // for b[i].flip();
    };

    // 22.9.2.2, constructors
    constexpr bitset() noexcept;
    constexpr bitset(unsigned long long val) noexcept;
    template<class charT, class traits, class Allocator>
      constexpr explicit bitset(
        const basic_string<charT, traits, Allocator>& str,
        typename basic_string<charT, traits, Allocator>::size_type pos = 0,
        typename basic_string<charT, traits, Allocator>::size_type n
          = basic_string<charT, traits, Allocator>::npos,
        charT zero = charT('0'),
        charT one = charT('1'));
    template<class charT, class traits>
      constexpr explicit bitset(
        basic_string_view<charT, traits> str,
        typename basic_string_view<charT, traits>::size_type pos = 0,
        typename basic_string_view<charT, traits>::size_type n
          = basic_string_view<charT, traits>::npos,
        charT zero = charT('0'),
        charT one = charT('1'));
    template<class charT>
      constexpr explicit bitset(
        const charT* str,
        typename basic_string_view<charT>::size_type n = basic_string_view<charT>::npos,
        charT zero = charT('0'),
        charT one = charT('1'));

    // 22.9.2.3, bitset operations
    constexpr bitset& operator&=(const bitset& rhs) noexcept;
    constexpr bitset& operator|=(const bitset& rhs) noexcept;
    constexpr bitset& operator^=(const bitset& rhs) noexcept;
    constexpr bitset& operator<<=(size_t pos) noexcept;
    constexpr bitset& operator>>=(size_t pos) noexcept;
    constexpr bitset  operator<<(size_t pos) const noexcept;
    constexpr bitset  operator>>(size_t pos) const noexcept;
    constexpr bitset& set() noexcept;
    constexpr bitset& set(size_t pos, bool val = true);
    constexpr bitset& reset() noexcept;
    constexpr bitset& reset(size_t pos);
    constexpr bitset  operator~() const noexcept;
    constexpr bitset& flip() noexcept;
    constexpr bitset& flip(size_t pos);

    // element access
    constexpr bool operator[](size_t pos) const;
    constexpr reference operator[](size_t pos);

    constexpr unsigned long to_ulong() const;
    constexpr unsigned long long to_ullong() const;
    template<class charT = char,
             class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
      constexpr basic_string<charT, traits, Allocator>
        to_string(charT zero = charT('0'), charT one = charT('1')) const;

    // observers
    constexpr size_t count() const noexcept;
    constexpr size_t size() const noexcept;
    constexpr bool operator==(const bitset& rhs) const noexcept;
    constexpr bool test(size_t pos) const;
    constexpr bool all() const noexcept;
    constexpr bool any() const noexcept;
    constexpr bool none() const noexcept;
  };

  // 22.9.3, hash support
  template<class T> struct hash;
  template<size_t N> struct hash<bitset<N>>;
}
```

1 The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, `N`.

2 Each bit represents either the value zero (reset) or one (set). To *toggle* a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object

of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the *bit value* `1 << pos`. The integral value corresponding to two or more bits is the sum of their bit values.

3 The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:

(3.1) — an *invalid-argument* error is associated with exceptions of type `invalid_argument` (19.2.5);

(3.2) — an *out-of-range* error is associated with exceptions of type `out_of_range` (19.2.7);

(3.3) — an *overflow* error is associated with exceptions of type `overflow_error` (19.2.10).

22.9.2.2 Constructors [bitset.cons]

```
constexpr bitset() noexcept;
```

1 *Effects*: Initializes all bits in `*this` to zero.

```
constexpr bitset(unsigned long long val) noexcept;
```

2 *Effects*: Initializes the first `M` bit positions to the corresponding bit values in `val`. `M` is the smaller of `N` and the number of bits in the value representation (6.8.1) of `unsigned long long`. If `M < N`, the remaining bit positions are initialized to zero.

```
template<class charT, class traits, class Allocator>
  constexpr explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n
      = basic_string<charT, traits, Allocator>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
template<class charT, class traits>
  constexpr explicit bitset(
    basic_string_view<charT, traits> str,
    typename basic_string_view<charT, traits>::size_type pos = 0,
    typename basic_string_view<charT, traits>::size_type n
      = basic_string_view<charT, traits>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

3 *Effects*: Determines the effective length `rlen` of the initializing string as the smaller of `n` and `str.size() - pos`. Initializes the first `M` bit positions to values determined from the corresponding characters in the string `str`. `M` is the smaller of `N` and `rlen`.

4 An element of the constructed object has value zero if the corresponding character in `str`, beginning at position `pos`, is `zero`. Otherwise, the element has the value one. Character position `pos + M - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.

5 If `M < N`, remaining bit positions are initialized to zero.

6 The function uses `traits::eq` to compare the character values.

7 *Throws*: `out_of_range` if `pos > str.size()` or `invalid_argument` if any of the `rlen` characters in `str` beginning at position `pos` is other than `zero` or `one`.

```
template<class charT>
  constexpr explicit bitset(
    const charT* str,
    typename basic_string_view<charT>::size_type n = basic_string_view<charT>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

8 *Effects*: As if by:

```
bitset(n == basic_string_view<charT>::npos
          ? basic_string_view<charT>(str)
          : basic_string_view<charT>(str, n),
       0, n, zero, one)
```

22.9.2.3 Members [bitset.members]

`constexpr bitset& operator&=(const bitset& rhs) noexcept;`

1 *Effects*: Clears each bit in `*this` for which the corresponding bit in `rhs` is clear, and leaves all other bits unchanged.

2 *Returns*: `*this`.

`constexpr bitset& operator|=(const bitset& rhs) noexcept;`

3 *Effects*: Sets each bit in `*this` for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

4 *Returns*: `*this`.

`constexpr bitset& operator^=(const bitset& rhs) noexcept;`

5 *Effects*: Toggles each bit in `*this` for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

6 *Returns*: `*this`.

`constexpr bitset& operator<<=(size_t pos) noexcept;`

7 *Effects*: Replaces each bit at position `I` in `*this` with a value determined as follows:

(7.1) — If `I < pos`, the new value is zero;

(7.2) — If `I >= pos`, the new value is the previous value of the bit at position `I - pos`.

8 *Returns*: `*this`.

`constexpr bitset& operator>>=(size_t pos) noexcept;`

9 *Effects*: Replaces each bit at position `I` in `*this` with a value determined as follows:

(9.1) — If `pos >= N - I`, the new value is zero;

(9.2) — If `pos < N - I`, the new value is the previous value of the bit at position `I + pos`.

10 *Returns*: `*this`.

`constexpr bitset operator<<(size_t pos) const noexcept;`

11 *Returns*: `bitset(*this) <<= pos`.

`constexpr bitset operator>>(size_t pos) const noexcept;`

12 *Returns*: `bitset(*this) >>= pos`.

`constexpr bitset& set() noexcept;`

13 *Effects*: Sets all bits in `*this`.

14 *Returns*: `*this`.

`constexpr bitset& set(size_t pos, bool val = true);`

15 *Effects*: Stores a new value in the bit at position `pos` in `*this`. If `val` is `true`, the stored value is one, otherwise it is zero.

16 *Returns*: `*this`.

17 *Throws*: `out_of_range` if `pos` does not correspond to a valid bit position.

`constexpr bitset& reset() noexcept;`

18 *Effects*: Resets all bits in `*this`.

19 *Returns*: `*this`.

`constexpr bitset& reset(size_t pos);`

20 *Effects*: Resets the bit at position `pos` in `*this`.

21 *Returns*: `*this`.

22 *Throws*: `out_of_range` if `pos` does not correspond to a valid bit position.

```
constexpr bitset operator~() const noexcept;
```

23 *Effects*: Constructs an object `x` of class `bitset` and initializes it with `*this`.

24 *Returns*: `x.flip()`.

```
constexpr bitset& flip() noexcept;
```

25 *Effects*: Toggles all bits in `*this`.

26 *Returns*: `*this`.

```
constexpr bitset& flip(size_t pos);
```

27 *Effects*: Toggles the bit at position `pos` in `*this`.

28 *Returns*: `*this`.

29 *Throws*: `out_of_range` if `pos` does not correspond to a valid bit position.

```
constexpr bool operator[](size_t pos) const;
```

30 *Hardened preconditions*: `pos < size()` is `true`.

31 *Returns*: `true` if the bit at position `pos` in `*this` has the value one, otherwise `false`.

32 *Throws*: Nothing.

```
constexpr bitset::reference operator[](size_t pos);
```

33 *Hardened preconditions*: `pos < size()` is `true`.

34 *Returns*: An object of type `bitset::reference` such that `(*this)[pos] == this->test(pos)`, and such that `(*this)[pos] = val` is equivalent to `this->set(pos, val)`.

35 *Throws*: Nothing.

36 *Remarks*: For the purpose of determining the presence of a data race (6.9.2), any access or update through the resulting reference potentially accesses or modifies, respectively, the entire underlying bitset.

```
constexpr unsigned long to_ulong() const;
```

37 *Returns*: `x`.

38 *Throws*: `overflow_error` if the integral value `x` corresponding to the bits in `*this` cannot be represented as type `unsigned long`.

```
constexpr unsigned long long to_ullong() const;
```

39 *Returns*: `x`.

40 *Throws*: `overflow_error` if the integral value `x` corresponding to the bits in `*this` cannot be represented as type `unsigned long long`.

```
template<class charT = char,
         class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
  constexpr basic_string<charT, traits, Allocator>
    to_string(charT zero = charT('0'), charT one = charT('1')) const;
```

41 *Effects*: Constructs a string object of the appropriate type and initializes it to a string of length `N` characters. Each character is determined by the value of its corresponding bit position in `*this`. Character position `N - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions. Bit value zero becomes the character `zero`, bit value one becomes the character `one`.

42 *Returns*: The created object.

```
constexpr size_t count() const noexcept;
```

43 *Returns*: A count of the number of bits set in `*this`.

```
constexpr size_t size() const noexcept;
```

44 *Returns*: `N`.

```
constexpr bool operator==(const bitset& rhs) const noexcept;
```

45 *Returns*: `true` if the value of each bit in `*this` equals the value of the corresponding bit in `rhs`.

```
constexpr bool test(size_t pos) const;
```

46 *Returns*: `true` if the bit at position `pos` in `*this` has the value one.

47 *Throws*: `out_of_range` if `pos` does not correspond to a valid bit position.

```
constexpr bool all() const noexcept;
```

48 *Returns*: `count() == size()`.

```
constexpr bool any() const noexcept;
```

49 *Returns*: `count() != 0`.

```
constexpr bool none() const noexcept;
```

50 *Returns*: `count() == 0`.

22.9.3 bitset hash support [bitset.hash]

```
template<size_t N> struct hash<bitset<N>>;
```

1 The specialization is enabled (22.10.19).

22.9.4 bitset operators [bitset.operators]

```
template<size_t N>
  constexpr bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

1 *Returns*: `bitset<N>(lhs) &= rhs`.

```
template<size_t N>
  constexpr bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

2 *Returns*: `bitset<N>(lhs) |= rhs`.

```
template<size_t N>
  constexpr bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

3 *Returns*: `bitset<N>(lhs) ^= rhs`.

```
template<class charT, class traits, size_t N>
  basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
```

4 A formatted input function (31.7.5.3).

5 *Effects*: Extracts up to `N` characters from `is`. Stores these characters in a temporary object `str` of type `basic_string<charT, traits>`, then evaluates the expression `x = bitset<N>(str)`. Characters are extracted and stored until any of the following occurs:

(5.1) — `N` characters have been extracted and stored;

(5.2) — end-of-file occurs on the input sequence;

(5.3) — the next input character is neither `is.widen('0')` nor `is.widen('1')` (in which case the input character is not extracted).

6 If `N > 0` and no characters are stored in `str`, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

7 *Returns*: `is`.

```
template<class charT, class traits, size_t N>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
```

8 *Returns*:

```
os << x.template to_string<charT, traits, allocator<charT>>(
  use_facet<ctype<charT>>(os.getloc()).widen('0'),
  use_facet<ctype<charT>>(os.getloc()).widen('1'))
```

(see 31.7.6.3).

22.10 Function objects [function.objects]

22.10.1 General [function.objects.general]

1 A *function object type* is an object type (6.8.1) that can be the type of the *postfix-expression* in a function call (7.6.1.3, 12.2.2.2).[194] A *function object* is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 26), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

22.10.2 Header `<functional>` synopsis [functional.syn]

```
namespace std {
  // 22.10.5, invoke
  template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)           // freestanding
      noexcept(is_nothrow_invocable_v<F, Args...>);

  template<class R, class F, class... Args>
    constexpr R invoke_r(F&& f, Args&&... args)                                    // freestanding
      noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

  // 22.10.6, reference_wrapper
  template<class T> class reference_wrapper;                                       // freestanding

  template<class T> constexpr reference_wrapper<T> ref(T&) noexcept;               // freestanding

      };

  template<class Fn, class... Args>
    concept nothrow-callable =                              // exposition only
      callable<Fn, Args...> &&
      requires (Fn&& fn, Args&&... args) {
        { std::forward<Fn>(fn)(std::forward<Args>(args)...) } noexcept;
      };

  template<class Fn, class... Args>
    using call-result-t = decltype(declval<Fn>()(declval<Args>()...));   // exposition only

  template<const auto& T>
    using decayed-typeof = decltype(auto(T));               // exposition only
}
```

1 [*Example 1*: If a C++ program wants to have a by-element addition of two vectors `a` and `b` containing `double` and put the result into `a`, it can do:

```
transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

— *end example*]

2 [*Example 2*: To negate every element of `a`:

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

— *end example*]

22.10.3 Definitions [func.def]

1 The following definitions apply to this Clause:

2 A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.

3 A *callable type* is a function object type (22.10) or a pointer to member.

4 A *callable object* is an object of a callable type.

5 A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.

6 A *call wrapper* is an object of a call wrapper type.

7 A *target object* is the callable object held by a call wrapper.

8 A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.

9 The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

22.10.4 Requirements [func.require]

1 Define *INVOKE*(`f`, t_1, t_2, ..., t_N) as follows:

(1.1) — (t_1`.*f`)(t_2, ..., t_N) when `f` is a pointer to a member function of a class `T` and `is_same_v<T, remove_cvref_t<decltype(`t_1`)>> || is_base_of_v<T, remove_cvref_t<decltype(`t_1`)>>` is `true`;

(1.2) — `(t`$_1$`.get().*f)(t`$_2$`, ..., t`$_N$`)` when `f` is a pointer to a member function of a class `T` and `remove_cvref_t<decltype(t`$_1$`)>` is a specialization of `reference_wrapper`;

(1.3) — `((*t`$_1$`).*f)(t`$_2$`, ..., t`$_N$`)` when `f` is a pointer to a member function of a class `T` and `t`$_1$ does not satisfy the previous two items;

(1.4) — `t`$_1$`.*f` when $N = 1$ and `f` is a pointer to data member of a class `T` and `is_same_v<T, remove_cvref_t<decltype(t`$_1$`)>> || is_base_of_v<T, remove_cvref_t<decltype(t`$_1$`)>>` is `true`;

(1.5) — `t`$_1$`.get().*f` when $N = 1$ and `f` is a pointer to data member of a class `T` and `remove_cvref_t<decltype(t`$_1$`)>` is a specialization of `reference_wrapper`;

(1.6) — `(*t`$_1$`).*f` when $N = 1$ and `f` is a pointer to data member of a class `T` and `t`$_1$ does not satisfy the previous two items;

(1.7) — `f(t`$_1$`, t`$_2$`, ..., t`$_N$`)` in all other cases.

2 Define *`INVOKE`*`<R>(f, t`$_1$`, t`$_2$`, ..., t`$_N$`)` as `static_cast<void>(`*`INVOKE`*`(f, t`$_1$`, t`$_2$`, ..., t`$_N$`))` if `R` is *cv* `void`, otherwise *`INVOKE`*`(f, t`$_1$`, t`$_2$`, ..., t`$_N$`)` implicitly converted to `R`. If `reference_converts_from_temporary_v<R, decltype(`*`INVOKE`*`(f, t`$_1$`, t`$_2$`, ..., t`$_N$`))>` is `true`, *`INVOKE`*`<R>(f, t`$_1$`, t`$_2$`, ..., t`$_N$`)` is ill-formed.

3 Every call wrapper (22.10.3) meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. An *argument forwarding call wrapper* is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

[*Note 1*: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

```
template<class... UnBoundArgs>
  constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
```

— *end note*]

4 A *perfect forwarding call wrapper* is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type `T` as *cv* `T&` when the call is performed on an lvalue of the call wrapper type and as *cv* `T&&` otherwise, where *cv* represents the cv-qualifiers of the call wrapper and where *cv* shall be neither `volatile` nor `const volatile`.

5 A *call pattern* defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.22) to an expression `e` determined from its call pattern `cp` by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.

6 A *simple call wrapper* is a perfect forwarding call wrapper that meets the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements and whose copy constructor, move constructor, and assignment operators are constexpr functions that do not throw exceptions.

7 The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).

[*Note 2*: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as `constexpr` if the corresponding implicit definition would be considered to be constexpr. — *end note*]

8 Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

22.10.5 invoke functions [func.invoke]

```
template<class F, class... Args>
  constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_v<F, Args...>);
```

1 *Constraints*: `is_invocable_v<F, Args...>` is `true`.

2 *Returns*: *`INVOKE`*`(std::forward<F>(f), std::forward<Args>(args)...)` (22.10.4).

```
template<class R, class F, class... Args>
  constexpr R invoke_r(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_r_v<R, F, Args...>);
```

3 *Constraints*: `is_invocable_r_v<R, F, Args...>` is `true`.

4 *Returns*: `INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...)` (22.10.4).

22.10.6 Class template `reference_wrapper` [refwrap]

22.10.6.1 General [refwrap.general]

```
namespace std {
  template<class T> class reference_wrapper {
  public:
    // types
    using type = T;

    // 22.10.6.2, constructors
    template<class U>
      constexpr reference_wrapper(U&&) noexcept(see below);
    constexpr reference_wrapper(const reference_wrapper& x) noexcept;

    // 22.10.6.3, assignment
    constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

    // 22.10.6.4, access
    constexpr operator T& () const noexcept;
    constexpr T& get() const noexcept;

    // 22.10.6.5, invocation
    template<class... ArgTypes>
      constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const
        noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);

    // 22.10.6.6, comparisons
    friend constexpr bool operator==(reference_wrapper, reference_wrapper);
    friend constexpr bool operator==(reference_wrapper, const T&);
    friend constexpr bool operator==(reference_wrapper, reference_wrapper<const T>);

    friend constexpr auto operator<=>(reference_wrapper, reference_wrapper);
    friend constexpr auto operator<=>(reference_wrapper, const T&);
    friend constexpr auto operator<=>(reference_wrapper, reference_wrapper<const T>);
  };

  template<class T>
    reference_wrapper(T&) -> reference_wrapper<T>;
}
```

1 `reference_wrapper<T>` is a *Cpp17CopyConstructible* and *Cpp17CopyAssignable* wrapper around a reference to an object or function of type `T`.

2 `reference_wrapper<T>` is a trivially copyable type (6.8.1).

3 The template parameter `T` of `reference_wrapper` may be an incomplete type.

[*Note 1*: Using the comparison operators described in 22.10.6.6 with `T` being an incomplete type can lead to an ill-formed program with no diagnostic required (13.8.4.1, 13.5.2.3). — *end note*]

22.10.6.2 Constructors [refwrap.const]

```
template<class U>
  constexpr reference_wrapper(U&& u) noexcept(see below);
```

1 Let *FUN* denote the exposition-only functions

```
void FUN(T&) noexcept;
void FUN(T&&) = delete;
```

2 *Constraints*: The expression *`FUN`*`(declval<U>())` is well-formed and `is_same_v<remove_cvref_t<U>, reference_wrapper>` is `false`.

3 *Effects*: Creates a variable `r` as if by `T& r = std::forward<U>(u)`, then constructs a `reference_wrapper` object that stores a reference to `r`.

4 *Remarks*: The exception specification is equivalent to `noexcept(`*`FUN`*`(declval<U>()))`.

```
constexpr reference_wrapper(const reference_wrapper& x) noexcept;
```

5 *Effects*: Constructs a `reference_wrapper` object that stores a reference to `x.get()`.

22.10.6.3 Assignment [refwrap.assign]

```
constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

1 *Postconditions*: `*this` stores a reference to `x.get()`.

22.10.6.4 Access [refwrap.access]

```
constexpr operator T& () const noexcept;
```

1 *Returns*: The stored reference.

```
constexpr T& get() const noexcept;
```

2 *Returns*: The stored reference.

22.10.6.5 Invocation [refwrap.invoke]

```
template<class... ArgTypes>
  constexpr invoke_result_t<T&, ArgTypes...>
    operator()(ArgTypes&&... args) const noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);
```

1 *Mandates*: `T` is a complete type.

2 *Returns*: *`INVOKE`*`(get(), std::forward<ArgTypes>(args)...)` (22.10.4).

22.10.6.6 Comparisons [refwrap.comparisons]

```
friend constexpr bool operator==(reference_wrapper x, reference_wrapper y);
```

1 *Constraints*: The expression `x.get() == y.get()` is well-formed and its result is convertible to `bool`.

2 *Returns*: `x.get() == y.get()`.

```
friend constexpr bool operator==(reference_wrapper x, const T& y);
```

3 *Constraints*: The expression `x.get() == y` is well-formed and its result is convertible to `bool`.

4 *Returns*: `x.get() == y`.

```
friend constexpr bool operator==(reference_wrapper x, reference_wrapper<const T> y);
```

5 *Constraints*: `is_const_v<T>` is `false` and the expression `x.get() == y.get()` is well-formed and its result is convertible to `bool`.

6 *Returns*: `x.get() == y.get()`.

```
friend constexpr auto operator<=>(reference_wrapper x, reference_wrapper y);
```

7 *Constraints*: The expression *`synth-three-way`*`(x.get(), y.get())` is well-formed.

8 *Returns*: *`synth-three-way`*`(x.get(), y.get())`.

```
friend constexpr auto operator<=>(reference_wrapper x, const T& y);
```

9 *Constraints*: The expression *`synth-three-way`*`(x.get(), y)` is well-formed.

10 *Returns*: *`synth-three-way`*`(x.get(), y)`.

```
friend constexpr auto operator<=>(reference_wrapper x, reference_wrapper<const T> y);
```

11 *Constraints*: `is_const_v<T>` is `false`. The expression *`synth-three-way`*`(x.get(), y.get())` is well-formed.

12 *Returns*: *`synth-three-way`*`(x.get(), y.get())`.

22.10.6.7 Helper functions [refwrap.helpers]

1 The template parameter `T` of the following `ref` and `cref` function templates may be an incomplete type.

```
template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;
```

2 *Returns*: `reference_wrapper<T>(t)`.

```
template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;
```

3 *Returns*: `t`.

```
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;
```

4 *Returns*: `reference_wrapper<const T>(t)`.

```
template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
```

5 *Returns*: `t`.

22.10.6.8 `common_reference` related specializations [refwrap.common.ref]

```
namespace std {
  template<class T>
    constexpr bool is-ref-wrapper = false;                           // exposition only

  template<class T>
    constexpr bool is-ref-wrapper<reference_wrapper<T>> = true;

  template<class R, class T, class RQ, class TQ>
    concept ref-wrap-common-reference-exists-with =                  // exposition only
      is-ref-wrapper<R> &&
      requires { typename common_reference_t<typename R::type&, TQ>; } &&
      convertible_to<RQ, common_reference_t<typename R::type&, TQ>>;

  template<class R, class T, template<class> class RQual, template<class> class TQual>
    requires (ref-wrap-common-reference-exists-with<R, T, RQual<R>, TQual<T>> &&
              !ref-wrap-common-reference-exists-with<T, R, TQual<T>, RQual<R>>)
  struct basic_common_reference<R, T, RQual, TQual> {
    using type = common_reference_t<typename R::type&, TQual<T>>;
  };

  template<class T, class R, template<class> class TQual, template<class> class RQual>
    requires (ref-wrap-common-reference-exists-with<R, T, RQual<R>, TQual<T>> &&
              !ref-wrap-common-reference-exists-with<T, R, TQual<T>, RQual<R>>)
  struct basic_common_reference<T, R, TQual, RQual> {
    using type = common_reference_t<typename R::type&, TQual<T>>;
  };
}
```

22.10.7 Arithmetic operations [arithmetic.operations]

22.10.7.1 General [arithmetic.operations.general]

1 The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

22.10.7.2 Class template `plus` [arithmetic.operations.plus]

```
template<class T = void> struct plus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x + y`.

```
template<> struct plus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) + std::forward<U>(u)`.

22.10.7.3 Class template `minus` [arithmetic.operations.minus]

```
template<class T = void> struct minus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x - y`.

```
template<> struct minus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) - std::forward<U>(u)`.

22.10.7.4 Class template `multiplies` [arithmetic.operations.multiplies]

```
template<class T = void> struct multiplies {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x * y`.

```
template<> struct multiplies<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) * std::forward<U>(u)`.

22.10.7.5 Class template `divides` [arithmetic.operations.divides]

```
template<class T = void> struct divides {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x / y`.

```
template<> struct divides<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) / std::forward<U>(u)`.

22.10.7.6 Class template `modulus` [arithmetic.operations.modulus]

```
template<class T = void> struct modulus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x % y`.

```
template<> struct modulus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) % std::forward<U>(u)`.

22.10.7.7 Class template `negate` [arithmetic.operations.negate]

```
template<class T = void> struct negate {
  constexpr T operator()(const T& x) const;
};
```

```
constexpr T operator()(const T& x) const;
```

1 *Returns*: `-x`.

```
template<> struct negate<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));
```

2 *Returns*: `-std::forward<T>(t)`.

22.10.8 Comparisons [comparisons]

22.10.8.1 General [comparisons.general]

1 The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

2 For templates `less`, `greater`, `less_equal`, and `greater_equal`, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.28).

[*Note 1*: If `a < b` is well-defined for pointers `a` and `b` of type `P`, then `(a < b) == less<P>()(a, b)`, `(a > b) == greater<P>()(a, b)`, and so forth. — *end note*]

For template specializations `less<void>`, `greater<void>`, `less_equal<void>`, and `greater_equal<void>`, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

22.10.8.2 Class template `equal_to` [comparisons.equal.to]

```
template<class T = void> struct equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x == y`.

```
template<> struct equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) == std::forward<U>(u)`.

22.10.8.3 Class template `not_equal_to` [comparisons.not.equal.to]

```
template<class T = void> struct not_equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x != y`.

```
template<> struct not_equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) != std::forward<U>(u)`.

22.10.8.4 Class template `greater` [comparisons.greater]

```
template<class T = void> struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x > y`.

```
template<> struct greater<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) > std::forward<U>(u)`.

22.10.8.5 Class template `less` [comparisons.less]

```
template<class T = void> struct less {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x < y`.

```
template<> struct less<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) < std::forward<U>(u)`.

22.10.8.6 Class template `greater_equal` [comparisons.greater.equal]

```
template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x >= y`.

```
template<> struct greater_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) >= std::forward<U>(u)`.

22.10.8.7 Class template `less_equal` [comparisons.less.equal]

```
template<class T = void> struct less_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x <= y`.

```
template<> struct less_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) <= std::forward<U>(u)`.

22.10.8.8 Class `compare_three_way` [comparisons.three.way]

```
namespace std {
  struct compare_three_way {
    template<class T, class U>
      constexpr auto operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
  };
}
```

```
template<class T, class U>
  constexpr auto operator()(T&& t, U&& u) const;
```

1 *Constraints*: `T` and `U` satisfy `three_way_comparable_with`.

2 *Preconditions*: If the expression `std::forward<T>(t) <=> std::forward<U>(u)` results in a call to a built-in operator `<=>` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2); otherwise, `T` and `U` model `three_way_comparable_with`.

3 *Effects*:

(3.1) — If the expression `std::forward<T>(t) <=> std::forward<U>(u)` results in a call to a built-in operator `<=>` comparing pointers of type `P`, returns `strong_ordering::less` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (3.28), `strong_ordering::greater` if `u` precedes `t`, and otherwise `strong_ordering::equal`.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) <=> std::forward<U>(u);`

22.10.9 Concept-constrained comparisons [range.cmp]

```
struct ranges::equal_to {
  template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

1 *Constraints*: `T` and `U` satisfy `equality_comparable_with`.

2 *Preconditions*: If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2); otherwise, `T` and `U` model `equality_comparable_with`.

3 *Effects*:

(3.1) — If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers: returns `false` if either (the converted value of) `t` precedes `u` or `u` precedes `t` in the implementation-defined strict total order over pointers (3.28) and otherwise `true`.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) == std::forward<U>(u);`

```
struct ranges::not_equal_to {
  template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

4 *Constraints*: `T` and `U` satisfy `equality_comparable_with`.

5 *Effects*: Equivalent to:

```
return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::greater {
  template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

6 *Constraints*: `T` and `U` satisfy `totally_ordered_with`.

7 *Effects*: Equivalent to:

```
return ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

```
  struct ranges::less {
    template<class T, class U>
      constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
  };
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

8 *Constraints*: `T` and `U` satisfy `totally_ordered_with`.

9 *Preconditions*: If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2); otherwise, `T` and `U` model `totally_ordered_with`. For any expressions `ET` and `EU` such that `decltype((ET))` is `T` and `decltype((EU))` is `U`, exactly one of `ranges::less{}(ET, EU)`, `ranges::less{}(EU, ET)`, or `ranges::equal_to{}(ET, EU)` is `true`.

10 *Effects*:

(10.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers: returns `true` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (3.28) and otherwise `false`.

(10.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```
  struct ranges::greater_equal {
    template<class T, class U>
      constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
  };
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

11 *Constraints*: `T` and `U` satisfy `totally_ordered_with`.

12 *Effects*: Equivalent to:

```
return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::less_equal {
  template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

```
template<class T, class U>
  constexpr bool operator()(T&& t, U&& u) const;
```

13 *Constraints*: `T` and `U` satisfy `totally_ordered_with`.

14 *Effects*: Equivalent to:

```
return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

22.10.10 Logical operations [logical.operations]

22.10.10.1 General [logical.operations.general]

1 The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

22.10.10.2 Class template `logical_and` [logical.operations.and]

```
template<class T = void> struct logical_and {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x && y`.

```
template<> struct logical_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) && std::forward<U>(u)`.

22.10.10.3 Class template `logical_or` [logical.operations.or]

```
template<class T = void> struct logical_or {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x || y`.

```
template<> struct logical_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) || std::forward<U>(u)`.

22.10.10.4 Class template `logical_not` [logical.operations.not]

```
template<class T = void> struct logical_not {
  constexpr bool operator()(const T& x) const;
};
```

```
constexpr bool operator()(const T& x) const;
```

1 *Returns*: `!x`.

```
template<> struct logical_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));
```

2 *Returns*: `!std::forward<T>(t)`.

22.10.11 Bitwise operations [bitwise.operations]

22.10.11.1 General [bitwise.operations.general]

1 The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template `bit_and` [bitwise.operations.and]

```
template<class T = void> struct bit_and {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x & y`.

```
template<> struct bit_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) & std::forward<U>(u)`.

22.10.11.3 Class template `bit_or` [bitwise.operations.or]

```
template<class T = void> struct bit_or {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x | y`.

```
template<> struct bit_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) | std::forward<U>(u)`.

22.10.11.4 Class template `bit_xor` [bitwise.operations.xor]

```
template<class T = void> struct bit_xor {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x ^ y`.

```
template<> struct bit_xor<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) ^ std::forward<U>(u)`.

22.10.11.5 Class template bit_not [bitwise.operations.not]

```
template<class T = void> struct bit_not {
  constexpr T operator()(const T& x) const;
};
```

```
constexpr T operator()(const T& x) const;
```

1 *Returns*: `~x`.

```
template<> struct bit_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));
```

2 *Returns*: `~std::forward<T>(t)`.

22.10.12 Class identity [func.identity]

```
struct identity {
  template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

  using is_transparent = unspecified;
};
```

```
template<class T>
  constexpr T&& operator()(T&& t) const noexcept;
```

1 *Effects*: Equivalent to: `return std::forward<T>(t);`

22.10.13 Function template not_fn [func.not.fn]

```
template<class F> constexpr unspecified not_fn(F&& f);
```

1 In the text that follows:

(1.1) — `g` is a value of the result of a `not_fn` invocation,

(1.2) — `FD` is the type `decay_t<F>`,

(1.3) — `fd` is the target object of `g` (22.10.3) of type `FD`, direct-non-list-initialized with `std::forward<F>(f)`,

(1.4) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

2 *Mandates*: `is_constructible_v<FD, F> && is_move_constructible_v<FD>` is `true`.

3 *Preconditions*: `FD` meets the *Cpp17MoveConstructible* requirements.

4 *Returns*: A perfect forwarding call wrapper (22.10.4) `g` with call pattern `!invoke(fd, call_args...)`.

5 *Throws*: Any exception thrown by the initialization of `fd`.

```
template<auto f> constexpr unspecified not_fn() noexcept;
```

6 In the text that follows:

(6.1) — `F` is the type of `f`,

(6.2) — `g` is a value of the result of a `not_fn` invocation,

(6.3) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

7 *Mandates*: If `is_pointer_v<F> || is_member_pointer_v<F>` is `true`, then `f != nullptr` is `true`.

8 *Returns*: A perfect forwarding call wrapper (22.10.4) `g` that does not have state entities, and has the call pattern `!invoke(f, call_args...)`.

22.10.14 Function templates `bind_front` and `bind_back` [func.bind.partial]

```
template<class F, class... Args>
  constexpr unspecified bind_front(F&& f, Args&&... args);
template<class F, class... Args>
  constexpr unspecified bind_back(F&& f, Args&&... args);
```

1 Within this subclause:

- (1.1) — `g` is a value of the result of a `bind_front` or `bind_back` invocation,
- (1.2) — `FD` is the type `decay_t<F>`,
- (1.3) — `fd` is the target object of `g` (22.10.3) of type `FD`, direct-non-list-initialized with `std::forward<F>(f)`,
- (1.4) — `BoundArgs` is a pack that denotes `decay_t<Args>...`,
- (1.5) — `bound_args` is a pack of bound argument entities of `g` (22.10.3) of types `BoundArgs...`, direct-non-list-initialized with `std::forward<Args>(args)...`, respectively, and
- (1.6) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

2 *Mandates*:

```
is_constructible_v<FD, F> &&
is_move_constructible_v<FD> &&
(is_constructible_v<BoundArgs, Args> && ...) &&
(is_move_constructible_v<BoundArgs> && ...)
```

is `true`.

3 *Preconditions*: `FD` meets the *Cpp17MoveConstructible* requirements. For each T_i in `BoundArgs`, if T_i is an object type, T_i meets the *Cpp17MoveConstructible* requirements.

4 *Returns*: A perfect forwarding call wrapper (22.10.4) `g` with call pattern:

- (4.1) — `invoke(fd, bound_args..., call_args...)` for a `bind_front` invocation, or
- (4.2) — `invoke(fd, call_args..., bound_args...)` for a `bind_back` invocation.

5 *Throws*: Any exception thrown by the initialization of the state entities of `g` (22.10.3).

```
template<auto f, class... Args>
  constexpr unspecified bind_front(Args&&... args);
template<auto f, class... Args>
  constexpr unspecified bind_back(Args&&... args);
```

6 Within this subclause:

- (6.1) — `F` is the type of `f`,
- (6.2) — `g` is a value of the result of a `bind_front` or `bind_back` invocation,
- (6.3) — `BoundArgs` is a pack that denotes `decay_t<Args>...`,
- (6.4) — `bound_args` is a pack of bound argument entities of `g` (22.10.3) of types `BoundArgs...`, direct-non-list-initialized with `std::forward<Args>(args)...`, respectively, and
- (6.5) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

7 *Mandates*:

- (7.1) — `(is_constructible_v<BoundArgs, Args> && ...)` is `true`, and
- (7.2) — `(is_move_constructible_v<BoundArgs> && ...)` is `true`, and
- (7.3) — if `is_pointer_v<F> || is_member_pointer_v<F>` is `true`, then `f != nullptr` is `true`.

8 *Preconditions*: For each T_i in `BoundArgs`, T_i meets the *Cpp17MoveConstructible* requirements.

9 *Returns*: A perfect forwarding call wrapper (22.10.4) `g` that does not have a target object, and has the call pattern:

- (9.1) — `invoke(f, bound_args..., call_args...)` for a `bind_front` invocation, or
- (9.2) — `invoke(f, call_args..., bound_args...)` for a `bind_back` invocation.

10 throws Any exception thrown by the initialization of `bound_args`.

22.10.15 Function object binders [func.bind]

22.10.15.1 General [func.bind.general]

1 Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

22.10.15.2 Class template `is_bind_expression` [func.bind.isbind]

```
namespace std {
  template<class T> struct is_bind_expression;  // see below
}
```

1 The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.

2 Specializations of the `is_bind_expression` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if `T` is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `true_type` to indicate that `T` should be treated as a subexpression in a `bind` call.

22.10.15.3 Class template `is_placeholder` [func.bind.isplace]

```
namespace std {
  template<class T> struct is_placeholder;      // see below
}
```

1 The class template `is_placeholder` can be used to detect the standard placeholders `_1`, `_2`, and so on (22.10.15.5). The function template `bind` uses `is_placeholder` to detect placeholders.

2 Specializations of the `is_placeholder` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has the base characteristic of `integral_constant<int, J>` if `T` is the type of `std::placeholders::_J`, otherwise it has a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `integral_constant<int, N>` with `N > 0` to indicate that `T` should be treated as a placeholder type.

22.10.15.4 Function template `bind` [func.bind.bind]

1 In the text that follows:

(1.1) — `g` is a value of the result of a `bind` invocation,

(1.2) — `FD` is the type `decay_t<F>`,

(1.3) — `fd` is an lvalue that is a target object of `g` (22.10.3) of type `FD` direct-non-list-initialized with `std::forward<F>(f)`,

(1.4) — T_i is the i^{th} type in the template parameter pack `BoundArgs`,

(1.5) — TD_i is the type `decay_t<`T_i`>`,

(1.6) — t_i is the i^{th} argument in the function parameter pack `bound_args`,

(1.7) — td_i is a bound argument entity of `g` (22.10.3) of type TD_i direct-non-list-initialized with `std::forward<`T_i`>(`t_i`)`,

(1.8) — U_j is the j^{th} deduced type of the `UnBoundArgs&&...` parameter of the argument forwarding call wrapper, and

(1.9) — u_j is the j^{th} argument associated with U_j.

```
template<class F, class... BoundArgs>
  constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
template<class R, class F, class... BoundArgs>
  constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

2 *Mandates*: `is_constructible_v<FD, F>` is `true`. For each T_i in `BoundArgs`, `is_constructible_v<`TD_i`, `T_i`>` is `true`.

3 *Preconditions*: `FD` and each TD_i meet the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. *`INVOKE`*`(fd, `w_1`, `w_2`, ..., `w_N`)` (22.10.4) is a valid expression for some values w_1, w_2, ..., w_N, where N has the value `sizeof...(bound_args)`.

4 *Returns*: An argument forwarding call wrapper `g` (22.10.4). A program that attempts to invoke a volatile-qualified `g` is ill-formed. When `g` is not volatile-qualified, invocation of `g(`u_1`, `u_2`, ..., `u_M`)` is expression-equivalent (3.22) to

```
INVOKE(static_cast<Vfd>(vfd),
       static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))
```

for the first overload, and

```
INVOKE<R>(static_cast<Vfd>(vfd),
          static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))
```

for the second overload, where the values and types of the target argument v_{fd} and of the bound arguments v_1, v_2, ..., v_N are determined as specified below.

5 *Throws*: Any exception thrown by the initialization of the state entities of `g`.

6 [*Note 1*: If all of `FD` and TD_i meet the requirements of *Cpp17CopyConstructible*, then the return type meets the requirements of *Cpp17CopyConstructible*. — *end note*]

7 The values of the *bound arguments* v_1, v_2, ..., v_N and their corresponding types V_1, V_2, ..., V_N depend on the types TD_i derived from the call to `bind` and the cv-qualifiers *cv* of the call wrapper `g` as follows:

(7.1) — if TD_i is `reference_wrapper<T>`, the argument is td_i`.get()` and its type V_i is `T&`;

(7.2) — if the value of `is_bind_expression_v<`TD_i`>` is `true`, the argument is

```
static_cast<cv TDi&>(tdi)(std::forward<Uj>(uj)...)
```

and its type V_i is `invoke_result_t<`*cv* TD_i`&, `U_j`...>&&`;

(7.3) — if the value `j` of `is_placeholder_v<`TD_i`>` is not zero, the argument is `std::forward<`U_j`>(`u_j`)` and its type V_i is U_j`&&`;

(7.4) — otherwise, the value is td_i and its type V_i is *cv* TD_i`&`.

8 The value of the target argument v_{fd} is `fd` and its corresponding type V_{fd} is *cv* `FD&`.

22.10.15.5 Placeholders [func.bind.place]

```
namespace std::placeholders {
  // M is the number of placeholders
  see below _1;
  see below _2;
              ⋮
  see below _M;
}
```

1 The number *M* of placeholders is implementation-defined.

2 All placeholder types meet the *Cpp17DefaultConstructible* and *Cpp17CopyConstructible* requirements, and their default constructors and copy/move constructors are constexpr functions that do not throw exceptions. It is implementation-defined whether placeholder types meet the *Cpp17CopyAssignable* requirements, but if so, their copy assignment operators are constexpr functions that do not throw exceptions.

3 Placeholders should be defined as:

```
inline constexpr unspecified _1{};
```

If they are not, they are declared as:

```
extern unspecified _1;
```

4 Placeholders are freestanding items (16.3.3.7).

22.10.16 Function template `mem_fn` [func.memfn]

```
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

1 *Returns*: A simple call wrapper (22.10.4) `fn` with call pattern `invoke(pmd, call_args...)`, where `pmd` is the target object of `fn` of type `R T::*` direct-non-list-initialized with `pm`, and `call_args` is an argument pack used in a function call expression (7.6.1.3) of `fn`.

22.10.17 Polymorphic function wrappers [func.wrap]

22.10.17.1 General [func.wrap.general]

1 Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

2 Let `t` be an object of a type that is a specialization of `function`, `copyable_function`, or `move_only_function`, such that the target object `x` of `t` has a type that is a specialization of `function`, `copyable_function`, or `move_only_function`. Each argument of the invocation of `x` evaluated as part of the invocation of `t` may alias an argument in the same position in the invocation of `t` that has the same type, even if the corresponding parameter is not of reference type.

[*Example 1*:

```
move_only_function<void(T)>
  f{copyable_function<void(T)>{[](T) {}}};
T t;
f(t);                                   // it is unspecified how many copies of T are made
```

— *end example*]

3 *Recommended practice*: Implementations should avoid double wrapping when constructing polymorphic wrappers from one another.

22.10.17.2 Class `bad_function_call` [func.wrap.badcall]

1 An exception of type `bad_function_call` is thrown by `function::operator()` (22.10.17.3.5) when the function wrapper object has no target.

```
namespace std {
  class bad_function_call : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
  };
}
```

```
const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS.

22.10.17.3 Class template `function` [func.wrap.func]

22.10.17.3.1 General [func.wrap.func.general]

```
namespace std {
  template<class R, class... ArgTypes>
  class function<R(ArgTypes...)> {
  public:
    using result_type = R;

    // 22.10.17.3.2, construct/copy/destroy
    function() noexcept;
    function(nullptr_t) noexcept;
    function(const function&);
    function(function&&) noexcept;
    template<class F> function(F&&);

    function& operator=(const function&);
    function& operator=(function&&);
    function& operator=(nullptr_t) noexcept;
    template<class F> function& operator=(F&&);
    template<class F> function& operator=(reference_wrapper<F>) noexcept;

    ~function();

    // 22.10.17.3.3, function modifiers
    void swap(function&) noexcept;

    // 22.10.17.3.4, function capacity
    explicit operator bool() const noexcept;
    // 22.10.17.3.5, function invocation
    R operator()(ArgTypes...) const;

    // 22.10.17.3.6, function target access
    const type_info& target_type() const noexcept;
    template<class T>       T* target() noexcept;
    template<class T> const T* target() const noexcept;
  };

  template<class R, class... ArgTypes>
    function(R(*)(ArgTypes...)) -> function<R(ArgTypes...)>;

  template<class F> function(F) -> function<see below>;
}
```

1 The `function` class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).

2 The `function` class template is a call wrapper (22.10.3) whose call signature (22.10.3) is `R(ArgTypes...)`.

3 [*Note 1*: The types deduced by the deduction guides for `function` might change in future revisions of C++. — *end note*]

22.10.17.3.2 Constructors and destructor [func.wrap.func.con]

`function() noexcept;`

1 *Postconditions*: `!*this`.

`function(nullptr_t) noexcept;`

2 *Postconditions*: `!*this`.

`function(const function& f);`

3 *Postconditions*: `!*this` if `!f`; otherwise, the target object of `*this` is a copy of the target object of `f`.

4 *Throws*: Nothing if `f`'s target is a specialization of `reference_wrapper` or a function pointer. Otherwise, may throw `bad_alloc` or any exception thrown by the copy constructor of the stored callable object.

5 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`'s target is an object holding only a pointer or reference to an object and a member function pointer.

`function(function&& f) noexcept;`

6 *Postconditions*: If `!f`, `*this` has no target; otherwise, the target of `*this` is equivalent to the target of `f` before the construction, and `f` is in a valid state with an unspecified value.

7 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`'s target is an object holding only a pointer or reference to an object and a member function pointer.

`template<class F> function(F&& f);`

8 Let `FD` be `decay_t<F>`.

9 *Constraints*:

(9.1) — `is_same_v<remove_cvref_t<F>, function>` is `false`, and

(9.2) — `is_invocable_r_v<R, FD&, ArgTypes...>` is `true`.

10 *Mandates*:

(10.1) — `is_copy_constructible_v<FD>` is `true`, and

(10.2) — `is_constructible_v<FD, F>` is `true`.

11 *Preconditions*: `FD` meets the *Cpp17CopyConstructible* requirements.

12 *Postconditions*: `!*this` is `true` if any of the following hold:

(12.1) — `f` is a null function pointer value.

(12.2) — `f` is a null member pointer value.

(12.3) — `remove_cvref_t<F>` is a specialization of the `function` class template, and `!f` is `true`.

13 Otherwise, `*this` has a target object of type `FD` direct-non-list-initialized with `std::forward<F>(f)`.

14 *Throws*: Nothing if `FD` is a specialization of `reference_wrapper` or a function pointer type. Otherwise, may throw `bad_alloc` or any exception thrown by the initialization of the target object.

15 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f` refers to an object holding only a pointer or reference to an object and a member function pointer.

`template<class F> function(F) -> function<`*`see below`*`>;`

16 *Constraints*: `&F::operator()` is well-formed when treated as an unevaluated operand and either

(16.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G::*)(A...)` *cv* `&`$_{opt}$ `noexcept`$_{opt}$ or of the form `R(*)(G, A...) noexcept`$_{opt}$ for a type `G`, or

(16.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*)(A...) noexcept`$_{opt}$.

17 *Remarks*: The deduced type is `function<R(A...)>`.

18 [*Example 1*:

```
void f() {
  int i{5};
  function g = [&](double) { return i; };       // deduces function<int(double)>
}
```

— end example]

`function& operator=(const function& f);`

19 *Effects*: As if by `function(f).swap(*this);`

20 *Returns*: `*this`.

`function& operator=(function&& f);`

21 *Effects*: Replaces the target of `*this` with the target of `f`.

22 *Returns*: `*this`.

`function& operator=(nullptr_t) noexcept;`

23 *Effects*: If `*this != nullptr`, destroys the target of `this`.

24 *Postconditions*: `!(*this)`.

25 *Returns*: `*this`.

`template<class F> function& operator=(F&& f);`

26 *Constraints*: `is_invocable_r_v<R, decay_t<F>&, ArgTypes...>` is `true`.

27 *Effects*: As if by: `function(std::forward<F>(f)).swap(*this);`

28 *Returns*: `*this`.

`template<class F> function& operator=(reference_wrapper<F> f) noexcept;`

29 *Effects*: As if by: `function(f).swap(*this);`

30 *Returns*: `*this`.

`~function();`

31 *Effects*: If `*this != nullptr`, destroys the target of `this`.

22.10.17.3.3 Modifiers [func.wrap.func.mod]

`void swap(function& other) noexcept;`

1 *Effects*: Interchanges the target objects of `*this` and `other`.

22.10.17.3.4 Capacity [func.wrap.func.cap]

```
explicit operator bool() const noexcept;
```

1 *Returns*: `true` if `*this` has a target, otherwise `false`.

22.10.17.3.5 Invocation [func.wrap.func.inv]

```
R operator()(ArgTypes... args) const;
```

1 *Returns*: *`INVOKE`*`<R>(f, std::forward<ArgTypes>(args)...)` (22.10.4), where `f` is the target object (22.10.3) of `*this`.

2 *Throws*: `bad_function_call` if `!*this`; otherwise, any exception thrown by the target object.

22.10.17.3.6 Target access [func.wrap.func.targ]

```
const type_info& target_type() const noexcept;
```

1 *Returns*: If `*this` has a target of type `T`, `typeid(T)`; otherwise, `typeid(void)`.

```
template<class T>       T* target() noexcept;
template<class T> const T* target() const noexcept;
```

2 *Returns*: If `target_type() == typeid(T)` a pointer to the stored function target; otherwise a null pointer.

22.10.17.3.7 Null pointer comparison operator functions [func.wrap.func.nullptr]

```
template<class R, class... ArgTypes>
  bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
```

1 *Returns*: `!f`.

22.10.17.3.8 Specialized algorithms [func.wrap.func.alg]

```
template<class R, class... ArgTypes>
  void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```

1 *Effects*: As if by: `f1.swap(f2);`

22.10.17.4 Move-only wrapper [func.wrap.move]

22.10.17.4.1 General [func.wrap.move.general]

1 The header provides partial specializations of `move_only_function` for each combination of the possible replacements of the placeholders *cv*, *ref*, and *noex* where

(1.1) — *cv* is either const or empty,

(1.2) — *ref* is either `&`, `&&`, or empty, and

(1.3) — *noex* is either `true` or `false`.

2 For each of the possible combinations of the placeholders mentioned above, there is a placeholder *inv-quals* defined as follows:

(2.1) — If *ref* is empty, let *inv-quals* be *cv*`&`,

(2.2) — otherwise, let *inv-quals* be *cv ref*.

22.10.17.4.2 Class template `move_only_function` [func.wrap.move.class]

```
namespace std {
  template<class R, class... ArgTypes>
  class move_only_function<R(ArgTypes...) cv ref noexcept(noex)> {
  public:
    using result_type = R;

    // 22.10.17.4.3, constructors, assignment, and destructor
    move_only_function() noexcept;
    move_only_function(nullptr_t) noexcept;
    move_only_function(move_only_function&&) noexcept;
    template<class F> move_only_function(F&&);
    template<class T, class... Args>
      explicit move_only_function(in_place_type_t<T>, Args&&...);
    template<class T, class U, class... Args>
      explicit move_only_function(in_place_type_t<T>, initializer_list<U>, Args&&...);

    move_only_function& operator=(move_only_function&&);
    move_only_function& operator=(nullptr_t) noexcept;
    template<class F> move_only_function& operator=(F&&);

    ~move_only_function();

    // 22.10.17.4.4, invocation
    explicit operator bool() const noexcept;
    R operator()(ArgTypes...) cv ref noexcept(noex);

    // 22.10.17.4.5, utility
    void swap(move_only_function&) noexcept;
    friend void swap(move_only_function&, move_only_function&) noexcept;
    friend bool operator==(const move_only_function&, nullptr_t) noexcept;

  private:
    template<class VT>
      static constexpr bool is-callable-from = see below;       // exposition only
  };
}
```

1 The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

2 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for a small contained value.

[*Note 1*: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is `true`. — *end note*]

22.10.17.4.3 Constructors, assignment, and destructor [func.wrap.move.ctor]

```
template<class VT>
  static constexpr bool is-callable-from = see below;
```

1 If *noex* is `true`, *`is-callable-from`*`<VT>` is equal to:

```
is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

Otherwise, *`is-callable-from`*`<VT>` is equal to:

```
is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

```
move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;
```

2 *Postconditions*: `*this` has no target object.

```
move_only_function(move_only_function&& f) noexcept;
```

3 *Postconditions*: The target object of `*this` is the target object `f` had before construction, and `f` is in a valid state with an unspecified value.

```
template<class F> move_only_function(F&& f);
```

4 Let `VT` be `decay_t<F>`.

5 *Constraints*:

(5.1) — `remove_cvref_t<F>` is not the same type as `move_only_function`, and

(5.2) — `remove_cvref_t<F>` is not a specialization of `in_place_type_t`, and

(5.3) — *`is-callable-from`*`<VT>` is `true`.

6 *Mandates*: `is_constructible_v<VT, F>` is `true`.

7 *Preconditions*: `VT` meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is `true`, `VT` meets the *Cpp17MoveConstructible* requirements.

8 *Postconditions*: `*this` has no target object if any of the following hold:

(8.1) — `f` is a null function pointer value, or

(8.2) — `f` is a null member pointer value, or

(8.3) — `remove_cvref_t<F>` is a specialization of the `move_only_function` class template, and `f` has no target object.

Otherwise, `*this` has a target object of type `VT` direct-non-list-initialized with `std::forward<F>(f)`.

9 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class... Args>
  explicit move_only_function(in_place_type_t<T>, Args&&... args);
```

10 Let `VT` be `decay_t<T>`.

11 *Constraints*:

(11.1) — `is_constructible_v<VT, Args...>` is `true`, and

(11.2) — *`is-callable-from`*`<VT>` is `true`.

12 *Mandates*: `VT` is the same type as `T`.

13 *Preconditions*: `VT` meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is `true`, `VT` meets the *Cpp17MoveConstructible* requirements.

14 *Postconditions*: `*this` has a target object of type `VT` direct-non-list-initialized with `std::forward<Args>(args)...`.

15 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class U, class... Args>
  explicit move_only_function(in_place_type_t<T>, initializer_list<U> ilist, Args&&... args);
```

16 Let `VT` be `decay_t<T>`.

17 *Constraints*:

(17.1) — `is_constructible_v<VT, initializer_list<U>&, Args...>` is `true`, and

(17.2) — *`is-callable-from`*`<VT>` is `true`.

18 *Mandates*: `VT` is the same type as `T`.

19 *Preconditions*: `VT` meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is `true`, `VT` meets the *Cpp17MoveConstructible* requirements.

20 *Postconditions*: `*this` has a target object of type `VT` direct-non-list-initialized with `ilist, std::forward<Args>(args)...`.

21 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a function pointer or a specialization of `reference_wrapper`.

```
move_only_function& operator=(move_only_function&& f);
```

22 *Effects*: Equivalent to: `move_only_function(std::move(f)).swap(*this);`

23 *Returns*: `*this`.

```
move_only_function& operator=(nullptr_t) noexcept;
```

24 *Effects*: Destroys the target object of `*this`, if any.

25 *Returns*: `*this`.

```
template<class F> move_only_function& operator=(F&& f);
```

26 *Effects*: Equivalent to: `move_only_function(std::forward<F>(f)).swap(*this);`

27 *Returns*: `*this`.

```
~move_only_function();
```

28 *Effects*: Destroys the target object of `*this`, if any.

22.10.17.4.4 Invocation [func.wrap.move.inv]

```
explicit operator bool() const noexcept;
```

1 *Returns*: `true` if `*this` has a target object, otherwise `false`.

```
R operator()(ArgTypes... args) cv ref noexcept(noex);
```

2 *Preconditions*: `*this` has a target object.

3 *Effects*: Equivalent to:

```
  return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);
```

where `f` is an lvalue designating the target object of `*this` and `F` is the type of `f`.

22.10.17.4.5 Utility [func.wrap.move.util]

```
void swap(move_only_function& other) noexcept;
```

1 *Effects*: Exchanges the target objects of `*this` and `other`.

```
friend void swap(move_only_function& f1, move_only_function& f2) noexcept;
```

2 *Effects*: Equivalent to `f1.swap(f2)`.

```
friend bool operator==(const move_only_function& f, nullptr_t) noexcept;
```

3 *Returns*: `true` if `f` has no target object, otherwise `false`.

22.10.17.5 Copyable wrapper [func.wrap.copy]

22.10.17.5.1 General [func.wrap.copy.general]

1 The header provides partial specializations of `copyable_function` for each combination of the possible replacements of the placeholders *cv*, *ref*, and *noex* where

(1.1) — *cv* is either const or empty,

(1.2) — *ref* is either `&`, `&&`, or empty, and

(1.3) — *noex* is either `true` or `false`.

2 For each of the possible combinations of the placeholders mentioned above, there is a placeholder *inv-quals* defined as follows:

(2.1) — If *ref* is empty, let *inv-quals* be *cv*`&`,

(2.2) — otherwise, let *inv-quals* be *cv ref*.

22.10.17.5.2 Class template copyable_function [func.wrap.copy.class]

```
namespace std {
  template<class R, class... ArgTypes>
  class copyable_function<R(ArgTypes...) cv ref noexcept(noex)> {
  public:
    using result_type = R;

    // 22.10.17.5.3, constructors, assignments, and destructors
    copyable_function() noexcept;
    copyable_function(nullptr_t) noexcept;
    copyable_function(const copyable_function&);
    copyable_function(copyable_function&&) noexcept;
    template<class F> copyable_function(F&&);
    template<class T, class... Args>
      explicit copyable_function(in_place_type_t<T>, Args&&...);
    template<class T, class U, class... Args>
      explicit copyable_function(in_place_type_t<T>, initializer_list<U>, Args&&...);
    copyable_function& operator=(const copyable_function&);
    copyable_function& operator=(copyable_function&&);
    copyable_function& operator=(nullptr_t) noexcept;
    template<class F> copyable_function& operator=(F&&);

    ~copyable_function();

    // 22.10.17.5.4, invocation
    explicit operator bool() const noexcept;
    R operator()(ArgTypes...) cv ref noexcept(noex);

    // 22.10.17.5.5, utility
    void swap(copyable_function&) noexcept;
    friend void swap(copyable_function&, copyable_function&) noexcept;
    friend bool operator==(const copyable_function&, nullptr_t) noexcept;

  private:
    template<class VT>
      static constexpr bool is-callable-from = see below;        // exposition only
  };
}
```

1 The `copyable_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, copy, move, and call arbitrary callable objects, given a call signature.

2 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for a small contained value.

[*Note 1*: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is `true`. — *end note*]

22.10.17.5.3 Constructors, assignments, and destructors [func.wrap.copy.ctor]

```
template<class VT>
  static constexpr bool is-callable-from = see below;
```

1 If *noex* is `true`, *`is-callable-from`*`<VT>` is equal to:

```
is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

Otherwise, *`is-callable-from`*`<VT>` is equal to:

```
is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

```
copyable_function() noexcept;
copyable_function(nullptr_t) noexcept;
```

2 *Postconditions*: `*this` has no target object.

```
copyable_function(const copyable_function& f);
```

3 *Postconditions*: `*this` has no target object if `f` had no target object. Otherwise, the target object of `*this` is a copy of the target object of `f`.

4 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc`.

```
copyable_function(copyable_function&& f) noexcept;
```

5 *Postconditions*: The target object of `*this` is the target object `f` had before construction, and `f` is in a valid state with an unspecified value.

```
template<class F> copyable_function(F&& f);
```

6 Let `VT` be `decay_t<F>`.

7 *Constraints*:

(7.1) — `remove_cvref_t<F>` is not the same type as `copyable_function`, and

(7.2) — `remove_cvref_t<F>` is not a specialization of `in_place_type_t`, and

(7.3) — *`is-callable-from`*`<VT>` is `true`.

8 *Mandates*:

(8.1) — `is_constructible_v<VT, F>` is `true`, and

(8.2) — `is_copy_constructible_v<VT>` is `true`.

9 *Preconditions*: `VT` meets the *Cpp17Destructible* and *Cpp17CopyConstructible* requirements.

10 *Postconditions*: `*this` has no target object if any of the following hold:

(10.1) — `f` is a null function pointer value, or

(10.2) — `f` is a null member pointer value, or

(10.3) — `remove_cvref_t<F>` is a specialization of the `copyable_function` class template, and `f` has no target object.

Otherwise, `*this` has a target object of type `VT` direct-non-list-initialized with `std::forward<F>(f)`.

11 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class... Args>
  explicit copyable_function(in_place_type_t<T>, Args&&... args);
```

12 Let `VT` be `decay_t<T>`.

13 *Constraints*:

(13.1) — `is_constructible_v<VT, Args...>` is `true`, and

(13.2) — *`is-callable-from`*`<VT>` is `true`.

14 *Mandates*:

(14.1) — `VT` is the same type as `T`, and

(14.2) — `is_copy_constructible_v<VT>` is `true`.

15 *Preconditions*: `VT` meets the *Cpp17Destructible* and *Cpp17CopyConstructible* requirements.

16 *Postconditions*: `*this` has a target object of type `VT` direct-non-list-initialized with `std::forward<Args>(args)...`.

17 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a pointer or a specialization of `reference_wrapper`.

```
template<class T, class U, class... Args>
  explicit copyable_function(in_place_type_t<T>, initializer_list<U> ilist, Args&&... args);
```

18 Let `VT` be `decay_t<T>`.

19 *Constraints*:

(19.1) — `is_constructible_v<VT, initializer_list<U>&, Args...>` is `true`, and

(19.2) — *`is-callable-from`*`<VT>` is `true`.

20 *Mandates*:

(20.1) — `VT` is the same type as `T`, and

(20.2) — `is_copy_constructible_v<VT>` is `true`.

21 *Preconditions*: `VT` meets the *Cpp17Destructible* and *Cpp17CopyConstructible* requirements.

22 *Postconditions*: `*this` has a target object of type `VT` direct-non-list-initialized with `ilist, std::forward<Args>(args)...`.

23 *Throws*: Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a pointer or a specialization of `reference_wrapper`.

```
copyable_function& operator=(const copyable_function& f);
```

24 *Effects*: Equivalent to: `copyable_function(f).swap(*this);`

25 *Returns*: `*this`.

```
copyable_function& operator=(copyable_function&& f);
```

26 *Effects*: Equivalent to: `copyable_function(std::move(f)).swap(*this);`

27 *Returns*: `*this`.

```
copyable_function& operator=(nullptr_t) noexcept;
```

28 *Effects*: Destroys the target object of `*this`, if any.

29 *Returns*: `*this`.

```
template<class F> copyable_function& operator=(F&& f);
```

30 *Effects*: Equivalent to: `copyable_function(std::forward<F>(f)).swap(*this);`

31 *Returns*: `*this`.

```
~copyable_function();
```

32 *Effects*: Destroys the target object of `*this`, if any.

22.10.17.5.4 Invocation [func.wrap.copy.inv]

```
explicit operator bool() const noexcept;
```

1 *Returns*: `true` if `*this` has a target object, otherwise `false`.

```
R operator()(ArgTypes... args) cv ref noexcept(noex);
```

2 *Preconditions*: `*this` has a target object.

3 *Effects*: Equivalent to:

```
return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);
```

where `f` is an lvalue designating the target object of `*this` and `F` is the type of `f`.

22.10.17.5.5 Utility [func.wrap.copy.util]

```
void swap(copyable_function& other) noexcept;
```

1 *Effects*: Exchanges the target objects of `*this` and `other`.

```
friend void swap(copyable_function& f1, copyable_function& f2) noexcept;
```

2 *Effects*: Equivalent to `f1.swap(f2)`.

```
friend bool operator==(const copyable_function& f, nullptr_t) noexcept;
```

3 *Returns*: `true` if `f` has no target object, otherwise `false`.

22.10.17.6 Non-owning wrapper [func.wrap.ref]

22.10.17.6.1 General [func.wrap.ref.general]

1 The header provides partial specializations of `function_ref` for each combination of the possible replacements of the placeholders *cv* and *noex* where:

(1.1) — *cv* is either const or empty, and

(1.2) — *noex* is either `true` or `false`.

22.10.17.6.2 Class template `function_ref` [func.wrap.ref.class]

```
namespace std {
  template<class R, class... ArgTypes>
  class function_ref<R(ArgTypes...) cv noexcept(noex)> {
  public:
    // 22.10.17.6.3, constructors and assignment operators
    template<class F> function_ref(F*) noexcept;
    template<class F> constexpr function_ref(F&&) noexcept;
    template<auto f> constexpr function_ref(nontype_t<f>) noexcept;
    template<auto f, class U> constexpr function_ref(nontype_t<f>, U&&) noexcept;
    template<auto f, class T> constexpr function_ref(nontype_t<f>, cv T*) noexcept;
```

```
      constexpr function_ref(const function_ref&) noexcept = default;
      constexpr function_ref& operator=(const function_ref&) noexcept = default;
      template<class T> function_ref& operator=(T) = delete;

      // 22.10.17.6.4, invocation
      R operator()(ArgTypes...) const noexcept(noex);

    private:
      template<class... T>
        static constexpr bool is-invocable-using = see below;     // exposition only

      R (*thunk-ptr)(BoundEntityType, Args&&...) noexcept(noex);  // exposition only
      BoundEntityType bound-entity;                               // exposition only
    };

    // 22.10.17.6.5, deduction guides
    template<class F>
      function_ref(F*) -> function_ref<F>;
    template<auto f>
      function_ref(nontype_t<f>) -> function_ref<see below>;
    template<auto f, class T>
      function_ref(nontype_t<f>, T&&) -> function_ref<see below>;
  }
```

1 An object of class `function_ref<R(Args...)` *`cv`* `noexcept(`*`noex`*`)>` stores a pointer to function *`thunk-ptr`* and an object *`bound-entity`*. *`bound-entity`* has an unspecified trivially copyable type *`BoundEntityType`*, that models `copyable` and is capable of storing a pointer to object value or a pointer to function value. The type of *`thunk-ptr`* is `R(*)(`*`BoundEntityType`*`, Args&&...) noexcept(`*`noex`*`)`.

2 Each specialization of `function_ref` is a trivially copyable type (6.8.1) that models `copyable`.

3 Within 22.10.17.6, *`call-args`* is an argument pack with elements such that `decltype((`*`call-args`*`))...` denote `Args&&...` respectively.

22.10.17.6.3 Constructors and assignment operators [func.wrap.ref.ctor]

```
template<class... T>
  static constexpr bool is-invocable-using = see below;
```

1 If *noex* is `true`, *`is-invocable-using`*`<T...>` is equal to:

`is_nothrow_invocable_r_v<R, T..., ArgTypes...>`

Otherwise, *`is-invocable-using`*`<T...>` is equal to:

`is_invocable_r_v<R, T..., ArgTypes...>`

```
template<class F> function_ref(F* f) noexcept;
```

2 *Constraints*:

(2.1) — `is_function_v<F>` is `true`, and

(2.2) — *`is-invocable-using`*`<F>` is `true`.

3 *Preconditions*: `f` is not a null pointer.

4 *Effects*: Initializes *`bound-entity`* with `f`, and *`thunk-ptr`* with the address of a function *`thunk`* such that *`thunk`*`(`*`bound-entity`*`, `*`call-args`*`...)` is expression-equivalent (3.22) to `invoke_r<R>(f, `*`call-args`*`...)`.

```
template<class F> constexpr function_ref(F&& f) noexcept;
```

5 Let `T` be `remove_reference_t<F>`.

6 *Constraints*:

(6.1) — `remove_cvref_t<F>` is not the same type as `function_ref`,

(6.2) — `is_member_pointer_v<T>` is `false`, and

(6.3) — *`is-invocable-using`*`<`*`cv`*` T&>` is `true`.

7 *Effects*: Initializes *`bound-entity`* with `addressof(f)`, and *`thunk-ptr`* with the address of a function *`thunk`* such that *`thunk`*`(`*`bound-entity`*`, `*`call-args`*`...)` is expression-equivalent (3.22) to `invoke_r<R>(static_cast<`*`cv`*` T&>(f), `*`call-args`*`...)`.

```
template<auto f> constexpr function_ref(nontype_t<f>) noexcept;
```

8 Let `F` be `decltype(f)`.

9 *Constraints*: *`is-invocable-using`*`<F>` is `true`.

10 *Mandates*: If `is_pointer_v<F> || is_member_pointer_v<F>` is `true`, then `f != nullptr` is `true`.

11 *Effects*: Initializes *`bound-entity`* with a pointer to an unspecified object or null pointer value, and *`thunk-ptr`* with the address of a function *`thunk`* such that *`thunk`*`(`*`bound-entity`*`, `*`call-args`*`...)` is expression-equivalent (3.22) to `invoke_r<R>(f, `*`call-args`*`...)`.

```
template<auto f, class U>
  constexpr function_ref(nontype_t<f>, U&& obj) noexcept;
```

12 Let `T` be `remove_reference_t<U>` and `F` be `decltype(f)`.

13 *Constraints*:

(13.1) — `is_rvalue_reference_v<U&&>` is `false`, and

(13.2) — *`is-invocable-using`*`<F, `*`cv`*` T&>` is `true`.

14 *Mandates*: If `is_pointer_v<F> || is_member_pointer_v<F>` is `true`, then `f != nullptr` is `true`.

15 *Effects*: Initializes *`bound-entity`* with `addressof(obj)`, and *`thunk-ptr`* with the address of a function *`thunk`* such that *`thunk`*`(`*`bound-entity`*`, `*`call-args`*`...)` is expression-equivalent (3.22) to `invoke_r<R>(f, static_cast<`*`cv`*` T&>(obj), `*`call-args`*`...)`.

```
template<auto f, class T>
  constexpr function_ref(nontype_t<f>, cv T* obj) noexcept;
```

16 Let `F` be `decltype(f)`.

17 *Constraints*: *`is-invocable-using`*`<F, `*`cv`*` T*>` is `true`.

18 *Mandates*: If `is_pointer_v<F> || is_member_pointer_v<F>` is `true`, then `f != nullptr` is `true`.

19 *Preconditions*: If `is_member_pointer_v<F>` is `true`, `obj` is not a null pointer.

20 *Effects*: Initializes *`bound-entity`* with `obj`, and *`thunk-ptr`* with the address of a function *`thunk`* such that *`thunk`*`(`*`bound-entity`*`, `*`call-args`*`...)` is expression-equivalent (3.22) to `invoke_r<R>(f, obj, `*`call-args`*`...)`.

```
template<class T> function_ref& operator=(T) = delete;
```

21 *Constraints*:

(21.1) — `T` is not the same type as `function_ref`,

(21.2) — `is_pointer_v<T>` is `false`, and

(21.3) — `T` is not a specialization of `nontype_t`.

22.10.17.6.4 Invocation [func.wrap.ref.inv]

```
R operator()(ArgTypes... args) const noexcept(noex);
```

1 *Effects*: Equivalent to: `return `*`thunk-ptr`*`(`*`bound-entity`*`, std::forward<ArgTypes>(args)...);`

22.10.17.6.5 Deduction guides [func.wrap.ref.deduct]

```
template<class F>
  function_ref(F*) -> function_ref<F>;
```

1 *Constraints*: `is_function_v<F>` is `true`.

```
template<auto f>
  function_ref(nontype_t<f>) -> function_ref<see below>;
```

2 Let `F` be `remove_pointer_t<decltype(f)>`.

3 *Constraints*: `is_function_v<F>` is `true`.

4 *Remarks*: The deduced type is `function_ref<F>`.

```
template<auto f, class T>
  function_ref(nontype_t<f>, T&&) -> function_ref<see below>;
```

5 Let `F` be `decltype(f)`.

6 *Constraints*:

(6.1) — `F` is of the form `R(G::*)(A...)` *cv* `&`$_{opt}$ `noexcept(E)` for a type `G`, or

(6.2) — `F` is of the form `M G::*` for a type `G` and an object type `M`, in which case let `R` be `invoke_result_t<F, T&>`, `A...` be an empty pack, and `E` be `false`, or

(6.3) — `F` is of the form `R(*)(G, A...) noexcept(E)` for a type `G`.

7 *Remarks*: The deduced type is `function_ref<R(A...) noexcept(E)>`.

22.10.18 Searchers [func.search]

22.10.18.1 General [func.search.general]

1 Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence [`pat_first`, `pat_last`) in another sequence [`first`, `last`) that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.

2 Each specialization of a class template specified in 22.10.18 shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. Template parameters named

(2.1) — `ForwardIterator`,

(2.2) — `ForwardIterator1`,

(2.3) — `ForwardIterator2`,

(2.4) — `RandomAccessIterator`,

(2.5) — `RandomAccessIterator1`,

(2.6) — `RandomAccessIterator2`, and

(2.7) — `BinaryPredicate`

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 26.1. Template parameters named `Hash` shall meet the *Cpp17Hash* requirements (Table 37).

3 The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

22.10.18.2 Class template `default_searcher` [func.search.default]

```
namespace std {
  template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
  class default_searcher {
  public:
    constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                               BinaryPredicate pred = BinaryPredicate());

    template<class ForwardIterator2>
      constexpr pair<ForwardIterator2, ForwardIterator2>
        operator()(ForwardIterator2 first, ForwardIterator2 last) const;

  private:
    ForwardIterator1 pat_first_;        // exposition only
    ForwardIterator1 pat_last_;         // exposition only
    BinaryPredicate pred_;              // exposition only
  };
}
```

```
constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                           BinaryPredicate pred = BinaryPredicate());
```

1 *Effects*: Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

2 *Throws*: Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

```
template<class ForwardIterator2>
  constexpr pair<ForwardIterator2, ForwardIterator2>
    operator()(ForwardIterator2 first, ForwardIterator2 last) const;
```

3 *Effects*: Returns a pair of iterators `i` and `j` such that

(3.1) — `i == search(first, last, pat_first_, pat_last_, pred_)`, and

(3.2) — if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

22.10.18.3 Class template boyer_moore_searcher [func.search.bm]

```
namespace std {
  template<class RandomAccessIterator1,
           class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
           class BinaryPredicate = equal_to<>>
  class boyer_moore_searcher {
  public:
    boyer_moore_searcher(RandomAccessIterator1 pat_first,
                         RandomAccessIterator1 pat_last,
                         Hash hf = Hash(),
                         BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
      pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

  private:
    RandomAccessIterator1 pat_first_;    // exposition only
    RandomAccessIterator1 pat_last_;     // exposition only
    Hash hash_;                          // exposition only
    BinaryPredicate pred_;               // exposition only
  };
}
```

```
boyer_moore_searcher(RandomAccessIterator1 pat_first,
                     RandomAccessIterator1 pat_last,
                     Hash hf = Hash(),
                     BinaryPredicate pred = BinaryPredicate());
```

1 *Preconditions*: The value type of `RandomAccessIterator1` meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

2 Let `V` be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values `A` and `B` of type `V`, if `pred(A, B) == true`, then `hf(A) == hf(B)` is `true`.

3 *Effects*: Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

4 *Throws*: Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccess-Iterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
  pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates*: `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects*: Finds a subsequence of equal values in a sequence.

7 *Returns*: A pair of iterators `i` and `j` such that

(7.1) — i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*(i + n), *(pat_first_ + n)) != false, and

(7.2) — j == next(i, distance(pat_first_, pat_last_)).

Returns make_pair(first, first) if [pat_first_, pat_last_) is empty, otherwise returns make_-pair(last, last) if no such iterator is found.

8 *Complexity*: At most (last - first) * (pat_last_ - pat_first_) applications of the predicate.

22.10.18.4 Class template boyer_moore_horspool_searcher [func.search.bmh]

```
namespace std {
  template<class RandomAccessIterator1,
           class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
           class BinaryPredicate = equal_to<>>
  class boyer_moore_horspool_searcher {
  public:
    boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                  RandomAccessIterator1 pat_last,
                                  Hash hf = Hash(),
                                  BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
      pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

  private:
    RandomAccessIterator1 pat_first_;    // exposition only
    RandomAccessIterator1 pat_last_;     // exposition only
    Hash hash_;                          // exposition only
    BinaryPredicate pred_;               // exposition only
  };
}
```

```
boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                              RandomAccessIterator1 pat_last,
                              Hash hf = Hash(),
                              BinaryPredicate pred = BinaryPredicate());
```

1 *Preconditions*: The value type of RandomAccessIterator1 meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

2 Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

3 *Effects*: Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and pred_ with pred.

4 *Throws*: Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default constructor, copy constructor, or the copy assignment operator of the value type of RandomAccess-Iterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
  pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates*: RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

6 *Effects*: Finds a subsequence of equal values in a sequence.

7 *Returns*: A pair of iterators i and j such that

(7.1) — i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*(i + n), *(pat_first_ + n)) != false, and

(7.2) — j == next(i, distance(pat_first_, pat_last_)).

Returns `make_pair(first, first)` if [`pat_first_`, `pat_last_`) is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity*: At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

22.10.19 Class template `hash` [unord.hash]

1 The unordered associative containers defined in 23.5 use specializations of the class template `hash` (22.10.2) as the default hash function.

2 Each specialization of `hash` is either enabled or disabled, as described below.

[*Note 1*: Enabled specializations meet the *Cpp17Hash* requirements, and disabled specializations do not. — *end note*]

Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.

3 If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.

4 If `H` is a disabled specialization of `hash`, these values are `false`: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_move_assignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

[*Note 2*: This means that the specialization of `hash` exists, but any attempts to use it as a *Cpp17Hash* will be ill-formed. — *end note*]

5 An enabled specialization `hash<Key>` will:

(5.1) — meet the *Cpp17Hash* requirements (Table 37), with `Key` as the function call argument type, the *Cpp17DefaultConstructible* requirements (Table 30), the *Cpp17CopyAssignable* requirements (Table 34), the *Cpp17Swappable* requirements (16.4.4.3),

(5.2) — meet the requirement that if `k1 == k2` is `true`, `h(k1) == h(k2)` is also `true`, where `h` is an object of type `hash<Key>` and `k1` and `k2` are objects of type `Key`;

(5.3) — meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

22.11 Bit manipulation [bit]

22.11.1 General [bit.general]

1 The header `<bit>` provides components to access, manipulate and process both individual bits and bit sequences.

22.11.2 Header `<bit>` synopsis [bit.syn]

```
// all freestanding
namespace std {
  // 22.11.3, bit_cast
  template<class To, class From>
    constexpr To bit_cast(const From& from) noexcept;

  // 22.11.4, byteswap
  template<class T>
    constexpr T byteswap(T value) noexcept;

  // 22.11.5, integral powers of 2
  template<class T>
    constexpr bool has_single_bit(T x) noexcept;
  template<class T>
    constexpr T bit_ceil(T x);
  template<class T>
    constexpr T bit_floor(T x) noexcept;
  template<class T>
    constexpr int bit_width(T x) noexcept;
  // 22.11.6, rotating
  template<class T>
    constexpr T rotl(T x, int s) noexcept;
  template<class T>
    constexpr T rotr(T x, int s) noexcept;

  // 22.11.7, counting
  template<class T>
    constexpr int countl_zero(T x) noexcept;
  template<class T>
    constexpr int countl_one(T x) noexcept;
  template<class T>
    constexpr int countr_zero(T x) noexcept;
  template<class T>
    constexpr int countr_one(T x) noexcept;
  template<class T>
    constexpr int popcount(T x) noexcept;

  // 22.11.8, endian
  enum class endian {
    little = see below,
    big    = see below,
    native = see below
  };
}
```

22.11.3 Function template bit_cast [bit.cast]

```
template<class To, class From>
  constexpr To bit_cast(const From& from) noexcept;
```

1 *Constraints*:

(1.1) — `sizeof(To) == sizeof(From)` is `true`;

(1.2) — `is_trivially_copyable_v<To>` is `true`; and

(1.3) — `is_trivially_copyable_v<From>` is `true`.

2 *Returns*: An object of type `To`. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of `from`. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object's type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of `from` or corresponds to a bit for which the smallest enclosing object is not within its lifetime or has an indeterminate value (6.7.5). A bit in the value representation of the result is erroneous if it corresponds to a bit for which the smallest enclosing object has an erroneous value. For each bit b in the value representation of the result that is indeterminate or erroneous, let u be the smallest object containing that bit enclosing b:

(2.1) — If u is of unsigned ordinary character type or `std::byte` type, u has an indeterminate value if any of the bits in its value representation are indeterminate, or otherwise has an erroneous value.

(2.2) — Otherwise, if b is indeterminate, the behavior is undefined.

(2.3) — Otherwise, the behavior is erroneous, and the result is as specified above.

The result does not otherwise contain any indeterminate or erroneous values.

3 *Remarks*: This function is `constexpr` if and only if `To`, `From`, and the types of all subobjects of `To` and `From` are types `T` such that:

(3.1) — `is_union_v<T>` is `false`;

(3.2) — `is_pointer_v<T>` is `false`;

(3.3) — `is_member_pointer_v<T>` is `false`;

(3.4) — `is_volatile_v<T>` is `false`; and

(3.5) — `T` has no non-static data members of reference type.

22.11.4 `byteswap` [bit.byteswap]

```
template<class T>
  constexpr T byteswap(T value) noexcept;
```

1 *Constraints*: `T` models `integral`.

2 *Mandates*: `T` does not have padding bits (6.8.1).

3 Let the sequence R comprise the bytes of the object representation of `value` in reverse order.

4 *Returns*: An object `v` of type `T` such that each byte in the object representation of `v` is equal to the byte in the corresponding position in R.

22.11.5 Integral powers of 2 [bit.pow.two]

```
template<class T>
  constexpr bool has_single_bit(T x) noexcept;
```

1 *Constraints*: `T` is an unsigned integer type (6.8.2).

2 *Returns*: `true` if `x` is an integral power of two; `false` otherwise.

```
template<class T>
  constexpr T bit_ceil(T x);
```

3 Let N be the smallest power of 2 greater than or equal to `x`.

4 *Constraints*: `T` is an unsigned integer type (6.8.2).

5 *Preconditions*: N is representable as a value of type `T`.

6 *Returns*: N.

7 *Throws*: Nothing.

8 *Remarks*: A function call expression that violates the precondition in the *Preconditions*: element is not a core constant expression (7.7).

```
template<class T>
  constexpr T bit_floor(T x) noexcept;
```

9 *Constraints*: `T` is an unsigned integer type (6.8.2).

10 *Returns*: If `x == 0`, `0`; otherwise the maximal value `y` such that `has_single_bit(y)` is `true` and `y <= x`.

```
template<class T>
  constexpr int bit_width(T x) noexcept;
```

11 *Constraints*: `T` is an unsigned integer type (6.8.2).

12 *Returns*: If `x == 0`, `0`; otherwise one plus the base-2 logarithm of `x`, with any fractional part discarded.

22.11.6 Rotating [bit.rotate]

1 In the following descriptions, let `N` denote `numeric_limits<T>::digits`.

```
template<class T>
  constexpr T rotl(T x, int s) noexcept;
```

2 *Constraints*: `T` is an unsigned integer type (6.8.2).

3 Let `r` be `s % N`.

4 *Returns*: If `r` is `0`, `x`; if `r` is positive, `(x << r) | (x >> (N - r))`; if `r` is negative, `rotr(x, -r)`.

```
template<class T>
  constexpr T rotr(T x, int s) noexcept;
```

5 *Constraints*: `T` is an unsigned integer type (6.8.2).

6 Let `r` be `s % N`.

7 *Returns*: If `r` is `0`, `x`; if `r` is positive, `(x >> r) | (x << (N - r))`; if `r` is negative, `rotl(x, -r)`.

22.11.7 Counting [bit.count]

1 In the following descriptions, let `N` denote `numeric_limits<T>::digits`.

```
template<class T>
  constexpr int countl_zero(T x) noexcept;
```

2 *Constraints*: `T` is an unsigned integer type (6.8.2).

3 *Returns*: The number of consecutive `0` bits in the value of `x`, starting from the most significant bit.
[*Note 1*: Returns `N` if `x == 0`. — *end note*]

```
template<class T>
  constexpr int countl_one(T x) noexcept;
```

4 *Constraints*: `T` is an unsigned integer type (6.8.2).

5 *Returns*: The number of consecutive `1` bits in the value of `x`, starting from the most significant bit.
[*Note 2*: Returns `N` if `x == numeric_limits<T>::max()`. — *end note*]

```
template<class T>
  constexpr int countr_zero(T x) noexcept;
```

6 *Constraints*: `T` is an unsigned integer type (6.8.2).

7 *Returns*: The number of consecutive `0` bits in the value of `x`, starting from the least significant bit.
[*Note 3*: Returns `N` if `x == 0`. — *end note*]

```
template<class T>
  constexpr int countr_one(T x) noexcept;
```

8 *Constraints*: `T` is an unsigned integer type (6.8.2).

9 *Returns*: The number of consecutive `1` bits in the value of `x`, starting from the least significant bit.
[*Note 4*: Returns `N` if `x == numeric_limits<T>::max()`. — *end note*]

```
template<class T>
  constexpr int popcount(T x) noexcept;
```

10 *Constraints*: `T` is an unsigned integer type (6.8.2).

11 *Returns*: The number of `1` bits in the value of `x`.

22.11.8 Endian [bit.endian]

1 Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```
enum class endian {
  little = see below,
  big    = see below,
  native = see below
};
```

2 If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

22.12 Header <stdbit.h> synopsis [stdbit.h.syn]

1 For a function template whose return type is not specified above, the return type is an implementation-defined unsigned integer type large enough to represent all possible result values. Each function template has the same semantics as the corresponding type-generic function with the same name specified in ISO/IEC 9899:2024, 7.18.

2 *Mandates*: `T` is an unsigned integer type.

3 Otherwise, the contents and meaning of the header `<stdbit.h>` are the same as the C standard library header `<stdbit.h>`.

23 Containers library [containers]

23.1 General [containers.general]

1 This Clause describes components that C++ programs may use to organize collections of information.

2 The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 72.

Table 72 — Containers library summary [tab:containers.summary]

	Subclause	Header
23.2	Requirements	
23.3	Sequence containers	`<array>`, `<deque>`, `<forward_list>`, `<hive>`, `<inplace_vector>`, `<list>`, `<vector>`
23.4	Associative containers	`<map>`, `<set>`
23.5	Unordered associative containers	`<unordered_map>`, `<unordered_set>`
23.6	Container adaptors	`<queue>`, `<stack>`, `<flat_map>`, `<flat_set>`
23.7	Views	`<span>`, `<mdspan>`

23.2 Requirements [container.requirements]

23.2.1 Preamble [container.requirements.pre]

1 Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

2 All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[*Example 1*: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — *end example*]

3 Allocator-aware containers (23.2.2.5) other than `basic_string` construct elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroy elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` (20.2.9.3), where `U` is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container.

[*Note 1*: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — *end note*]

23.2.2 General containers [container.requirements.general]

23.2.2.1 Introduction [container.intro.reqmts]

1 In 23.2.2,

(1.1) — `X` denotes a container class containing objects of type `T`,

(1.2) — `a` denotes a value of type `X`,

(1.3) — `b` and `c` denote values of type (possibly const) `X`,

(1.4) — `i` and `j` denote values of type (possibly const) `X::iterator`,

(1.5) — `u` denotes an identifier,

(1.6) — `v` denotes an lvalue of type (possibly const) `X` or an rvalue of type `const X`,

(1.7) — `s` and `t` denote non-const lvalues of type `X`, and

(1.8) — `rv` denotes a non-const rvalue of type `X`.

2 The following exposition-only concept is used in the definition of containers:

```
template<class R, class T>
concept container-compatible-range =     // exposition only
  ranges::input_range<R> && convertible_to<ranges::range_reference_t<R>, T>;
```

23.2.2.2 Container requirements [container.reqmts]

1 A type `X` meets the *container* requirements if the following types, statements, and expressions are well-formed and have the specified semantics.

`typename X::value_type`

2 *Result*: `T`

3 *Preconditions*: `T` is *Cpp17Erasable* from `X` (see 23.2.2.5, below).

`typename X::reference`

4 *Result*: `T&`

`typename X::const_reference`

5 *Result*: `const T&`

`typename X::iterator`

6 *Result*: A type that meets the forward iterator requirements (24.3.5.5) with value type `T`. The type `X::iterator` is convertible to `X::const_iterator`.

`typename X::const_iterator`

7 *Result*: A type that meets the requirements of a constant iterator and those of a forward iterator with value type `T`.

`typename X::difference_type`

8 *Result*: A signed integer type, identical to the difference type of `X::iterator` and `X::const_iterator`.

`typename X::size_type`

9 *Result*: An unsigned integer type that can represent any non-negative value of `X::difference_type`.

```
X u;
X u = X();
```

10 *Postconditions*: `u.empty()`

11 *Complexity*: Constant.

```
X u(v);
X u = v;
```

12 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X` (see below).

13 *Postconditions*: `u == v`.

14 *Complexity*: Linear.

```
X u(rv);
X u = rv;
```

15 *Postconditions*: `u` is equal to the value that `rv` had before this construction.

16 *Complexity*: Linear for `array` and `inplace_vector` and constant for all other standard containers.

`t = v;`

17 *Result*: `X&`.

18 *Postconditions*: `t == v`.

19 *Complexity*: Linear.

`t = rv`

20 *Result*: `X&`.

21 *Effects*: All existing elements of `t` are either move assigned to or destroyed.

22 *Postconditions*: If `t` and `rv` do not refer to the same object, `t` is equal to the value that `rv` had before this assignment.

23 *Complexity*: Linear.

`a.~X()`

24 *Result*: `void`.

25 *Effects*: Destroys every element of `a`; any memory obtained is deallocated.

26 *Complexity*: Linear.

`b.begin()`

27 *Result*: `iterator`; `const_iterator` for constant `b`.

28 *Returns*: An iterator referring to the first element in the container.

29 *Complexity*: Constant.

`b.end()`

30 *Result*: `iterator`; `const_iterator` for constant `b`.

31 *Returns*: An iterator which is the past-the-end value for the container.

32 *Complexity*: Constant.

`b.cbegin()`

33 *Result*: `const_iterator`.

34 *Returns*: `const_cast<X const&>(b).begin()`

35 *Complexity*: Constant.

`b.cend()`

36 *Result*: `const_iterator`.

37 *Returns*: `const_cast<X const&>(b).end()`

38 *Complexity*: Constant.

`i <=> j`

39 *Result*: `strong_ordering`.

40 *Constraints*: `X::iterator` meets the random access iterator requirements.

41 *Complexity*: Constant.

`c == b`

42 *Preconditions*: `T` meets the *Cpp17EqualityComparable* requirements.

43 *Result*: `bool`.

44 *Returns*: `equal(c.begin(), c.end(), b.begin(), b.end())`

[*Note 1*: The algorithm `equal` is defined in 26.6.13. — *end note*]

45 *Complexity*: Constant if `c.size() != b.size()`, linear otherwise.

46 *Remarks*: `==` is an equivalence relation.

`c != b`

47 *Effects*: Equivalent to `!(c == b)`.

`t.swap(s)`

48 *Result*: `void`.

49 *Effects*: Exchanges the contents of `t` and `s`.

50 *Complexity*: Linear for `array` and `inplace_vector`, and constant for all other standard containers.

`swap(t, s)`

51 *Effects*: Equivalent to `t.swap(s)`.

`c.size()`

52 *Result*: `size_type`.

53 *Returns*: `distance(c.begin(), c.end())`, i.e., the number of elements in the container.

54 *Complexity*: Constant.

55 *Remarks*: The number of elements is defined by the rules of constructors, inserts, and erases.

`c.max_size()`

56 *Result*: `size_type`.

57 *Returns*: `distance(begin(), end())` for the largest possible container.

58 *Complexity*: Constant.

`c.empty()`

59 *Result*: `bool`.

60 *Returns*: `c.begin() == c.end()`

61 *Complexity*: Constant.

62 *Remarks*: If the container is empty, then `c.empty()` is `true`.

63 In the expressions

```
i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j
```

where `i` and `j` denote objects of a container's `iterator` type, either or both may be replaced by an object of the container's `const_iterator` type referring to the same element with no change in semantics.

64 Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[*Note 2*: In particular, containers and iterators do not store references to allocated elements other than through the allocator's pointer type, i.e., as objects of type `P` or `pointer_traits<P>::template rebind<`*`unspecified`*`>`, where `P` is `allocator_traits<allocator_type>::pointer`. — *end note*]

Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument.

[*Note 3*: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — *end note*]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

(64.1) — `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`,

(64.2) — `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or

(64.3) — `allocator_traits<allocator_type>::propagate_on_container_swap::value`

is `true` within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

65 The expression `a.swap(b)`, for containers `a` and `b` of a standard container type other than `array` and `inplace_vector`, shall exchange the values of `a` and `b` without invoking any move, copy, or swap operations on the individual container elements. Any `Compare`, `Pred`, or `Hash` types belonging to `a` and `b` shall meet the *Cpp17Swappable* requirements and shall be exchanged by calling `swap` as described in 16.4.4.3. If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is `true`, then `allocator_type` shall meet the *Cpp17Swappable* requirements and the allocators of `a` and `b` shall also be exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.

66 Unless otherwise specified (see 23.2.7.2, 23.2.8.2, 23.3.5.4, 23.3.16.5, and 23.3.13.5) all container types defined in this Clause meet the following additional requirements:

(66.1) — If an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.

(66.2) — If an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.

(66.3) — No `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.

(66.4) — No copy constructor or assignment operator of a returned iterator throws an exception.

(66.5) — No `swap()` function throws an exception.

(66.6) — No `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[*Note 4*: The `end()` iterator does not refer to any element, so it can be invalidated. — *end note*]

67 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

68 A *contiguous container* is a container whose member types `iterator` and `const_iterator` meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) and model `contiguous_iterator` (24.3.4.14).

69 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type `A` shall not qualify as an allocator unless it meets both of the following conditions:

(69.1) — The *qualified-id* `A::value_type` is valid and denotes a type (13.10.3).

(69.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

23.2.2.3 Reversible container requirements [container.rev.reqmts]

1 A type `X` meets the *reversible container* requirements if `X` meets the container requirements, the iterator type of `X` belongs to the bidirectional or random access iterator categories (24.3), and the following types and expressions are well-formed and have the specified semantics.

```
typename X::reverse_iterator
```

2 *Result*: The type `reverse_iterator<X::iterator>`, an iterator type whose value type is `T`.

```
typename X::const_reverse_iterator
```

3 *Result*: The type `reverse_iterator<X::const_iterator>`, a constant iterator type whose value type is `T`.

```
a.rbegin()
```

4 *Result*: `reverse_iterator`; `const_reverse_iterator` for constant `a`.

5 *Returns*: `reverse_iterator(end())`

6 *Complexity*: Constant.

`a.rend()`

7 *Result*: `reverse_iterator`; `const_reverse_iterator` for constant `a`.

8 *Returns*: `reverse_iterator(begin())`

9 *Complexity*: Constant.

`a.crbegin()`

10 *Result*: `const_reverse_iterator`.

11 *Returns*: `const_cast<X const&>(a).rbegin()`

12 *Complexity*: Constant.

`a.crend()`

13 *Result*: `const_reverse_iterator`.

14 *Returns*: `const_cast<X const&>(a).rend()`

15 *Complexity*: Constant.

23.2.2.4 Optional container requirements [container.opt.reqmts]

1 The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the iterators passed to `lexicographical_compare_three_way` meet the constexpr iterator requirements (24.3.1) then the operations described below are implemented by constexpr functions.

`a <=> b`

2 *Result*: `synth-three-way-result<X::value_type>`.

3 *Preconditions*: Either `T` models `three_way_comparable`, or `<` is defined for values of type (possibly const) `T` and `<` is a total ordering relationship.

4 *Returns*: `lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(), synth-three-way)`

[*Note 1*: The algorithm `lexicographical_compare_three_way` is defined in Clause 26. — *end note*]

5 *Complexity*: Linear.

23.2.2.5 Allocator-aware containers [container.alloc.reqmts]

1 Except for `array` and `inplace_vector`, all of the containers defined in Clause 23, 19.6.4, 27.4.3, and 28.6.9 meet the additional requirements of an *allocator-aware container*, as described below.

2 Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` that denotes an lvalue of type `T` or `const T` or an rvalue of type `const T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware or is a specialization of `basic_string`, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

(2.1) — `T` is *Cpp17DefaultInsertable into* `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p)
```

(2.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression

```
allocator_traits<A>::construct(m, p)
```

where `p` is the address of the uninitialized storage for the element allocated within `X`.

(2.3) — `T` is *Cpp17MoveInsertable into* `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, rv)
```

and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation.

[*Note 1*: `rv` remains a valid object. Its state is unspecified. — *end note*]

(2.4) — `T` is *Cpp17CopyInsertable into `X`* means that, in addition to `T` being *Cpp17MoveInsertable* into `X`, the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, v)
```

and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

(2.5) — `T` is *Cpp17EmplaceConstructible into `X` from `args`*, for zero or more arguments `args`, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

(2.6) — `T` is *Cpp17Erasable from `X`* means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[*Note 2*: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default `construct` in `allocator` will call `::new((void*)p) T(args)`, but specialized allocators can choose a different definition. — *end note*]

3 In this subclause,

(3.1) — `X` denotes an allocator-aware container class with a `value_type` of `T` using an allocator of type `A`,

(3.2) — `u` denotes a variable,

(3.3) — `a` and `b` denote non-const lvalues of type `X`,

(3.4) — `c` denotes an lvalue of type `const X`,

(3.5) — `t` denotes an lvalue or a const rvalue of type `X`,

(3.6) — `rv` denotes a non-const rvalue of type `X`, and

(3.7) — `m` is a value of type `A`.

A type `X` meets the allocator-aware container requirements if `X` meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

```
typename X::allocator_type
```

4 *Result*: `A`

5 *Mandates*: `allocator_type::value_type` is the same as `X::value_type`.

```
c.get_allocator()
```

6 *Result*: `A`

7 *Complexity*: Constant.

```
X u;
X u = X();
```

8 *Preconditions*: `A` meets the *Cpp17DefaultConstructible* requirements.

9 *Postconditions*: `u.empty()` returns `true`, `u.get_allocator() == A()`.

10 *Complexity*: Constant.

```
X u(m);
```

11 *Postconditions*: `u.empty()` returns `true`, `u.get_allocator() == m`.

12 *Complexity*: Constant.

```
X u(t, m);
```

13 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X`.

14 *Postconditions*: `u == t`, `u.get_allocator() == m`.

15 *Complexity*: Linear.

```
X u(rv);
```

16 *Postconditions*: `u` has the same elements as `rv` had before this construction; the value of `u.get_-allocator()` is the same as the value of `rv.get_allocator()` before this construction.

17 *Complexity*: Constant.

`X u(rv, m);`

18 *Preconditions*: `T` is *Cpp17MoveInsertable* into `X`.

19 *Postconditions*: `u` has the same elements, or copies of the elements, that `rv` had before this construction, `u.get_allocator() == m`.

20 *Complexity*: Constant if `m == rv.get_allocator()`, otherwise linear.

`a = t`

21 *Result*: `X&`.

22 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

23 *Postconditions*: `a == t` is `true`.

24 *Complexity*: Linear.

`a = rv`

25 *Result*: `X&`.

26 *Preconditions*: If `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value` is `false`, `T` is *Cpp17MoveInsertable* into `X` and *Cpp17MoveAssignable*.

27 *Effects*: All existing elements of `a` are either move assigned to or destroyed.

28 *Postconditions*: If `a` and `rv` do not refer to the same object, `a` is equal to the value that `rv` had before this assignment.

29 *Complexity*: Linear.

`a.swap(b)`

30 *Result*: `void`

31 *Effects*: Exchanges the contents of `a` and `b`.

32 *Complexity*: Constant.

23.2.3 Container data races [container.requirements.dataraces]

1 For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.

2 Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.

3 [*Note 1*: For a `vector<int> x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently can result in a data race. As an exception to the general rule, for a `vector<bool> y`, `y[0] = true` can race with `y[1] = true`. — *end note*]

23.2.4 Sequence containers [sequence.reqmts]

1 A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides the following basic kinds of sequence containers: `vector`, `inplace_vector`, `forward_list`, `list`, and `deque`. In addition, `array` and `hive` are provided as sequence containers which provide limited sequence operations, in `array`'s case because it has a fixed number of elements, and in `hive`'s case because insertion order is unspecified. The library also provides container adaptors that make it easy to construct abstract data types, such as `stack`s, `queue`s, `flat_map`s, `flat_multimap`s, `flat_set`s, or `flat_multiset`s, out of the basic sequence container kinds (or out of other program-defined sequence containers).

2 In this subclause,

(2.1) — `X` denotes a sequence container class,

(2.2) — `a` denotes a value of type `X` containing elements of type `T`,

(2.3) — `u` denotes the name of a variable being declared,

(2.4) — `A` denotes `X::allocator_type` if the *qualified-id* `X::allocator_type` is valid and denotes a type (13.10.3) and `allocator<T>` if it doesn't, (2.5) — `i` and `j` denote iterators that meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`,

(2.6) — [`i`, `j`) denotes a valid range,

(2.7) — `rg` denotes a value of a type `R` that models *`container-compatible-range`*`<T>`,

(2.8) — `il` designates an object of type `initializer_list<value_type>`,

(2.9) — `n` denotes a value of type `X::size_type`,

(2.10) — `p` denotes a valid constant iterator to `a`,

(2.11) — `q` denotes a valid dereferenceable constant iterator to `a`,

(2.12) — [`q1`, `q2`) denotes a valid range of constant iterators in `a`,

(2.13) — `t` denotes an lvalue or a const rvalue of `X::value_type`, and

(2.14) — `rv` denotes a non-const rvalue of `X::value_type`.

(2.15) — `Args` denotes a template parameter pack;

(2.16) — `args` denotes a function parameter pack with the pattern `Args&&`.

3 The complexities of the expressions are sequence dependent.

4 A type `X` meets the *sequence container* requirements if `X` meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

```
X u(n, t);
```

5 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X`.

6 *Effects*: Constructs a sequence container with `n` copies of `t`.

7 *Postconditions*: `distance(u.begin(), u.end()) == n` is `true`.

```
X u(i, j);
```

8 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i`. For `vector`, if the iterator does not meet the *Cpp17ForwardIterator* requirements (24.3.5.5), `T` is also *Cpp17MoveInsertable* into `X`.

9 *Effects*: Constructs a sequence container equal to the range [`i`, `j`). Each iterator in the range [`i`, `j`) is dereferenced exactly once.

10 *Postconditions*: `distance(u.begin(), u.end()) == distance(i, j)` is `true`.

```
X(from_range, rg)
```

11 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `vector`, if `R` models `ranges::approximately_sized_range` but not `ranges::sized_range` or models `ranges::input_-range` but not `ranges::forward_range`, `T` is also *Cpp17MoveInsertable* into `X`.

12 *Effects*: Constructs a sequence container equal to the range `rg`. Each iterator in the range `rg` is dereferenced exactly once.

13 *Recommended practice*: If `R` models `ranges::approximately_sized_range` and `ranges::distance(rg) <= ranges::reserve_hint(rg)` is `true`, an implementation should not perform any reallocation.

14 *Postconditions*: `distance(begin(), end()) == ranges::distance(rg)` is `true`.

```
X(il)
```

15 *Effects*: Equivalent to `X(il.begin(), il.end())`.

```
a = il
```

16 *Result*: `X&`.

17 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

18 *Effects*: Assigns the range [`il.begin()`, `il.end()`) into `a`. All existing elements of `a` are either assigned to or destroyed.

19 *Returns*: `*this`.

`a.emplace(p, args)`

20 *Result*: `iterator`.

21 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `args`. For `vector`, `inplace_vector`, and `deque`, `T` is also *Cpp17MoveInsertable* into `X` and *Cpp17MoveAssignable*.

22 *Effects*: Inserts an object of type `T` constructed with `std::forward<Args>(args)...` before `p`.

[*Note 1*: `args` can directly or indirectly refer to a value in `a`. — *end note*]

23 *Returns*: An iterator that points to the new element.

`a.insert(p, t)`

24 *Result*: `iterator`.

25 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X`. For `vector`, `inplace_vector`, and `deque`, `T` is also *Cpp17CopyAssignable*.

26 *Effects*: Inserts a copy of `t` before `p`.

27 *Returns*: An iterator that points to the copy of `t` inserted into `a`.

`a.insert(p, rv)`

28 *Result*: `iterator`.

29 *Preconditions*: `T` is *Cpp17MoveInsertable* into `X`. For `vector`, `inplace_vector`, and `deque`, `T` is also *Cpp17MoveAssignable*.

30 *Effects*: Inserts a copy of `rv` before `p`.

31 *Returns*: An iterator that points to the copy of `rv` inserted into `a`.

`a.insert(p, n, t)`

32 *Result*: `iterator`.

33 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

34 *Effects*: Inserts `n` copies of `t` before `p`.

35 *Returns*: An iterator that points to the copy of the first element inserted into `a`, or `p` if `n == 0`.

`a.insert(p, i, j)`

36 *Result*: `iterator`.

37 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i`. For `vector`, `inplace_vector`, and `deque`, `T` is also *Cpp17MoveInsertable* into `X`, and `T` meets the *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and *Cpp17Swappable* (16.4.4.3) requirements. Neither `i` nor `j` are iterators into `a`.

38 *Effects*: Inserts copies of elements in [`i`, `j`) before `p`. Each iterator in the range [`i`, `j`) shall be dereferenced exactly once.

39 *Returns*: An iterator that points to the copy of the first element inserted into `a`, or `p` if `i == j`.

`a.insert_range(p, rg)`

40 *Result*: `iterator`.

41 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `vector`, `inplace_vector`, and `deque`, `T` is also *Cpp17MoveInsertable* into `X`, and `T` meets the *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and *Cpp17Swappable* (16.4.4.3) requirements. `rg` and `a` do not overlap.

42 *Effects*: Inserts copies of elements in `rg` before `p`. Each iterator in the range `rg` is dereferenced exactly once.

43 *Returns*: An iterator that points to the copy of the first element inserted into `a`, or `p` if `rg` is empty.

`a.insert(p, il)`

44 *Effects*: Equivalent to `a.insert(p, il.begin(), il.end())`.

`a.erase(q)`

45 *Result*: `iterator`.

46 *Preconditions*: For `vector`, `inplace_vector`, and `deque`, `T` is *Cpp17MoveAssignable*.

47 *Effects*: Erases the element pointed to by `q`.

48 *Returns*: An iterator that points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.

`a.erase(q1, q2)`

49 *Result*: `iterator`.

50 *Preconditions*: For `vector`, `inplace_vector`, and `deque`, `T` is *Cpp17MoveAssignable*.

51 *Effects*: Erases the elements in the range [`q1`, `q2`).

52 *Returns*: An iterator that points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

`a.clear()`

53 *Result*: `void`

54 *Effects*: Destroys all elements in `a`. Invalidates all references, pointers, and iterators referring to the elements of `a` and may invalidate the past-the-end iterator.

55 *Postconditions*: `a.empty()` is `true`.

56 *Complexity*: Linear.

`a.assign(i, j)`

57 *Result*: `void`

58 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i` and assignable from `*i`. For `vector`, if the iterator does not meet the forward iterator requirements (24.3.5.5), `T` is also *Cpp17MoveInsertable* into `X`. Neither `i` nor `j` are iterators into `a`.

59 *Effects*: Replaces elements in `a` with a copy of [`i`, `j`). Invalidates all references, pointers and iterators referring to the elements of `a`. For `vector` and `deque`, also invalidates the past-the-end iterator. Each iterator in the range [`i`, `j`) is dereferenced exactly once.

`a.assign_range(rg)`

60 *Result*: `void`

61 *Mandates*: `assignable_from<T&, ranges::range_reference_t<R>>` is modeled.

62 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `vector`, if `R` models `ranges::approximately_sized_range` but not `ranges::sized_range` or models `ranges::input_range` but not `ranges::forward_range`, `T` is also *Cpp17MoveInsertable* into `X`. `rg` and `a` do not overlap.

63 *Effects*: Replaces elements in `a` with a copy of each element in `rg`. Invalidates all references, pointers, and iterators referring to the elements of `a`. For `vector` and `deque`, also invalidates the past-the-end iterator. Each iterator in the range `rg` is dereferenced exactly once.

64 *Recommended practice*: If `R` models `ranges::approximately_sized_range` and `ranges::distance(rg) <= ranges::reserve_hint(rg)` is `true`, an implementation should not perform any reallocation.

`a.assign(il)`

65 *Effects*: Equivalent to `a.assign(il.begin(), il.end())`.

`a.assign(n, t)`

66 *Result*: `void`

67 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. `t` is not a reference into `a`.

68 *Effects*: Replaces elements in `a` with `n` copies of `t`. Invalidates all references, pointers and iterators referring to the elements of `a`. For `vector` and `deque`, also invalidates the past-the-end iterator.

69 For every sequence container defined in this Clause and in Clause 27:

(69.1) — If the constructor

```
template<class InputIterator>
  X(InputIterator first, InputIterator last,
    const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(69.2) — If the member functions of the forms:

```
template<class InputIterator>
  return-type F(const_iterator p,
                InputIterator first, InputIterator last);       // such as insert

template<class InputIterator>
  return-type F(InputIterator first, InputIterator last);       // such as append, assign

template<class InputIterator>
  return-type F(const_iterator i1, const_iterator i2,
                InputIterator first, InputIterator last);       // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

(69.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

70 The following operations are provided for some types of sequence containers but not others. Operations other than `prepend_range` and `append_range` are implemented so as to take amortized constant time.

`a.front()`

71 *Result*: `reference; const_reference` for constant `a`.

72 *Hardened preconditions*: `a.empty()` is `false`.

73 *Returns*: `*a.begin()`

74 *Remarks*: Required for `basic_string`, `array`, `deque`, `forward_list`, `inplace_vector`, `list`, and `vector`.

`a.back()`

75 *Result*: `reference; const_reference` for constant `a`.

76 *Hardened preconditions*: `a.empty()` is `false`.

77 *Effects*: Equivalent to:

```
auto tmp = a.end();
--tmp;
return *tmp;
```

78 *Remarks*: Required for `basic_string`, `array`, `deque`, `inplace_vector`, `list`, and `vector`.

`a.emplace_front(args)`

79 *Result*: `reference`

80 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `args`.

81 *Effects*: Prepends an object of type `T` constructed with `std::forward<Args>(args)...`.

82 *Returns*: `a.front()`.

83 *Remarks*: Required for `deque`, `forward_list`, and `list`.

`a.emplace_back(args)`

84 *Result*: `reference`

85 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `args`. For `vector`, `T` is also *Cpp17MoveInsertable* into `X`.

86 *Effects*: Appends an object of type `T` constructed with `std::forward<Args>(args)...`.

87 *Returns*: `a.back()`.

88 *Remarks*: Required for `deque`, `inplace_vector`, `list`, and `vector`.

`a.push_front(t)`

89 *Result*: `void`

90 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X`.

91 *Effects*: Prepends a copy of `t`.

92 *Remarks*: Required for `deque`, `forward_list`, and `list`.

`a.push_front(rv)`

93 *Result*: `void`

94 *Preconditions*: `T` is *Cpp17MoveInsertable* into `X`.

95 *Effects*: Prepends a copy of `rv`.

96 *Remarks*: Required for `deque`, `forward_list`, and `list`.

`a.prepend_range(rg)`

97 *Result*: `void`

98 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `deque`, `T` is also *Cpp17MoveInsertable* into `X`, and `T` meets the *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and *Cpp17Swappable* (16.4.4.3) requirements.

99 *Effects*: Inserts copies of elements in `rg` before `begin()`. Each iterator in the range `rg` is dereferenced exactly once.

[*Note 2*: The order of elements in `rg` is not reversed. — *end note*]

100 *Remarks*: Required for `deque`, `forward_list`, and `list`.

`a.push_back(t)`

101 *Result*: `void`

102 *Preconditions*: `T` is *Cpp17CopyInsertable* into `X`.

103 *Effects*: Appends a copy of `t`.

104 *Remarks*: Required for `basic_string`, `deque`, `inplace_vector`, `list`, and `vector`.

`a.push_back(rv)`

105 *Result*: `void`

106 *Preconditions*: `T` is *Cpp17MoveInsertable* into `X`.

107 *Effects*: Appends a copy of `rv`.

108 *Remarks*: Required for `basic_string`, `deque`, `inplace_vector`, `list`, and `vector`.

`a.append_range(rg)`

109 *Result*: `void`

110 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. For `vector`, `T` is also *Cpp17MoveInsertable* into `X`.

111 *Effects*: Inserts copies of elements in `rg` before `end()`. Each iterator in the range `rg` is dereferenced exactly once.

112 *Remarks*: Required for `deque`, `inplace_vector`, `list`, and `vector`.

`a.pop_front()`

113 *Result*: `void`

114 *Hardened preconditions*: `a.empty()` is `false`.

115 *Effects*: Destroys the first element.

116 *Remarks*: Required for `deque`, `forward_list`, and `list`.

`a.pop_back()`

117 *Result*: `void`

118 *Hardened preconditions*: `a.empty()` is `false`.

119 *Effects*: Destroys the last element.

120 *Remarks*: Required for `basic_string`, `deque`, `inplace_vector`, `list`, and `vector`.

`a[n]`

121 *Result*: `reference; const_reference` for constant `a`.

122 *Hardened preconditions*: `n < a.size()` is `true`.

123 *Effects*: Equivalent to: `return *(a.begin() + n);`

124 *Remarks*: Required for `basic_string`, `array`, `deque`, `inplace_vector`, and `vector`.

`a.at(n)`

125 *Result*: `reference; const_reference` for constant `a`.

126 *Returns*: `*(a.begin() + n)`

127 *Throws*: `out_of_range` if `n >= a.size()`.

128 *Remarks*: Required for `basic_string`, `array`, `deque`, `inplace_vector`, and `vector`.

23.2.5 Node handles [container.node]

23.2.5.1 Overview [container.node.overview]

1 A *node handle* is an object that accepts ownership of a single element from an associative container (23.2.7) or an unordered associative container (23.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 73.

Table 73 — Container types with compatible nodes [tab:container.node.compat]

`map<K, T, C1, A>`	`map<K, T, C2, A>`
`map<K, T, C1, A>`	`multimap<K, T, C2, A>`
`set<K, C1, A>`	`set<K, C2, A>`
`set<K, C1, A>`	`multiset<K, C2, A>`
`unordered_map<K, T, H1, E1, A>`	`unordered_map<K, T, H2, E2, A>`
`unordered_map<K, T, H1, E1, A>`	`unordered_multimap<K, T, H2, E2, A>`
`unordered_set<K, H1, E1, A>`	`unordered_set<K, H2, E2, A>`
`unordered_set<K, H1, E1, A>`	`unordered_multiset<K, H2, E2, A>`

2 If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

3 Class *`node-handle`* is for exposition only.

4 If a user-defined specialization of `pair` exists for `pair<const Key, T>` or `pair<Key, T>`, where `Key` is the container's `key_type` and `T` is the container's `mapped_type`, the behavior of operations involving node handles is undefined.

```
template<unspecified>
class node-handle {
public:
  // These type declarations are described in 23.2.7 and 23.2.8.
  using value_type     = see below;      // not present for map containers
  using key_type       = see below;      // not present for set containers
  using mapped_type    = see below;      // not present for set containers
  using allocator_type = see below;
private:
  using container_node_type = unspecified;                  // exposition only
  using ator_traits = allocator_traits<allocator_type>;     // exposition only

  typename ator_traits::template
    rebind_traits<container_node_type>::pointer ptr_;       // exposition only
  optional<allocator_type> alloc_;                          // exposition only

public:
  // 23.2.5.2, constructors, copy, and assignment
  constexpr node-handle() noexcept : ptr_(), alloc_() {}
  constexpr node-handle(node-handle&&) noexcept;
  constexpr node-handle& operator=(node-handle&&);

  // 23.2.5.3, destructor
  constexpr ~node-handle();

  // 23.2.5.4, observers
  constexpr value_type& value() const;          // not present for map containers
  key_type& key() const;                        // not present for set containers
  constexpr mapped_type& mapped() const;        // not present for set containers

  constexpr allocator_type get_allocator() const;
  constexpr explicit operator bool() const noexcept;
  constexpr bool empty() const noexcept;

  // 23.2.5.5, modifiers
  constexpr void swap(node-handle&)
    noexcept(ator_traits::propagate_on_container_swap::value ||
             ator_traits::is_always_equal::value);

  constexpr friend void swap(node-handle& x, node-handle& y) noexcept(noexcept(x.swap(y))) {
    x.swap(y);
  }
};
```

23.2.5.2 Constructors, copy, and assignment [container.node.cons]

`constexpr node-handle(node-handle&& nh) noexcept;`

1 *Effects*: Constructs a *`node-handle`* object initializing `ptr_` with `nh.ptr_`. Move constructs `alloc_` with `nh.alloc_`. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

`constexpr node-handle& operator=(node-handle&& nh);`

2 *Preconditions*: Either `!alloc_`, or `ator_traits::propagate_on_container_move_assignment::value` is `true`, or `alloc_ == nh.alloc_`.

3 *Effects*:

(3.1) — If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

(3.2) — Assigns `nh.ptr_` to `ptr_`.

(3.3) — If `!alloc_` or `ator_traits::propagate_on_container_move_assignment::value` is `true`, move assigns `nh.alloc_` to `alloc_`.

(3.4) — Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

4 *Returns*: `*this`.

5 *Throws*: Nothing.

23.2.5.3 Destructor [container.node.dtor]

```
constexpr ~node-handle();
```

1 *Effects*: If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

23.2.5.4 Observers [container.node.observers]

```
constexpr value_type& value() const;
```

1 *Preconditions*: `empty() == false`.

2 *Returns*: A reference to the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

3 *Throws*: Nothing.

```
key_type& key() const;
```

4 *Preconditions*: `empty() == false`.

5 *Returns*: A non-const reference to the `key_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

6 *Throws*: Nothing.

7 *Remarks*: Modifying the key through the returned reference is permitted.

```
constexpr mapped_type& mapped() const;
```

8 *Preconditions*: `empty() == false`.

9 *Returns*: A reference to the `mapped_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

10 *Throws*: Nothing.

```
constexpr allocator_type get_allocator() const;
```

11 *Preconditions*: `empty() == false`.

12 *Returns*: `*alloc_`.

13 *Throws*: Nothing.

```
constexpr explicit operator bool() const noexcept;
```

14 *Returns*: `ptr_ != nullptr`.

```
constexpr bool empty() const noexcept;
```

15 *Returns*: `ptr_ == nullptr`.

23.2.5.5 Modifiers [container.node.modifiers]

```
constexpr void swap(node-handle& nh)
  noexcept(ator_traits::propagate_on_container_swap::value ||
           ator_traits::is_always_equal::value);
```

1 *Preconditions*: `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is `true`, or `alloc_ == nh.alloc_`.

2 *Effects*: Calls `swap(ptr_, nh.ptr_)`. If `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is `true` calls `swap(alloc_, nh.alloc_)`.

23.2.6 Insert return type [container.insert.return]

1 The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

```
template<class Iterator, class NodeType>
struct insert-return-type
{
  Iterator position;
  bool     inserted;
  NodeType node;
};
```

2 The name *`insert-return-type`* is exposition only. *`insert-return-type`* has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

23.2.7 Associative containers [associative.reqmts]

23.2.7.1 General [associative.reqmts.general]

1 Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`. The library also provides container adaptors that make it easy to construct abstract data types, such as `flat_maps`, `flat_multimaps`, `flat_sets`, or `flat_multisets`, out of the basic sequence container kinds (or out of other program-defined sequence containers).

2 Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (26.8) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.

3 The phrase "equivalence of keys" means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`.

[*Note 1*: This is not necessarily the same as the result of `k1 == k2`. — *end note*]

For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

4 An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

6 `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[*Note 2*: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note*]

7 In this subclause,

(7.1) — `X` denotes an associative container class,

(7.2) — `a` denotes a value of type `X`,

(7.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 73),

(7.4) — `b` denotes a value of type `X` or `const X`,

(7.5) — `u` denotes the name of a variable being declared,

(7.6) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,

(7.7) — `a_eq` denotes a value of type `X` when `X` supports multiple keys,

(7.8) — `a_tran` denotes a value of type `X` or `const X` when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type (13.10.3),

(7.9) — `i` and `j` meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`,

(7.10) — [`i`, `j`) denotes a valid range, (7.11) — `rg` denotes a value of a type `R` that models *`container-compatible-range`*`<value_type>`,

(7.12) — `p` denotes a valid constant iterator to `a`,

(7.13) — `q` denotes a valid dereferenceable constant iterator to `a`,

(7.14) — `r` denotes a valid dereferenceable iterator to `a`,

(7.15) — [`q1`, `q2`) denotes a valid range of constant iterators in `a`,

(7.16) — `il` designates an object of type `initializer_list<value_type>`,

(7.17) — `t` denotes a value of type `X::value_type`,

(7.18) — `k` denotes a value of type `X::key_type`, and

(7.19) — `c` denotes a value of type `X::key_compare` or `const X::key_compare`;

(7.20) — `kl` is a value such that `a` is partitioned (26.8) with respect to `c(x, kl)`, with `x` the key value of `e` and `e` in `a`;

(7.21) — `ku` is a value such that `a` is partitioned with respect to `!c(ku, x)`, with `x` the key value of `e` and `e` in `a`;

(7.22) — `ke` is a value such that `a` is partitioned with respect to `c(x, ke)` and `!c(ke, x)`, with `c(x, ke)` implying `!c(ke, x)` and with `x` the key value of `e` and `e` in `a`;

(7.23) — `kx` is a value such that

(7.23.1) — `a` is partitioned with respect to `c(x, kx)` and `!c(kx, x)`, with `c(x, kx)` implying `!c(kx, x)` and with `x` the key value of `e` and `e` in `a`, and

(7.23.2) — `kx` is not convertible to either `iterator` or `const_iterator`; and

(7.24) — `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise,

(7.25) — `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

8 A type `X` meets the *associative container* requirements if `X` meets all the requirements of an allocator-aware container (23.2.2.5) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `map` and `multimap`, the requirements placed on `value_type` in 23.2.2.2 apply instead to `key_type` and `mapped_type`.

[*Note 3*: For example, in some cases `key_type` and `mapped_type` need to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. —*end note*]

```
typename X::key_type
```

9 *Result*: `Key`.

```
typename X::mapped_type
```

10 *Result*: `T`.

11 *Remarks*: For `map` and `multimap` only.

```
typename X::value_type
```

12 *Result*: `Key` for `set` and `multiset` only; `pair<const Key, T>` for `map` and `multimap` only.

13 *Preconditions*: `X::value_type` is *Cpp17Erasable* from `X`.

```
typename X::key_compare
```

14 *Result*: `Compare`.

15 *Preconditions*: `key_compare` is *Cpp17CopyConstructible*.

```
typename X::value_compare
```

16 *Result*: A binary predicate type. It is the same as `key_compare` for `set` and `multiset`; is an ordering relation on pairs induced by the first component (i.e., `Key`) for `map` and `multimap`.

```
typename X::node_type
```

17 *Result*: A specialization of the *`node-handle`* class template (23.2.5), such that the public nested types are the same types as the corresponding types in `X`.

`X(c)`

18 *Effects*: Constructs an empty container. Uses a copy of `c` as a comparison object.

19 *Complexity*: Constant.

```
X u = X();
X u;
```

20 *Preconditions*: `key_compare` meets the *Cpp17DefaultConstructible* requirements.

21 *Effects*: Constructs an empty container. Uses `Compare()` as a comparison object.

22 *Complexity*: Constant.

`X(i, j, c)`

23 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

24 *Effects*: Constructs an empty container and inserts elements from the range `[i, j)` into it; uses `c` as a comparison object.

25 *Complexity*: $N \log N$ in general, where N has the value `distance(i, j)`; linear if `[i, j)` is sorted with respect to `value_comp()`.

`X(i, j)`

26 *Preconditions*: `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

27 *Effects*: Constructs an empty container and inserts elements from the range `[i, j)` into it; uses `Compare()` as a comparison object.

28 *Complexity*: $N \log N$ in general, where N has the value `distance(i, j)`; linear if `[i, j)` is sorted with respect to `value_comp()`.

`X(from_range, rg, c)`

29 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

30 *Effects*: Constructs an empty container and inserts each element from `rg` into it. Uses `c` as the comparison object.

31 *Complexity*: $N \log N$ in general, where N has the value `ranges::distance(rg)`; linear if `rg` is sorted with respect to `value_comp()`.

`X(from_range, rg)`

32 *Preconditions*: `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

33 *Effects*: Constructs an empty container and inserts each element from `rg` into it. Uses `Compare()` as the comparison object.

34 *Complexity*: Same as `X(from_range, rg, c)`.

`X(il, c)`

35 *Effects*: Equivalent to `X(il.begin(), il.end(), c)`.

`X(il)`

36 *Effects*: Equivalent to `X(il.begin(), il.end())`.

`a = il`

37 *Result*: `X&`

38 *Preconditions*: `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

39 *Effects*: Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.

40 *Complexity*: $N \log N$ in general, where N has the value `il.size() + a.size()`; linear if `[il.begin(), il.end())` is sorted with respect to `value_comp()`.

`b.key_comp()`

41 *Result*: `X::key_compare`

42 *Returns*: The comparison object out of which `b` was constructed.

43 *Complexity*: Constant.

`b.value_comp()`

44 *Result*: `X::value_compare`

45 *Returns*: An object of `value_compare` constructed out of the comparison object.

46 *Complexity*: Constant.

`a_uniq.emplace(args)`

47 *Result*: `pair<iterator, bool>`

48 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

49 *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.

50 *Returns*: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.

51 *Complexity*: Logarithmic.

`a_eq.emplace(args)`

52 *Result*: `iterator`

53 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

54 *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...`. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

55 *Returns*: An iterator pointing to the newly inserted element.

56 *Complexity*: Logarithmic.

`a.emplace_hint(p, args)`

57 *Result*: `iterator`

58 *Effects*: Equivalent to `a.emplace(std::forward<Args>(args)...)`, except that the element is inserted as close as possible to the position just prior to `p`.

59 *Returns*: An iterator pointing to the element with the key equivalent to the newly inserted element.

60 *Complexity*: Logarithmic in general, but amortized constant if the element is inserted right before `p`.

`a_uniq.insert(t)`

61 *Result*: `pair<iterator, bool>`

62 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

63 *Effects*: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

64 *Returns*: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the `iterator` component of the pair points to the element with key equivalent to the key of `t`.

65 *Complexity*: Logarithmic.

`a_eq.insert(t)`

66 *Result*: `iterator`

67 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

68 *Effects*: Inserts `t` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

69 *Complexity*: Logarithmic.

`a.insert(p, t)`

70 *Result*: `iterator`

71 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

72 *Effects*: Inserts `t` if and only if there is no element with key equivalent to the key of `t` in containers with unique keys; always inserts `t` in containers with equivalent keys. `t` is inserted as close as possible to the position just prior to `p`.

73 *Returns*: An iterator pointing to the element with key equivalent to the key of `t`.

74 *Complexity*: Logarithmic in general, but amortized constant if `t` is inserted right before `p`.

`a.insert(i, j)`

75 *Result*: `void`

76 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

77 *Effects*: Inserts each element from the range [`i`, `j`) if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

78 *Complexity*: $N \log($`a.size()` $+ N)$, where N has the value `distance(i, j)`.

`a.insert_range(rg)`

79 *Result*: `void`

80 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

81 *Effects*: Inserts each element from `rg` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

82 *Complexity*: $N \log($`a.size()` $+ N)$, where N has the value `ranges::distance(rg)`.

`a.insert(il)`

83 *Effects*: Equivalent to `a.insert(il.begin(), il.end())`.

`a_uniq.insert(nh)`

84 *Result*: `insert_return_type`

85 *Preconditions*: `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is `true`.

86 *Effects*: If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`.

87 *Returns*: If `nh` is empty, `inserted` is `false`, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is `true`, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is `false`, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.

88 *Complexity*: Logarithmic.

`a_eq.insert(nh)`

89 *Result*: `iterator`

90 *Preconditions*: `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()` is `true`.

91 *Effects*: If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to `nh.key()` exists in `a_eq`, the element is inserted at the end of that range.

92 *Postconditions*: `nh` is empty.

93 *Complexity*: Logarithmic.

`a.insert(p, nh)`

94 *Result*: `iterator`

95 *Preconditions*: `nh` is empty or `a.get_allocator() == nh.get_allocator()` is `true`.

96 *Effects*: If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. The element is inserted as close as possible to the position just prior to `p`.

97 *Postconditions*: `nh` is empty if insertion succeeds, unchanged if insertion fails.

98 *Returns*: An iterator pointing to the element with key equivalent to `nh.key()`.

99 *Complexity*: Logarithmic in general, but amortized constant if the element is inserted right before `p`.

`a.extract(k)`

100 *Result*: `node_type`

101 *Effects*: Removes the first element in the container with key equivalent to `k`.

102 *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.

103 *Complexity*: log(`a.size()`)

`a_tran.extract(kx)`

104 *Result*: `node_type`

105 *Effects*: Removes the first element in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is `true`.

106 *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.

107 *Complexity*: log(`a_tran.size()`)

`a.extract(q)`

108 *Result*: `node_type`

109 *Effects*: Removes the element pointed to by `q`.

110 *Returns*: A `node_type` owning that element.

111 *Complexity*: Amortized constant.

`a.merge(a2)`

112 *Result*: `void`

113 *Preconditions*: `a.get_allocator() == a2.get_allocator()` is `true`.

114 *Effects*: Attempts to extract each element in `a2` and insert it into `a` using the comparison object of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`.

115 *Postconditions*: Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. If `a.begin()` and `a2.begin()` have the same type, iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into `a`, not into `a2`.

116 *Throws*: Nothing unless the comparison object throws.

117 *Complexity*: N log(`a.size()`+N), where N has the value `a2.size()`.

`a.erase(k)`

118 *Result*: `size_type`

119 *Effects*: Erases all elements in the container with key equivalent to `k`.

120 *Returns*: The number of erased elements.

121 *Complexity*: log(`a.size()`) + `a.count(k)`

`a_tran.erase(kx)`

122 *Result*: `size_type`

123 *Effects*: Erases all elements in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is `true`.

124 *Returns*: The number of erased elements.

125 *Complexity*: $\log($`a_tran.size()`$) +$ `a_tran.count(kx)`

`a.erase(q)`

126 *Result*: `iterator`

127 *Effects*: Erases the element pointed to by `q`.

128 *Returns*: An iterator pointing to the element immediately following `q` prior to the element being erased. If no such element exists, returns `a.end()`.

129 *Complexity*: Amortized constant.

`a.erase(r)`

130 *Result*: `iterator`

131 *Effects*: Erases the element pointed to by `r`.

132 *Returns*: An iterator pointing to the element immediately following `r` prior to the element being erased. If no such element exists, returns `a.end()`.

133 *Complexity*: Amortized constant.

`a.erase(q1, q2)`

134 *Result*: `iterator`

135 *Effects*: Erases all the elements in the range [`q1`, `q2`).

136 *Returns*: An iterator pointing to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

137 *Complexity*: $\log($`a.size()`$) + N$, where N has the value `distance(q1, q2)`.

`a.clear()`

138 *Effects*: Equivalent to `a.erase(a.begin(), a.end())`.

139 *Postconditions*: `a.empty()` is `true`.

140 *Complexity*: Linear in `a.size()`.

`b.find(k)`

141 *Result*: `iterator`; `const_iterator` for constant `b`.

142 *Returns*: An iterator pointing to an element with the key equivalent to `k`, or `b.end()` if such an element is not found.

143 *Complexity*: Logarithmic.

`a_tran.find(ke)`

144 *Result*: `iterator`; `const_iterator` for constant `a_tran`.

145 *Returns*: An iterator pointing to an element with key `r` such that `!c(r, ke) && !c(ke, r)` is `true`, or `a_tran.end()` if such an element is not found.

146 *Complexity*: Logarithmic.

`b.count(k)`

147 *Result*: `size_type`

148 *Returns*: The number of elements with key equivalent to `k`.

149 *Complexity*: $\log($`b.size()`$) +$ `b.count(k)`

`a_tran.count(ke)`

150 *Result*: `size_type`

151 *Returns*: The number of elements with key `r` such that `!c(r, ke) && !c(ke, r)`.

152 *Complexity*: log(`a_tran.size()`) + `a_tran.count(ke)`

`b.contains(k)`

153 *Result*: `bool`

154 *Effects*: Equivalent to: `return b.find(k) != b.end();`

`a_tran.contains(ke)`

155 *Result*: `bool`

156 *Effects*: Equivalent to: `return a_tran.find(ke) != a_tran.end();`

`b.lower_bound(k)`

157 *Result*: `iterator`; `const_iterator` for constant `b`.

158 *Returns*: An iterator pointing to the first element with key not less than `k`, or `b.end()` if such an element is not found.

159 *Complexity*: Logarithmic.

`a_tran.lower_bound(kl)`

160 *Result*: `iterator`; `const_iterator` for constant `a_tran`.

161 *Returns*: An iterator pointing to the first element with key `r` such that `!c(r, kl)`, or `a_tran.end()` if such an element is not found.

162 *Complexity*: Logarithmic.

`b.upper_bound(k)`

163 *Result*: `iterator`; `const_iterator` for constant `b`.

164 *Returns*: An iterator pointing to the first element with key greater than `k`, or `b.end()` if such an element is not found.

165 *Complexity*: Logarithmic.

`a_tran.upper_bound(ku)`

166 *Result*: `iterator`; `const_iterator` for constant `a_tran`.

167 *Returns*: An iterator pointing to the first element with key `r` such that `c(ku, r)`, or `a_tran.end()` if such an element is not found.

168 *Complexity*: Logarithmic.

`b.equal_range(k)`

169 *Result*: `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `b`.

170 *Effects*: Equivalent to: `return make_pair(b.lower_bound(k), b.upper_bound(k));`

171 *Complexity*: Logarithmic.

`a_tran.equal_range(ke)`

172 *Result*: `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `a_tran`.

173 *Effects*: Equivalent to: `return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));`

174 *Complexity*: Logarithmic.

175 The `insert`, `insert_range`, and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.

176 The `extract` members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

177 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to

construct them. For any two dereferenceable iterators `i` and `j` such that distance from `i` to `j` is positive, the following condition holds:

```
value_comp(*j, *i) == false
```

178 For associative containers with unique keys the stronger condition holds:

```
value_comp(*i, *j) != false
```

179 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

180 The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, `equal_range`, `erase`, and `extract` shall not participate in overload resolution unless the *qualified-id* `Compare::is_transparent` is valid and denotes a type (13.10.3). Additionally, the member function templates `extract` and `erase` shall not participate in overload resolution if `is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator>` is `true`, where `K` is the type substituted as the first template argument.

181 A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

(181.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(181.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(181.3) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

23.2.7.2 Exception safety guarantees [associative.reqmts.except]

1 For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).

2 For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

3 For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

23.2.8 Unordered associative containers [unord.req]

23.2.8.1 General [unord.req.general]

1 Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.

2 Unordered associative containers conform to the requirements for Containers (23.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.

3 Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the *Cpp17Hash* requirements (16.4.4.5) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.

4 The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.

5 Two values `k1` and `k2` are considered equivalent if the container's key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both.

[*Note 1*: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — *end note*]

For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

6 An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

7 For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.

8 For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[*Note 2*: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note*]

9 The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.

10 In this subclause,

(10.1) — `X` denotes an unordered associative container class,

(10.2) — `a` denotes a value of type `X`,

(10.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 73),

(10.4) — `b` denotes a value of type `X` or `const X`,

(10.5) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,

(10.6) — `a_eq` denotes a value of type `X` when `X` supports equivalent keys,

(10.7) — `a_tran` denotes a value of type `X` or `const X` when the *qualified-id*s `X::key_equal::is_transparent` and `X::hasher::is_transparent` are both valid and denote types (13.10.3),

(10.8) — `i` and `j` denote input iterators that refer to `value_type`,

(10.9) — `[i, j)` denotes a valid range,

(10.10) — `rg` denotes a value of a type `R` that models *`container-compatible-range`*`<value_type>`,

(10.11) — `p` and `q2` denote valid constant iterators to `a`,

(10.12) — `q` and `q1` denote valid dereferenceable constant iterators to `a`,

(10.13) — `r` denotes a valid dereferenceable iterator to `a`,

(10.14) — `[q1, q2)` denotes a valid range in `a`,

(10.15) — `il` denotes a value of type `initializer_list<value_type>`,

(10.16) — `t` denotes a value of type `X::value_type`,

(10.17) — `k` denotes a value of type `key_type`,

(10.18) — `hf` denotes a value of type `hasher` or `const hasher`,

(10.19) — `eq` denotes a value of type `key_equal` or `const key_equal`,

(10.20) — `ke` is a value such that

(10.20.1) — `eq(r1, ke) == eq(ke, r1)`,

(10.20.2) — `hf(r1) == hf(ke)` if `eq(r1, ke)` is `true`, and

(10.20.3) — if any two of `eq(r1, ke)`, `eq(r2, ke)`, and `eq(r1, r2)` are `true`, then all three are `true`,

where `r1` and `r2` are keys of elements in `a_tran`,

(10.21) — `kx` is a value such that

(10.21.1) — `eq(r1, kx) == eq(kx, r1)`,

(10.21.2) — `hf(r1) == hf(kx)` if `eq(r1, kx)` is `true`,

(10.21.3) — if any two of `eq(r1, kx)`, `eq(r2, kx)`, and `eq(r1, r2)` are `true`, then all three are `true`, and

(10.21.4) — `kx` is not convertible to either `iterator` or `const_iterator`,

where `r1` and `r2` are keys of elements in `a_tran`,

(10.22) — `n` denotes a value of type `size_type`,

(10.23) — `z` denotes a value of type `float`, and

(10.24) — `nh` denotes an rvalue of type `X::node_type`.

11 A type `X` meets the *unordered associative container* requirements if `X` meets all the requirements of an allocator-aware container (23.2.2.5) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in 23.2.2.2 apply instead to `key_type` and `mapped_type`.

[*Note 3*: For example, `key_type` and `mapped_type` sometimes need to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — *end note*]

`typename X::key_type`

12 *Result*: `Key`.

`typename X::mapped_type`

13 *Result*: `T`.

14 *Remarks*: For `unordered_map` and `unordered_multimap` only.

`typename X::value_type`

15 *Result*: `Key` for `unordered_set` and `unordered_multiset` only; `pair<const Key, T>` for `unordered_map` and `unordered_multimap` only.

16 *Preconditions*: `value_type` is *Cpp17Erasable* from `X`.

`typename X::hasher`

17 *Result*: `Hash`.

18 *Preconditions*: `Hash` is a unary function object type such that the expression `hf(k)` has type `size_t`.

`typename X::key_equal`

19 *Result*: `Pred`.

20 *Preconditions*: `Pred` meets the *Cpp17CopyConstructible* requirements. `Pred` is a binary predicate that takes two arguments of type `Key`. `Pred` is an equivalence relation.

`typename X::local_iterator`

21 *Result*: An iterator type whose category, value type, difference type, and pointer and reference types are the same as `X::iterator`'s.

[*Note 4*: A `local_iterator` object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — *end note*]

`typename X::const_local_iterator`

22 *Result*: An iterator type whose category, value type, difference type, and pointer and reference types are the same as `X::const_iterator`'s.

[*Note 5*: A `const_local_iterator` object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — *end note*] `typename X::node_type`

23 *Result*: A specialization of a ***`node-handle`*** class template (23.2.5), such that the public nested types are the same types as the corresponding types in `X`.

`X(n, hf, eq)`

24 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate.

25 *Complexity*: $\mathcal{O}(\texttt{n})$

`X(n, hf)`

26 *Preconditions*: `key_equal` meets the *Cpp17DefaultConstructible* requirements.

27 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate.

28 *Complexity*: $\mathcal{O}(\texttt{n})$

`X(n)`

29 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements.

30 *Effects*: Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate.

31 *Complexity*: $\mathcal{O}(\texttt{n})$

```
X a = X();
X a;
```

32 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements.

33 *Effects*: Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate.

34 *Complexity*: Constant.

`X(i, j, n, hf, eq)`

35 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

36 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from $[\texttt{i}, \texttt{j})$ into it.

37 *Complexity*: Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j, n, hf)`

38 *Preconditions*: `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17-EmplaceConstructible* into `X` from `*i`.

39 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from $[\texttt{i}, \texttt{j})$ into it.

40 *Complexity*: Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j, n)`

41 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

42 *Effects*: Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from $[\texttt{i}, \texttt{j})$ into it.

43 *Complexity*: Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(i, j)`

44 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

45 *Effects*: Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from $[\texttt{i}, \texttt{j})$ into it.

46 *Complexity*: Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n, hf, eq)`

47 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

48 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from `rg` into it.

49 *Complexity*: Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n, hf)`

50 *Preconditions*: `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17-EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

51 *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

52 *Complexity*: Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg, n)`

53 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

54 *Effects*: Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

55 *Complexity*: Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(from_range, rg)`

56 *Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

57 *Effects*: Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

58 *Complexity*: Average case $\mathcal{O}(N)$ (N is `ranges::distance(rg)`), worst case $\mathcal{O}(N^2)$.

`X(il)`

59 *Effects*: Equivalent to `X(il.begin(), il.end())`.

`X(il, n)`

60 *Effects*: Equivalent to `X(il.begin(), il.end(), n)`.

`X(il, n, hf)`

61 *Effects*: Equivalent to `X(il.begin(), il.end(), n, hf)`.

`X(il, n, hf, eq)`

62 *Effects*: Equivalent to `X(il.begin(), il.end(), n, hf, eq)`.

`X(b)`

63 *Effects*: In addition to the container requirements (23.2.2.2), copies the hash function, predicate, and maximum load factor.

64 *Complexity*: Average case linear in `b.size()`, worst case quadratic.

`a = b`

65 *Result*: `X&`

66 *Effects*: In addition to the container requirements, copies the hash function, predicate, and maximum load factor.

67 *Complexity*: Average case linear in `b.size()`, worst case quadratic.

`a = il`

68 *Result*: `X&`

69 *Preconditions*: `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

70 *Effects*: Assigns the range [`il.begin()`, `il.end()`) into `a`. All existing elements of `a` are either assigned to or destroyed.

71 *Complexity*: Average case linear in `il.size()`, worst case quadratic.

`b.hash_function()`

72 *Result*: `hasher`

73 *Returns*: `b`'s hash function.

74 *Complexity*: Constant.

`b.key_eq()`

75 *Result*: `key_equal`

76 *Returns*: `b`'s key equality predicate.

77 *Complexity*: Constant.

`a_uniq.emplace(args)`

78 *Result*: `pair<iterator, bool>`

79 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

80 *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.

81 *Returns*: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.

82 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_uniq.size()`$)$.

`a_eq.emplace(args)`

83 *Result*: `iterator`

84 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

85 *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...`.

86 *Returns*: An iterator pointing to the newly inserted element.

87 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_eq.size()`$)$.

`a.emplace_hint(p, args)`

88 *Result*: `iterator`

89 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

90 *Effects*: Equivalent to `a.emplace(std::forward<Args>(args)...)`.

91 *Returns*: An iterator pointing to the element with the key equivalent to the newly inserted element. The `const_iterator p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

92 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a_uniq.insert(t)`

93 *Result*: `pair<iterator, bool>`

94 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

95 *Effects*: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

96 *Returns*: The `bool` component of the returned pair indicates whether the insertion takes place, and the `iterator` component points to the element with key equivalent to the key of `t`.

97 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_uniq.size()`$)$.

`a_eq.insert(t)`

98 *Result*: `iterator`

99 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

100 *Effects*: Inserts `t`.

101 *Returns*: An iterator pointing to the newly inserted element.

102 *Complexity*: Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a_eq.size()`$)$.

`a.insert(p, t)`

103 *Result*: `iterator`

104 *Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

105 *Effects*: Equivalent to `a.insert(t)`. The iterator `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

106 *Returns*: An iterator pointing to the element with the key equivalent to that of `t`.

107 *Complexity*: Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a.size()`$)$.

`a.insert(i, j)`

108 *Result*: `void`

109 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

110 *Effects*: Equivalent to `a.insert(t)` for each element in `[i, j)`.

111 *Complexity*: Average case $\mathscr{O}(N)$, where N is `distance(i, j)`, worst case $\mathscr{O}(N($`a.size()`$+1))$.

`a.insert_range(rg)`

112 *Result*: `void`

113 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

114 *Effects*: Equivalent to `a.insert(t)` for each element `t` in `rg`.

115 *Complexity*: Average case $\mathscr{O}(N)$, where N is `ranges::distance(rg)`, worst case $\mathscr{O}(N($`a.size()`$+1))$.

`a.insert(il)`

116 *Effects*: Equivalent to `a.insert(il.begin(), il.end())`.

`a_uniq.insert(nh)`

117 *Result*: `insert_return_type`

118 *Preconditions*: `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is `true`.

119 *Effects*: If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`.

120 *Postconditions*: If `nh` is empty, `inserted` is `false`, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is `true`, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is `false`, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.

121 *Complexity*: Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a_uniq.size()`$)$.

`a_eq.insert(nh)`

122 *Result*: `iterator`

123 *Preconditions*: `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()` is `true`.

124 *Effects*: If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element.

125 *Postconditions*: `nh` is empty.

126 *Complexity*: Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a_eq.size()`$)$.

`a.insert(q, nh)`

127 *Result*: `iterator`

128 *Preconditions*: `nh` is empty or `a.get_allocator() == nh.get_allocator()` is `true`.

129 *Effects*: If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. The iterator `q` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

130 *Postconditions*: `nh` is empty if insertion succeeds, unchanged if insertion fails.

131 *Returns*: An iterator pointing to the element with key equivalent to `nh.key()`.

132 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a.extract(k)`

133 *Result*: `node_type`

134 *Effects*: Removes an element in the container with key equivalent to `k`.

135 *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.

136 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a_tran.extract(kx)`

137 *Result*: `node_type`

138 *Effects*: Removes an element in the container with key equivalent to `kx`.

139 *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.

140 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_tran.size()`$)$.

`a.extract(q)`

141 *Result*: `node_type`

142 *Effects*: Removes the element pointed to by `q`.

143 *Returns*: A `node_type` owning that element.

144 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a.merge(a2)`

145 *Result*: `void`

146 *Preconditions*: `a.get_allocator() == a2.get_allocator()`.

147 *Effects*: Attempts to extract each element in `a2` and insert it into `a` using the hash function and key equality predicate of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`.

148 *Postconditions*: Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements and all iterators referring to `a` will be invalidated, but iterators to elements remaining in `a2` will remain valid.

149 *Complexity*: Average case $\mathcal{O}(N)$, where N is `a2.size()`, worst case $\mathcal{O}(N$`*a.size() + N`$)$.

`a.erase(k)`

150 *Result*: `size_type`

151 *Effects*: Erases all elements with key equivalent to `k`.

152 *Returns*: The number of elements erased.

153 *Complexity*: Average case $\mathcal{O}($`a.count(k)`$)$, worst case $\mathcal{O}($`a.size()`$)$.

`a_tran.erase(kx)`

154 *Result*: `size_type`

155 *Effects*: Erases all elements with key equivalent to `kx`.

156 *Returns*: The number of elements erased.

157 *Complexity*: Average case $\mathcal{O}($`a_tran.count(kx)`$)$, worst case $\mathcal{O}($`a_tran.size()`$)$.

`a.erase(q)`

158 *Result*: `iterator`

159 *Effects*: Erases the element pointed to by `q`.

160 *Returns*: The iterator immediately following `q` prior to the erasure.

161 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a.erase(r)`

162 *Result*: `iterator`

163 *Effects*: Erases the element pointed to by `r`.

164 *Returns*: The iterator immediately following `r` prior to the erasure.

165 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

`a.erase(q1, q2)`

166 *Result*: `iterator`

167 *Effects*: Erases all elements in the range [`q1`, `q2`).

168 *Returns*: The iterator immediately following the erased elements prior to the erasure.

169 *Complexity*: Average case linear in `distance(q1, q2)`, worst case $\mathcal{O}($`a.size()`$)$.

`a.clear()`

170 *Result*: `void`

171 *Effects*: Erases all elements in the container.

172 *Postconditions*: `a.empty()` is `true`.

173 *Complexity*: Linear in `a.size()`.

`b.find(k)`

174 *Result*: `iterator`; `const_iterator` for constant `b`.

175 *Returns*: An iterator pointing to an element with key equivalent to `k`, or `b.end()` if no such element exists.

176 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`b.size()`$)$.

`a_tran.find(ke)`

177 *Result*: `iterator`; `const_iterator` for constant `a_tran`.

178 *Returns*: An iterator pointing to an element with key equivalent to `ke`, or `a_tran.end()` if no such element exists.

179 *Complexity*: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_tran.size()`$)$.

`b.count(k)`

180 *Result*: `size_type`

181 *Returns*: The number of elements with key equivalent to `k`.

182 *Complexity*: Average case $\mathcal{O}($`b.count(k)`$)$, worst case $\mathcal{O}($`b.size()`$)$.

`a_tran.count(ke)`

183 *Result*: `size_type`

184 *Returns*: The number of elements with key equivalent to `ke`.

185 *Complexity*: Average case $\mathcal{O}($`a_tran.count(ke)`$)$, worst case $\mathcal{O}($`a_tran.size()`$)$.

`b.contains(k)`

186 *Effects*: Equivalent to `b.find(k) != b.end()`.

`a_tran.contains(ke)`

187 *Effects*: Equivalent to `a_tran.find(ke) != a_tran.end()`.

`b.equal_range(k)`

188 *Result*: `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `b`.

189 *Returns*: A range containing all elements with keys equivalent to `k`. Returns `make_pair(b.end(), b.end())` if no such elements exist.

190 *Complexity*: Average case $\mathcal{O}($`b.count(k)`$)$, worst case $\mathcal{O}($`b.size()`$)$.

`a_tran.equal_range(ke)`

191 *Result*: `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `a_tran`.

192 *Returns*: A range containing all elements with keys equivalent to `ke`. Returns `make_pair(a_tran.end(), a_tran.end())` if no such elements exist.

193 *Complexity*: Average case $\mathcal{O}($`a_tran.count(ke)`$)$, worst case $\mathcal{O}($`a_tran.size()`$)$.

`b.bucket_count()`

194 *Result*: `size_type`

195 *Returns*: The number of buckets that `b` contains.

196 *Complexity*: Constant.

`b.max_bucket_count()`

197 *Result*: `size_type`

198 *Returns*: An upper bound on the number of buckets that `b` can ever contain.

199 *Complexity*: Constant.

`b.bucket(k)`

200 *Result*: `size_type`

201 *Preconditions*: `b.bucket_count() > 0`.

202 *Returns*: The index of the bucket in which elements with keys equivalent to `k` would be found, if any such element existed. The return value is in the range $[0,$`b.bucket_count()`$)$.

203 *Complexity*: Constant.

`a_tran.bucket(ke)`

204 *Result*: `size_type`

205 *Preconditions*: `a_tran.bucket_count() > 0`.

206 *Postconditions*: The return value is in the range $[0,$`a_tran.bucket_count()`$)$.

207 *Returns*: The index of the bucket in which elements with keys equivalent to `ke` would be found, if any such element existed.

208 *Complexity*: Constant.

`b.bucket_size(n)`

209 *Result*: `size_type`

210 *Preconditions*: `n` shall be in the range $[0,$`b.bucket_count()`$)$.

211 *Returns*: The number of elements in the $\texttt{n}^{\text{th}}$ bucket.

212 *Complexity*: $\mathcal{O}($`b.bucket_size(n)`$)$

`b.begin(n)`

213 *Result*: `local_iterator`; `const_local_iterator` for constant `b`.

214 *Preconditions*: `n` is in the range $[0,$`b.bucket_count()`$)$.

215 *Returns*: An iterator referring to the first element in the bucket. If the bucket is empty, then `b.begin(n) == b.end(n)`.

216 *Complexity*: Constant.

`b.end(n)`

217 *Result*: `local_iterator`; `const_local_iterator` for constant `b`.

218 *Preconditions*: `n` is in the range [`0`, `b.bucket_count()`).

219 *Returns*: An iterator which is the past-the-end value for the bucket.

220 *Complexity*: Constant.

`b.cbegin(n)`

221 *Result*: `const_local_iterator`

222 *Preconditions*: `n` shall be in the range [`0`, `b.bucket_count()`).

223 *Returns*: An iterator referring to the first element in the bucket. If the bucket is empty, then `b.cbegin(n) == b.cend(n)`.

224 *Complexity*: Constant.

`b.cend(n)`

225 *Result*: `const_local_iterator`

226 *Preconditions*: `n` is in the range [`0`, `b.bucket_count()`).

227 *Returns*: An iterator which is the past-the-end value for the bucket.

228 *Complexity*: Constant.

`b.load_factor()`

229 *Result*: `float`

230 *Returns*: The average number of elements per bucket.

231 *Complexity*: Constant.

`b.max_load_factor()`

232 *Result*: `float`

233 *Returns*: A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.

234 *Complexity*: Constant.

`a.max_load_factor(z)`

235 *Result*: `void`

236 *Preconditions*: `z` is positive. May change the container's maximum load factor, using `z` as a hint.

237 *Complexity*: Constant.

`a.rehash(n)`

238 *Result*: `void`

239 *Postconditions*: `a.bucket_count() >= a.size() / a.max_load_factor()` and `a.bucket_count() >= n`.

240 *Complexity*: Average case linear in `a.size()`, worst case quadratic.

`a.reserve(n)`

241 *Effects*: Equivalent to `a.rehash(ceil(n / a.max_load_factor()))`.

242 Two unordered containers `a` and `b` compare equal if `a.size() == b.size()` and, for every equivalent-key group [`Ea1`, `Ea2`) obtained from `a.equal_range(Ea1)`, there exists an equivalent-key group [`Eb1`, `Eb2`) obtained from `b.equal_range(Ea1)`, such that `is_permutation(Ea1, Ea2, Eb1, Eb2)` returns `true`. For `unordered_set` and `unordered_map`, the complexity of `operator==` (i.e., the number of calls to the `==` operator of the `value_type`, to the predicate returned by `key_eq()`, and to the hasher returned by `hash_function()`) is proportional to N in the average case and to N^2 in the worst case, where N is `a.size()`. For

unordered_multiset and unordered_multimap, the complexity of operator== is proportional to $\sum E_i^2$ in the average case and to N^2 in the worst case, where N is a.size(), and E_i is the size of the i^{th} equivalent-key group in a. However, if the respective elements of each corresponding pair of equivalent-key groups Ea_i and Eb_i are arranged in the same order (as is commonly the case, e.g., if a and b are unmodified copies of the same container), then the average-case complexity for unordered_multiset and unordered_multimap becomes proportional to N (but worst-case complexity remains $\mathcal{O}(N^2)$, e.g., for a pathologically bad hash function). The behavior of a program that uses operator== or operator!= on unordered containers is undefined unless the Pred function object has the same behavior for both containers and the equality comparison function for Key is a refinement[195] of the partition into equivalent-key groups produced by Pred.

243 The iterator types iterator and const_iterator of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both iterator and const_iterator are constant iterators.

244 The insert, insert_range, and emplace members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The erase members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

245 The insert, insert_range, and emplace members shall not affect the validity of iterators if (N + n) <= z * B, where N is the number of elements in the container prior to the insert operation, n is the number of elements inserted, B is the container's bucket count, and z is the container's maximum load factor.

246 The extract members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node_type is undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalidated if the element is successfully inserted.

247 The member function templates find, count, equal_range, contains, extract, erase, and bucket shall not participate in overload resolution unless the *qualified-id*s Pred::is_transparent and Hash::is_transparent are both valid and denote types (13.10.3). Additionally, the member function templates extract and erase shall not participate in overload resolution if is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator> is true, where K is the type substituted as the first template argument.

248 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

(248.1) — It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(248.2) — It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(248.3) — It has a Hash template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.

(248.4) — It has a Pred template parameter and a type that qualifies as an allocator is deduced for that parameter.

23.2.8.2 Exception safety guarantees [unord.req.except]

1 For unordered associative containers, no clear() function throws an exception. erase(k) does not throw an exception unless that exception is thrown by the container's Hash or Pred object (if any).

2 For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an insert or emplace function inserting a single element, the insertion has no effect.

3 For unordered associative containers, no swap function throws an exception unless that exception is thrown by the swap of the container's Hash or Pred object (if any).

4 For unordered associative containers, if an exception is thrown from within a rehash() function other than by the container's hash function or comparison function, the rehash() function has no effect.

195) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

23.3 Sequence containers [sequences]

23.3.1 General [sequences.general]

1 The headers `<array>` (23.3.2), `<deque>` (23.3.4), `<forward_list>` (23.3.6), `<inplace_vector>` (23.3.15), `<list>` (23.3.10), and `<vector>` (23.3.12) define class templates that meet the requirements for sequence containers.

2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
  using iter-value-type = typename iterator_traits<InputIterator>::value_type;   // exposition only
```

23.3.2 Header `<array>` synopsis [array.syn]

```
// mostly freestanding
#include <compare>                // see 17.12.1
#include <initializer_list>       // see 17.11.2

namespace std {
  // 23.3.3, class template array
  template<class T, size_t N> struct array;                             // partially freestanding

  template<class T, size_t N>
    constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
  template<class T, size_t N>
    constexpr synth-three-way-result<T>
      operator<=>(const array<T, N>& x, const array<T, N>& y);

  // 23.3.3.4, specialized algorithms
  template<class T, size_t N>
    constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

  // 23.3.3.6, array creation functions
  template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
  template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);

  // 23.3.3.7, tuple interface
  template<class T> struct tuple_size;
  template<size_t I, class T> struct tuple_element;
  template<class T, size_t N>
    struct tuple_size<array<T, N>>;
  template<size_t I, class T, size_t N>
    struct tuple_element<I, array<T, N>>;
  template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

23.3.3 Class template `array` [array]

23.3.3.1 Overview [array.overview]

1 The header `<array>` defines a class template for storing fixed-size sequences of objects. An `array` is a contiguous container (23.2.2.2). An instance of `array<T, N>` stores `N` elements of type `T`, so that `size() == N` is an invariant.

2 An `array` is an aggregate (9.5.2) that can be list-initialized with up to `N` elements whose types are convertible to `T`.

3 An `array` meets all of the requirements of a container (23.2.2.2) and of a reversible container (23.2.2.3), except that a default constructed `array` object is not empty if $N > 0$. An `array` meets some of the requirements

of a sequence container (23.2.4). Descriptions are provided here only for operations on `array` that are not described in one of these tables and for operations where there is additional semantic information.

4 `array<T, N>` is a structural type (13.2) if `T` is a structural type. Two values `a1` and `a2` of type `array<T, N>` are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in `a1` and `a2` are template-argument-equivalent.

5 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class T, size_t N>
  struct array {
    // types
    using value_type             = T;
    using pointer                = T*;
    using const_pointer          = const T*;
    using reference              = T&;
    using const_reference        = const T&;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // no explicit construct/copy/destroy for aggregate type

    constexpr void fill(const T& u);
    constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

    // iterators
    constexpr iterator               begin() noexcept;
    constexpr const_iterator         begin() const noexcept;
    constexpr iterator               end() noexcept;
    constexpr const_iterator         end() const noexcept;

    constexpr reverse_iterator       rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator       rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;

    constexpr const_iterator         cbegin() const noexcept;
    constexpr const_iterator         cend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    // capacity
    constexpr bool empty() const noexcept;
    constexpr size_type size() const noexcept;
    constexpr size_type max_size() const noexcept;

    // element access
    constexpr reference       operator[](size_type n);
    constexpr const_reference operator[](size_type n) const;
    constexpr reference       at(size_type n);                    // freestanding-deleted
    constexpr const_reference at(size_type n) const;              // freestanding-deleted
    constexpr reference       front();
    constexpr const_reference front() const;
    constexpr reference       back();
    constexpr const_reference back() const;

    constexpr T*       data() noexcept;
    constexpr const T* data() const noexcept;
  };
```

```
    template<class T, class... U>
      array(T, U...) -> array<T, 1 + sizeof...(U)>;
  }
```

23.3.3.2 Constructors, copy, and assignment [array.cons]

1 An `array` relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 23.2. In addition to the requirements specified in the container requirements table, the implicitly-declared move constructor and move assignment operator for `array` require that `T` be *Cpp17MoveConstructible* or *Cpp17MoveAssignable*, respectively.

```
template<class T, class... U>
  array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

2 *Mandates*: `(is_same_v<T, U> && ...)` is `true`.

23.3.3.3 Member functions [array.members]

```
constexpr size_type size() const noexcept;
```

1 *Returns*: `N`.

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

2 *Returns*: A pointer such that [`data()`,`data() + size()`) is a valid range. For a non-empty array, `data() == addressof(front())` is `true`.

```
constexpr void fill(const T& u);
```

3 *Effects*: As if by `fill_n(begin(), N, u)`.

```
constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

4 *Effects*: Equivalent to `swap_ranges(begin(), end(), y.begin())`.

5 [*Note 1*: Unlike the `swap` function for other containers, `array::swap` takes linear time, can exit via an exception, and does not cause iterators to become associated with the other container. — *end note*]

23.3.3.4 Specialized algorithms [array.special]

```
template<class T, size_t N>
  constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `N == 0` or `is_swappable_v<T>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

3 *Complexity*: Linear in `N`.

23.3.3.5 Zero-sized arrays [array.zero]

1 `array` shall provide support for the special case `N == 0`.

2 In the case that `N == 0`, `begin() == end() ==` unique value. The return value of `data()` is unspecified.

3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.

4 Member function `swap()` shall have a non-throwing exception specification.

23.3.3.6 Array creation functions [array.creation]

```
template<class T, size_t N>
  constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

1 *Mandates*: `is_array_v<T>` is `false` and `is_constructible_v<remove_cv_t<T>, T&>` is `true`.

2 *Preconditions*: `T` meets the *Cpp17CopyConstructible* requirements.

3 *Returns*: `{{ a[0], ..., a[N - 1] }}`.

```
template<class T, size_t N>
  constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

4 *Mandates*: `is_array_v<T>` is `false` and `is_constructible_v<remove_cv_t<T>, T>` is `true`.

5 *Preconditions*: `T` meets the *Cpp17MoveConstructible* requirements.

6 *Returns*: `{{ std::move(a[0]), ..., std::move(a[N - 1]) }}`.

23.3.3.7 Tuple interface [array.tuple]

```
template<class T, size_t N>
  struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```

```
template<size_t I, class T, size_t N>
  struct tuple_element<I, array<T, N>> {
    using type = T;
  };
```

1 *Mandates*: `I < N` is `true`.

```
template<size_t I, class T, size_t N>
  constexpr T& get(array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr T&& get(array<T, N>&& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr const T& get(const array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr const T&& get(const array<T, N>&& a) noexcept;
```

2 *Mandates*: `I < N` is `true`.

3 *Returns*: A reference to the $\texttt{I}^{\text{th}}$ element of `a`, where indexing is zero-based.

23.3.4 Header `<deque>` synopsis [deque.syn]

```
  #include <compare>              // see 17.12.1
  #include <initializer_list>     // see 17.11.2

  namespace std {
    // 23.3.5, class template deque
    template<class T, class Allocator = allocator<T>> class deque;

    template<class T, class Allocator>
      constexpr bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template<class T, class Allocator>
      constexpr synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x,
                                                      const deque<T, Allocator>& y);

    template<class T, class Allocator>
      constexpr void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

    // 23.3.5.5, erasure
    template<class T, class Allocator, class U = T>
      constexpr typename deque<T, Allocator>::size_type
        erase(deque<T, Allocator>& c, const U& value);
    template<class T, class Allocator, class Predicate>
      constexpr typename deque<T, Allocator>::size_type
        erase_if(deque<T, Allocator>& c, Predicate pred);

    namespace pmr {
      template<class T>
        using deque = std::deque<T, polymorphic_allocator<T>>;
    }
  }
```

23.3.5 Class template deque [deque]

23.3.5.1 Overview [deque.overview]

1 A `deque` is a sequence container that supports random access iterators (24.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

2 A `deque` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), and of a sequence container, including the optional sequence container requirements (23.2.4). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class deque {
  public:
    // types
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;

    deque(from_range_t, R&&, Allocator = Allocator())
      -> deque<ranges::range_value_t<R>, Allocator>;
}
```

23.3.5.2 Constructors, copy, and assignment [deque.cons]

```
constexpr explicit deque(const Allocator&);
```

1 *Effects*: Constructs an empty `deque`, using the specified allocator.

2 *Complexity*: Constant.

```
constexpr explicit deque(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `deque`.

4 *Effects*: Constructs a `deque` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
constexpr deque(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `deque`.

7 *Effects*: Constructs a `deque` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `deque` equal to the range [`first`, `last`), using the specified allocator.

10 *Complexity*: Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
  constexpr deque(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a `deque` with the elements of the range `rg`, using the specified allocator.

12 *Complexity*: Linear in `ranges::distance(rg)`.

23.3.5.3 Capacity [deque.capacity]

```
constexpr void resize(size_type sz);
```

1 *Preconditions*: `T` is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into `deque`.

2 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

```
constexpr void resize(size_type sz, const T& c);
```

3 *Preconditions*: `T` is *Cpp17CopyInsertable* into `deque`.

4 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

```
constexpr void shrink_to_fit();
```

5 *Preconditions*: `T` is *Cpp17MoveInsertable* into `deque`.

6 *Effects*: `shrink_to_fit` is a non-binding request to reduce memory use but does not change the size of the sequence.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T`, then there are no effects.

7 *Complexity*: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

8 *Remarks*: If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

23.3.5.4 Modifiers [deque.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position,
                            InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_front(Args&&... args);
template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_front(const T& x);
constexpr void push_front(T&& x);
template<container-compatible-range<T> R>
  constexpr void prepend_range(R&& rg);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
```

1 *Effects*: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 *Complexity*: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of `T`.

3 *Remarks*: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T`, there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* `T`, the effects are unspecified.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_front();
constexpr void pop_back();
```

4 *Effects*: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[*Note 1*: `pop_front` and `pop_back` are erase operations. — *end note*]

5 *Throws*: Nothing unless an exception is thrown by the assignment operator of `T`.

6 *Complexity*: The number of calls to the destructor of `T` is the same as the number of elements erased, but the number of calls to the assignment operator of `T` is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

23.3.5.5 Erasure [deque.erasure]

```
template<class T, class Allocator, class U = T>
  constexpr typename deque<T, Allocator>::size_type
    erase(deque<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
```

```
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;
```

```
template<class T, class Allocator, class Predicate>
  constexpr typename deque<T, Allocator>::size_type
    erase_if(deque<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
    auto it = remove_if(c.begin(), c.end(), pred);
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;
```

23.3.6 Header `<forward_list>` synopsis [forward.list.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.3.7, class template forward_list
  template<class T, class Allocator = allocator<T>> class forward_list;

    constexpr typename forward_list<T, Allocator>::size_type
      erase_if(forward_list<T, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class T>
      using forward_list = std::forward_list<T, polymorphic_allocator<T>>;
  }
}
```

23.3.7 Class template `forward_list` [forward.list]

23.3.7.1 Overview [forward.list.overview]

1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.

[*Note 1*: It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — *end note*]

2 A `forward_list` meets all of the requirements of a container (23.2.2.2), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also meets all of the requirements for an allocator-aware container (23.2.2.5). In addition, a `forward_list` provides the `assign` member functions and several of the optional sequence container requirements (23.2.4). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.

3 [*Note 2*: Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, `erase_after` and `splice_after` take fully-open ranges, not semi-open ranges. — *end note*]

4 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class forward_list {
  public:
    // types
    using value_type      = T;
    using allocator_type  = Allocator;
    using pointer         = typename allocator_traits<Allocator>::pointer;
    using const_pointer   = typename allocator_traits<Allocator>::const_pointer;
    using reference       = value_type&;
    using const_reference = const value_type&;
    using size_type       = implementation-defined; // see 23.2
    using difference_type = implementation-defined; // see 23.2
    using iterator        = implementation-defined; // see 23.2
    using const_iterator  = implementation-defined; // see 23.2

    // 23.3.7.2, construct/copy/destroy
    constexpr forward_list() : forward_list(Allocator()) { }
    constexpr explicit forward_list(const Allocator&);
    constexpr explicit forward_list(size_type n, const Allocator& = Allocator());
    constexpr forward_list(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>

      constexpr iterator emplace_after(const_iterator position, Args&&... args);
    constexpr iterator insert_after(const_iterator position, const T& x);
    constexpr iterator insert_after(const_iterator position, T&& x);

    constexpr iterator insert_after(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      constexpr iterator insert_after(const_iterator position,
                                      InputIterator first, InputIterator last);
    constexpr iterator insert_after(const_iterator position, initializer_list<T> il);
    template<container-compatible-range<T> R>
      constexpr iterator insert_range_after(const_iterator position, R&& rg);

    constexpr iterator erase_after(const_iterator position);
    constexpr iterator erase_after(const_iterator position, const_iterator last);
    constexpr void swap(forward_list&)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);

    constexpr void resize(size_type sz);
    constexpr void resize(size_type sz, const value_type& c);
    constexpr void clear() noexcept;

    // 23.3.7.6, forward_list operations
    constexpr void splice_after(const_iterator position, forward_list& x);
    constexpr void splice_after(const_iterator position, forward_list&& x);
    constexpr void splice_after(const_iterator position, forward_list& x, const_iterator i);
    constexpr void splice_after(const_iterator position, forward_list&& x, const_iterator i);
    constexpr void splice_after(const_iterator position, forward_list& x,
                                const_iterator first, const_iterator last);
    constexpr void splice_after(const_iterator position, forward_list&& x,
                                const_iterator first, const_iterator last);

    constexpr size_type remove(const T& value);
    template<class Predicate> constexpr size_type remove_if(Predicate pred);

    size_type unique();
    template<class BinaryPredicate> constexpr size_type unique(BinaryPredicate binary_pred);

    constexpr void merge(forward_list& x);
    constexpr void merge(forward_list&& x);
    template<class Compare> constexpr void merge(forward_list& x, Compare comp);
    template<class Compare> constexpr void merge(forward_list&& x, Compare comp);

    constexpr void sort();
    template<class Compare> constexpr void sort(Compare comp);

    constexpr void reverse() noexcept;
  };

  template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
    forward_list(InputIterator, InputIterator, Allocator = Allocator())
      -> forward_list<iter-value-type<InputIterator>, Allocator>;
  template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
    forward_list(from_range_t, R&&, Allocator = Allocator())
      -> forward_list<ranges::range_value_t<R>, Allocator>;
}
```

5 An incomplete type `T` may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). `T` shall be complete before any member of the resulting specialization of `forward_list` is referenced.

23.3.7.2 Constructors, copy, and assignment [forward.list.cons]

```
constexpr explicit forward_list(const Allocator&);
```

1 *Effects*: Constructs an empty `forward_list` object using the specified allocator.

2 *Complexity*: Constant.

```
constexpr explicit forward_list(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `forward_list`.

4 *Effects*: Constructs a `forward_list` object with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
constexpr forward_list(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `forward_list`.

7 *Effects*: Constructs a `forward_list` object with `n` copies of `value` using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `forward_list` object equal to the range [`first`, `last`).

10 *Complexity*: Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
  constexpr forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a `forward_list` object with the elements of the range `rg`.

12 *Complexity*: Linear in `ranges::distance(rg)`.

23.3.7.3 Iterators [forward.list.iter]

```
constexpr iterator before_begin() noexcept;
constexpr const_iterator before_begin() const noexcept;
constexpr const_iterator cbefore_begin() const noexcept;
```

1 *Effects*: `cbefore_begin()` is equivalent to `const_cast<forward_list const&>(*this).before_-begin()`.

2 *Returns*: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.

3 *Remarks*: `before_begin() == end()` shall equal `false`.

23.3.7.4 Element access [forward.list.access]

```
constexpr reference front();
constexpr const_reference front() const;
```

1 *Returns*: `*begin()`

23.3.7.5 Modifiers [forward.list.modifiers]

1 The member functions in this subclause do not affect the validity of iterators and references when inserting elements, and when erasing elements invalidate iterators and references to the erased elements only. If an exception is thrown by any of these member functions there is no effect on the container. Inserting `n` elements into a `forward_list` is linear in `n`, and the number of calls to the copy or move constructor of `T` is exactly

equal to `n`. Erasing `n` elements from a `forward_list` is linear in `n` and the number of calls to the destructor of type `T` is exactly equal to `n`.

```
template<class... Args> constexpr reference emplace_front(Args&&... args);
```

2 *Effects*: Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...)` at the beginning of the list.

```
constexpr void push_front(const T& x);
constexpr void push_front(T&& x);
```

3 *Effects*: Inserts a copy of `x` at the beginning of the list.

```
template<container-compatible-range<T> R>
  constexpr void prepend_range(R&& rg);
```

4 *Effects*: Inserts a copy of each element of `rg` at the beginning of the list.

[*Note 1*: The order of elements is not reversed. — *end note*]

```
constexpr void pop_front();
```

5 *Effects*: As if by `erase_after(before_begin())`.

```
constexpr iterator insert_after(const_iterator position, const T& x);
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `forward_list`. `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`).

7 *Effects*: Inserts a copy of `x` after `position`.

8 *Returns*: An iterator pointing to the copy of `x`.

```
constexpr iterator insert_after(const_iterator position, T&& x);
```

9 *Preconditions*: `T` is *Cpp17MoveInsertable* into `forward_list`. `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`).

10 *Effects*: Inserts a copy of `x` after `position`.

11 *Returns*: An iterator pointing to the copy of `x`.

```
constexpr iterator insert_after(const_iterator position, size_type n, const T& x);
```

12 *Preconditions*: `T` is *Cpp17CopyInsertable* into `forward_list`. `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`).

13 *Effects*: Inserts `n` copies of `x` after `position`.

14 *Returns*: An iterator pointing to the last inserted copy of `x`, or `position` if `n == 0` is `true`.

```
template<class InputIterator>
  constexpr iterator insert_after(const_iterator position,
                                  InputIterator first, InputIterator last);
```

15 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `forward_list` from `*first`. `position` is `before_-begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`). Neither `first` nor `last` are iterators in `*this`.

16 *Effects*: Inserts copies of elements in [`first`, `last`) after `position`.

17 *Returns*: An iterator pointing to the last inserted element, or `position` if `first == last` is `true`.

```
template<container-compatible-range<T> R>
  constexpr iterator insert_range_after(const_iterator position, R&& rg);
```

18 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `forward_list` from `*ranges::begin(rg)`. `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`). `rg` and `*this` do not overlap.

19 *Effects*: Inserts copies of elements in the range `rg` after `position`.

20 *Returns*: An iterator pointing to the last inserted element, or `position` if `rg` is empty.

```
constexpr iterator insert_after(const_iterator position, initializer_list<T> il);
```

21 *Effects*: Equivalent to: `return insert_after(position, il.begin(), il.end());`

```
template<class... Args>
  constexpr iterator emplace_after(const_iterator position, Args&&... args);
```

22 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `forward_list` from `std::forward<Args>(args)...`. `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`).

23 *Effects*: Inserts an object of type `value_type` direct-non-list-initialized with `std::forward<Args>(args)...` after `position`.

24 *Returns*: An iterator pointing to the new object.

```
constexpr iterator erase_after(const_iterator position);
```

25 *Preconditions*: The iterator following `position` is dereferenceable.

26 *Effects*: Erases the element pointed to by the iterator following `position`.

27 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

28 *Throws*: Nothing.

```
constexpr iterator erase_after(const_iterator position, const_iterator last);
```

29 *Preconditions*: All iterators in the range (`position`, `last`) are dereferenceable.

30 *Effects*: Erases the elements in the range (`position`, `last`).

31 *Returns*: `last`.

32 *Throws*: Nothing.

```
constexpr void resize(size_type sz);
```

33 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `forward_list`.

34 *Effects*: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` default-inserted elements at the end of the list.

```
constexpr void resize(size_type sz, const value_type& c);
```

35 *Preconditions*: `T` is *Cpp17CopyInsertable* into `forward_list`.

36 *Effects*: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` copies of `c` at the end of the list.

```
constexpr void clear() noexcept;
```

37 *Effects*: Erases all elements in the range [`begin()`, `end()`).

38 *Remarks*: Does not invalidate past-the-end iterators.

23.3.7.6 Operations [forward.list.ops]

1 In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 26.2. The semantics of `i + n`, where `i` is an iterator into the list and `n` is an integer, are the same as those of `next(i, n)`. The expression `i - n`, where `i` is an iterator into the list and `n` is an integer, means an iterator `j` such that `j + n == i` is `true`. For `merge` and `sort`, the definitions and requirements in 26.8 apply.

```
constexpr void splice_after(const_iterator position, forward_list& x);
constexpr void splice_after(const_iterator position, forward_list&& x);
```

2 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`). `get_allocator() == x.get_allocator()` is `true`. `addressof(x) != this` is `true`.

3 *Effects*: Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring

to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

4 *Throws*: Nothing.

5 *Complexity*: $\mathcal{O}$(`distance(x.begin(), x.end())`)

```
constexpr void splice_after(const_iterator position, forward_list& x, const_iterator i);
constexpr void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

6 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`). The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator() == x.get_allocator()` is `true`.

7 *Effects*: Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*++i` continue to refer to the same element but as a member of `*this`. Iterators to `*++i` continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

8 *Throws*: Nothing.

9 *Complexity*: $\mathcal{O}(1)$

```
constexpr void splice_after(const_iterator position, forward_list& x,
                            const_iterator first, const_iterator last);
constexpr void splice_after(const_iterator position, forward_list&& x,
                            const_iterator first, const_iterator last);
```

10 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range [`begin()`, `end()`). (`first`, `last`) is a valid range in `x`, and all iterators in the range (`first`, `last`) are dereferenceable. `position` is not an iterator in the range (`first`, `last`). `get_allocator() == x.get_allocator()` is `true`.

11 *Effects*: Inserts elements in the range (`first`, `last`) after `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

12 *Complexity*: $\mathcal{O}$(`distance(first, last)`)

```
constexpr size_type remove(const T& value);
template<class Predicate> constexpr size_type remove_if(Predicate pred);
```

13 *Effects*: Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value` (for `remove()`), `pred(*i)` is `true` (for `remove_if()`). Invalidates only the iterators and references to the erased elements.

14 *Returns*: The number of elements erased.

15 *Throws*: Nothing unless an exception is thrown by the equality comparison or the predicate.

16 *Complexity*: Exactly `distance(begin(), end())` applications of the corresponding predicate.

17 *Remarks*: Stable (16.4.6.8).

```
constexpr size_type unique();
template<class BinaryPredicate> constexpr size_type unique(BinaryPredicate binary_pred);
```

18 Let `binary_pred` be `equal_to<>{}` for the first overload.

19 *Preconditions*: `binary_pred` is an equivalence relation.

20 *Effects*: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator `i` in the range [`begin() + 1`, `end()`) for which `binary_pred(*i, *(i - 1))` is `true`. Invalidates only the iterators and references to the erased elements.

21 *Returns*: The number of elements erased.

22 *Throws*: Nothing unless an exception is thrown by the predicate.

23 *Complexity*: If `empty()` is `false`, exactly `distance(begin(), end()) - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
constexpr void merge(forward_list& x);
constexpr void merge(forward_list&& x);
template<class Compare> constexpr void merge(forward_list& x, Compare comp);
template<class Compare> constexpr void merge(forward_list&& x, Compare comp);
```

24 Let `comp` be `less<>` for the first two overloads.

25 *Preconditions*: `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator() == x.get_allocator()` is `true`.

26 *Effects*: If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges [`begin()`, `end()`) and [`x.begin()`, `x.end()`). The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

27 *Complexity*: At most `distance(begin(), end()) + distance(x.begin(), x.end()) - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

28 *Remarks*: Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```
constexpr void sort();
template<class Compare> constexpr void sort(Compare comp);
```

29 *Effects*: Sorts the list according to the `operator<` or the `comp` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

30 *Complexity*: Approximately $N \log N$ comparisons, where N is `distance(begin(), end())`.

31 *Remarks*: Stable (16.4.6.8).

```
constexpr void reverse() noexcept;
```

32 *Effects*: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

33 *Complexity*: Linear time.

23.3.7.7 Erasure [forward.list.erasure]

```
template<class T, class Allocator, class U = T>
  constexpr typename forward_list<T, Allocator>::size_type
    erase(forward_list<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to: `return erase_if(c, [&](const auto& elem) -> bool { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
  constexpr typename forward_list<T, Allocator>::size_type
    erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to: `return c.remove_if(pred);`

23.3.8 Header `<hive>` synopsis [hive.syn]

```
#include <initializer_list>     // see 17.11.2
#include <compare>              // see 17.12.1

namespace std {
  struct hive_limits {
    size_t min;
    size_t max;
    constexpr hive_limits(size_t minimum, size_t maximum) noexcept
      : min(minimum), max(maximum) {}
  };

  // 23.3.9, class template hive
  template<class T, class Allocator = allocator<T>> class hive;
```

```
    template<class T, class Allocator>
      void swap(hive<T, Allocator>& x, hive<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

    template<class T, class Allocator, class U = T>
      typename hive<T, Allocator>::size_type
        erase(hive<T, Allocator>& c, const U& value);

    template<class T, class Allocator, class Predicate>
      typename hive<T, Allocator>::size_type
        erase_if(hive<T, Allocator>& c, Predicate pred);

    namespace pmr {
      template<class T>
        using hive = std::hive<T, polymorphic_allocator<T>>;
    }
  }
```

23.3.9 Class template `hive` [hive]

23.3.9.1 Overview [hive.overview]

1 A `hive` is a type of sequence container that provides constant-time insertion and erasure operations. Storage is automatically managed in multiple memory blocks, referred to as *element blocks*. Insertion position is determined by the container, and insertion may re-use the memory locations of erased elements.

2 Element blocks which contain elements are referred to as *active blocks*, those which do not are referred to as *reserved blocks*. Active blocks which become empty of elements are either deallocated or become reserved blocks. Reserved blocks become active blocks when they are used to store elements. A user can create additional reserved blocks by calling `reserve`.

3 Erasures use unspecified techniques of constant time complexity to identify the memory locations of erased elements, which are subsequently skipped during iteration, as opposed to relocating subsequent elements during erasure.

4 Active block capacities have an implementation-defined growth factor (which need not be integral), for example a new active block's capacity could be equal to the summed capacities of the pre-existing active blocks.

5 Limits can be placed on both the minimum and maximum element capacities of element blocks, both by users and implementations.

(5.1) — The minimum limit shall be no larger than the maximum limit.

(5.2) — When limits are not specified by a user during construction, the implementation's default limits are used.

(5.3) — The default limits of an implementation are not guaranteed to be the same as the minimum and maximum possible capacities for an implementation's element blocks.

[*Note 1*: To allow latitude for both implementation-specific and user-directed optimization. — *end note*]

The latter are defined as hard limits. The maximum hard limit shall be no larger than `std::allocator_traits<Allocator>::max_size()`.

(5.4) — If user-specified limits are not within hard limits, or if the specified minimum limit is greater than the specified maximum limit, the behavior is undefined.

(5.5) — An element block is said to be *within the bounds* of a pair of minimum/maximum limits when its capacity is greater-or-equal-to the minimum limit and less-than-or-equal-to the maximum limit.

6 A `hive` conforms to the requirements for containers (23.2.2.2), with the exception of operators `==` and `!=`. A `hive` also meets the requirements of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), and some of the requirements of a sequence container (23.2.4). Descriptions are provided here only for operations on `hive` that are not described in that table or for operations where there is additional semantic information.

7 The iterators of `hive` meet the *Cpp17BidirectionalIterator* requirements but also model `three_way_comparable<strong_ordering>`.

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class hive {
  public:
    // types
    using value_type = T;
    using allocator_type = Allocator;
    using pointer = typename allocator_traits<Allocator>::pointer;
    using const_pointer = typename allocator_traits<Allocator>::const_pointer;
    using reference = value_type&;
    using const_reference = const value_type&;
    using size_type = implementation-defined;                            // see 23.2

    hive(from_range_t, R&&, Allocator = Allocator())
      -> hive<ranges::range_value_t<R>, Allocator>;

  template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
    hive(from_range_t, R&&, hive_limits, Allocator = Allocator())
      -> hive<ranges::range_value_t<R>, Allocator>;
}
```

23.3.9.2 Constructors, copy, and assignment [hive.cons]

```
constexpr explicit hive(const Allocator&) noexcept;
```

1 *Effects*: Constructs an empty `hive`, using the specified allocator.

2 *Complexity*: Constant.

```
constexpr hive(hive_limits block_limits, const Allocator&);
```

3 *Effects*: Constructs an empty `hive`, using the specified allocator. Initializes *`current-limits`* with `block_limits`.

4 *Complexity*: Constant.

```
explicit hive(size_type n, const Allocator& = Allocator());
hive(size_type n, hive_limits block_limits, const Allocator& = Allocator());
```

5 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `hive`.

6 *Effects*: Constructs a `hive` with `n` default-inserted elements, using the specified allocator. If the second overload is called, also initializes *`current-limits`* with `block_limits`.

7 *Complexity*: Linear in `n`.

```
hive(size_type n, const T& value, const Allocator& = Allocator());
hive(size_type n, const T& value, hive_limits block_limits, const Allocator& = Allocator());
```

8 *Preconditions*: `T` is *Cpp17CopyInsertable* into `hive`.

9 *Effects*: Constructs a `hive` with `n` copies of `value`, using the specified allocator. If the second overload is called, also initializes *`current-limits`* with `block_limits`.

10 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  hive(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<class InputIterator>
  hive(InputIterator first, InputIterator last, hive_limits block_limits,
       const Allocator& = Allocator());
```

11 *Effects*: Constructs a `hive` equal to the range [`first`, `last`), using the specified allocator. If the second overload is called, also initializes *`current-limits`* with `block_limits`.

12 *Complexity*: Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
  hive(from_range_t, R&& rg, const Allocator& = Allocator());
template<container-compatible-range<T> R>
  hive(from_range_t, R&& rg, hive_limits block_limits, const Allocator& = Allocator());
```

13 *Effects*: Constructs a `hive` object with the elements of the range `rg`, using the specified allocator. If the second overload is called, also initializes *`current-limits`* with `block_limits`.

14 *Complexity*: Linear in `ranges::distance(rg)`.

```
hive(const hive& x);
hive(const hive& x, const type_identity_t<Allocator>& alloc);
```

15 *Preconditions*: `T` is *Cpp17CopyInsertable* into `hive`.

16 *Effects*: Constructs a `hive` object with the elements of `x`. If the second overload is called, uses `alloc`. Initializes *`current-limits`* with `x.`*`current-limits`*.

17 *Complexity*: Linear in `x.size()`.

```
hive(hive&& x);
hive(hive&& x, const type_identity_t<Allocator>& alloc);
```

18 *Preconditions*: For the second overload, when `allocator_traits<alloc>::is_always_equal::value` is `false`, `T` meets the *Cpp17MoveInsertable* requirements.

19 *Effects*: When the first overload is called, or the second overload is called and `alloc == x.get_allocator()` is `true`, *`current-limits`* is set to `x.`*`current-limits`* and each element block is moved from `x` into `*this`. Pointers and references to the elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the elements of `x` will continue to refer to their elements, but they now behave as iterators into `*this`.

If the second overload is called and `alloc == x.get_allocator()` is `false`, each element in `x` is moved into `*this`. References, pointers and iterators referring to the elements of `x`, as well as the past-the-end iterator of `x`, are invalidated.

20 *Postconditions*: `x.empty()` is `true`.

21 *Complexity*: If the second overload is called and `alloc == x.get_allocator()` is `false`, linear in `x.size()`. Otherwise constant.

```
hive(initializer_list<T> il, const Allocator& = Allocator());
hive(initializer_list<T> il, hive_limits block_limits, const Allocator& = Allocator());
```

22 *Preconditions*: `T` is *Cpp17CopyInsertable* into `hive`.

23 *Effects*: Constructs a `hive` object with the elements of `il`, using the specified allocator. If the second overload is called, also initializes *`current-limits`* with `block_limits`.

24 *Complexity*: Linear in `il.size()`.

```
hive& operator=(const hive& x);
```

25 *Preconditions*: `T` is *Cpp17CopyInsertable* into `hive` and *Cpp17CopyAssignable*.

26 *Effects*: All elements in `*this` are either copy-assigned to, or destroyed. All elements in `x` are copied into `*this`.

[*Note 1*: *`current-limits`* is unchanged. — *end note*]

27 *Complexity*: Linear in `size() + x.size()`.

```
hive& operator=(hive&& x)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

28 *Preconditions*: When

```
(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 allocator_traits<Allocator>::is_always_equal::value)
```

is `false`, `T` is *Cpp17MoveInsertable* into `hive` and *Cpp17MoveAssignable*.

29 *Effects*: Each element in `*this` is either move-assigned to, or destroyed. When

```
(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 get_allocator() == x.get_allocator())
```

is `true`, *`current-limits`* is set to `x.`*`current-limits`* and each element block is moved from `x` into `*this`. Pointers and references to the elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the elements of `x` will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

When

```
(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 get_allocator() == x.get_allocator())
```

is `false`, each element in `x` is moved into `*this`. References, pointers and iterators referring to the elements of `x`, as well as the past-the-end iterator of `x`, are invalidated.

30 *Postconditions*: `x.empty()` is `true`.

31 *Complexity*: Linear in `size()`. If

```
(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 get_allocator() == x.get_allocator())
```

is `false`, also linear in `x.size()`.

23.3.9.3 Capacity [hive.capacity]

```
size_type capacity() const noexcept;
```

1 *Returns*: The total number of elements that `*this` can hold without requiring allocation of more element blocks.

2 *Complexity*: Constant.

```
void reserve(size_type n);
```

3 *Effects*: If `n <= capacity()` is `true`, there are no effects. Otherwise increases `capacity()` by allocating reserved blocks.

4 *Postconditions*: `capacity() >= n` is `true`.

5 *Throws*: `length_error` if `n > max_size()`, as well as any exceptions thrown by the allocator.

6 *Complexity*: It does not change the size of the sequence and takes at most linear time in the number of reserved blocks allocated.

7 *Remarks*: All references, pointers, and iterators referring to elements in `*this`, as well as the past-the-end iterator, remain valid.

```
void shrink_to_fit();
```

8 *Preconditions*: `T` is *Cpp17MoveInsertable* into `hive`.

9 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to be closer to `size()`.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()`. It may reallocate elements. If `capacity()` is already equal to `size()`, there are no effects. If an exception is thrown during allocation of a new element block, `capacity()` may be reduced and reallocation may occur. Otherwise if an exception is thrown, the effects are unspecified.

10 *Complexity*: If reallocation happens, linear in the size of the sequence.

11 *Remarks*: If reallocation happens, the order of the elements in `*this` may change and all references, pointers, and iterators referring to the elements in `*this`, as well as the past-the-end iterator, are invalidated.

```
void trim_capacity() noexcept;
void trim_capacity(size_type n) noexcept;
```

12 *Effects*: For the first overload, all reserved blocks are deallocated, and `capacity()` is reduced accordingly. For the second overload, `capacity()` is reduced to no less than `n`.

13 *Complexity*: Linear in the number of reserved blocks deallocated.

14 *Remarks*: All references, pointers, and iterators referring to elements in `*this`, as well as the past-the-end iterator, remain valid.

```
constexpr hive_limits block_capacity_limits() const noexcept;
```

15 *Returns*: *`current-limits`*.

16 *Complexity*: Constant.

```
static constexpr hive_limits block_capacity_default_limits() noexcept;
```

17 *Returns*: A `hive_limits` struct with the `min` and `max` members set to the implementation's default limits.

18 *Complexity*: Constant.

```
static constexpr hive_limits block_capacity_hard_limits() noexcept;
```

19 *Returns*: A `hive_limits` struct with the `min` and `max` members set to the implementation's hard limits.

20 *Complexity*: Constant.

```
void reshape(hive_limits block_limits);
```

21 *Preconditions*: `T` is *Cpp17MoveInsertable* into `hive`.

22 *Effects*: For any active blocks not within the bounds of `block_limits`, the elements within those active blocks are reallocated to new or existing element blocks which are within the bounds. Any element blocks not within the bounds of `block_limits` are deallocated. If an exception is thrown during allocation of a new element block, `capacity()` may be reduced, reallocation may occur, and *`current-limits`* may be assigned a value other than `block_limits`. Otherwise `block_limits` is assigned to *`current-limits`*. If any other exception is thrown the effects are unspecified.

23 *Postconditions*: `size()` is unchanged.

24 *Complexity*: Linear in the number of element blocks in `*this`. If reallocation happens, also linear in the number of elements reallocated.

25 *Remarks*: This operation may change `capacity()`. If reallocation happens, the order of the elements in `*this` may change. Reallocation invalidates all references, pointers, and iterators referring to the elements in `*this`, as well as the past-the-end iterator.

[*Note 2*: If no reallocation happens, they remain valid. — *end note*]

23.3.9.4 Modifiers [hive.modifiers]

```
template<class... Args> iterator emplace(Args&&... args);
template<class... Args> iterator emplace_hint(const_iterator hint, Args&&... args);
```

1 *Preconditions*: `T` is *Cpp17EmplaceConstructible* into `hive` from `args`.

2 *Effects*: Inserts an object of type `T` constructed with `std::forward<Args>(args)...`. The `hint` parameter is ignored. If an exception is thrown, there are no effects.

[*Note 1*: `args` can directly or indirectly refer to a value in `*this`. — *end note*]

3 *Returns*: An iterator that points to the new element.

4 *Complexity*: Constant. Exactly one object of type `T` is constructed.

5 *Remarks*: Invalidates the past-the-end iterator.

```
iterator insert(const T& x);
iterator insert(const_iterator hint, const T& x);
iterator insert(T&& x);
iterator insert(const_iterator hint, T&& x);
```

6 *Effects*: Equivalent to: `return emplace(std::forward<decltype(x)>(x));`

[*Note 2*: The `hint` parameter is ignored. — *end note*]

```
void insert(initializer_list<T> rg);
template<container-compatible-range<T> R>
  void insert_range(R&& rg);
```

7 *Preconditions*: `T` is *Cpp17EmplaceInsertable* into `hive` from `*ranges::begin(rg)`. `rg` and `*this` do not overlap.

8 *Effects*: Inserts copies of elements in `rg`. Each iterator in the range `rg` is dereferenced exactly once.

9 *Complexity*: Linear in the number of elements inserted. Exactly one object of type `T` is constructed for each element inserted.

10 *Remarks*: If an element is inserted, invalidates the past-the-end iterator.

```
void insert(size_type n, const T& x);
```

11 *Preconditions*: `T` is *Cpp17CopyInsertable* into `hive`.

12 *Effects*: Inserts n copies of x.

13 *Complexity*: Linear in `n`. Exactly one object of type `T` is constructed for each element inserted.

14 *Remarks*: If an element is inserted, invalidates the past-the-end iterator.

```
template<class InputIterator>
  void insert(InputIterator first, InputIterator last);
```

15 *Effects*: Equivalent to `insert_range(ranges::subrange(first, last))`.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
```

16 *Complexity*: Linear in the number of elements erased. Additionally, if any active blocks become empty of elements as a result of the function call, at worst linear in the number of element blocks.

17 *Remarks*: Invalidates references, pointers and iterators referring to the erased elements. An erase operation that erases the last element in `*this` also invalidates the past-the-end iterator.

```
void swap(hive& x)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

18 *Effects*: Exchanges the contents, `capacity()`, and *`current-limits`* of `*this` with that of `x`.

19 *Complexity*: Constant.

23.3.9.5 Operations [hive.operations]

In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 26.2. The semantics of `i + n` and `i - n`, where `i` is an iterator into the `hive` and `n` is an integer, are the same as those of `next(i, n)` and `prev(i, n)`, respectively. For `sort`, the definitions and requirements in 26.8 apply.

```
void splice(hive& x);
void splice(hive&& x);
```

1 *Preconditions*: `get_allocator() == x.get_allocator()` is `true`.

2 *Effects*: If `addressof(x) == this` is `true`, the behavior is erroneous and there are no effects. Otherwise, inserts the contents of `x` into `*this` and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

3 *Throws*: `length_error` if any of `x`'s active blocks are not within the bounds of *`current-limits`*.

4 *Complexity*: Linear in the sum of all element blocks in `x` plus all element blocks in `*this`.

5 *Remarks*: Reserved blocks in `x` are not transferred into `*this`. If `addressof(x) == this` is `false`, invalidates the past-the-end iterator for both `x` and `*this`.

```
template<class BinaryPredicate = equal_to<T>>
  size_type unique(BinaryPredicate binary_pred = BinaryPredicate());
```

6 *Preconditions*: `binary_pred` is an equivalence relation.

7 *Effects*: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty `hive`, erases all elements referred to by the iterator `i` in the range [`begin() + 1`, `end()`) for which `binary_pred(*i, *(i - 1))` is `true`.

8 *Returns*: The number of elements erased.

9 *Throws*: Nothing unless an exception is thrown by the predicate.

10 *Complexity*: If `empty()` is `false`, exactly `size() - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

11 *Remarks*: Invalidates references, pointers, and iterators referring to the erased elements. If the last element in `*this` is erased, also invalidates the past-the-end iterator.

```
template<class Compare = less<T>>
  void sort(Compare comp = Compare());
```

12 *Preconditions*: `T` is *Cpp17MoveInsertable* into `hive`, *Cpp17MoveAssignable*, and *Cpp17Swappable*.

13 *Effects*: Sorts `*this` according to the `comp` function object. If an exception is thrown, the order of the elements in `*this` is unspecified.

14 *Complexity*: $\mathcal{O}(N \log N)$ comparisons, where N is `size()`.

15 *Remarks*: May allocate. References, pointers, and iterators referring to elements in `*this`, as well as the past-the-end iterator, may be invalidated.

[*Note 1*: Not required to be stable16.4.6.8. — *end note*]

```
iterator get_iterator(const_pointer p) noexcept;
const_iterator get_iterator(const_pointer p) const noexcept;
```

16 *Preconditions*: `p` points to an element in `*this`.

17 *Returns*: An `iterator` or `const_iterator` pointing to the same element as `p`.

18 *Complexity*: Linear in the number of active blocks in `*this`.

23.3.9.6 Erasure [hive.erasure]

```
template<class T, class Allocator, class U>
  typename hive<T, Allocator>::size_type
    erase(hive<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
return erase_if(c, [&](auto& elem) { return elem == value; });
```

```
template<class T, class Allocator, class Predicate>
  typename hive<T, Allocator>::size_type
    erase_if(hive<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.3.10 Header `<list>` synopsis [list.syn]

```
#include <compare>                // see 17.12.1
#include <initializer_list>       // see 17.11.2

namespace std {
  // 23.3.11, class template list
  template<class T, class Allocator = allocator<T>> class list;

  template<class T, class Allocator>
    constexpr bool operator==(const list<T, Allocator>& x, const list<T, Allocator>& y);
  template<class T, class Allocator>
    constexpr synth-three-way-result<T> operator<=>(const list<T, Allocator>& x,
                                                     const list<T, Allocator>& y);

  template<class T, class Allocator>
    constexpr void swap(list<T, Allocator>& x, list<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  // 23.3.11.6, erasure
  template<class T, class Allocator, class U = T>
    constexpr typename list<T, Allocator>::size_type
      erase(list<T, Allocator>& c, const U& value);
  template<class T, class Allocator, class Predicate>
    constexpr typename list<T, Allocator>::size_type
      erase_if(list<T, Allocator>& c, Predicate pred);
  namespace pmr {
    template<class T>
      using list = std::list<T, polymorphic_allocator<T>>;
  }
}
```

23.3.11 Class template list [list]

23.3.11.1 Overview [list.overview]

1 A `list` is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (23.3.13) and deques (23.3.5), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

2 A `list` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), and of a sequence container, including most of the optional sequence container requirements (23.2.4). The exceptions are the `operator[]` and `at` member functions, which are not provided.[196] Descriptions are provided here only for operations on `list` that are not described in one of these tables or for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements24.3.1.

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class list {
  public:
    // types
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 23.2
    using difference_type        = implementation-defined; // see 23.2
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 23.3.11.2, construct/copy/destroy
    constexpr list() : list(Allocator()) { }
    constexpr explicit list(const Allocator&);
    constexpr explicit list(size_type n, const Allocator& = Allocator());
    constexpr list(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
      constexpr list(InputIterator first, InputIterator last, const Allocator& = Allocator());
    template<container-compatible-range<T> R>
      constexpr list(from_range_t, R&& rg, const Allocator& = Allocator());
    constexpr list(const list& x);
    constexpr list(list&& x);
    constexpr list(const list&, const type_identity_t<Allocator>&);
    constexpr list(list&&, const type_identity_t<Allocator>&);
    constexpr list(initializer_list<T>, const Allocator& = Allocator());
    constexpr ~list();
    constexpr list& operator=(const list& x);
    constexpr list& operator=(list&& x)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);
    constexpr list& operator=(initializer_list<T>);
    template<class InputIterator>
      constexpr void assign(InputIterator first, InputIterator last);
    template<container-compatible-range<T> R>
      constexpr void assign_range(R&& rg);
```

196) These member functions are only provided by containers whose iterators are random access iterators.

```
constexpr void assign(size_type n, const T& t);
constexpr void assign(initializer_list<T>);
constexpr allocator_type get_allocator() const noexcept;

// iterators
constexpr iterator               begin() noexcept;
constexpr const_iterator         begin() const noexcept;
constexpr iterator               end() noexcept;
constexpr const_iterator         end() const noexcept;
constexpr reverse_iterator       rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator       rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;

constexpr const_iterator         cbegin() const noexcept;
constexpr const_iterator         cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// 23.3.11.3, capacity
constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr void      resize(size_type sz);
constexpr void      resize(size_type sz, const T& c);

// element access
constexpr reference       front();
constexpr const_reference front() const;
constexpr reference       back();
constexpr const_reference back() const;

// 23.3.11.4, modifiers
template<class... Args> constexpr reference emplace_front(Args&&... args);
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_front(const T& x);
constexpr void push_front(T&& x);
template<container-compatible-range<T> R>
  constexpr void prepend_range(R&& rg);
constexpr void pop_front();
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
constexpr void pop_back();

template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position,
                            InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator position, const_iterator last);
constexpr void     swap(list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
constexpr void     clear() noexcept;

// 23.3.11.5, list operations
constexpr void splice(const_iterator position, list& x);
```

```
      constexpr void splice(const_iterator position, list&& x);
      constexpr void splice(const_iterator position, list& x, const_iterator i);
      constexpr void splice(const_iterator position, list&& x, const_iterator i);
      constexpr void splice(const_iterator position, list& x,
                            const_iterator first, const_iterator last);
      constexpr void splice(const_iterator position, list&& x,
                            const_iterator first, const_iterator last);

      constexpr size_type remove(const T& value);
      template<class Predicate> constexpr size_type remove_if(Predicate pred);

      constexpr size_type unique();
      template<class BinaryPredicate>
        constexpr size_type unique(BinaryPredicate binary_pred);

      constexpr void merge(list& x);
      constexpr void merge(list&& x);
      template<class Compare> constexpr void merge(list& x, Compare comp);
      template<class Compare> constexpr void merge(list&& x, Compare comp);

      constexpr void sort();
      template<class Compare> constexpr void sort(Compare comp);

      constexpr void reverse() noexcept;
    };

    template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
      list(InputIterator, InputIterator, Allocator = Allocator())
        -> list<iter-value-type<InputIterator>, Allocator>;

    template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
      list(from_range_t, R&&, Allocator = Allocator())
        -> list<ranges::range_value_t<R>, Allocator>;
  }
```

4 An incomplete type `T` may be used when instantiating `list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). `T` shall be complete before any member of the resulting specialization of `list` is referenced.

23.3.11.2 Constructors, copy, and assignment [list.cons]

```
constexpr explicit list(const Allocator&);
```

1 *Effects*: Constructs an empty list, using the specified allocator.

2 *Complexity*: Constant.

```
constexpr explicit list(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `list`.

4 *Effects*: Constructs a `list` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
constexpr list(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `list`.

7 *Effects*: Constructs a `list` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `list` equal to the range [`first`, `last`).

10 *Complexity*: Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
  constexpr list(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a `list` object with the elements of the range `rg`.

12 *Complexity*: Linear in `ranges::distance(rg)`.

23.3.11.3 Capacity [list.capacity]

```
constexpr void resize(size_type sz);
```

1 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `list`.

2 *Effects*: If `size() < sz`, appends `sz - size()` default-inserted elements to the sequence. If `sz <= size()`, equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

```
constexpr void resize(size_type sz, const T& c);
```

3 *Preconditions*: `T` is *Cpp17CopyInsertable* into `list`.

4 *Effects*: As if by:

```
if (sz > size())
  insert(end(), sz-size(), c);
else if (sz < size()) {
  iterator i = begin();
  advance(i, sz);
  erase(i, end());
}
else
  ;                    // do nothing
```

23.3.11.4 Modifiers [list.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position,
                            InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_front(Args&&... args);
template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_front(const T& x);
constexpr void push_front(T&& x);
template<container-compatible-range<T> R>
  constexpr void prepend_range(R&& rg);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
```

1 *Complexity*: Insertion of a single element into a list takes constant time and exactly one call to a constructor of `T`. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of `T` is exactly equal to the number of elements inserted.

2 *Remarks*: Does not affect the validity of iterators and references. If an exception is thrown, there are no effects.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_front();
constexpr void pop_back();
constexpr void clear() noexcept;
```

3 *Effects*: Invalidates only the iterators and references to the erased elements.

4 *Throws*: Nothing.

5 *Complexity*: Erasing a single element is a constant time operation with a single call to the destructor of `T`. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type `T` is exactly equal to the size of the range.

23.3.11.5 Operations [list.ops]

1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.[197] In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 26.2. The semantics of `i + n` and `i - n`, where `i` is an iterator into the list and `n` is an integer, are the same as those of `next(i, n)` and `prev(i, n)`, respectively. For `merge` and `sort`, the definitions and requirements in 26.8 apply.

2 `list` provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
constexpr void splice(const_iterator position, list& x);
constexpr void splice(const_iterator position, list&& x);
```

3 *Preconditions*: `addressof(x) != this` is `true`.

4 *Effects*: Inserts the contents of `x` before `position` and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

5 *Throws*: Nothing.

6 *Complexity*: Constant time.

```
constexpr void splice(const_iterator position, list& x, const_iterator i);
constexpr void splice(const_iterator position, list&& x, const_iterator i);
```

7 *Preconditions*: `i` is a valid dereferenceable iterator of `x`.

8 *Effects*: Inserts an element pointed to by `i` from list `x` before `position` and removes the element from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i` continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including `i` itself) continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

9 *Throws*: Nothing.

10 *Complexity*: Constant time.

```
constexpr void splice(const_iterator position, list& x,
                      const_iterator first, const_iterator last);
constexpr void splice(const_iterator position, list&& x,
                      const_iterator first, const_iterator last);
```

11 *Preconditions*: [`first`, `last`) is a valid range in `x`. `position` is not an iterator in the range [`first`, `last`).

12 *Effects*: Inserts elements in the range [`first`, `last`) before `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

13 *Throws*: Nothing.

14 *Complexity*: Constant time if `addressof(x) == this`; otherwise, linear time.

197) As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.

```
constexpr size_type remove(const T& value);
template<class Predicate> constexpr size_type remove_if(Predicate pred);
```

15 *Effects*: Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value`, `pred(*i) != false`. Invalidates only the iterators and references to the erased elements.

16 *Returns*: The number of elements erased.

17 *Throws*: Nothing unless an exception is thrown by `*i == value` or `pred(*i) != false`.

18 *Complexity*: Exactly `size()` applications of the corresponding predicate.

19 *Remarks*: Stable (16.4.6.8).

```
constexpr size_type unique();
template<class BinaryPredicate> constexpr size_type unique(BinaryPredicate binary_pred);
```

20 Let `binary_pred` be `equal_to<>{}` for the first overload.

21 *Preconditions*: `binary_pred` is an equivalence relation.

22 *Effects*: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator `i` in the range [`begin() + 1`, `end()`) for which `binary_pred(*i, *(i - 1))` is `true`. Invalidates only the iterators and references to the erased elements.

23 *Returns*: The number of elements erased.

24 *Throws*: Nothing unless an exception is thrown by the predicate.

25 *Complexity*: If `empty()` is `false`, exactly `size() - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
constexpr void merge(list& x);
constexpr void merge(list&& x);
template<class Compare> constexpr void merge(list& x, Compare comp);
template<class Compare> constexpr void merge(list&& x, Compare comp);
```

26 Let `comp` be `less<>` for the first two overloads.

27 *Preconditions*: `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator() == x.get_allocator()` is `true`.

28 *Effects*: If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges [`begin()`, `end()`) and [`x.begin()`, `x.end()`). The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

29 *Complexity*: At most `size() + x.size() - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

30 *Remarks*: Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```
constexpr void reverse() noexcept;
```

31 *Effects*: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

32 *Complexity*: Linear time.

```
void sort();
template<class Compare> void sort(Compare comp);
```

33 *Effects*: Sorts the list according to the `operator<` or a `Compare` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

34 *Complexity*: Approximately $N \log N$ comparisons, where `N == size()`.

35 *Remarks*: Stable (16.4.6.8).

23.3.11.6 Erasure [list.erasure]

```
template<class T, class Allocator, class U = T>
  typename list<T, Allocator>::size_type
    constexpr erase(list<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to: `return erase_if(c, [&](const auto& elem) -> bool { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
  typename list<T, Allocator>::size_type
    constexpr erase_if(list<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to: `return c.remove_if(pred);`

23.3.12 Header <vector> synopsis [vector.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.3.13, class template vector
  template<class T, class Allocator = allocator<T>> class vector;

  template<class T, class Allocator>

  // 23.3.14.2, formatter specialization for vector<bool>
  template<class T, class charT> requires is-vector-bool-reference<T>
    struct formatter<T, charT>;
}
```

23.3.13 Class template `vector` [vector]

23.3.13.1 Overview [vector.overview]

1 A `vector` is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

2 A `vector` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), of a sequence container, including most of the optional sequence container requirements (23.2.4), and, for an element type other than `bool`, of a contiguous container (23.2.2.2). The exceptions are the `push_front`, `prepend_range`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on `vector` that are not described in one of these tables or for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class vector {
  public:
    // types
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 23.2
    using difference_type        = implementation-defined; // see 23.2
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 23.3.13.2, construct/copy/destroy
    constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
    constexpr explicit vector(const Allocator&) noexcept;
    constexpr explicit vector(size_type n, const Allocator& = Allocator());
    constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
      constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
    template<container-compatible-range<T> R>

    constexpr vector(vector&&) noexcept;
    constexpr vector(const vector&, const type_identity_t<Allocator>&);
    constexpr vector(vector&&, const type_identity_t<Allocator>&);
    constexpr vector(initializer_list<T>, const Allocator& = Allocator());
    constexpr ~vector();
    constexpr vector& operator=(const vector& x);
    constexpr vector& operator=(vector&& x)
      noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
               allocator_traits<Allocator>::is_always_equal::value);
    constexpr vector& operator=(initializer_list<T>);
    template<class InputIterator>
      constexpr void assign(InputIterator first, InputIterator last);
    template<container-compatible-range<T> R>
      constexpr void assign_range(R&& rg);
    constexpr void assign(size_type n, const T& u);
    constexpr void assign(initializer_list<T>);
    constexpr allocator_type get_allocator() const noexcept;

    // iterators
    constexpr iterator               begin() noexcept;
    constexpr const_iterator         begin() const noexcept;
    constexpr iterator               end() noexcept;
    constexpr const_iterator         end() const noexcept;
    constexpr reverse_iterator       rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator       rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;

    constexpr const_iterator         cbegin() const noexcept;
    constexpr const_iterator         cend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    // 23.3.13.3, capacity
    constexpr bool empty() const noexcept;
    constexpr size_type size() const noexcept;
    constexpr size_type max_size() const noexcept;
    constexpr size_type capacity() const noexcept;
    constexpr void      resize(size_type sz);
    constexpr void      resize(size_type sz, const T& c);
    constexpr void      reserve(size_type n);
    constexpr void      shrink_to_fit();

    // element access
    constexpr reference       operator[](size_type n);
    constexpr const_reference operator[](size_type n) const;
    constexpr reference       at(size_type n);
    constexpr const_reference at(size_type n) const;
    constexpr reference       front();
    constexpr const_reference front() const;
    constexpr reference       back();
    constexpr const_reference back() const;

    // 23.3.13.4, data access
    constexpr T*       data() noexcept;
    constexpr const T* data() const noexcept;

    // 23.3.13.5, modifiers
    template<class... Args> constexpr reference emplace_back(Args&&... args);
    constexpr void push_back(const T& x);
    constexpr void push_back(T&& x);
    template<container-compatible-range<T> R>
      constexpr void append_range(R&& rg);
    constexpr void pop_back();

    template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
    constexpr iterator insert(const_iterator position, const T& x);
    constexpr iterator insert(const_iterator position, T&& x);
    constexpr iterator insert(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      constexpr iterator insert(const_iterator position,
                                InputIterator first, InputIterator last);
    template<container-compatible-range<T> R>
      constexpr iterator insert_range(const_iterator position, R&& rg);
    constexpr iterator insert(const_iterator position, initializer_list<T> il);
    constexpr iterator erase(const_iterator position);
    constexpr iterator erase(const_iterator first, const_iterator last);
    constexpr void     swap(vector&)
      noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
               allocator_traits<Allocator>::is_always_equal::value);
    constexpr void     clear() noexcept;
  };
```

```
    template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
      vector(InputIterator, InputIterator, Allocator = Allocator())
        -> vector<iter-value-type<InputIterator>, Allocator>;

    template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
      vector(from_range_t, R&&, Allocator = Allocator())
        -> vector<ranges::range_value_t<R>, Allocator>;
  }
```

4 An incomplete type `T` may be used when instantiating `vector` if the allocator meets the allocator completeness requirements (16.4.4.6.2). `T` shall be complete before any member of the resulting specialization of `vector` is referenced.

23.3.13.2 Constructors [vector.cons]

```
constexpr explicit vector(const Allocator&) noexcept;
```

1 *Effects*: Constructs an empty `vector`, using the specified allocator.

2 *Complexity*: Constant.

```
constexpr explicit vector(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `vector`.

4 *Effects*: Constructs a `vector` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
constexpr vector(size_type n, const T& value,
                 const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `vector`.

7 *Effects*: Constructs a `vector` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr vector(InputIterator first, InputIterator last,
                   const Allocator& = Allocator());
```

9 *Effects*: Constructs a `vector` equal to the range [`first`, `last`), using the specified allocator.

10 *Complexity*: Makes only N calls to the copy constructor of `T` (where N is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order N calls to the copy constructor of `T` and order $\log N$ reallocations if they are just input iterators.

```
template<container-compatible-range<T> R>
  constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a `vector` object with the elements of the range `rg`, using the specified allocator.

12 *Complexity*: Initializes exactly N elements from the results of dereferencing successive iterators of `rg`, where N is `ranges::distance(rg)`.

13 Performs no reallocations if:

(13.1) — `R` models `ranges::approximately_sized_range`, and `ranges::distance(rg) <= ranges::reserve_hint(rg)` is `true`, or

(13.2) — `R` models `ranges::forward_range` and `R` does not model `ranges::approximately_sized_range`.

Otherwise, performs order $\log N$ reallocations and order N calls to the copy or move constructor of `T`.

23.3.13.3 Capacity [vector.capacity]

```
constexpr size_type capacity() const noexcept;
```

1 *Returns*: The total number of elements that the vector can hold without requiring reallocation.

2 *Complexity*: Constant time.

```
constexpr void reserve(size_type n);
```

3 *Preconditions*: `T` is *Cpp17MoveInsertable* into `vector`.

4 *Effects*: A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* type, there are no effects.

5 *Throws*: `length_error` if `n > max_size()`.[198]

6 *Complexity*: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

7 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[*Note 1*: If no reallocation happens, they remain valid. — *end note*]

No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```
constexpr void shrink_to_fit();
```

8 *Preconditions*: `T` is *Cpp17MoveInsertable* into `vector`.

9 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[*Note 2*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T`, there are no effects.

10 *Complexity*: If reallocation happens, linear in the size of the sequence.

11 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[*Note 3*: If no reallocation happens, they remain valid. — *end note*]

```
constexpr void swap(vector& x)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

12 *Effects*: Exchanges the contents and `capacity()` of `*this` with that of `x`.

13 *Complexity*: Constant time.

```
constexpr void resize(size_type sz);
```

14 *Preconditions*: `T` is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into `vector`.

15 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

16 *Remarks*: If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T`, there are no effects.

```
constexpr void resize(size_type sz, const T& c);
```

17 *Preconditions*: `T` is *Cpp17CopyInsertable* into `vector`.

18 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

19 *Remarks*: If an exception is thrown, there are no effects.

23.3.13.4 Data [vector.data]

```
constexpr T*       data() noexcept;
constexpr const T* data() const noexcept;
```

1 *Returns*: A pointer such that `[data(),data() + size())` is a valid range. For a non-empty vector, `data() == addressof(front())` is `true`.

198) `reserve()` uses `Allocator::allocate()` which can throw an appropriate exception.

2 *Complexity*: Constant time.

23.3.13.5 Modifiers [vector.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
```

1 *Complexity*: If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

2 *Remarks*: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` or by any `InputIterator` operation, there are no effects. If an exception is thrown while inserting a single element at the end and `T` is *Cpp17CopyInsertable* or `is_nothrow_move_constructible_v<T>` is `true`, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* `T`, the effects are unspecified.

3 For the declarations taking a range `R`, performs at most one reallocation if:

(3.1) — `R` models `ranges::approximately_sized_range` and `ranges::distance(rg) <= ranges::reserve_hint(rg)` is `true`, or

(3.2) — `R` models `ranges::forward_range` and `R` does not model `ranges::approximately_sized_range`.

For the declarations taking a pair of `InputIterator`, performs at most one reallocation if `InputIterator` models *Cpp17ForwardIterator*.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();
```

4 *Effects*: Invalidates iterators and references at or after the point of the erase.

5 *Throws*: Nothing unless an exception is thrown by the assignment operator or move assignment operator of `T`.

6 *Complexity*: The destructor of `T` is called the number of times equal to the number of the elements erased, but the assignment operator of `T` is called the number of times equal to the number of elements in the vector after the erased elements.

23.3.13.6 Erasure [vector.erasure]

```
template<class T, class Allocator, class U = T>
  constexpr typename vector<T, Allocator>::size_type
    erase(vector<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, class Allocator, class Predicate>
  constexpr typename vector<T, Allocator>::size_type
    erase_if(vector<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

23.3.14 Specialization of `vector` for `bool` [vector.bool]

23.3.14.1 Partial class template specialization `vector<bool, Allocator>` [vector.bool.pspc]

1 To optimize space allocation, a partial specialization of `vector` for `bool` elements is provided:

```
namespace std {
  template<class Allocator>
  class vector<bool, Allocator> {
  public:
    // types
    using value_type             = bool;
    using allocator_type         = Allocator;
    using pointer                = implementation-defined;
    using const_pointer          = implementation-defined;
    using const_reference        = bool;

constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position,
                            InputIterator first, InputIterator last);
template<container-compatible-range<bool> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<bool> il);

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
static constexpr void swap(reference x, reference y) noexcept;
```

```
      constexpr void flip() noexcept;      // flips all bits
      constexpr void clear() noexcept;
    };
  }
```

2 Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (20.2.9.3) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.

4 `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion function returns `true` when the bit is set, and `false` otherwise. The assignment operators set the bit when the argument is (convertible to) `true` and clear it otherwise. `flip` reverses the state of the bit.

```
constexpr void flip() noexcept;
```

5 *Effects*: Replaces each element in the container with its complement.

```
static constexpr void swap(reference x, reference y) noexcept;
```

6 *Effects*: Exchanges the contents of `x` and `y` as if by:

```
bool b = x;
x = y;
y = b;
```

```
template<class Allocator> struct hash<vector<bool, Allocator>>;
```

7 The specialization is enabled (22.10.19).

```
template<class T>
  constexpr bool is-vector-bool-reference = see below;
```

8 The expression *`is-vector-bool-reference`*`<T>` is `true` if `T` denotes the type `vector<bool, Alloc>::reference` for some type `Alloc` and `vector<bool, Alloc>` is not a program-defined specialization.

23.3.14.2 Formatter specialization for `vector<bool>` [vector.bool.fmt]

```
namespace std {
  template<class T, class charT>
    requires is-vector-bool-reference<T>
  struct formatter<T, charT> {
  private:
    formatter<bool, charT> underlying_;       // exposition only

  public:
    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(const T& ref, FormatContext& ctx) const;
  };
}
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

1 Equivalent to: `return` *`underlying_`*`.parse(ctx);`

```
template<class FormatContext>
  typename FormatContext::iterator
    format(const T& ref, FormatContext& ctx) const;
```

2 Equivalent to: `return` *`underlying_`*`.format(ref, ctx);`

23.3.15 Header `<inplace_vector>` synopsis [inplace.vector.syn]

```
// mostly freestanding
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.3.16, class template inplace_vector
  template<class T, size_t N> class inplace_vector;                // partially freestanding

  // 23.3.16.6, erasure
  template<class T, size_t N, class U = T>
    constexpr typename inplace_vector<T, N>::size_type
      erase(inplace_vector<T, N>& c, const U& value);
  template<class T, size_t N, class Predicate>
    constexpr typename inplace_vector<T, N>::size_type
      erase_if(inplace_vector<T, N>& c, Predicate pred);
}
```

23.3.16 Class template `inplace_vector` [inplace.vector]

23.3.16.1 Overview [inplace.vector.overview]

1 An `inplace_vector` is a contiguous container. Its capacity is fixed and its elements are stored within the `inplace_vector` object itself.

2 An `inplace_vector` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of a contiguous container, and of a sequence container, including most of the optional sequence container requirements (23.2.4). The exceptions are the `push_front`, `prepend_range`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on `inplace_vector` that are not described in one of these tables or for operations where there is additional semantic information.

3 For any `N`, `inplace_vector<T, N>::iterator` and `inplace_vector<T, N>::const_iterator` meet the constexpr iterator requirements.

4 Any member function of `inplace_vector<T, N>` that would cause the size to exceed `N` throws an exception of type `bad_alloc`.

5 Let `IV` denote a specialization of `inplace_vector<T, N>`. If `N` is zero, then `IV` is trivially copyable and empty, and `std::is_trivially_default_constructible_v<IV>` is `true`. Otherwise:

(5.1) — If `is_trivially_copy_constructible_v<T>` is `true`, then `IV` has a trivial copy constructor.

(5.2) — If `is_trivially_move_constructible_v<T>` is `true`, then `IV` has a trivial move constructor.

(5.3) — If `is_trivially_destructible_v<T>` is `true`, then:

  (5.3.1) — `IV` has a trivial destructor.

  (5.3.2) — If

  ```
  is_trivially_copy_constructible_v<T> && is_trivially_copy_assignable_v<T>
  ```

  is `true`, then `IV` has a trivial copy assignment operator.

  (5.3.3) — If

  ```
  is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T>
  ```

  is `true`, then `IV` has a trivial move assignment operator.

```

      { x.swap(y); }
  };
}
```

23.3.16.2 Constructors [inplace.vector.cons]

`constexpr explicit inplace_vector(size_type n);`

1 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `inplace_vector`.

2 *Effects*: Constructs an `inplace_vector` with `n` default-inserted elements.

3 *Complexity*: Linear in `n`.

```
constexpr inplace_vector(size_type n, const T& value);
```

4 *Preconditions*: `T` is *Cpp17CopyInsertable* into `inplace_vector`.

5 *Effects*: Constructs an `inplace_vector` with `n` copies of `value`.

6 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr inplace_vector(InputIterator first, InputIterator last);
```

7 *Effects*: Constructs an `inplace_vector` equal to the range [`first`,`last`).

8 *Complexity*: Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
  constexpr inplace_vector(from_range_t, R&& rg);
```

9 *Effects*: Constructs an `inplace_vector` with the elements of the range `rg`.

10 *Complexity*: Linear in `ranges::distance(rg)`.

23.3.16.3 Size and capacity [inplace.vector.capacity]

```
static constexpr size_type capacity() noexcept;
static constexpr size_type max_size() noexcept;
```

1 *Returns*: `N`.

```
constexpr void resize(size_type sz);
```

2 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `inplace_vector`.

3 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

4 *Remarks*: If an exception is thrown, there are no effects on `*this`.

```
constexpr void resize(size_type sz, const T& c);
```

5 *Preconditions*: `T` is *Cpp17CopyInsertable* into `inplace_vector`.

6 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

7 *Remarks*: If an exception is thrown, there are no effects on `*this`.

23.3.16.4 Data [inplace.vector.data]

```
constexpr       T* data()       noexcept;
constexpr const T* data() const noexcept;
```

1 *Returns*: A pointer such that [`data()`,`data() + size()`) is a valid range. For a non-empty `inplace_-vector`, `data() == addressof(front())` is `true`.

2 *Complexity*: Constant time.

23.3.16.5 Modifiers [inplace.vector.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);

template<class... Args>
  constexpr iterator emplace(const_iterator position, Args&&... args);
```

```
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
```

1 Let n be the value of `size()` before this call for the `append_range` overload, and `distance(begin, position)` otherwise.

2 *Complexity*: Linear in the number of elements inserted plus the distance to the end of the vector.

3 *Remarks*: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` or by any `InputIterator` operation, there are no effects. Otherwise, if an exception is thrown, then `size()` $\geq n$ and elements in the range `begin() +` $[0, n)$ are not modified.

```
constexpr reference push_back(const T& x);
constexpr reference push_back(T&& x);
template<class... Args>
  constexpr reference emplace_back(Args&&... args);
```

4 *Returns*: `back()`.

5 *Throws*: `bad_alloc` or any exception thrown by the initialization of the inserted element.

6 *Complexity*: Constant.

7 *Remarks*: If an exception is thrown, there are no effects on `*this`.

```
template<class... Args>
  constexpr pointer try_emplace_back(Args&&... args);
constexpr pointer try_push_back(const T& x);
constexpr pointer try_push_back(T&& x);
```

8 Let `vals` denote a pack:

(8.1) — `std::forward<Args>(args)...` for the first overload,

(8.2) — `x` for the second overload,

(8.3) — `std::move(x)` for the third overload.

9 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `inplace_vector` from `vals...`.

10 *Effects*: If `size() < capacity()` is `true`, appends an object of type `T` direct-non-list-initialized with `vals...`. Otherwise, there are no effects.

11 *Returns*: `nullptr` if `size() == capacity()` is `true`, otherwise `addressof(back())`.

12 *Throws*: Nothing unless an exception is thrown by the initialization of the inserted element.

13 *Complexity*: Constant.

14 *Remarks*: If an exception is thrown, there are no effects on `*this`.

```
template<container-compatible-range<T> R>
  constexpr ranges::borrowed_iterator_t<R> try_append_range(R&& rg);
```

15 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `inplace_vector` from `*ranges::begin(rg)`.

16 *Effects*: Appends copies of initial elements in `rg` before `end()`, until all elements are inserted or `size() == capacity()` is `true`. Each iterator in the range `rg` is dereferenced at most once.

17 *Returns*: An iterator pointing to the first element of `rg` that was not inserted into `*this`, or `ranges::end(rg)` if no such element exists.

18 *Complexity*: Linear in the number of elements inserted.

19 *Remarks*: Let n be the value of `size()` prior to this call. If an exception is thrown after the insertion of k elements, then `size()` equals $n + k$, elements in the range `begin() +` $[0, n)$ are not modified, and elements in the range `begin() +` $[n, n + k)$ correspond to the inserted elements.

```
template<class... Args>
  constexpr reference unchecked_emplace_back(Args&&... args);
```

20 *Preconditions*: `size() < capacity()` is `true`.

21 *Effects*: Equivalent to: `return *try_emplace_back(std::forward<Args>(args)...);`

```
constexpr reference unchecked_push_back(const T& x);
constexpr reference unchecked_push_back(T&& x);
```

22 *Preconditions*: `size() < capacity()` is `true`.

23 *Effects*: Equivalent to: `return *try_push_back(std::forward<decltype(x)>(x));`

```
static constexpr void reserve(size_type n);
```

24 *Effects*: None.

25 *Throws*: `bad_alloc` if `n > capacity()` is `true`.

```
static constexpr void shrink_to_fit() noexcept;
```

26 *Effects*: None.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();
```

27 *Effects*: Invalidates iterators and references at or after the point of the erase.

28 *Throws*: Nothing unless an exception is thrown by the assignment operator or move assignment operator of `T`.

29 *Complexity*: The destructor of `T` is called the number of times equal to the number of the elements erased, but the assignment operator of `T` is called the number of times equal to the number of elements after the erased elements.

23.3.16.6 Erasure [inplace.vector.erasure]

```
template<class T, size_t N, class U = T>
  constexpr size_t erase(inplace_vector<T, N>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, size_t N, class Predicate>
  constexpr size_t erase_if(inplace_vector<T, N>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

23.4 Associative containers [associative]

23.4.1 General [associative.general]

1 The header `<map>` (23.4.2) defines the class templates `map` and `multimap`; the header `<set>` (23.4.5) defines the class templates `set` and `multiset`.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```
template<class InputIterator>
  using iter-value-type =
    typename iterator_traits<InputIterator>::value_type;              // exposition only
template<class InputIterator>
  using iter-key-type = remove_const_t<
    tuple_element_t<0, iter-value-type<InputIterator>>>;              // exposition only
template<class InputIterator>
  using iter-mapped-type =
    tuple_element_t<1, iter-value-type<InputIterator>>;               // exposition only
```

```
template<class InputIterator>
  using iter-to-alloc-type = pair<
    add_const_t<tuple_element_t<0, iter-value-type<InputIterator>>>,
    tuple_element_t<1, iter-value-type<InputIterator>>>;                // exposition only
template<ranges::input_range Range>
  using range-key-type =
    remove_const_t<typename ranges::range_value_t<Range>::first_type>;  // exposition only
template<ranges::input_range Range>
  using range-mapped-type = typename ranges::range_value_t<Range>::second_type; // exposition only
template<ranges::input_range Range>
  using range-to-alloc-type =
    pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
         typename ranges::range_value_t<Range>::second_type>;           // exposition only
```

23.4.2 Header <map> synopsis [associative.map.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.4.3, class template map
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
    class map;

  template<class Key, class T, class Compare, class Allocator>
    constexpr bool operator==(const map<Key, T, Compare, Allocator>& x,
                              const map<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>
    constexpr synth-three-way-result<pair<const Key, T>>
      operator<=>(const map<Key, T, Compare, Allocator>& x,
                  const map<Key, T, Compare, Allocator>& y);

  template<class Key, class T, class Compare, class Allocator>
    constexpr void swap(map<Key, T, Compare, Allocator>& x,
                        map<Key, T, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  // 23.4.3.5, erasure for map
  template<class Key, class T, class Compare, class Allocator, class Predicate>
    constexpr typename map<Key, T, Compare, Allocator>::size_type
      erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

  // 23.4.4, class template multimap
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
    class multimap;

  template<class Key, class T, class Compare, class Allocator>
    constexpr bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                              const multimap<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>
    constexpr synth-three-way-result<pair<const Key, T>>
      operator<=>(const multimap<Key, T, Compare, Allocator>& x,
                  const multimap<Key, T, Compare, Allocator>& y);

  template<class Key, class T, class Compare, class Allocator>
    constexpr void swap(multimap<Key, T, Compare, Allocator>& x,
             multimap<Key, T, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  // 23.4.4.4, erasure for multimap
  template<class Key, class T, class Compare, class Allocator, class Predicate>
    constexpr typename multimap<Key, T, Compare, Allocator>::size_type
      erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
  namespace pmr {
    template<class Key, class T, class Compare = less<Key>>
      using map = std::map<Key, T, Compare,
                           polymorphic_allocator<pair<const Key, T>>>;

    template<class Key, class T, class Compare = less<Key>>
      using multimap = std::multimap<Key, T, Compare,
                                     polymorphic_allocator<pair<const Key, T>>>;
  }
}
```

23.4.3 Class template map [map]

23.4.3.1 Overview [map.overview]

1 A `map` is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. The `map` class supports bidirectional iterators.

2 A `map` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), and of an associative container (23.2.7). A `map` also provides most operations described in 23.2.7 for unique keys. This means that a `map` supports the `a_uniq` operations in 23.2.7 but not the `a_eq` operations. For a `map<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `map` that are not described in one of those tables or for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class map {
  public:
    // types
    using key_type               = Key;
    using mapped_type            = T;
    using value_type             = pair<const Key, T>;
    using key_compare            = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 23.2
    using difference_type        = implementation-defined; // see 23.2
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    using node_type              = unspecified;
    using insert_return_type     = insert-return-type<iterator, node_type>;

    class value_compare {
    protected:
      Compare comp;
      constexpr value_compare(Compare c) : comp(c) {}

    public:

    map(initializer_list<pair<Key, T>>, Allocator) -> map<Key, T, less<Key>, Allocator>;
}
```

23.4.3.2 Constructors, copy, and assignment [map.cons]

```
constexpr explicit map(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `map` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr map(InputIterator first, InputIterator last,
                const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range [`first`, `last`).

4 *Complexity*: Linear in N if the range [`first`, `last`) is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
  constexpr map(from_range_t, R&& rg, const Compare& comp = Compare(),
                const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

23.4.3.3 Element access [map.access]

```
constexpr mapped_type& operator[](const key_type& x);
```

1 *Effects*: Equivalent to: `return try_emplace(x).first->second;`

```
constexpr mapped_type& operator[](key_type&& x);
```

2 *Effects*: Equivalent to: `return try_emplace(std::move(x)).first->second;`

```
template<class K> constexpr mapped_type& operator[](K&& x);
```

3 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

4 *Effects*: Equivalent to: `return try_emplace(std::forward<K>(x)).first->second;`

```
constexpr mapped_type&       at(const key_type& x);
constexpr const mapped_type& at(const key_type& x) const;
```

5 *Returns*: A reference to the `mapped_type` corresponding to `x` in `*this`.

6 *Throws*: An exception object of type `out_of_range` if no such element is present.

7 *Complexity*: Logarithmic.

```
template<class K> constexpr mapped_type&       at(const K& x);
template<class K> constexpr const mapped_type& at(const K& x) const;
```

8 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

9 *Preconditions*: The expression `find(x)` is well-formed and has well-defined behavior.

10 *Returns*: A reference to `find(x)->second`.

11 *Throws*: An exception object of type `out_of_range` if `find(x) == end()` is `true`.

12 *Complexity*: Logarithmic.

23.4.3.4 Modifiers [map.modifiers]

```
template<class P>
  constexpr pair<iterator, bool> insert(P&& x);
template<class P>
  constexpr iterator insert(const_iterator position, P&& x);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

```
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

3 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

4 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

5 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

6 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

7 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

8 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

9 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

10 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class K, class... Args>
  constexpr pair<iterator, bool> try_emplace(K&& k, Args&&... args);
template<class K, class... Args>
  constexpr iterator try_emplace(const_iterator hint, K&& k, Args&&... args);
```

11 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type. For the first overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_v<K&&, iterator>` are both `false`.

12 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(std::forward<K>(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

13 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise, let `r` be `equal_range(k)`. Constructs an object `u` of type `value_type` with `piecewise_construct`, `forward_as_tuple(std::forward<K>(k))`, `forward_as_tuple(std::forward<Args>(args)...)`. If `equal_range(u.first) == r` is `false`, the behavior is undefined. Inserts `u` into `*this`.

14 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

15 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

16 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

17 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `k`, `std::forward<M>(obj)`.

18 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

19 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

20 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

21 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

22 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `std::move(k)`, `std::forward<M>(obj)`.

23 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

24 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

25 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class K, class M>
  constexpr pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
  constexpr iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

26 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

27 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

28 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `std::forward<K>(k), std::forward<M>(obj)`.

29 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, let `r` be `equal_range(k)`. Constructs an object `u` of type `value_type` with `std::forward<K>(k), std::forward<M>(obj)`. If `equal_range(u.first) == r` is `false`, the behavior is undefined. Inserts `u` into `*this`.

30 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

31 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

23.4.3.5 Erasure [map.erasure]

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename map<Key, T, Compare, Allocator>::size_type
    constexpr erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.4.4 Class template `multimap` [multimap]

23.4.4.1 Overview [multimap.overview]

1 A `multimap` is an associative container that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.

2 A `multimap` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), and of an associative container (23.2.7). A `multimap` also provides most operations described in 23.2.7 for equal keys. This means that a `multimap` supports the `a_eq` operations in 23.2.7 but not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is

pair<const Key,T>. Descriptions are provided here only for operations on multimap that are not described in one of those tables or for operations where there is additional semantic information.

3 The types iterator and const_iterator meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class multimap {
  public:
    // types
    using key_type               = Key;
    using mapped_type            = T;
    using value_type             = pair<const Key, T>;
    using key_compare            = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 23.2
    using difference_type        = implementation-defined; // see 23.2
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    using node_type              = unspecified;

    multimap(initializer_list<pair<Key, T>>, Allocator)
      -> multimap<Key, T, less<Key>, Allocator>;
}
```

23.4.4.2 Constructors [multimap.cons]

```
constexpr explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr multimap(InputIterator first, InputIterator last,
                     const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range [`first`, `last`).

4 *Complexity*: Linear in N if the range [`first`, `last`) is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
  constexpr multimap(from_range_t, R&& rg,
                     const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

23.4.4.3 Modifiers [multimap.modifiers]

```
template<class P> constexpr iterator insert(P&& x);
template<class P> constexpr iterator insert(const_iterator position, P&& x);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

23.4.4.4 Erasure [multimap.erasure]

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename multimap<Key, T, Compare, Allocator>::size_type
    constexpr erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.4.5 Header <set> synopsis [associative.set.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

      erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class Key, class Compare = less<Key>>
      using set = std::set<Key, Compare, polymorphic_allocator<Key>>;

    template<class Key, class Compare = less<Key>>
      using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
  }
}
```

23.4.6 Class template set [set]

23.4.6.1 Overview [set.overview]

1 A `set` is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. The `set` class supports bidirectional iterators.

2 A `set` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5). and of an associative container (23.2.7). A `set` also provides most operations described in 23.2.7 for unique keys. This means that a `set` supports the `a_uniq` operations in 23.2.7 but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `set` that are not described in one of these tables and for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key, class Compare = less<Key>,
           class Allocator = allocator<Key>>
  class set {
  public:
    // types
    using key_type               = Key;
    using key_compare            = Compare;
    using value_type             = Key;
    using value_compare          = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 23.2
    using difference_type        = implementation-defined; // see 23.2
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    using node_type              = unspecified;
    using insert_return_type     = insert-return-type<iterator, node_type>;

    set(initializer_list<Key>, Allocator) -> set<Key, less<Key>, Allocator>;
}
```

23.4.6.2 Constructors, copy, and assignment [set.cons]

```
constexpr explicit set(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `set` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr set(InputIterator first, InputIterator last,
                const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range [`first`, `last`).

4 *Complexity*: Linear in N if the range [`first`, `last`) is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
  constexpr set(from_range_t, R&& rg, const Compare& comp = Compare(),
                const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

23.4.6.3 Erasure [set.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
  constexpr typename set<Key, Compare, Allocator>::size_type
    erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.4.6.4 Modifiers [set.modifiers]

```
template<class K> constexpr pair<iterator, bool> insert(K&& x);
template<class K> constexpr iterator insert(const_iterator hint, K&& x);
```

1 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type. For the second overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_v<K&&, iterator>` are both `false`.

2 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `set` from `std::forward<K>(x)`.

3 *Effects*: If the set already contains an element that is equivalent to `x`, there is no effect. Otherwise, let `r` be `equal_range(x)`. Constructs an object `u` of type `value_type` with `std::forward<K>(x)`. If `equal_range(u) == r` is `false`, the behavior is undefined. Inserts `u` into `*this`.

4 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the set element that is equivalent to `x`.

5 *Complexity*: Logarithmic.

23.4.7 Class template `multiset` [multiset]

23.4.7.1 Overview [multiset.overview]

1 A `multiset` is an associative container that supports equivalent keys (i.e., possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.

2 A `multiset` meets all of the requirements of a container (23.2.2.2), of a reversible container (23.2.2.3), of an allocator-aware container (23.2.2.5), of an associative container (23.2.7). `multiset` also provides most operations described in 23.2.7 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 23.2.7 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`.

Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key, class Compare = less<Key>,
           class Allocator = allocator<Key>>
  class multiset {
  public:

23.4.7.2 Constructors [multiset.cons]

```
constexpr explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr multiset(InputIterator first, InputIterator last,
                     const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range [`first`, `last`).

4 *Complexity*: Linear in N if the range [`first`, `last`) is already sorted with respect to `comp` and otherwise $N \log N$, where N is `last - first`.

```
template<container-compatible-range<value_type> R>
  constexpr multiset(from_range_t, R&& rg, const Compare& comp = Compare(),
                     const Allocator& = Allocator());
```

5 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range `rg`.

6 *Complexity*: Linear in N if `rg` is already sorted with respect to `comp` and otherwise $N \log N$, where N is `ranges::distance(rg)`.

23.4.7.3 Erasure [multiset.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
  constexpr typename multiset<Key, Compare, Allocator>::size_type
    erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.5 Unordered associative containers [unord]

23.5.1 General [unord.general]

1 The header `<unordered_map>` (23.5.2) defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` (23.5.5) defines the class templates `unordered_set` and `unordered_multiset`.

2 The exposition-only alias templates *`iter-value-type`*, *`iter-key-type`*, *`iter-mapped-type`*, *`iter-to--alloc-type`*, *`range-key-type`*, *`range-mapped-type`*, and *`range-to-alloc-type`* defined in 23.4.1 may appear in deduction guides for unordered containers.

23.5.2 Header `<unordered_map>` synopsis [unord.map.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.5.3, class template unordered_map
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;

  // 23.5.4, class template unordered_multimap
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Alloc = allocator<pair<const Key, T>>>
```

```
      class unordered_multimap;

    template<class Key, class T, class Hash, class Pred, class Alloc>
      constexpr bool operator==(const unordered_map<Key, T, Hash, Pred, Alloc>& a,
                                const unordered_map<Key, T, Hash, Pred, Alloc>& b);

    template<class Key, class T, class Hash, class Pred, class Alloc>
      constexpr bool operator==(const unordered_multimap<Key, T, Hash, Pred, Alloc>& a,
                                const unordered_multimap<Key, T, Hash, Pred, Alloc>& b);

    template<class Key, class T, class Hash, class Pred, class Alloc>
      constexpr void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
                          unordered_map<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));

    template<class Key, class T, class Hash, class Pred, class Alloc>
      constexpr void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
                          unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));

    // 23.5.3.5, erasure for unordered_map

    }
  }
```

23.5.3 Class template `unordered_map` [unord.map]

23.5.3.1 Overview [unord.map.overview]

1 An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.

2 An `unordered_map` meets all of the requirements of a container (23.2.2.2), of an allocator-aware container (23.2.2.5), and of an unordered associative container (23.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `pair<const Key, T>`.

3 Subclause 23.5.3 only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

4 The types iterator and const_iterator meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class unordered_map {
  public:
    // types
    using key_type             = Key;
    using mapped_type          = T;
    using value_type           = pair<const Key, T>;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;

      -> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;
}
```

5 A `size_type` parameter type in an `unordered_map` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

23.5.3.2 Constructors [unord.map.cnstr]

```
constexpr unordered_map() : unordered_map(size_type(see below)) { }
constexpr explicit unordered_map(size_type n, const hasher& hf = hasher(),
                                 const key_equal& eql = key_equal(),
                                 const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr unordered_map(InputIterator f, InputIterator l,
                          size_type n = see below, const hasher& hf = hasher(),
                          const key_equal& eql = key_equal(),
                          const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
  constexpr unordered_map(from_range_t, R&& rg,
                          size_type n = see below, const hasher& hf = hasher(),
                          const key_equal& eql = key_equal(),
                          const allocator_type& a = allocator_type());
```

```
constexpr unordered_map(initializer_list<value_type> il,
                        size_type n = see below, const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [`f`, `l`), `rg`, or `il`, respectively. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

23.5.3.3 Element access [unord.map.elem]

```
constexpr mapped_type& operator[](const key_type& k);
```

1 *Effects*: Equivalent to: `return try_emplace(k).first->second;`

```
constexpr mapped_type& operator[](key_type&& k);
```

2 *Effects*: Equivalent to: `return try_emplace(std::move(k)).first->second;`

```
template<class K> constexpr mapped_type& operator[](K&& k);
```

3 *Constraints*: The *qualified-id*s `Hash::is_transparent` and `Pred::is_transparent` are valid and denote types.

4 *Effects*: Equivalent to: `return try_emplace(std::forward<K>(k)).first->second;`

```
constexpr mapped_type& at(const key_type& k);
constexpr const mapped_type& at(const key_type& k) const;
```

5 *Returns*: A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

6 *Throws*: An exception object of type `out_of_range` if no such element is present.

```
template<class K> constexpr mapped_type&       at(const K& k);
template<class K> constexpr const mapped_type& at(const K& k) const;
```

7 *Constraints*: The *qualified-id*s `Hash::is_transparent` and `Pred::is_transparent` are valid and denote types.

8 *Preconditions*: The expression `find(k)` is well-formed and has well-defined behavior.

9 *Returns*: A reference to `find(k)->second`.

10 *Throws*: An exception object of type `out_of_range` if `find(k) == end()` is `true`.

23.5.3.4 Modifiers [unord.map.modifiers]

```
template<class P>
  constexpr pair<iterator, bool> insert(P&& obj);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
  constexpr iterator insert(const_iterator hint, P&& obj);
```

3 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

4 *Effects*: Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

```
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

6 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

7 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

10 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

11 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class K, class... Args>
  constexpr pair<iterator, bool> try_emplace(K&& k, Args&&... args);
template<class K, class... Args>
  constexpr iterator try_emplace(const_iterator hint, K&& k, Args&&... args);
```

13 *Constraints*: The *qualified-id*s `Hash::is_transparent` and `Pred::is_transparent` are valid and denote types. For the first overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_v<K&&, iterator>` are both `false`.

14 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct, forward_as_tuple(std::forward<K>(k)), forward_as_tuple(std::forward<Args>(args)...)`.

15 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise, let `h` be `hash_function()(k)`. Constructs an object `u` of type `value_type` with `piecewise_construct, forward_as_tuple(std::forward<K>(k)), forward_as_tuple(std::forward<Args>(args)...)`. If `hash_function()(u.first) != h || contains(u.first)` is `true`, the behavior is undefined. Inserts `u` into `*this`.

16 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

17 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

18 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

19 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `k`, `std::forward<M>(obj)`.

20 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

21 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

22 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

23 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

24 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `std::move(k)`, `std::forward<M>(obj)`.

25 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

26 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

27 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class K, class M>
  constexpr pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
  constexpr iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

28 *Constraints*: The *qualified-id*s `Hash::is_transparent` and `Pred::is_transparent` are valid and denote types.

29 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

30 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `std::forward<K>(k), std::forward<M>(obj)`.

31 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, let `h` be `hash_function()(k)`. Constructs an object `u` of type `value_type` with `std::forward<K>(k), std::forward<M>(obj)`. If `hash_function()(u.first) != h || contains(u.first)` is `true`, the behavior is undefined. Inserts `u` into `*this`.

32 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

33 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

23.5.3.5 Erasure [unord.map.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
  constexpr typename unordered_map<K, T, H, P, A>::size_type
    erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.5.4 Class template `unordered_multimap` [unord.multimap]

23.5.4.1 Overview [unord.multimap.overview]

1 An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.

2 An `unordered_multimap` meets all of the requirements of a container (23.2.2.2), of an allocator-aware container (23.2.2.5), and of an unordered associative container (23.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `pair<const Key, T>`.

3 Subclause 23.5.4 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

4 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class unordered_multimap {
  public:
    // types
    using key_type             = Key;
    using mapped_type          = T;
    using value_type           = pair<const Key, T>;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;

      -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

  template<class Key, class T, class Hash, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
                       Hash, Allocator)
      -> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;
}
```

5 A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

23.5.4.2 Constructors [unord.multimap.cnstr]

```
constexpr unordered_multimap() : unordered_multimap(size_type(see below)) { }
constexpr explicit unordered_multimap(size_type n, const hasher& hf = hasher(),
                                      const key_equal& eql = key_equal(),
                                      const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr unordered_multimap(InputIterator f, InputIterator l,
                               size_type n = see below, const hasher& hf = hasher(),
                               const key_equal& eql = key_equal(),
                               const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
  constexpr unordered_multimap(from_range_t, R&& rg,
                               size_type n = see below, const hasher& hf = hasher(),
                               const key_equal& eql = key_equal(),
                               const allocator_type& a = allocator_type());
constexpr unordered_multimap(initializer_list<value_type> il,
                             size_type n = see below, const hasher& hf = hasher(),
                             const key_equal& eql = key_equal(),
                             const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [`f`, `l`), `rg`, or `il`, respectively. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

23.5.4.3 Modifiers [unord.multimap.modifiers]

```
template<class P>
  constexpr iterator insert(P&& obj);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
  constexpr iterator insert(const_iterator hint, P&& obj);
```

3 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

4 *Effects*: Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

23.5.4.4 Erasure [unord.multimap.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
  constexpr typename unordered_multimap<K, T, H, P, A>::size_type
    erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
```

```
    return original_size - c.size();
```

}
```

23.5.6 Class template unordered_set [unord.set]

23.5.6.1 Overview [unord.set.overview]

1 An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.

2 An `unordered_set` meets all of the requirements of a container (23.2.2.2), of an allocator-aware container (23.2.2.5), of an unordered associative container (23.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the `key_type` and the `value_type` are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

3 Subclause 23.5.6 only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

4 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<Key>>
  class unordered_set {
  public:
    // types
    using key_type             = Key;
    using value_type           = Key;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;

  template<class T, class Hash, class Allocator>
    unordered_set(initializer_list<T>, typename see below::size_type, Hash, Allocator)
      -> unordered_set<T, Hash, equal_to<T>, Allocator>;
}
```

5 A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

23.5.6.2 Constructors [unord.set.cnstr]

```
constexpr unordered_set() : unordered_set(size_type(see below)) { }
constexpr explicit unordered_set(size_type n, const hasher& hf = hasher(),
                                 const key_equal& eql = key_equal(),
                                 const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr unordered_set(InputIterator f, InputIterator l,
                          size_type n = see below, const hasher& hf = hasher(),
                          const key_equal& eql = key_equal(),
                          const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
  constexpr unordered_multiset(from_range_t, R&& rg,
                               size_type n = see below, const hasher& hf = hasher(),
                               const key_equal& eql = key_equal(),
                               const allocator_type& a = allocator_type());
constexpr unordered_set(initializer_list<value_type> il,
                        size_type n = see below, const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [`f`, `l`), `rg`, or `il`, respectively. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

23.5.6.3 Erasure [unord.set.erasure]

```
template<class K, class H, class P, class A, class Predicate>
  constexpr typename unordered_set<K, H, P, A>::size_type
    erase_if(unordered_set<K, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

23.5.6.4 Modifiers [unord.set.modifiers]

```
template<class K> constexpr pair<iterator, bool> insert(K&& obj);
template<class K> constexpr iterator insert(const_iterator hint, K&& obj);
```

1 *Constraints*: The *qualified-id*s `Hash::is_transparent` and `Pred::is_transparent` are valid and denote types. For the second overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_-v<K&&, iterator>` are both `false`.

2 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_set` from `std::forward<K>(obj)`.

3 *Effects*: If the set already contains an element that is equivalent to `obj`, there is no effect. Otherwise, let `h` be `hash_function()(obj)`. Constructs an object `u` of type `value_type` with `std::forward<K>(obj)`. If `hash_function()(u) != h || contains(u)` is `true`, the behavior is undefined. Inserts `u` into `*this`.

4 *Returns*: For the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the set element that is equivalent to `obj`.

5 *Complexity*: Average case constant, worst case linear.

23.5.7 Class template `unordered_multiset` [unord.multiset]

23.5.7.1 Overview [unord.multiset.overview]

1 An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.

2 An `unordered_multiset` meets all of the requirements of a container (23.2.2.2), of an allocator-aware container (23.2.2.5), and of an unordered associative container (23.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the `key_type` and the `value_type` are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

3 Subclause 23.5.7 only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

4 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

```
namespace std {
  template<class Key,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<Key>>
  class unordered_multiset {
  public:
    // types
    using key_type             = Key;
    using value_type           = Key;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
    using reference            = value_type&;
    using const_reference      = const value_type&;
    using size_type            = implementation-defined; // see 23.2

    unordered_multiset(initializer_list<T>, typename see below::size_type, Allocator)
      -> unordered_multiset<T, hash<T>, equal_to<T>, Allocator>;

  template<class T, class Hash, class Allocator>
    unordered_multiset(initializer_list<T>, typename see below::size_type, Hash, Allocator)
      -> unordered_multiset<T, Hash, equal_to<T>, Allocator>;
}
```

5 A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

23.5.7.2 Constructors [unord.multiset.cnstr]

```
constexpr unordered_multiset() : unordered_multiset(size_type(see below)) { }
constexpr explicit unordered_multiset(size_type n, const hasher& hf = hasher(),
                                      const key_equal& eql = key_equal(),
                                      const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  constexpr unordered_multiset(InputIterator f, InputIterator l,
                               size_type n = see below, const hasher& hf = hasher(),
                               const key_equal& eql = key_equal(),
                               const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
  constexpr unordered_multiset(from_range_t, R&& rg,
                               size_type n = see below, const hasher& hf = hasher(),
                               const key_equal& eql = key_equal(),
                               const allocator_type& a = allocator_type());
constexpr unordered_multiset(initializer_list<value_type> il,
                             size_type n = see below, const hasher& hf = hasher(),
                             const key_equal& eql = key_equal(),
                             const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [`f`, `l`), `rg`, or `il`, respectively. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

23.5.7.3 Erasure [unord.multiset.erasure]

```
template<class K, class H, class P, class A, class Predicate>
  constexpr typename unordered_multiset<K, H, P, A>::size_type
    erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
```

```
    return original_size - c.size();
```

23.6 Container adaptors [container.adaptors]

23.6.1 General [container.adaptors.general]

1 The headers `<queue>` (23.6.2), `<stack>` (23.6.5), `<flat_map>` (23.6.7), and `<flat_set>` (23.6.10) define the container adaptors `queue` and `priority_queue`, `stack`, `flat_map` and `flat_multimap`, and `flat_set` and `flat_multiset`, respectively.

2 Each container adaptor takes one or more template parameters named `Container`, `KeyContainer`, or `MappedContainer` that denote the types of containers that the container adaptor adapts. Each container adaptor has at least one constructor that takes a reference argument to one or more such template parameters. For each constructor reference argument to a container `C`, the constructor copies the container into the container adaptor. If `C` takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. For the container adaptors that take a single container template parameter `Container`, the first template parameter `T` of the container adaptor shall denote the same type as `Container::value_type`.

3 For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor's `Container`, `KeyContainer`, `MappedContainer`, or `Compare` object (if any).

4 A constructor template of a container adaptor shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

5 For container adaptors that have them, the `insert`, `emplace`, and `erase` members affect the validity of iterators, references, and pointers to the adaptor's container(s) in the same way that the containers' respective `insert`, `emplace`, and `erase` members do.

[*Example 1*: A call to `flat_map<Key, T>::insert` can invalidate all iterators to the `flat_map`. — *end example*]

6 A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

(6.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(6.2) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.3) — It has a `Container`, `KeyContainer`, or `MappedContainer` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.4) — It has no `Container`, `KeyContainer`, or `MappedContainer` template parameter, and it has an `Allocator` template parameter, and a type that does not qualify as an allocator is deduced for that parameter.

(6.5) — It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is `false`.

(6.6) — It has both `KeyContainer` and `Allocator` template parameters, and `uses_allocator_v<KeyContainer, Allocator>` is `false`.

(6.7) — It has both `KeyContainer` and `Compare` template parameters, and

```
is_invocable_v<const Compare&,
              const typename KeyContainer::value_type&,
              const typename KeyContainer::value_type&>
```

is not a valid expression or is `false`.

(6.8) — It has both `MappedContainer` and `Allocator` template parameters, and `uses_allocator_v<MappedContainer, Allocator>` is `false`.

7 The exposition-only alias template *`iter-value-type`* defined in 23.3.1 and the exposition-only alias templates *`iter-key-type`*, *`iter-mapped-type`*, *`range-key-type`*, and *`range-mapped-type`* defined in 23.4.1 may appear in deduction guides for container adaptors.

8 The following exposition-only alias template may appear in deduction guides for container adaptors:

```
template<class Allocator, class T>
  using alloc-rebind =                        // exposition only
    typename allocator_traits<Allocator>::template rebind_alloc<T>;
```

23.6.2 Header <queue> synopsis [queue.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.6.3, class template queue
  template<class T, class Container = deque<T>> class queue;

23.6.3 Class template queue [queue]

23.6.3.1 Definition [queue.defn]

1 Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate `queue`. In particular, `list` (23.3.11) and `deque` (23.3.5) can be used.

```
namespace std {
  template<class T, class Container = deque<T>>
  class queue {
  public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type       = typename Container::size_type;
    using container_type  =          Container;

  protected:
    Container c;

  public:
    constexpr queue() : queue(Container()) {}
    constexpr explicit queue(const Container&);
    constexpr explicit queue(Container&&);
    template<class InputIterator> constexpr queue(InputIterator first, InputIterator last);
    template<container-compatible-range<T> R> constexpr queue(from_range_t, R&& rg);
    template<class Alloc> constexpr explicit queue(const Alloc&);
    template<class Alloc> constexpr queue(const Container&, const Alloc&);
    template<class Alloc> constexpr queue(Container&&, const Alloc&);
    template<class Alloc> constexpr queue(const queue&, const Alloc&);
    template<class Alloc> constexpr queue(queue&&, const Alloc&);
    template<class InputIterator, class Alloc>
      constexpr queue(InputIterator first, InputIterator last, const Alloc&);
    template<container-compatible-range<T> R, class Alloc>
      constexpr queue(from_range_t, R&& rg, const Alloc&);

    constexpr bool              empty() const     { return c.empty(); }
    constexpr size_type         size()  const     { return c.size(); }
    constexpr reference         front()           { return c.front(); }
    constexpr const_reference   front() const     { return c.front(); }
    constexpr reference         back()            { return c.back(); }
    constexpr const_reference   back() const      { return c.back(); }
    constexpr void push(const value_type& x)      { c.push_back(x); }
    constexpr void push(value_type&& x)           { c.push_back(std::move(x)); }
    template<container-compatible-range<T> R> constexpr void push_range(R&& rg);
    template<class... Args>
      constexpr decltype(auto) emplace(Args&&... args)
        { return c.emplace_back(std::forward<Args>(args)...); }
    constexpr void pop()                          { c.pop_front(); }
    constexpr void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
      { using std::swap; swap(c, q.c); }
  };

  template<class Container>
    queue(Container) -> queue<typename Container::value_type, Container>;

  template<class InputIterator>
    queue(InputIterator, InputIterator) -> queue<iter-value-type<InputIterator>>;

  template<ranges::input_range R>
    queue(from_range_t, R&&) -> queue<ranges::range_value_t<R>>;

  template<class Container, class Allocator>
    queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

  template<class InputIterator, class Allocator>
    queue(InputIterator, InputIterator, Allocator)
      -> queue<iter-value-type<InputIterator>, deque<iter-value-type<InputIterator>,
               Allocator>>;

  template<ranges::input_range R, class Allocator>
    queue(from_range_t, R&&, Allocator)
      -> queue<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

  template<class T, class Container, class Alloc>
    struct uses_allocator<queue<T, Container>, Alloc>
      : uses_allocator<Container, Alloc>::type { };
}
```

23.6.3.2 Constructors [queue.cons]

```
constexpr explicit queue(const Container& cont);
```

1 *Effects*: Initializes `c` with `cont`.

```
constexpr explicit queue(Container&& cont);
```

2 *Effects*: Initializes `c` with `std::move(cont)`.

```
template<class InputIterator>
  constexpr queue(InputIterator first, InputIterator last);
```

3 *Effects*: Initializes `c` with `first` as the first argument and `last` as the second argument.

```
template<container-compatible-range<T> R>
  constexpr queue(from_range_t, R&& rg);
```

4 *Effects*: Initializes `c` with `ranges::to<Container>(std::forward<R>(rg))`.

23.6.3.3 Constructors with allocators [queue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> constexpr explicit queue(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a`.

```
template<class Alloc> constexpr queue(const container_type& cont, const Alloc& a);
```

3 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr queue(container_type&& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr queue(const queue& q, const Alloc& a);
```

5 *Effects*: Initializes `c` with `q.c` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr queue(queue&& q, const Alloc& a);
```

6 *Effects*: Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument.

```
template<class InputIterator, class Alloc>
  constexpr queue(InputIterator first, InputIterator last, const Alloc& alloc);
```

7 *Effects*: Initializes `c` with `first` as the first argument, `last` as the second argument, and `alloc` as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
  constexpr queue(from_range_t, R&& rg, const Alloc& a);
```

8 *Effects*: Initializes `c` with `ranges::to<Container>(std::forward<R>(rg), a)`.

23.6.3.4 Modifiers [queue.mod]

```
template<container-compatible-range<T> R>
  constexpr void push_range(R&& rg);
```

1 *Effects*: Equivalent to `c.append_range(std::forward<R>(rg))` if that is a valid expression, otherwise `ranges::copy(rg, back_inserter(c))`.

23.6.3.5 Operators [queue.ops]

```
template<class T, class Container>
  constexpr bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

1 *Returns*: `x.c == y.c`.

```
template<class T, class Container>
  constexpr bool operator!=(const queue<T, Container>& x,  const queue<T, Container>& y);
```

2 *Returns*: `x.c != y.c`.

```
template<class T, class Container>
  constexpr bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
```

3 *Returns*: `x.c < y.c`.

```
template<class T, class Container>
  constexpr bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
```

4 *Returns*: `x.c > y.c`.

```
template<class T, class Container>
  constexpr bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
```

5 *Returns*: `x.c <= y.c`.

```
template<class T, class Container>
  constexpr bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);
```

6 *Returns*: `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
  constexpr compare_three_way_result_t<Container>
    operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);
```

7 *Returns*: `x.c <=> y.c`.

23.6.3.6 Specialized algorithms [queue.special]

```
template<class T, class Container>
  constexpr void swap(queue<T, Container>& x, queue<T, Container>& y)
    noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

23.6.4 Class template `priority_queue` [priority.queue]

23.6.4.1 Overview [priqueue.overview]

1 Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (23.3.13) and `deque` (23.3.5) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (26.8).

```
namespace std {
  template<class T, class Container = vector<T>,
           class Compare = less<typename Container::value_type>>
  class priority_queue {
  public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type       = typename Container::size_type;
    using container_type  = Container;
    using value_compare   = Compare;

  protected:
    Container c;
    Compare comp;

  public:
    constexpr priority_queue() : priority_queue(Compare()) {}
    constexpr explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}
    constexpr priority_queue(const Compare& x, const Container&);
    constexpr priority_queue(const Compare& x, Container&&);
    template<class InputIterator>
      constexpr priority_queue(InputIterator first, InputIterator last,
                               const Compare& x = Compare());
    template<class InputIterator>
      constexpr priority_queue(InputIterator first, InputIterator last, const Compare& x,
                               const Container&);
    template<class InputIterator>
      constexpr priority_queue(InputIterator first, InputIterator last, const Compare& x,
                               Container&&);
    template<container-compatible-range<T> R>
      constexpr priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
    template<class Alloc> constexpr explicit priority_queue(const Alloc&);
    template<class Alloc> constexpr priority_queue(const Compare&, const Alloc&);
    template<class Alloc>

      : uses_allocator<Container, Alloc>::type { };
}
```

23.6.4.2 Constructors [priqueue.cons]

```
constexpr priority_queue(const Compare& x, const Container& y);
constexpr priority_queue(const Compare& x, Container&& y);
```

1 *Preconditions*: `x` defines a strict weak ordering (26.8).

2 *Effects*: Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator>
  constexpr priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
```

3 *Preconditions*: `x` defines a strict weak ordering (26.8).

4 *Effects*: Initializes `c` with `first` as the first argument and `last` as the second argument, and initializes `comp` with `x`; then calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator>
  constexpr priority_queue(InputIterator first, InputIterator last, const Compare& x,
                           const Container& y);
template<class InputIterator>
  constexpr priority_queue(InputIterator first, InputIterator last, const Compare& x,
                           Container&& y);
```

5 *Preconditions*: `x` defines a strict weak ordering (26.8).

6 *Effects*: Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R>
  constexpr priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
```

7 *Preconditions*: `x` defines a strict weak ordering (26.8).

8 *Effects*: Initializes `comp` with `x` and `c` with `ranges::to<Container>(std::forward<R>(rg))` and finally calls `make_heap(c.begin(), c.end(), comp)`.

23.6.4.3 Constructors with allocators [priqueue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> constexpr explicit priority_queue(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a` and value-initializes `comp`.

```
template<class Alloc> constexpr priority_queue(const Compare& compare, const Alloc& a);
```

3 *Effects*: Initializes `c` with `a` and initializes `comp` with `compare`.

```
template<class Alloc>
  constexpr priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc>
  constexpr priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

5 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc> constexpr priority_queue(const priority_queue& q, const Alloc& a);
```

6 *Effects*: Initializes `c` with `q.c` as the first argument and `a` as the second argument, and initializes `comp` with `q.comp`.

```
template<class Alloc> constexpr priority_queue(priority_queue&& q, const Alloc& a);
```

7 *Effects*: Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument, and initializes `comp` with `std::move(q.comp)`.

```
template<class InputIterator, class Alloc>
  constexpr priority_queue(InputIterator first, InputIterator last, const Alloc& a);
```

8 *Effects*: Initializes `c` with `first` as the first argument, `last` as the second argument, and `a` as the third argument, and value-initializes `comp`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
  constexpr priority_queue(InputIterator first, InputIterator last,
                           const Compare& compare, const Alloc& a);
```

9 *Effects*: Initializes `c` with `first` as the first argument, `last` as the second argument, and `a` as the third argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
  constexpr priority_queue(InputIterator first, InputIterator last, const Compare& compare,
                           const Container& cont, const Alloc& a);
```

10 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
  constexpr priority_queue(InputIterator first, InputIterator last, const Compare& compare,
                           Container&& cont, const Alloc& a);
```

11 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R, class Alloc>
  constexpr priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);
```

12 *Effects*: Initializes `comp` with `compare` and `c` with `ranges::to<Container>(std::forward<R>(rg), a)`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R, class Alloc>
  constexpr priority_queue(from_range_t, R&& rg, const Alloc& a);
```

13 *Effects*: Initializes `c` with `ranges::to<Container>(std::forward<R>(rg), a)` and value-initializes `comp`; calls `make_heap(c.begin(), c.end(), comp)`.

23.6.4.4 Members [priqueue.members]

```
constexpr void push(const value_type& x);
```

1 *Effects*: As if by:

```
c.push_back(x);
push_heap(c.begin(), c.end(), comp);
```

```
constexpr void push(value_type&& x);
```

2 *Effects*: As if by:

```
c.push_back(std::move(x));
push_heap(c.begin(), c.end(), comp);
```

```
template<container-compatible-range<T> R>
  constexpr void push_range(R&& rg);
```

3 *Effects*: Inserts all elements of `rg` in `c` via `c.append_range(std::forward<R>(rg))` if that is a valid expression, or `ranges::copy(rg, back_inserter(c))` otherwise. Then restores the heap property as if by `make_heap(c.begin(), c.end(), comp)`.

4 *Postconditions*: `is_heap(c.begin(), c.end(), comp)` is `true`.

```
template<class... Args> constexpr void emplace(Args&&... args);
```

5 *Effects*: As if by:

```
c.emplace_back(std::forward<Args>(args)...);
push_heap(c.begin(), c.end(), comp);
```

```
constexpr void pop();
```

6 *Effects*: As if by:

```
pop_heap(c.begin(), c.end(), comp);
c.pop_back();
```

23.6.4.5 Specialized algorithms [priqueue.special]

```
template<class T, class Container, class Compare>
  constexpr void swap(priority_queue<T, Container, Compare>& x,
                      priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true` and `is_swappable_v<Compare>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

23.6.5 Header `<stack>` synopsis [stack.syn]

```
#include <compare>              // see 17.12.1

```

23.6.6 Class template stack [stack]

23.6.6.1 General [stack.general]

1 Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (23.3.13), `list` (23.3.11) and `deque` (23.3.5) can be used.

23.6.6.2 Definition [stack.defn]

```
  namespace std {
    template<class T, class Container = deque<T>>
    class stack {
    public:
      using value_type      = typename Container::value_type;
      using reference       = typename Container::reference;
      using const_reference = typename Container::const_reference;
      using size_type       = typename Container::size_type;
      using container_type  = Container;

    protected:
      Container c;

    public:
      constexpr stack() : stack(Container()) {}
      constexpr explicit stack(const Container&);
      constexpr explicit stack(Container&&);
      template<class InputIterator> constexpr stack(InputIterator first, InputIterator last);
      template<container-compatible-range<T> R>
        constexpr stack(from_range_t, R&& rg);
      template<class Alloc> constexpr explicit stack(const Alloc&);
      template<class Alloc> constexpr stack(const Container&, const Alloc&);
      template<class Alloc> constexpr stack(Container&&, const Alloc&);
      template<class Alloc> constexpr stack(const stack&, const Alloc&);
      template<class Alloc> constexpr stack(stack&&, const Alloc&);
      template<class InputIterator, class Alloc>
        constexpr stack(InputIterator first, InputIterator last, const Alloc&);
      template<container-compatible-range<T> R, class Alloc>
        constexpr stack(from_range_t, R&& rg, const Alloc&);

      constexpr bool              empty() const     { return c.empty(); }
      constexpr size_type         size()  const     { return c.size(); }
      constexpr reference         top()             { return c.back(); }
      constexpr const_reference   top()   const     { return c.back(); }
      constexpr void push(const value_type& x)      { c.push_back(x); }
      constexpr void push(value_type&& x)           { c.push_back(std::move(x)); }
      template<container-compatible-range<T> R>
        constexpr void push_range(R&& rg);
      template<class... Args>
        constexpr decltype(auto) emplace(Args&&... args)
          { return c.emplace_back(std::forward<Args>(args)...); }
      constexpr void pop()                          { c.pop_back(); }
      constexpr void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
        { using std::swap; swap(c, s.c); }
    };

    template<class Container>
      stack(Container) -> stack<typename Container::value_type, Container>;

    template<class InputIterator>
      stack(InputIterator, InputIterator) -> stack<iter-value-type<InputIterator>>;

    template<ranges::input_range R>
      stack(from_range_t, R&&) -> stack<ranges::range_value_t<R>>;

    template<class Container, class Allocator>
      stack(Container, Allocator) -> stack<typename Container::value_type, Container>;

    template<class InputIterator, class Allocator>
      stack(InputIterator, InputIterator, Allocator)
        -> stack<iter-value-type<InputIterator>, deque<iter-value-type<InputIterator>,
                 Allocator>>;

    template<ranges::input_range R, class Allocator>
      stack(from_range_t, R&&, Allocator)
        -> stack<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

    template<class T, class Container, class Alloc>
      struct uses_allocator<stack<T, Container>, Alloc>
        : uses_allocator<Container, Alloc>::type { };
  }
```

23.6.6.3 Constructors [stack.cons]

```
constexpr explicit stack(const Container& cont);
```

1 *Effects*: Initializes `c` with `cont`.

```
constexpr explicit stack(Container&& cont);
```

2 *Effects*: Initializes `c` with `std::move(cont)`.

```
template<class InputIterator>
  constexpr stack(InputIterator first, InputIterator last);
```

3 *Effects*: Initializes `c` with `first` as the first argument and `last` as the second argument.

```
template<container-compatible-range<T> R>
  constexpr stack(from_range_t, R&& rg);
```

4 *Effects*: Initializes `c` with `ranges::to<Container>(std::forward<R>(rg))`.

23.6.6.4 Constructors with allocators [stack.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> constexpr explicit stack(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a`.

```
template<class Alloc> constexpr stack(const container_type& cont, const Alloc& a);
```

3 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr stack(container_type&& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr stack(const stack& s, const Alloc& a);
```

5 *Effects*: Initializes `c` with `s.c` as the first argument and `a` as the second argument.

```
template<class Alloc> constexpr stack(stack&& s, const Alloc& a);
```

6 *Effects*: Initializes `c` with `std::move(s.c)` as the first argument and `a` as the second argument.

```
template<class InputIterator, class Alloc>
  constexpr stack(InputIterator first, InputIterator last, const Alloc& alloc);
```

7 *Effects*: Initializes `c` with `first` as the first argument, `last` as the second argument, and `alloc` as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
  constexpr stack(from_range_t, R&& rg, const Alloc& a);
```

8 *Effects*: Initializes `c` with `ranges::to<Container>(std::forward<R>(rg), a)`.

23.6.6.5 Modifiers [stack.mod]

```
template<container-compatible-range<T> R>
  constexpr void push_range(R&& rg);
```

1 *Effects*: Equivalent to `c.append_range(std::forward<R>(rg))` if that is a valid expression, otherwise `ranges::copy(rg, back_inserter(c))`.

23.6.6.6 Operators [stack.ops]

```
template<class T, class Container>
  constexpr bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
```

1 *Returns*: `x.c == y.c`.

```
template<class T, class Container>
  constexpr bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
```

2 *Returns*: `x.c != y.c`.

```
template<class T, class Container>
  constexpr bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
```

3 *Returns*: `x.c < y.c`.

```
template<class T, class Container>
  constexpr bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
```

4 *Returns*: `x.c > y.c`.

```
template<class T, class Container>
  constexpr bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
```

5 *Returns*: `x.c <= y.c`.

```
template<class T, class Container>
  constexpr bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
```

6 *Returns*: `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
  constexpr compare_three_way_result_t<Container>
    operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);
```

7 *Returns*: `x.c <=> y.c`.

23.6.6.7 Specialized algorithms [stack.special]

```
template<class T, class Container>
  constexpr void swap(stack<T, Container>& x, stack<T, Container>& y)
    noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

23.6.7 Header <flat_map> synopsis [flat.map.syn]

```
#include <compare>               // see 17.12.1
#include <initializer_list>      // see 17.11.2

namespace std {
  // 23.6.8, class template flat_map
  template<class Key, class T, class Compare = less<Key>,

                          Allocator>;

  // 23.6.8.8, erasure for flat_map
  template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
           class Predicate>
    constexpr typename flat_map<Key, T, Compare, KeyContainer, MappedContainer>::size_type
      erase_if(flat_map<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);

  // 23.6.9, class template flat_multimap
  template<class Key, class T, class Compare = less<Key>,
           class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
    class flat_multimap;

  struct sorted_equivalent_t { explicit sorted_equivalent_t() = default; };
  inline constexpr sorted_equivalent_t sorted_equivalent{};

  template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
           class Allocator>
    struct uses_allocator<flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>,
                          Allocator>;

  // 23.6.9.5, erasure for flat_multimap
  template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
           class Predicate>
    constexpr typename flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>::size_type
      erase_if(flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);
}
```

23.6.8 Class template `flat_map` [flat.map]

23.6.8.1 Overview [flat.map.overview]

1 A `flat_map` is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. `flat_map` supports iterators that meet the *Cpp17InputIterator* requirements and model the `random_access_iterator` concept (24.3.4.13).

2 A `flat_map` meets all of the requirements of a container (23.2.2.2) and of a reversible container (23.2.2.3), plus the optional container requirements (23.2.2.4). `flat_map` meets the requirements of an associative container (23.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (23.2.5),

(2.2) — it does not meet the requirements related to iterator invalidation, and

(2.3) — the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

[*Note 1*: A `flat_map` does not meet the additional requirements of an allocator-aware container (23.2.2.5). — *end note*]

3 A `flat_map` also provides most operations described in 23.2.7 for unique keys. This means that a `flat_map` supports the `a_uniq` operations in 23.2.7 but not the `a_eq` operations. For a `flat_map<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<Key, T>`.

4 Descriptions are provided here only for operations on `flat_map` that are not described in one of those sets of requirements or for operations where there is additional semantic information.

5 A `flat_map` maintains the following invariants:

(5.1) — it contains the same number of keys and values;

(5.2) — the keys are sorted with respect to the comparison object; and

(5.3) — the value at offset `off` within the value container is the value associated with the key at offset `off` within the key container.

6 If any member function in 23.6.8.2 exits via an exception the invariants are restored.

[*Note 2*: This can result in the `flat_map` being emptied. — *end note*]

7 Any type `C` that meets the sequence container requirements (23.2.4) can be used to instantiate `flat_map`, as long as `C::iterator` meets the *Cpp17RandomAccessIterator* requirements and invocations of member functions `C::size` and `C::max_size` do not exit via an exception. In particular, `vector` (23.3.13) and `deque` (23.3.5) can be used.

[*Note 3*: `vector<bool>` is not a sequence container. — *end note*]

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type` or `T` is not the same type as `MappedContainer::value_type`.

9 The effect of calling a constructor that takes both `key_container_type` and `mapped_container_type` arguments with containers of different sizes is undefined.

10 The effect of calling a constructor or member function that takes a `sorted_unique_t` argument with a container, containers, or range that is not sorted with respect to `key_comp()`, or that contains equal elements, is undefined.

11 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

23.6.8.2 Definition [flat.map.defn]

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
  class flat_map {
  public:
    // types
    using key_type               = Key;
    using mapped_type            = T;
    using value_type             = pair<key_type, mapped_type>;
    using key_compare            = Compare;
    using reference              = pair<const key_type&, mapped_type&>;
    using const_reference        = pair<const key_type&, const mapped_type&>;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    using iterator               = implementation-defined; // see 23.2
    using const_iterator         = implementation-defined; // see 23.2

}
```

1 The member type `containers` has the data members and special members specified above. It has no base classes or members other than those specified.

23.6.8.3 Constructors [flat.map.cons]

```
constexpr flat_map(key_container_type key_cont, mapped_container_type mapped_cont,
                   const key_compare& comp = key_compare());
```

1 *Effects*: Initializes *c*`.keys` with `std::move(key_cont)`, *c*`.values` with `std::move(mapped_cont)`, and *compare* with `comp`; sorts the range [`begin()`, `end()`) with respect to `value_comp()`; and finally erases the duplicate elements as if by:

```
auto zv = views::zip(c.keys, c.values);
auto it = ranges::unique(zv, key-equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

2 *Complexity*: Linear in N if the container arguments are already sorted with respect to `value_comp()` and otherwise $N \log N$, where N is the value of `key_cont.size()` before this call.

```
constexpr flat_map(sorted_unique_t, key_container_type key_cont, mapped_container_type mapped_cont,
                   const key_compare& comp = key_compare());
```

3 *Effects*: Initializes *c*`.keys` with `std::move(key_cont)`, *c*`.values` with `std::move(mapped_cont)`, and *compare* with `comp`.

4 *Complexity*: Constant.

23.6.8.4 Constructors with allocators [flat.map.cons.alloc]

1 The constructors in this subclause shall not participate in overload resolution unless `uses_allocator_v<key_-container_type, Alloc>` is `true` and `uses_allocator_v<mapped_container_type, Alloc>` is `true`.

```
template<class Alloc>
  constexpr flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
                     const Alloc& a);
template<class Alloc>
  constexpr flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
                     const key_compare& comp, const Alloc& a);
```

2 *Effects*: Equivalent to `flat_map(key_cont, mapped_cont)` and `flat_map(key_cont, mapped_cont, comp)`, respectively, except that *c*`.keys` and *c*`.values` are constructed with uses-allocator construction (20.2.8.2).

3 *Complexity*: Same as `flat_map(key_cont, mapped_cont)` and `flat_map(key_cont, mapped_cont, comp)`, respectively.

```
template<class Alloc>
  constexpr flat_map(sorted_unique_t s, const key_container_type& key_cont,
                     const mapped_container_type& mapped_cont, const Alloc& a);
template<class Alloc>
  constexpr flat_map(sorted_unique_t s, const key_container_type& key_cont,
                     const mapped_container_type& mapped_cont, const key_compare& comp,
                     const Alloc& a);
```

4 *Effects*: Equivalent to `flat_map(s, key_cont, mapped_cont)` and `flat_map(s, key_cont, mapped_cont, comp)`, respectively, except that *c*`.keys` and *c*`.values` are constructed with uses-allocator construction (20.2.8.2).

5 *Complexity*: Linear.

```
template<class Alloc>
  constexpr explicit flat_map(const Alloc& a);
template<class Alloc>
  constexpr flat_map(const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_map(const flat_map&, const Alloc& a);
template<class Alloc>
  constexpr flat_map(flat_map&&, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_map(InputIterator first, InputIterator last, const Alloc& a);
```

```
template<class InputIterator, class Alloc>
  constexpr flat_map(InputIterator first, InputIterator last, const key_compare& comp,
                     const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_map(sorted_unique_t, InputIterator first, InputIterator last, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_map(sorted_unique_t, InputIterator first, InputIterator last,
                     const key_compare& comp, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_map(from_range_t, R&& rg, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_map(from_range_t, R&& rg, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_map(initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_map(initializer_list<value_type> il, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_map(sorted_unique_t, initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_map(sorted_unique_t, initializer_list<value_type> il,
                     const key_compare& comp, const Alloc& a);
```

6 *Effects*: Equivalent to the corresponding non-allocator constructors except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

23.6.8.5 Capacity [flat.map.capacity]

```
constexpr size_type size() const noexcept;
```

1 *Returns*: `c.keys.size()`.

```
constexpr size_type max_size() const noexcept;
```

2 *Returns*: `min<size_type>(c.keys.max_size(), c.values.max_size())`.

23.6.8.6 Access [flat.map.access]

```
constexpr mapped_type& operator[](const key_type& x);
```

1 *Effects*: Equivalent to: `return try_emplace(x).first->second;`

```
constexpr mapped_type& operator[](key_type&& x);
```

2 *Effects*: Equivalent to: `return try_emplace(std::move(x)).first->second;`

```
template<class K> constexpr mapped_type& operator[](K&& x);
```

3 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

4 *Effects*: Equivalent to: `return try_emplace(std::forward<K>(x)).first->second;`

```
constexpr mapped_type&       at(const key_type& x);
constexpr const mapped_type& at(const key_type& x) const;
```

5 *Returns*: A reference to the `mapped_type` corresponding to `x` in `*this`.

6 *Throws*: An exception object of type `out_of_range` if no such element is present.

7 *Complexity*: Logarithmic.

```
template<class K> constexpr mapped_type&       at(const K& x);
template<class K> constexpr const mapped_type& at(const K& x) const;
```

8 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

9 *Preconditions*: The expression `find(x)` is well-formed and has well-defined behavior.

10 *Returns*: A reference to the `mapped_type` corresponding to `x` in `*this`.

11 *Throws*: An exception object of type `out_of_range` if no such element is present.

12 *Complexity*: Logarithmic.

23.6.8.7 Modifiers [flat.map.modifiers]

```
template<class... Args> constexpr pair<iterator, bool> emplace(Args&&... args);
```

1 *Constraints*: `is_constructible_v<pair<key_type, mapped_type>, Args...>` is `true`.

2 *Effects*: Initializes an object `t` of type `pair<key_type, mapped_type>` with `std::forward<Args>(args)...`; if the map already contains an element whose key is equivalent to `t.first`, `*this` is unchanged. Otherwise, equivalent to:

```
auto key_it = ranges::upper_bound(c.keys, t.first, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.insert(key_it, std::move(t.first));
c.values.insert(value_it, std::move(t.second));
```

3 *Returns*: The `bool` component of the returned pair is `true` if and only if the insertion took place, and the iterator component of the pair points to the element with key equivalent to `t.first`.

```
template<class P> constexpr pair<iterator, bool> insert(P&& x);
template<class P> constexpr iterator insert(const_iterator position, P&& x);
```

4 *Constraints*: `is_constructible_v<pair<key_type, mapped_type>, P>` is `true`.

5 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x));`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x));`.

```
template<class InputIterator>
  constexpr void insert(InputIterator first, InputIterator last);
```

6 *Effects*: Adds elements to `c` as if by:

```
for (; first != last; ++first) {
  value_type value = *first;
  c.keys.insert(c.keys.end(), std::move(value.first));
  c.values.insert(c.values.end(), std::move(value.second));
}
```

Then, sorts the range of newly inserted elements with respect to `value_comp()`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = views::zip(c.keys, c.values);
auto it = ranges::unique(zv, key-equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

7 *Complexity*: $N + M \log M$, where N is `size()` before the operation and M is `distance(first, last)`.

8 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
  constexpr void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

9 *Effects*: Adds elements to `c` as if by:

```
for (; first != last; ++first) {
  value_type value = *first;
  c.keys.insert(c.keys.end(), std::move(value.first));
  c.values.insert(c.values.end(), std::move(value.second));
}
```

Then, merges the sorted range of newly added elements and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = views::zip(c.keys, c.values);
auto it = ranges::unique(zv, key-equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

10 *Complexity*: Linear in N, where N is `size()` after the operation.

11 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
template<container-compatible-range<value_type> R>
  constexpr void insert_range(R&& rg);
```

12 *Effects*: Adds elements to `c` as if by:

```
for (const auto& e : rg) {
  c.keys.insert(c.keys.end(), e.first);
  c.values.insert(c.values.end(), e.second);
}
```

Then, sorts the range of newly inserted elements with respect to `value_comp()`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```
auto zv = views::zip(c.keys, c.values);
auto it = ranges::unique(zv, key-equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

13 *Complexity*: $N + M \log M$, where N is `size()` before the operation and M is `ranges::distance(rg)`.

14 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
  constexpr pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
template<class... Args>
  constexpr iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

15 *Constraints*: `is_constructible_v<mapped_type, Args...>` is `true`.

16 *Effects*: If the map already contains an element whose key is equivalent to `k`, `*this` and `args...` are unchanged. Otherwise equivalent to:

```
auto key_it = ranges::upper_bound(c.keys, k, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.insert(key_it, std::forward<decltype(k)>(k));
c.values.emplace(value_it, std::forward<Args>(args)...);
```

17 *Returns*: In the first two overloads, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

18 *Complexity*: The same as `emplace` for the first two overloads, and the same as `emplace_hint` for the last two overloads.

```
template<class K, class... Args>
  constexpr pair<iterator, bool> try_emplace(K&& k, Args&&... args);
template<class K, class... Args>
  constexpr iterator try_emplace(const_iterator hint, K&& k, Args&&... args);
```

19 *Constraints*:

(19.1) — The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

(19.2) — `is_constructible_v<key_type, K>` is `true`.

(19.3) — `is_constructible_v<mapped_type, Args...>` is `true`.

(19.4) — For the first overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_v<K&&, iterator>` are both `false`.

20 *Preconditions*: The conversion from `k` into `key_type` constructs an object `u`, for which `find(k) == find(u)` is `true`.

21 *Effects*: If the map already contains an element whose key is equivalent to `k`, `*this` and `args...` are unchanged. Otherwise equivalent to:

```
auto key_it = ranges::upper_bound(c.keys, k, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.emplace(key_it, std::forward<K>(k));
c.values.emplace(value_it, std::forward<Args>(args)...);
```

22 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

23 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
  constexpr pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
template<class M>
  constexpr iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

24 *Constraints*: `is_assignable_v<mapped_type&, M>` is `true` and `is_constructible_v<mapped_type, M>` is `true`.

25 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, equivalent to

```
try_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the first two overloads or

```
try_emplace(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the last two overloads.

26 *Returns*: In the first two overloads, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

27 *Complexity*: The same as `emplace` for the first two overloads and the same as `emplace_hint` for the last two overloads.

```
template<class K, class M>
  constexpr pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
  constexpr iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

28 *Constraints*:

(28.1) — The *qualified-id* `Compare::is_transparent` is valid and denotes a type.

(28.2) — `is_constructible_v<key_type, K>` is `true`.

(28.3) — `is_assignable_v<mapped_type&, M>` is `true`.

(28.4) — `is_constructible_v<mapped_type, M>` is `true`.

29 *Preconditions*: The conversion from `k` into `key_type` constructs an object `u`, for which `find(k) == find(u)` is `true`.

30 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, equivalent to

```
try_emplace(std::forward<K>(k), std::forward<M>(obj))
```

for the first overload or

```
try_emplace(hint, std::forward<K>(k), std::forward<M>(obj))
```

for the second overload.

31 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

32 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
constexpr void swap(flat_map& y) noexcept;
```

33 *Effects*: Equivalent to:

```
ranges::swap(compare, y.compare);
```

```
    ranges::swap(c.keys, y.c.keys);
    ranges::swap(c.values, y.c.values);
```

```
constexpr containers extract() &&;
```

34 *Postconditions*: `*this` is emptied, even if the function exits via an exception.

35 *Returns*: `std::move(c)`.

```
constexpr void replace(key_container_type&& key_cont, mapped_container_type&& mapped_cont);
```

36 *Preconditions*: `key_cont.size() == mapped_cont.size()` is `true`, the elements of `key_cont` are sorted with respect to *`compare`*, and `key_cont` contains no equal elements.

37 *Effects*: Equivalent to:

```
c.keys = std::move(key_cont);
c.values = std::move(mapped_cont);
```

23.6.8.8 Erasure [flat.map.erasure]

```
template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
         class Predicate>
  constexpr typename flat_map<Key, T, Compare, KeyContainer, MappedContainer>::size_type
    erase_if(flat_map<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);
```

1 *Preconditions*: `Key` and `T` meet the *Cpp17MoveAssignable* requirements.

2 *Effects*: Let E be `bool(pred(pair<const Key&, const T&>(e)))`. Erases all elements `e` in `c` for which E holds.

3 *Returns*: The number of elements erased.

4 *Complexity*: Exactly `c.size()` applications of the predicate.

5 *Remarks*: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).

[*Note 1*: `c` still meets its invariants, but can be empty. — *end note*]

23.6.9 Class template `flat_multimap` [flat.multimap]

23.6.9.1 Overview [flat.multimap.overview]

1 A `flat_multimap` is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. `flat_multimap` supports iterators that meet the *Cpp17InputIterator* requirements and model the `random_access_iterator` concept (24.3.4.13).

2 A `flat_multimap` meets all of the requirements for a container (23.2.2.2) and for a reversible container (23.2.2.3), plus the optional container requirements (23.2.2.4). `flat_multimap` meets the requirements of an associative container (23.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (23.2.5),

(2.2) — it does not meet the requirements related to iterator invalidation, and

(2.3) — the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

[*Note 1*: A `flat_multimap` does not meet the additional requirements of an allocator-aware container (23.2.2.5). — *end note*]

3 A `flat_multimap` also provides most operations described in 23.2.7 for equal keys. This means that a `flat_-multimap` supports the `a_eq` operations in 23.2.7 but not the `a_uniq` operations. For a `flat_multimap<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<Key, T>`.

4 Except as otherwise noted, operations on `flat_multimap` are equivalent to those of `flat_map`, except that `flat_multimap` operations do not remove or replace elements with equal keys.

[*Example 1*: `flat_multimap` constructors and emplace do not erase non-unique elements after sorting them. — *end example*]

5 A `flat_multimap` maintains the following invariants:

(5.1) — it contains the same number of keys and values;

(5.2) — the keys are sorted with respect to the comparison object; and

(5.3) — the value at offset `off` within the value container is the value associated with the key at offset `off` within the key container.

6 If any member function in 23.6.9.2 exits via an exception, the invariants are restored.

[*Note 2*: This can result in the `flat_multimap` being emptied. — *end note*]

7 Any type `C` that meets the sequence container requirements (23.2.4) can be used to instantiate `flat_multimap`, as long as `C::iterator` meets the *Cpp17RandomAccessIterator* requirements and invocations of member functions `C::size` and `C::max_size` do not exit via an exception. In particular, `vector` (23.3.13) and `deque` (23.3.5) can be used.

[*Note 3*: `vector<bool>` is not a sequence container. — *end note*]

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type` or `T` is not the same type as `MappedContainer::value_type`.

9 The effect of calling a constructor that takes both `key_container_type` and `mapped_container_type` arguments with containers of different sizes is undefined.

10 The effect of calling a constructor or member function that takes a `sorted_equivalent_t` argument with a container, containers, or range that are not sorted with respect to `key_comp()` is undefined.

11 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

23.6.9.2 Definition [flat.multimap.defn]

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class KeyContainer = vector<Key>, class MappedContainer = vector<T>>

                        uses_allocator_v<MappedContainer, Allocator>> { };
  }
```

1 The member type `containers` has the data members and special members specified above. It has no base classes or members other than those specified.

23.6.9.3 Constructors [flat.multimap.cons]

```
constexpr flat_multimap(key_container_type key_cont, mapped_container_type mapped_cont,
                        const key_compare& comp = key_compare());
```

1 *Effects*: Initializes `c.keys` with `std::move(key_cont)`, `c.values` with `std::move(mapped_cont)`, and *`compare`* with `comp`; sorts the range $[$`begin()`, `end()`$)$ with respect to `value_comp()`.

2 *Complexity*: Linear in N if the container arguments are already sorted with respect to `value_comp()` and otherwise $N \log N$, where N is the value of `key_cont.size()` before this call.

```
constexpr flat_multimap(sorted_equivalent_t, key_container_type key_cont,
                        mapped_container_type mapped_cont,
                        const key_compare& comp = key_compare());
```

3 *Effects*: Initializes `c.keys` with `std::move(key_cont)`, `c.values` with `std::move(mapped_cont)`, and *`compare`* with `comp`.

4 *Complexity*: Constant.

23.6.9.4 Constructors with allocators [flat.multimap.cons.alloc]

1 The constructors in this subclause shall not participate in overload resolution unless `uses_allocator_v<key_-container_type, Alloc>` is `true` and `uses_allocator_v<mapped_container_type, Alloc>` is `true`.

```
template<class Alloc>
  constexpr flat_multimap(const key_container_type& key_cont,
                          const mapped_container_type& mapped_cont, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(const key_container_type& key_cont,
                          const mapped_container_type& mapped_cont,
                          const key_compare& comp, const Alloc& a);
```

2 *Effects*: Equivalent to `flat_multimap(key_cont, mapped_cont)` and `flat_multimap(key_cont, mapped_cont, comp)`, respectively, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

3 *Complexity*: Same as `flat_multimap(key_cont, mapped_cont)` and `flat_multimap(key_cont, mapped_cont, comp)`, respectively.

```
template<class Alloc>
  constexpr flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
                const mapped_container_type& mapped_cont, const Alloc& a);
```

```
template<class Alloc>
  constexpr flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
              const mapped_container_type& mapped_cont, const key_compare& comp,
              const Alloc& a);
```

4 *Effects*: Equivalent to `flat_multimap(s, key_cont, mapped_cont)` and `flat_multimap(s, key_cont, mapped_cont, comp)`, respectively, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

5 *Complexity*: Linear.

```
template<class Alloc>
  constexpr explicit flat_multimap(const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(const flat_multimap&, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(flat_multimap&&, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multimap(InputIterator first, InputIterator last, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multimap(InputIterator first, InputIterator last, const key_compare& comp,
                          const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
                          const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
                          const key_compare& comp, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_multimap(from_range_t, R&& rg, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_multimap(from_range_t, R&& rg, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(initializer_list<value_type> il, const key_compare& comp,
                          const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(sorted_equivalent_t, initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_multimap(sorted_equivalent_t, initializer_list<value_type> il,
                          const key_compare& comp, const Alloc& a);
```

6 *Effects*: Equivalent to the corresponding non-allocator constructors except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

23.6.9.5 Erasure [flat.multimap.erasure]

```
template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
         class Predicate>
  constexpr typename flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>::size_type
    erase_if(flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);
```

1 *Preconditions*: `Key` and `T` meet the *Cpp17MoveAssignable* requirements.

2 *Effects*: Let E be `bool(pred(pair<const Key&, const T&>(e)))`. Erases all elements `e` in `c` for which E holds.

3 *Returns*: The number of elements erased.

4 *Complexity*: Exactly `c.size()` applications of the predicate.

5 *Remarks*: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).

[*Note 1*: `c` still meets its invariants, but can be empty. — *end note*]

23.6.10 Header <flat_set> synopsis [flat.set.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 23.6.11, class template flat_set
  template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>
    class flat_set;

  struct sorted_unique_t { explicit sorted_unique_t() = default; };
  inline constexpr sorted_unique_t sorted_unique{};

  template<class Key, class Compare, class KeyContainer, class Allocator>
    struct uses_allocator<flat_set<Key, Compare, KeyContainer>, Allocator>;

  // 23.6.11.6, erasure for flat_set
  template<class Key, class Compare, class KeyContainer, class Predicate>
    constexpr typename flat_set<Key, Compare, KeyContainer>::size_type
      erase_if(flat_set<Key, Compare, KeyContainer>& c, Predicate pred);

  // 23.6.12, class template flat_multiset
  template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>
    class flat_multiset;

  struct sorted_equivalent_t { explicit sorted_equivalent_t() = default; };
  inline constexpr sorted_equivalent_t sorted_equivalent{};

  template<class Key, class Compare, class KeyContainer, class Allocator>
    struct uses_allocator<flat_multiset<Key, Compare, KeyContainer>, Allocator>;

  // 23.6.12.6, erasure for flat_multiset
  template<class Key, class Compare, class KeyContainer, class Predicate>
    constexpr typename flat_multiset<Key, Compare, KeyContainer>::size_type
      erase_if(flat_multiset<Key, Compare, KeyContainer>& c, Predicate pred);
}
```

23.6.11 Class template `flat_set` [flat.set]

23.6.11.1 Overview [flat.set.overview]

1 A `flat_set` is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. `flat_set` supports iterators that model the `random_access_iterator` concept (24.3.4.13).

2 A `flat_set` meets all of the requirements for a container (23.2.2.2) and for a reversible container (23.2.2.3), plus the optional container requirements (23.2.2.4). `flat_set` meets the requirements of an associative container (23.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (23.2.5.1),

(2.2) — it does not meet the requirements related to iterator invalidation, and

(2.3) — the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

[*Note 1*: A `flat_set` does not meet the additional requirements of an allocator-aware container, as described in 23.2.2.5. — *end note*]

3 A `flat_set` also provides most operations described in 23.2.7 for unique keys. This means that a `flat_set` supports the `a_uniq` operations in 23.2.7 but not the `a_eq` operations. For a `flat_set<Key>`, both the `key_type` and `value_type` are `Key`.

4 Descriptions are provided here only for operations on `flat_set` that are not described in one of those sets of requirements or for operations where there is additional semantic information.

5 A `flat_set` maintains the invariant that the keys are sorted with respect to the comparison object.

6 If any member function in 23.6.11.2 exits via an exception, the invariant is restored.

[*Note 2*: This can result in the `flat_set`'s being emptied. — *end note*]

7 Any sequence container (23.2.4) supporting *Cpp17RandomAccessIterator* can be used to instantiate `flat_set`. In particular, `vector` (23.3.13) and `deque` (23.3.5) can be used.

[*Note 3*: `vector<bool>` is not a sequence container. — *end note*]

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type`.

9 The effect of calling a constructor or member function that takes a `sorted_unique_t` argument with a range that is not sorted with respect to `key_comp()`, or that contains equal elements, is undefined.

10 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

23.6.11.2 Definition [flat.set.defn]

```
namespace std {
  template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>
  class flat_set {
  public:
    // types
    using key_type                  = Key;
    using value_type                = Key;
    using key_compare               = Compare;
    using value_compare             = Compare;
    using reference                 = value_type&;
    using const_reference           = const value_type&;
    using size_type                 = typename KeyContainer::size_type;
    using difference_type           = typename KeyContainer::difference_type;
    using iterator                  = implementation-defined;  // see 23.2
    using const_iterator            = implementation-defined;  // see 23.2

      : bool_constant<uses_allocator_v<KeyContainer, Allocator>> { };
}
```

23.6.11.3 Constructors [flat.set.cons]

```
constexpr explicit flat_set(container_type cont, const key_compare& comp = key_compare());
```

1 *Effects*: Initializes `c` with `std::move(cont)` and *`compare`* with `comp`, sorts the range [`begin()`, `end()`) with respect to *`compare`*, and finally erases all but the first element from each group of consecutive equivalent elements.

2 *Complexity*: Linear in N if `cont` is already sorted with respect to *`compare`* and otherwise $N \log N$, where N is the value of `cont.size()` before this call.

23.6.11.4 Constructors with allocators [flat.set.cons.alloc]

1 The constructors in this subclause shall not participate in overload resolution unless `uses_allocator_v<container_type, Alloc>` is `true`.

```
template<class Alloc>
  constexpr flat_set(const container_type& cont, const Alloc& a);
template<class Alloc>
  constexpr flat_set(const container_type& cont, const key_compare& comp, const Alloc& a);
```

2 *Effects*: Equivalent to `flat_set(cont)` and `flat_set(cont, comp)`, respectively, except that `c` is constructed with uses-allocator construction (20.2.8.2).

3 *Complexity*: Same as `flat_set(cont)` and `flat_set(cont, comp)`, respectively.

```
template<class Alloc>
  constexpr flat_set(sorted_unique_t s, const container_type& cont, const Alloc& a);
template<class Alloc>
  constexpr flat_set(sorted_unique_t s, const container_type& cont,
                     const key_compare& comp, const Alloc& a);
```

4 *Effects*: Equivalent to `flat_set(s, cont)` and `flat_set(s, cont, comp)`, respectively, except that `c` is constructed with uses-allocator construction (20.2.8.2).

5 *Complexity*: Linear.

```
template<class Alloc>
  constexpr explicit flat_set(const Alloc& a);
template<class Alloc>
  constexpr flat_set(const key_compare& comp, const Alloc& a);
```

```
template<class Alloc>
  constexpr flat_set(const flat_set&, const Alloc& a);
template<class Alloc>
  constexpr flat_set(flat_set&&, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_set(InputIterator first, InputIterator last, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_set(InputIterator first, InputIterator last, const key_compare& comp,
                     const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_set(sorted_unique_t, InputIterator first, InputIterator last, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_set(sorted_unique_t, InputIterator first, InputIterator last,
                     const key_compare& comp, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_set(from_range_t, R&& rg, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_set(from_range_t, R&& rg, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_set(initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_set(initializer_list<value_type> il, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_set(sorted_unique_t, initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_set(sorted_unique_t, initializer_list<value_type> il,
                     const key_compare& comp, const Alloc& a);
```

6 *Effects*: Equivalent to the corresponding non-allocator constructors except that `c` is constructed with uses-allocator construction (20.2.8.2).

23.6.11.5 Modifiers [flat.set.modifiers]

```
template<class K> constexpr pair<iterator, bool> insert(K&& x);
template<class K> constexpr iterator insert(const_iterator hint, K&& x);
```

1 *Constraints*: The *qualified-id* `Compare::is_transparent` is valid and denotes a type. `is_constructible_v<value_type, K>` is `true`.

2 *Preconditions*: The conversion from `x` into `value_type` constructs an object `u`, for which `find(x) == find(u)` is `true`.

3 *Effects*: If the set already contains an element equivalent to `x`, `*this` and `x` are unchanged. Otherwise, inserts a new element as if by `emplace(std::forward<K>(x))`.

4 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the element whose key is equivalent to `x`.

```
template<class InputIterator>
  constexpr void insert(InputIterator first, InputIterator last);
```

5 *Effects*: Adds elements to `c` as if by:

```
c.insert(c.end(), first, last);
```

Then, sorts the range of newly inserted elements with respect to `compare`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

6 *Complexity*: $N + M \log M$, where N is `size()` before the operation and M is `distance(first, last)`.

7 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
  constexpr void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

8 *Effects*: Equivalent to `insert(first, last)`.

9 *Complexity*: Linear.

```
template<container-compatible-range<value_type> R>
  constexpr void insert_range(R&& rg);
```

10 *Effects*: Adds elements to `c` as if by:

```
for (const auto& e : rg) {
  c.insert(c.end(), e);
}
```

Then, sorts the range of newly inserted elements with respect to *`compare`*; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

11 *Complexity*: $N + M \log M$, where N is `size()` before the operation and M is `ranges::distance(rg)`.

12 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
constexpr void swap(flat_set& y) noexcept;
```

13 *Effects*: Equivalent to:

```
ranges::swap(compare, y.compare);
ranges::swap(c, y.c);
```

```
constexpr container_type extract() &&;
```

14 *Postconditions*: `*this` is emptied, even if the function exits via an exception.

15 *Returns*: `std::move(c)`.

```
constexpr void replace(container_type&& cont);
```

16 *Preconditions*: The elements of `cont` are sorted with respect to *`compare`*, and `cont` contains no equal elements.

17 *Effects*: Equivalent to: `c = std::move(cont);`

23.6.11.6 Erasure [flat.set.erasure]

```
template<class Key, class Compare, class KeyContainer, class Predicate>
  constexpr typename flat_set<Key, Compare, KeyContainer>::size_type
    erase_if(flat_set<Key, Compare, KeyContainer>& c, Predicate pred);
```

1 *Preconditions*: `Key` meets the *Cpp17MoveAssignable* requirements.

2 *Effects*: Let E be `bool(pred(as_const(e)))`. Erases all elements `e` in `c` for which E holds.

3 *Returns*: The number of elements erased.

4 *Complexity*: Exactly `c.size()` applications of the predicate.

5 *Remarks*: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).

[*Note 1*: `c` still meets its invariants, but can be empty. — *end note*]

23.6.12 Class template `flat_multiset` [flat.multiset]

23.6.12.1 Overview [flat.multiset.overview]

1 A `flat_multiset` is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of the keys themselves. `flat_multiset` supports iterators that model the `random_access_iterator` concept (24.3.4.13).

2 A `flat_multiset` meets all of the requirements for a container (23.2.2.2) and for a reversible container (23.2.2.3), plus the optional container requirements (23.2.2.4). `flat_multiset` meets the requirements of an associative container (23.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (23.2.5.1),

(2.2) — it does not meet the requirements related to iterator invalidation, and

(2.3) — the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

[*Note 1*: A `flat_multiset` does not meet the additional requirements of an allocator-aware container, as described in 23.2.2.5. — *end note*]

3 A `flat_multiset` also provides most operations described in 23.2.7 for equal keys. This means that a `flat_multiset` supports the `a_eq` operations in 23.2.7 but not the `a_uniq` operations. For a `flat_multiset<Key>`, both the `key_type` and `value_type` are `Key`.

4 Descriptions are provided here only for operations on `flat_multiset` that are not described in one of the general sections or for operations where there is additional semantic information.

5 A `flat_multiset` maintains the invariant that the keys are sorted with respect to the comparison object.

6 If any member function in 23.6.12.2 exits via an exception, the invariant is restored.

[*Note 2*: This can result in the `flat_multiset`'s being emptied. — *end note*]

7 Any sequence container (23.2.4) supporting *Cpp17RandomAccessIterator* can be used to instantiate `flat_multiset`. In particular, `vector` (23.3.13) and `deque` (23.3.5) can be used.

[*Note 3*: `vector<bool>` is not a sequence container. — *end note*]

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type`.

9 The effect of calling a constructor or member function that takes a `sorted_equivalent_t` argument with a range that is not sorted with respect to `key_comp()` is undefined.

10 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

23.6.12.2 Definition [flat.multiset.defn]

```
namespace std {
  template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>
  class flat_multiset {
  public:
    // types
    using key_type                  = Key;
    using value_type                = Key;
    using key_compare               = Compare;
    using value_compare             = Compare;
    using reference                 = value_type&;
    using const_reference           = const value_type&;
    using size_type                 = typename KeyContainer::size_type;
    using difference_type           = typename KeyContainer::difference_type;
    using iterator                  = implementation-defined;  // see 23.2
    using const_iterator            = implementation-defined;  // see 23.2
    using reverse_iterator          = std::reverse_iterator<iterator>;
    using const_reverse_iterator    = std::reverse_iterator<const_iterator>;
    using container_type            = KeyContainer;

    // 23.6.12.3, constructors
    constexpr flat_multiset() : flat_multiset(key_compare()) { }

    constexpr explicit flat_multiset(const key_compare& comp)
      : c(), compare(comp) { }

    constexpr explicit flat_multiset(container_type cont,
                                     const key_compare& comp = key_compare());

    constexpr flat_multiset(sorted_equivalent_t, container_type cont,
                            const key_compare& comp = key_compare())
      : c(std::move(cont)), compare(comp) { }

    template<class InputIterator>

    struct uses_allocator<flat_multiset<Key, Compare, KeyContainer>, Allocator>
      : bool_constant<uses_allocator_v<KeyContainer, Allocator>> { };
}
```

23.6.12.3 Constructors [flat.multiset.cons]

```
constexpr explicit flat_multiset(container_type cont, const key_compare& comp = key_compare());
```

1 *Effects*: Initializes *c* with `std::move(cont)` and *compare* with `comp`, and sorts the range [`begin()`, `end()`) with respect to *compare*.

2 *Complexity*: Linear in N if `cont` is already sorted with respect to *compare* and otherwise $N \log N$, where N is the value of `cont.size()` before this call.

23.6.12.4 Constructors with allocators [flat.multiset.cons.alloc]

1 The constructors in this subclause shall not participate in overload resolution unless `uses_allocator_v<container_type, Alloc>` is `true`.

```
template<class Alloc>
  constexpr flat_multiset(const container_type& cont, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(const container_type& cont, const key_compare& comp, const Alloc& a);
```

2 *Effects*: Equivalent to `flat_multiset(cont)` and `flat_multiset(cont, comp)`, respectively, except that *c* is constructed with uses-allocator construction (20.2.8.2).

3 *Complexity*: Same as `flat_multiset(cont)` and `flat_multiset(cont, comp)`, respectively.

```
template<class Alloc>
  constexpr flat_multiset(sorted_equivalent_t s, const container_type& cont, const Alloc& a);
```

```
template<class Alloc>
  constexpr flat_multiset(sorted_equivalent_t s, const container_type& cont,
                          const key_compare& comp, const Alloc& a);
```

4 *Effects*: Equivalent to `flat_multiset(s, cont)` and `flat_multiset(s, cont, comp)`, respectively, except that *`c`* is constructed with uses-allocator construction (20.2.8.2).

5 *Complexity*: Linear.

```
template<class Alloc>
  constexpr explicit flat_multiset(const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(const flat_multiset&, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(flat_multiset&&, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multiset(InputIterator first, InputIterator last, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multiset(InputIterator first, InputIterator last,
                          const key_compare& comp, const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multiset(sorted_equivalent_t, InputIterator first, InputIterator last,
                          const Alloc& a);
template<class InputIterator, class Alloc>
  constexpr flat_multiset(sorted_equivalent_t, InputIterator first, InputIterator last,
                          const key_compare& comp, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_multiset(from_range_t, R&& rg, const Alloc& a);
template<container-compatible-range<value_type> R, class Alloc>
  constexpr flat_multiset(from_range_t, R&& rg, const key_compare& comp, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(initializer_list<value_type> il, const key_compare& comp,
                          const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(sorted_equivalent_t, initializer_list<value_type> il, const Alloc& a);
template<class Alloc>
  constexpr flat_multiset(sorted_equivalent_t, initializer_list<value_type> il,
                          const key_compare& comp, const Alloc& a);
```

6 *Effects*: Equivalent to the corresponding non-allocator constructors except that *`c`* is constructed with uses-allocator construction (20.2.8.2).

23.6.12.5 Modifiers [flat.multiset.modifiers]

```
template<class... Args> constexpr iterator emplace(Args&&... args);
```

1 *Constraints*: `is_constructible_v<value_type, Args...>` is `true`.

2 *Effects*: First, initializes an object `t` of type `value_type` with `std::forward<Args>(args)...`, then inserts `t` as if by:

```
  auto it = ranges::upper_bound(c, t, compare);
  c.insert(it, std::move(t));
```

3 *Returns*: An iterator that points to the inserted element.

```
template<class InputIterator>
  constexpr void insert(InputIterator first, InputIterator last);
```

4 *Effects*: Adds elements to *`c`* as if by:

```
  c.insert(c.end(), first, last);
```

Then, sorts the range of newly inserted elements with respect to *`compare`*, and merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range.

5 *Complexity*: $N + M \log M$, where N is `size()` before the operation and M is `distance(first, last)`.

6 *Remarks*: Since this operation performs an in-place merge, it may allocate memory.

```
template<class InputIterator>
  constexpr void insert(sorted_equivalent_t, InputIterator first, InputIterator last);
```

7 *Effects*: Equivalent to `insert(first, last)`.

8 *Complexity*: Linear.

```
constexpr void swap(flat_multiset& y) noexcept;
```

9 *Effects*: Equivalent to:

```
ranges::swap(compare, y.compare);
ranges::swap(c, y.c);
```

```
constexpr container_type extract() &&;
```

10 *Postconditions*: `*this` is emptied, even if the function exits via an exception.

11 *Returns*: `std::move(c)`.

```
constexpr void replace(container_type&& cont);
```

12 *Preconditions*: The elements of `cont` are sorted with respect to *`compare`*.

13 *Effects*: Equivalent to: `c = std::move(cont);`

23.6.12.6 Erasure [flat.multiset.erasure]

```
template<class Key, class Compare, class KeyContainer, class Predicate>
  constexpr typename flat_multiset<Key, Compare, KeyContainer>::size_type
    erase_if(flat_multiset<Key, Compare, KeyContainer>& c, Predicate pred);
```

1 *Preconditions*: `Key` meets the *Cpp17MoveAssignable* requirements.

2 *Effects*: Let E be `bool(pred(as_const(e)))`. Erases all elements `e` in `c` for which E holds.

3 *Returns*: The number of elements erased.

4 *Complexity*: Exactly `c.size()` applications of the predicate.

5 *Remarks*: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.67).

[*Note 1*: `c` still meets its invariants, but can be empty. — *end note*]

23.6.13 Container adaptors formatting [container.adaptors.format]

1 For each of `queue`, `priority_queue`, and `stack`, the library provides the following formatter specialization where *`adaptor-type`* is the name of the template:

```
namespace std {
  template<class charT, class T, formattable<charT> Container, class... U>
  struct formatter<adaptor-type<T, Container, U...>, charT> {
  private:
    using maybe-const-container =                                          // exposition only
      fmt-maybe-const<Container, charT>;
    using maybe-const-adaptor =                                            // exposition only
      maybe-const<is_const_v<maybe-const-container>,                       // see 25.2
                  adaptor-type<T, Container, U...>>;
    formatter<ranges::ref_view<maybe-const-container>, charT> underlying_;   // exposition only

  public:
    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
        format(maybe-const-adaptor& r, FormatContext& ctx) const;
    };
  }

template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

2 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  typename FormatContext::iterator
    format(maybe-const-adaptor& r, FormatContext& ctx) const;
```

3 *Effects*: Equivalent to: `return underlying_.format(r.c, ctx);`

23.7 Views [views]

23.7.1 General [views.general]

1 The header `<span>` (23.7.2.1) defines the view `span`. The header `<mdspan>` (23.7.3.2) defines the class template `mdspan` and other facilities for interacting with these multidimensional views.

23.7.2 Contiguous access [views.contiguous]

23.7.2.1 Header `<span>` synopsis [span.syn]

```
#include <initializer_list>      // see 17.11.2

// mostly freestanding
namespace std {
  // constants
  inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

  template<class T>
    concept integral-constant-like =                         // exposition only
      is_integral_v<decltype(T::value)> &&
      !is_same_v<bool, remove_const_t<decltype(T::value)>> &&
      convertible_to<T, decltype(T::value)> &&
      equality_comparable_with<T, decltype(T::value)> &&
      bool_constant<T() == T::value>::value &&
      bool_constant<static_cast<decltype(T::value)>(T()) == T::value>::value;

  template<class T>
    constexpr size_t maybe-static-ext = dynamic_extent; // exposition only
  template<integral-constant-like T>
    constexpr size_t maybe-static-ext<T> = {T::value};

  // 23.7.2.2, class template span
  template<class ElementType, size_t Extent = dynamic_extent>
    class span;                                                         // partially freestanding

  template<class ElementType, size_t Extent>
    constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
  template<class ElementType, size_t Extent>
    constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

  // 23.7.2.3, views of object representation
  template<class ElementType, size_t Extent>
    span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_bytes(span<ElementType, Extent> s) noexcept;

  template<class ElementType, size_t Extent>
    span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_writable_bytes(span<ElementType, Extent> s) noexcept;
}
```

23.7.2.2 Class template span [views.span]

23.7.2.2.1 Overview [span.overview]

1 A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.

2 All member functions of span have constant time complexity.

```
namespace std {
  template<class ElementType, size_t Extent = dynamic_extent>
  class span {
  public:
    // constants and types
    using element_type = ElementType;
    using value_type = remove_cv_t<ElementType>;
    using size_type = size_t;
    using difference_type = ptrdiff_t;
    using pointer = element_type*;
    using const_pointer = const element_type*;
    using reference = element_type&;
    using const_reference = const element_type&;
    using iterator = implementation-defined;        // see 23.7.2.2.7
    using const_iterator = std::const_iterator<iterator>;
    using reverse_iterator = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::const_iterator<reverse_iterator>;
    static constexpr size_type extent = Extent;

    // 23.7.2.2.2, constructors, copy, and assignment
    constexpr span() noexcept;
    template<class It>
      constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
    template<class It, class End>
      constexpr explicit(extent != dynamic_extent) span(It first, End last);
    template<size_t N>
      constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
    template<class T, size_t N>
      constexpr span(array<T, N>& arr) noexcept;
    template<class T, size_t N>
      constexpr span(const array<T, N>& arr) noexcept;
    template<class R>
      constexpr explicit(extent != dynamic_extent) span(R&& r);
    constexpr explicit(extent != dynamic_extent) span(std::initializer_list<value_type> il);
    constexpr span(const span& other) noexcept = default;
    template<class OtherElementType, size_t OtherExtent>
      constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

    constexpr span& operator=(const span& other) noexcept = default;

    // 23.7.2.2.4, subviews
    template<size_t Count>
      constexpr span<element_type, Count> first() const;
    template<size_t Count>
      constexpr span<element_type, Count> last() const;
    template<size_t Offset, size_t Count = dynamic_extent>
      constexpr span<element_type, see below> subspan() const;

    constexpr span<element_type, dynamic_extent> first(size_type count) const;
    constexpr span<element_type, dynamic_extent> last(size_type count) const;
    constexpr span<element_type, dynamic_extent> subspan(
      size_type offset, size_type count = dynamic_extent) const;

    // 23.7.2.2.5, observers
    constexpr size_type size() const noexcept;
    constexpr size_type size_bytes() const noexcept;
    constexpr bool empty() const noexcept;
    // 23.7.2.2.6, element access
    constexpr reference operator[](size_type idx) const;
    constexpr reference at(size_type idx) const;                          // freestanding-deleted
    constexpr reference front() const;
    constexpr reference back() const;
    constexpr pointer data() const noexcept;

    // 23.7.2.2.7, iterator support
    constexpr iterator begin() const noexcept;
    constexpr iterator end() const noexcept;
    constexpr const_iterator cbegin() const noexcept { return begin(); }
    constexpr const_iterator cend() const noexcept { return end(); }
    constexpr reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator rend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept { return rbegin(); }
    constexpr const_reverse_iterator crend() const noexcept { return rend(); }

  private:
    pointer data_;              // exposition only
    size_type size_;            // exposition only
  };

  template<class It, class EndOrSize>
    span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>,
                                maybe-static-ext<EndOrSize>>;
  template<class T, size_t N>
    span(T (&)[N]) -> span<T, N>;
  template<class T, size_t N>
    span(array<T, N>&) -> span<T, N>;
  template<class T, size_t N>
    span(const array<T, N>&) -> span<const T, N>;
  template<class R>
    span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
}
```

3 `span<ElementType, Extent>` is a trivially copyable type (6.8.1).

4 `ElementType` is required to be a complete object type that is not an abstract class type.

5 For a `span` `s`, any operation that invalidates a pointer in the range [`s.data()`, `s.data() + s.size()`) invalidates pointers, iterators, and references to elements of `s`.

23.7.2.2.2 Constructors, copy, and assignment [span.cons]

```
constexpr span() noexcept;
```

1 *Constraints*: `Extent == dynamic_extent || Extent == 0` is `true`.

2 *Postconditions*: `size() == 0 && data() == nullptr`.

```
template<class It>
  constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
```

3 *Constraints*: Let `U` be `remove_reference_t<iter_reference_t<It>>`.

(3.1) — `It` satisfies `contiguous_iterator`.

(3.2) — `is_convertible_v<U(*)[], element_type(*)[]>` is `true`.

[*Note 1*: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. — *end note*]

4 *Preconditions*:

(4.1) — [`first`, `first + count`) is a valid range.

(4.2) — `It` models `contiguous_iterator`.

5 *Hardened preconditions*: If `extent` is not equal to `dynamic_extent`, then `count == extent` is `true`.

6 *Effects*: Initializes *`data_`* with `to_address(first)` and *`size_`* with `count`.

7 *Throws*: Nothing.

```
template<class It, class End>
  constexpr explicit(extent != dynamic_extent) span(It first, End last);
```

8 *Constraints*: Let `U` be `remove_reference_t<iter_reference_t<It>>`.

(8.1) — `is_convertible_v<U(*)[], element_type(*)[]>` is `true`.

[*Note 2*: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. — *end note*]

(8.2) — `It` satisfies `contiguous_iterator`.

(8.3) — `End` satisfies `sized_sentinel_for<It>`.

(8.4) — `is_convertible_v<End, size_t>` is `false`.

9 *Preconditions*:

(9.1) — [`first`, `last`) is a valid range.

(9.2) — `It` models `contiguous_iterator`.

(9.3) — `End` models `sized_sentinel_for<It>`.

10 *Hardened preconditions*: If `extent` is not equal to `dynamic_extent`, then `(last - first) == extent` is `true`.

11 *Effects*: Initializes *`data_`* with `to_address(first)` and *`size_`* with `last - first`.

12 *Throws*: When and what `last - first` throws.

```
template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;
```

13 *Constraints*: Let `U` be `remove_pointer_t<decltype(std::data(arr))>`.

(13.1) — `extent == dynamic_extent || N == extent` is `true`, and

(13.2) — `is_convertible_v<U(*)[], element_type(*)[]>` is `true`.

[*Note 3*: The intent is to allow only qualification conversions of the array element type to `element_type`. — *end note*]

14 *Effects*: Constructs a `span` that is a view over the supplied array.

[*Note 4*: `type_identity_t` affects class template argument deduction. — *end note*]

15 *Postconditions*: `size() == N && data() == std::data(arr)` is `true`.

```
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);
```

16 *Constraints*: Let `U` be `remove_reference_t<ranges::range_reference_t<R>>`.

(16.1) — `R` satisfies `ranges::contiguous_range` and `ranges::sized_range`.

(16.2) — Either `R` satisfies `ranges::borrowed_range` or `is_const_v<element_type>` is `true`.

(16.3) — `remove_cvref_t<R>` is not a specialization of `span`.

(16.4) — `remove_cvref_t<R>` is not a specialization of `array`.

(16.5) — `is_array_v<remove_cvref_t<R>>` is `false`.

(16.6) — `is_convertible_v<U(*)[], element_type(*)[]>` is `true`.

[*Note 5*: The intent is to allow only qualification conversions of the range reference type to `element_type`. — *end note*]

17 *Preconditions*:

(17.1) — `R` models `ranges::contiguous_range` and `ranges::sized_range`.

(17.2) — If `is_const_v<element_type>` is `false`, `R` models `ranges::borrowed_range`.

18 *Hardened preconditions*: If `extent` is not equal to `dynamic_extent`, then `ranges::size(r) == extent` is `true`.

19 *Effects*: Initializes *`data_`* with `ranges::data(r)` and *`size_`* with `ranges::size(r)`.

20 *Throws*: What and when `ranges::data(r)` and `ranges::size(r)` throw.

```
constexpr explicit(extent != dynamic_extent) span(std::initializer_list<value_type> il);
```

21 *Constraints*: `is_const_v<element_type>` is `true`.

22 *Hardened preconditions*: If `extent` is not equal to `dynamic_extent`, then `il.size() == extent` is `true`.

23 *Effects*: Initializes *`data_`* with `il.begin()` and *`size_`* with `il.size()`.

```
constexpr span(const span& other) noexcept = default;
```

24 *Postconditions*: `other.size() == size() && other.data() == data()`.

```
template<class OtherElementType, size_t OtherExtent>
  constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```

25 *Constraints*:

(25.1) — `extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent` is `true`, and

(25.2) — `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is `true`.

[*Note 6*: The intent is to allow only qualification conversions of the `OtherElementType` to `element_type`. — *end note*]

26 *Hardened preconditions*: If `extent` is not equal to `dynamic_extent`, then `s.size() == extent` is `true`.

27 *Effects*: Constructs a `span` that is a view over the range [`s.data()`, `s.data() + s.size()`).

28 *Postconditions*: `size() == s.size() && data() == s.data()`.

29 *Remarks*: The expression inside `explicit` is equivalent to:

```
extent != dynamic_extent && OtherExtent == dynamic_extent
```

```
constexpr span& operator=(const span& other) noexcept = default;
```

30 *Postconditions*: `size() == other.size() && data() == other.data()`.

23.7.2.2.3 Deduction guides [span.deduct]

```
template<class It, class EndOrSize>
  span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>,
                              maybe-static-ext<EndOrSize>>;
```

1 *Constraints*: `It` satisfies `contiguous_iterator`.

```
template<class R>
  span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
```

2 *Constraints*: `R` satisfies `ranges::contiguous_range`.

23.7.2.2.4 Subviews [span.sub]

```
template<size_t Count> constexpr span<element_type, Count> first() const;
```

1 *Mandates*: `Count <= Extent` is `true`.

2 *Hardened preconditions*: `Count <= size()` is `true`.

3 *Effects*: Equivalent to: `return R{data(), Count};` where `R` is the return type.

```
template<size_t Count> constexpr span<element_type, Count> last() const;
```

4 *Mandates*: `Count <= Extent` is `true`.

5 *Hardened preconditions*: `Count <= size()` is `true`.

6 *Effects*: Equivalent to: `return R{data() + (size() - Count), Count};` where `R` is the return type.

```
template<size_t Offset, size_t Count = dynamic_extent>
  constexpr span<element_type, see below> subspan() const;
```

7 *Mandates*:

```
Offset <= Extent && (Count == dynamic_extent || Count <= Extent - Offset)
```

is `true`.

8 *Hardened preconditions*:

```
Offset <= size() && (Count == dynamic_extent || Count <= size() - Offset)
```

is `true`.

9 *Effects*: Equivalent to:

```
return span<ElementType, see below>(
  data() + Offset, Count != dynamic_extent ? Count : size() - Offset);
```

10 *Remarks*: The second template argument of the returned `span` type is:

```
Count != dynamic_extent ? Count
                        : (Extent != dynamic_extent ? Extent - Offset
                                                    : dynamic_extent)
```

```
constexpr span<element_type, dynamic_extent> first(size_type count) const;
```

11 *Hardened preconditions*: `count <= size()` is `true`.

12 *Effects*: Equivalent to: `return {data(), count};`

```
constexpr span<element_type, dynamic_extent> last(size_type count) const;
```

13 *Hardened preconditions*: `count <= size()` is `true`.

14 *Effects*: Equivalent to: `return {data() + (size() - count), count};`

```
constexpr span<element_type, dynamic_extent> subspan(
  size_type offset, size_type count = dynamic_extent) const;
```

15 *Hardened preconditions*:

```
offset <= size() && (count == dynamic_extent || count <= size() - offset)
```

is `true`.

16 *Effects*: Equivalent to:

```
return {data() + offset, count == dynamic_extent ? size() - offset : count};
```

23.7.2.2.5 Observers [span.obs]

```
constexpr size_type size() const noexcept;
```

1 *Effects*: Equivalent to: `return size_;`

```
constexpr size_type size_bytes() const noexcept;
```

2 *Effects*: Equivalent to: `return size() * sizeof(element_type);`

```
constexpr bool empty() const noexcept;
```

3 *Effects*: Equivalent to: `return size() == 0;`

23.7.2.2.6 Element access [span.elem]

```
constexpr reference operator[](size_type idx) const;
```

1 *Hardened preconditions*: `idx < size()` is `true`.

2 *Returns*: `*(data() + idx)`.

3 *Throws*: Nothing.

```
constexpr reference at(size_type idx) const;
```

4 *Returns*: `*(data() + idx)`.

5 *Throws*: `out_of_range` if `idx >= size()` is `true`.

```
constexpr reference front() const;
```

6 *Hardened preconditions*: `empty()` is `false`.

7 *Returns*: `*data()`.

8 *Throws*: Nothing.

```
constexpr reference back() const;
```

9 *Hardened preconditions*: `empty()` is `false`.

10 *Returns*: `*(data() + (size() - 1))`.

11 *Throws*: Nothing.

```
constexpr pointer data() const noexcept;
```

12 *Returns*: *`data_`*.

23.7.2.2.7 Iterator support [span.iterators]

```
using iterator = implementation-defined;
```

1 The type models `contiguous_iterator` (24.3.4.14), meets the *Cpp17RandomAccessIterator* requirements (24.3.5.7), and meets the requirements for constexpr iterators (24.3.1), whose value type is `value_type` and whose reference type is `reference`.

2 All requirements on container iterators (23.2.2.2) apply to `span::iterator` as well.

```
constexpr iterator begin() const noexcept;
```

3 *Returns*: An iterator referring to the first element in the span. If `empty()` is `true`, then it returns the same value as `end()`.

```
constexpr iterator end() const noexcept;
```

4 *Returns*: An iterator which is the past-the-end value.

```
constexpr reverse_iterator rbegin() const noexcept;
```

5 *Effects*: Equivalent to: `return reverse_iterator(end());`

```
constexpr reverse_iterator rend() const noexcept;
```

6 *Effects*: Equivalent to: `return reverse_iterator(begin());`

23.7.2.3 Views of object representation [span.objectrep]

```
template<class ElementType, size_t Extent>
  span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_bytes(span<ElementType, Extent> s) noexcept;
```

1 *Effects*: Equivalent to: `return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()};` where `R` is the return type.

```
template<class ElementType, size_t Extent>
  span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_writable_bytes(span<ElementType, Extent> s) noexcept;
```

2 *Constraints*: `is_const_v<ElementType>` is `false`.

3 *Effects*: Equivalent to: `return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()};` where `R` is the return type.

23.7.3 Multidimensional access [views.multidim]

23.7.3.1 Overview [mdspan.overview]

1 A *multidimensional index space* is a Cartesian product of integer intervals. Each interval can be represented by a half-open range $[L_i, U_i)$, where L_i and U_i are the lower and upper bounds of the i^{th} dimension. The *rank* of a multidimensional index space is the number of intervals it represents. The *size of a multidimensional index space* is the product of $U_i - L_i$ for each dimension i if its rank is greater than 0, and 1 otherwise.

2 An integer r is a *rank index* of an index space S if r is in the range $[0, \text{rank of } S)$.

3 A pack of integers `idx` is a *multidimensional index* in a multidimensional index space S (or representation thereof) if both of the following are true:

(3.1) — `sizeof...(idx)` is equal to the rank of S, and

(3.2) — for every rank index i of S, the i^{th} value of `idx` is an integer in the interval $[L_i, U_i)$ of S.

23.7.3.2 Header `<mdspan>` synopsis [mdspan.syn]

```
// all freestanding
namespace std {
  // 23.7.3.3, class template extents
  template<class IndexType, size_t... Extents>
    class extents;

      convertible_to<tuple_element_t<1, T>, IndexType>;
}
```

23.7.3.3 Class template `extents` [mdspan.extents]

23.7.3.3.1 Overview [mdspan.extents.overview]

The class template `extents` represents a multidimensional index space of rank equal to `sizeof...(Extents)`. In (23.7), `extents` is used synonymously with multidimensional index space.

```
namespace std {
  template<class IndexType, size_t... Extents>
  class extents {
  public:
    using index_type = IndexType;
    using size_type = make_unsigned_t<index_type>;
    using rank_type = size_t;

    // 23.7.3.3.4, observers of the multidimensional index space
    static constexpr rank_type rank() noexcept { return sizeof...(Extents); }
    static constexpr rank_type rank_dynamic() noexcept { return dynamic-index(rank()); }
    static constexpr size_t static_extent(rank_type) noexcept;
    constexpr index_type extent(rank_type) const noexcept;

    // 23.7.3.3.3, constructors
    constexpr extents() noexcept = default;

    template<class OtherIndexType, size_t... OtherExtents>
      constexpr explicit(see below)
        extents(const extents<OtherIndexType, OtherExtents...>&) noexcept;
    template<class... OtherIndexTypes>
      constexpr explicit extents(OtherIndexTypes...) noexcept;
    template<class OtherIndexType, size_t N>
      constexpr explicit(N != rank_dynamic())
        extents(span<OtherIndexType, N>) noexcept;
    template<class OtherIndexType, size_t N>
      constexpr explicit(N != rank_dynamic())
        extents(const array<OtherIndexType, N>&) noexcept;

    // 23.7.3.3.5, comparison operators
    template<class OtherIndexType, size_t... OtherExtents>
      friend constexpr bool operator==(const extents&,
                                       const extents<OtherIndexType, OtherExtents...>&) noexcept;

    // 23.7.3.3.2, exposition-only helpers
    constexpr size_t fwd-prod-of-extents(rank_type) const noexcept;     // exposition only
    constexpr size_t rev-prod-of-extents(rank_type) const noexcept;     // exposition only
    template<class OtherIndexType>
      static constexpr auto index-cast(OtherIndexType&&) noexcept;      // exposition only

  private:
    static constexpr rank_type dynamic-index(rank_type) noexcept;       // exposition only
    static constexpr rank_type dynamic-index-inv(rank_type) noexcept;   // exposition only
    array<index_type, rank_dynamic()> dynamic-extents{};                // exposition only
  };

  template<class... Integrals>
    explicit extents(Integrals...)
      -> see below;
}
```

1 *Mandates*:

(1.1) — `IndexType` is a signed or unsigned integer type, and

(1.2) — each element of `Extents` is either equal to `dynamic_extent`, or is representable as a value of type `IndexType`.

2 Each specialization of `extents` models `regular` and is trivially copyable.

3 Let E_r be the r^{th} element of `Extents`. E_r is a *dynamic extent* if it is equal to `dynamic_extent`, otherwise E_r is a *static extent*. Let D_r be the value of *`dynamic-extents`*`[`*`dynamic-index`*`(`r`)]` if E_r is a dynamic extent, otherwise E_r.

4 The r^{th} interval of the multidimensional index space represented by an `extents` object is $[0, D_r)$.

23.7.3.3.2 Exposition-only helpers [mdspan.extents.expo]

```
static constexpr rank_type dynamic-index(rank_type i) noexcept;
```

1 *Preconditions*: `i <= rank()` is `true`.

2 *Returns*: The number of E_r with $r <$ `i` for which E_r is a dynamic extent.

```
static constexpr rank_type dynamic-index-inv(rank_type i) noexcept;
```

3 *Preconditions*: `i < rank_dynamic()` is `true`.

4 *Returns*: The minimum value of r such that *`dynamic-index`*`(`r` + 1) == i + 1` is `true`.

```
constexpr size_t fwd-prod-of-extents(rank_type i) const noexcept;
```

5 *Preconditions*: `i <= rank()` is `true`.

6 *Returns*: If `i > 0` is `true`, the product of `extent(`k`)` for all k in the range $[0,$ `i`$)$, otherwise `1`.

```
constexpr size_t rev-prod-of-extents(rank_type i) const noexcept;
```

7 *Preconditions*: `i < rank()` is `true`.

8 *Returns*: If `i + 1 < rank()` is `true`, the product of `extent(`k`)` for all k in the range `[i + 1, rank())`, otherwise `1`.

```
template<class OtherIndexType>
  static constexpr auto index-cast(OtherIndexType&& i) noexcept;
```

9 *Effects*:

(9.1) — If `OtherIndexType` is an integral type other than `bool`, then equivalent to `return i;`,

(9.2) — otherwise, equivalent to `return static_cast<index_type>(i);`.

[*Note 1*: This function will always return an integral type other than `bool`. Since this function's call sites are constrained on convertibility of `OtherIndexType` to `index_type`, integer-class types can use the `static_cast` branch without loss of precision. — *end note*]

23.7.3.3.3 Constructors [mdspan.extents.cons]

```
template<class OtherIndexType, size_t... OtherExtents>
  constexpr explicit(see below)
    extents(const extents<OtherIndexType, OtherExtents...>& other) noexcept;
```

1 *Constraints*:

(1.1) — `sizeof...(OtherExtents) == rank()` is `true`.

(1.2) — `((OtherExtents == dynamic_extent || Extents == dynamic_extent || OtherExtents == Extents) && ...)` is `true`.

2 *Preconditions*:

(2.1) — `other.extent(`r`)` equals E_r for each r for which E_r is a static extent, and

(2.2) — either

(2.2.1) — `sizeof...(OtherExtents)` is zero, or

(2.2.2) — `other.extent(`r`)` is representable as a value of type `index_type` for every rank index r of `other`.

3 *Postconditions*: `*this == other` is `true`.

4 *Remarks*: The expression inside `explicit` is equivalent to:

```
(((Extents != dynamic_extent) && (OtherExtents == dynamic_extent)) || ... ) ||
(numeric_limits<index_type>::max() < numeric_limits<OtherIndexType>::max())
```

```
template<class... OtherIndexTypes>
  constexpr explicit extents(OtherIndexTypes... exts) noexcept;
```

5 Let `N` be `sizeof...(OtherIndexTypes)`, and let `exts_arr` be `array<index_type, N>{static_cast<index_type>(std::move(exts))...}`.

6 *Constraints*:

(6.1) — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is `true`,

(6.2) — `(is_nothrow_constructible_v<index_type, OtherIndexTypes> && ...)` is `true`, and

(6.3) — `N == rank_dynamic() || N == rank()` is `true`.

[*Note 1*: One can construct `extents` from just dynamic extents, which are all the values getting stored, or from all the extents with a precondition. — *end note*]

7 *Preconditions*:

(7.1) — If `N != rank_dynamic()` is `true`, `exts_arr[`r`]` equals E_r for each r for which E_r is a static extent, and

(7.2) — either

(7.2.1) — `sizeof...(exts) == 0` is `true`, or

(7.2.2) — each element of `exts` is representable as a nonnegative value of type `index_type`.

8 *Postconditions*: `*this == extents(exts_arr)` is `true`.

```
template<class OtherIndexType, size_t N>
  constexpr explicit(N != rank_dynamic())
    extents(span<OtherIndexType, N> exts) noexcept;
template<class OtherIndexType, size_t N>
  constexpr explicit(N != rank_dynamic())
    extents(const array<OtherIndexType, N>& exts) noexcept;
```

9 *Constraints*:

(9.1) — `is_convertible_v<const OtherIndexType&, index_type>` is `true`,

(9.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is `true`, and

(9.3) — `N == rank_dynamic() || N == rank()` is `true`.

10 *Preconditions*:

(10.1) — If `N != rank_dynamic()` is `true`, `exts[`r`]` equals E_r for each r for which E_r is a static extent, and

(10.2) — either

(10.2.1) — `N` is zero, or

(10.2.2) — `exts[`r`]` is representable as a nonnegative value of type `index_type` for every rank index r.

11 *Effects*:

(11.1) — If `N` equals `rank_dynamic()`, for all d in the range $[0,$ `rank_dynamic()`$)$, direct-non-list-initializes *`dynamic-extents`*`[`d`]` with `as_const(exts[`d`])`.

(11.2) — Otherwise, for all d in the range $[0,$ `rank_dynamic()`$)$, direct-non-list-initializes *`dynamic-extents`*`[`d`]` with `as_const(exts[`*`dynamic-index-inv`*`(`d`)])`.

```
template<class... Integrals>
  explicit extents(Integrals...) -> see below;
```

12 *Constraints*: `(is_convertible_v<Integrals, size_t> && ...)` is `true`.

13 *Remarks*: The deduced type is `extents<size_t,` *`maybe-static-ext`*`<Integrals>...>`.

23.7.3.3.4 Observers of the multidimensional index space [mdspan.extents.obs]

```
static constexpr size_t static_extent(rank_type i) noexcept;
```

1 *Preconditions*: `i < rank()` is `true`.

2 *Returns*: $E_{\texttt{i}}$.

```
constexpr index_type extent(rank_type i) const noexcept;
```

3 *Preconditions*: `i < rank()` is `true`.

4 *Returns*: $D_{\mathtt{i}}$.

23.7.3.3.5 Comparison operators [mdspan.extents.cmp]

```
template<class OtherIndexType, size_t... OtherExtents>
  friend constexpr bool operator==(const extents& lhs,
                                   const extents<OtherIndexType, OtherExtents...>& rhs) noexcept;
```

1 *Returns*: `true` if `lhs.rank()` equals `rhs.rank()` and if `lhs.extent(r)` equals `rhs.extent(r)` for every rank index `r` of `rhs`, otherwise `false`.

23.7.3.3.6 Alias template `dextents` [mdspan.extents.dextents]

```
template<class IndexType, size_t Rank>
  using dextents = see below;
```

1 *Result*: A type `E` that is a specialization of `extents` such that `E::rank() == Rank && E::rank() == E::rank_dynamic()` is `true`, and `E::index_type` denotes `IndexType`.

23.7.3.3.7 Alias template `dims` [mdspan.extents.dims]

```
template<size_t Rank, class IndexType = size_t>
  using dims = see below;
```

1 *Result*: A type `E` that is a specialization of `extents` such that `E::rank() == Rank && E::rank() == E::rank_dynamic()` is `true`, and `E::index_type` denotes `IndexType`.

23.7.3.4 Layout mapping [mdspan.layout]

23.7.3.4.1 General [mdspan.layout.general]

1 In 23.7.3.4.2 and 23.7.3.4.3:

(1.1) — `M` denotes a layout mapping class.

(1.2) — `m` denotes a (possibly const) value of type `M`.

(1.3) — `i` and `j` are packs of (possibly const) integers that are multidimensional indices in `m.extents()` (23.7.3.1).

[*Note 1*: The type of each element of the packs can be a different integer type. — *end note*]

(1.4) — `r` is a (possibly const) rank index of `typename M::extents_type`.

(1.5) — $\mathtt{d}_r$ is a pack of (possibly const) integers for which `sizeof...(`$\mathtt{d}_r$`) == M::extents_type::rank()` is `true`, the r^{th} element is equal to 1, and all other elements are equal to 0.

2 In 23.7.3.4.2 through 23.7.3.4.7:

(2.1) — Let *`is-mapping-of`* be the exposition-only variable template defined as follows:

```
template<class Layout, class Mapping>
constexpr bool is-mapping-of =    // exposition only
  is_same_v<typename Layout::template mapping<typename Mapping::extents_type>, Mapping>;
```

(2.2) — Let *`is-layout-left-padded-mapping-of`* be the exposition-only variable template defined as follows:

```
template<class Mapping>
constexpr bool is-layout-left-padded-mapping-of = see below;    // exposition only
```

where *`is-layout-left-padded-mapping-of`*`<Mapping>` is `true` if and only if `Mapping` denotes a specialization of `layout_left_padded<S>::mapping` for some value `S` of type `size_t`.

(2.3) — Let *`is-layout-right-padded-mapping-of`* be the exposition-only variable template defined as follows:

```
template<class Mapping>
constexpr bool is-layout-right-padded-mapping-of = see below;    // exposition only
```

where *`is-layout-right-padded-mapping-of`*`<Mapping>` is `true` if and only if `Mapping` denotes a specialization of `layout_right_padded<S>::mapping` for some value `S` of type `size_t`.

(2.4) — For nonnegative integers x and y, let *`LEAST-MULTIPLE-AT-LEAST`*(x, y) denote

(2.4.1) — y if x is zero,

(2.4.2) — otherwise, the least multiple of x that is greater than or equal to y.

23.7.3.4.2 Requirements [mdspan.layout.reqmts]

1 A type `M` meets the *layout mapping* requirements if

(1.1) — `M` models `copyable` and `equality_comparable`,

(1.2) — `is_nothrow_move_constructible_v<M>` is `true`,

(1.3) — `is_nothrow_move_assignable_v<M>` is `true`,

(1.4) — `is_nothrow_swappable_v<M>` is `true`, and

(1.5) — the following types and expressions are well-formed and have the specified semantics.

`typename M::extents_type`

2 *Result*: A type that is a specialization of `extents`.

`typename M::index_type`

3 *Result*: `typename M::extents_type::index_type`.

`typename M::rank_type`

4 *Result*: `typename M::extents_type::rank_type`.

`typename M::layout_type`

5 *Result*: A type `MP` that meets the layout mapping policy requirements (23.7.3.4.3) and for which *`is-mapping-of`*`<MP, M>` is `true`.

`m.extents()`

6 *Result*: `const typename M::extents_type&`

`m(i...)`

7 *Result*: `typename M::index_type`

8 *Returns*: A nonnegative integer less than `numeric_limits<typename M::index_type>::max()` and less than or equal to `numeric_limits<size_t>::max()`.

`m(i...) == m(static_cast<typename M::index_type>(i)...)`

9 *Result*: `bool`

10 *Returns*: `true`

`m.required_span_size()`

11 *Result*: `typename M::index_type`

12 *Returns*: If the size of the multidimensional index space `m.extents()` is 0, then `0`, else `1` plus the maximum value of `m(i...)` for all `i`.

`m.is_unique()`

13 *Result*: `bool`

14 *Returns*: `true` only if for every `i` and `j` where `(i != j || ...)` is `true`, `m(i...) != m(j...)` is `true`.

[*Note 1*: A mapping can return `false` even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is unique. — *end note*]

`m.is_exhaustive()`

15 *Result*: `bool`

16 *Returns*: `true` only if for all k in the range $[0,$ `m.required_span_size()`$)$ there exists an `i` such that `m(i...)` equals k.

[*Note 2*: A mapping can return `false` even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is exhaustive. — *end note*]

`m.is_strided()`

17 *Result*: `bool`

18 *Returns*: `true` only if for every rank index r of `m.extents()` there exists an integer s_r such that, for all `i` where $(\texttt{i} + d_r)$ is a multidimensional index in `m.extents()` (23.7.3.1), `m((i +` d_r`)...) - m(i...)` equals s_r.

[*Note 3*: This implies that for a strided layout $m(i_0, \ldots, i_k) = m(0, \ldots, 0) + i_0 \times s_0 + \cdots + i_k \times s_k$. — *end note*]

[*Note 4*: A mapping can return `false` even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is strided. — *end note*]

`m.stride(r)`

19 *Preconditions*: `m.is_strided()` is `true`.

20 *Result*: `typename M::index_type`

21 *Returns*: s_r as defined in `m.is_strided()` above.

`M::is_always_unique()`

22 *Result*: A constant expression (7.7) of type `bool`.

23 *Returns*: `true` only if `m.is_unique()` is `true` for all possible objects `m` of type `M`.

[*Note 5*: A mapping can return `false` even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is unique. — *end note*]

`M::is_always_exhaustive()`

24 *Result*: A constant expression (7.7) of type `bool`.

25 *Returns*: `true` only if `m.is_exhaustive()` is `true` for all possible objects `m` of type `M`.

[*Note 6*: A mapping can return `false` even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is exhaustive. — *end note*]

`M::is_always_strided()`

26 *Result*: A constant expression (7.7) of type `bool`.

27 *Returns*: `true` only if `m.is_strided()` is `true` for all possible objects `m` of type `M`.

[*Note 7*: A mapping can return `false` even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is strided. — *end note*]

23.7.3.4.3 Layout mapping policy requirements [mdspan.layout.policy.reqmts]

1 A type `MP` meets the *layout mapping policy* requirements if for a type `E` that is a specialization of `extents`, `MP::mapping<E>` is valid and denotes a type `X` that meets the layout mapping requirements (23.7.3.4.2), and for which the *qualified-id* `X::layout_type` is valid and denotes the type `MP` and the *qualified-id* `X::extents_type` denotes `E`.

23.7.3.4.4 Layout mapping policies [mdspan.layout.policy.overview]

```
namespace std {
  struct layout_left {
    template<class Extents>
      class mapping;
  };
  struct layout_right {
    template<class Extents>
      class mapping;
  };
  struct layout_stride {
    template<class Extents>
      class mapping;
  };

  template<size_t PaddingValue>
  struct layout_left_padded {
    template<class Extents> class mapping;
  };
  template<size_t PaddingValue>
  struct layout_right_padded {
    template<class Extents> class mapping;
  };
}
```

1 Each of `layout_left`, `layout_right`, and `layout_stride`, as well as each specialization of `layout_left_-padded` and `layout_right_padded`, meets the layout mapping policy requirements and is a trivially copyable type. Furthermore, `is_trivially_default_constructible_v<T>` is `true` for any such type `T`.

23.7.3.4.5 Class template `layout_left::mapping` [mdspan.layout.left]

23.7.3.4.5.1 Overview [mdspan.layout.left.overview]

1 `layout_left` provides a layout mapping where the leftmost extent has stride 1, and strides increase left-to-right as the product of extents.

```
namespace std {
  template<class Extents>
  class layout_left::mapping {
  public:
    using extents_type = Extents;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using layout_type = layout_left;

    // 23.7.3.4.5.2, constructors
    constexpr mapping() noexcept = default;
    constexpr mapping(const mapping&) noexcept = default;
    constexpr mapping(const extents_type&) noexcept;
    template<class OtherExtents>
      constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
        mapping(const mapping<OtherExtents>&) noexcept;
    template<class OtherExtents>
      constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
        mapping(const layout_right::mapping<OtherExtents>&) noexcept;
    template<class LayoutLeftPaddedMapping>
      constexpr explicit(!is_convertible_v<typename LayoutLeftPaddedMapping::extents_type,
                                           extents_type>)
        mapping(const LayoutLeftPaddedMapping&) noexcept;
    template<class OtherExtents>
      constexpr explicit(extents_type::rank() > 0)
        mapping(const layout_stride::mapping<OtherExtents>&);

    constexpr mapping& operator=(const mapping&) noexcept = default;

    // 23.7.3.4.5.3, observers
    constexpr const extents_type& extents() const noexcept { return extents_; }

    constexpr index_type required_span_size() const noexcept;

    template<class... Indices>
      constexpr index_type operator()(Indices...) const noexcept;

    static constexpr bool is_always_unique() noexcept { return true; }
    static constexpr bool is_always_exhaustive() noexcept { return true; }
    static constexpr bool is_always_strided() noexcept { return true; }

    static constexpr bool is_unique() noexcept { return true; }
    static constexpr bool is_exhaustive() noexcept { return true; }
    static constexpr bool is_strided() noexcept { return true; }

    constexpr index_type stride(rank_type) const noexcept;

    template<class OtherExtents>
      friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;
  private:
    extents_type extents_{};                                            // exposition only

    // 23.7.3.7.6, submdspan mapping specialization
    template<class... SliceSpecifiers>
      constexpr auto submdspan-mapping-impl(SliceSpecifiers...) const      // exposition only
        -> see below;

    template<class... SliceSpecifiers>
      friend constexpr auto submdspan_mapping(
        const mapping& src, SliceSpecifiers... slices) {
          return src.submdspan-mapping-impl(slices...);
      }
  };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_left::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

4 *Mandates*: If `Extents::rank_dynamic() == 0` is `true`, then the size of the multidimensional index space `Extents()` is representable as a value of type `typename Extents::index_type`.

23.7.3.4.5.2 Constructors [mdspan.layout.left.cons]

```
constexpr mapping(const extents_type& e) noexcept;
```

1 *Preconditions*: The size of the multidimensional index space `e` is representable as a value of type `index_type` (6.8.2).

2 *Effects*: Direct-non-list-initializes *`extents_`* with `e`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const mapping<OtherExtents>& other) noexcept;
```

3 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

4 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

5 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_right::mapping<OtherExtents>& other) noexcept;
```

6 *Constraints*:

(6.1) — `extents_type::rank() <= 1` is `true`, and

(6.2) — `is_constructible_v<extents_type, OtherExtents>` is `true`.

7 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

8 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

```
template<class LayoutLeftPaddedMapping>
  constexpr explicit(!is_convertible_v<typename LayoutLeftPaddedMapping::extents_type,
                                       extents_type>)
    mapping(const LayoutLeftPaddedMapping&) noexcept;
```

9 *Constraints*:

(9.1) — *`is-layout-left-padded-mapping-of`*`<LayoutLeftPaddedMapping>` is `true`.

(9.2) — `is_constructible_v<extents_type, typename LayoutLeftPaddedMapping::extents_type>` is `true`.

10 *Mandates*: If

(10.1) — `Extents::rank()` is greater than one,

(10.2) — `Extents::static_extent(0)` does not equal `dynamic_extent`, and

(10.3) — `LayoutLeftPaddedMapping::`*`static-padding-stride`* does not equal `dynamic_extent`, then `Extents::static_extent(0)` equals `LayoutLeftPaddedMapping::`*`static-padding-stride`*.

11 *Preconditions*:

(11.1) — If `extents_type::rank() > 1` is `true`, then `other.stride(1)` equals `other.extents(0)`.

(11.2) — `other.required_span_size()` is representable as a value of type `index_type`.

12 *Effects*: Direct-non-list-initializes `extents_` with `other.extents()`.

```
template<class OtherExtents>
  constexpr explicit(extents_type::rank() > 0)
    mapping(const layout_stride::mapping<OtherExtents>& other);
```

13 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

14 *Preconditions*:

(14.1) — If `extents_type::rank() > 0` is `true`, then for all r in the range $[0,$ `extents_type::rank()`$)$, `other.stride(`r`)` equals `other.extents().`*`fwd-prod-of-extents`*`(`r`)`, and

(14.2) — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

15 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

23.7.3.4.5.3 Observers [mdspan.layout.left.obs]

```
constexpr index_type required_span_size() const noexcept;
```

1 *Returns*: `extents().`*`fwd-prod-of-extents`*`(extents_type::rank())`.

```
template<class... Indices>
  constexpr index_type operator()(Indices... i) const noexcept;
```

2 *Constraints*:

(2.1) — `sizeof...(Indices) == extents_type::rank()` is `true`,

(2.2) — `(is_convertible_v<Indices, index_type> && ...)` is `true`, and

(2.3) — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is `true`.

3 *Preconditions*: `extents_type::`*`index-cast`*`(i)` is a multidimensional index in *`extents_`* (23.7.3.1).

4 *Effects*: Let `P` be a parameter pack such that

```
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
```

is `true`. Equivalent to:

```
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```
constexpr index_type stride(rank_type i) const;
```

5 *Constraints*: `extents_type::rank() > 0` is `true`.

6 *Preconditions*: `i < extents_type::rank()` is `true`.

7 *Returns*: `extents().`*`fwd-prod-of-extents`*`(i)`.

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
```

8 *Constraints*: `extents_type::rank() == OtherExtents::rank()` is `true`.

9 *Effects*: Equivalent to: `return x.extents() == y.extents();`

23.7.3.4.6 Class template `layout_right::mapping` [mdspan.layout.right]

23.7.3.4.6.1 Overview [mdspan.layout.right.overview]

1 `layout_right` provides a layout mapping where the rightmost extent is stride 1, and strides increase right-to-left as the product of extents.

```
namespace std {
  template<class Extents>
  class layout_right::mapping {
  public:
    using extents_type = Extents;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using layout_type = layout_right;

    // 23.7.3.4.6.2, constructors
    constexpr mapping() noexcept = default;
    constexpr mapping(const mapping&) noexcept = default;
    constexpr mapping(const extents_type&) noexcept;
    template<class OtherExtents>
      constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
        mapping(const mapping<OtherExtents>&) noexcept;
    template<class OtherExtents>
      constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
        mapping(const layout_left::mapping<OtherExtents>&) noexcept;
    template<class LayoutRightPaddedMapping>
      constexpr explicit(!is_convertible_v<typename LayoutRightPaddedMapping::extents_type,
                                           extents_type>)
        mapping(const LayoutRightPaddedMapping&) noexcept;
    template<class OtherExtents>
      constexpr explicit(extents_type::rank() > 0)
        mapping(const layout_stride::mapping<OtherExtents>&) noexcept;

    constexpr mapping& operator=(const mapping&) noexcept = default;

    // 23.7.3.4.6.3, observers
    constexpr const extents_type& extents() const noexcept { return extents_; }

    constexpr index_type required_span_size() const noexcept;

    template<class... Indices>
      constexpr index_type operator()(Indices...) const noexcept;

    static constexpr bool is_always_unique() noexcept { return true; }
    static constexpr bool is_always_exhaustive() noexcept { return true; }
    static constexpr bool is_always_strided() noexcept { return true; }

    static constexpr bool is_unique() noexcept { return true; }
    static constexpr bool is_exhaustive() noexcept { return true; }
    static constexpr bool is_strided() noexcept { return true; }

    constexpr index_type stride(rank_type) const noexcept;

    template<class OtherExtents>
      friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

  private:
    extents_type extents_{};      // exposition only

    // 23.7.3.7.6, submdspan mapping specialization
    template<class... SliceSpecifiers>
      constexpr auto submdspan-mapping-impl(SliceSpecifiers...) const       // exposition only
        -> see below;

    template<class... SliceSpecifiers>
      friend constexpr auto submdspan_mapping(
        const mapping& src, SliceSpecifiers... slices) {
          return src.submdspan-mapping-impl(slices...);
      }
  };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_right::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

4 *Mandates*: If `Extents::rank_dynamic() == 0` is `true`, then the size of the multidimensional index space `Extents()` is representable as a value of type `typename Extents::index_type`.

23.7.3.4.6.2 Constructors [mdspan.layout.right.cons]

```
constexpr mapping(const extents_type& e) noexcept;
```

1 *Preconditions*: The size of the multidimensional index space `e` is representable as a value of type `index_type` (6.8.2).

2 *Effects*: Direct-non-list-initializes *`extents_`* with `e`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const mapping<OtherExtents>& other) noexcept;
```

3 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

4 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

5 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_left::mapping<OtherExtents>& other) noexcept;
```

6 *Constraints*:

(6.1) — `extents_type::rank() <= 1` is `true`, and

(6.2) — `is_constructible_v<extents_type, OtherExtents>` is `true`.

7 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

8 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

```
template<class LayoutRightPaddedMapping>
  constexpr explicit(!is_convertible_v<typename LayoutRightPaddedMapping::extents_type,
                                       extents_type>)
    mapping(const LayoutRightPaddedMapping&) noexcept;
```

9 *Constraints*:

(9.1) — *`is-layout-right-padded-mapping-of`*`<LayoutRightPaddedMapping>` is `true`.

(9.2) — `is_constructible_v<extents_type, typename LayoutRightPaddedMapping::extents_-type>` is `true`.

10 *Mandates*: If

(10.1) — `Extents::rank()` is greater than one,

(10.2) — `Extents::static_extent(Extents::rank() - 1)` does not equal `dynamic_extent`, and

(10.3) — `LayoutRightPaddedMapping::`*`static-padding-stride`* does not equal `dynamic_extent`,

then `Extents::static_extent(Extents::rank() - 1)` equals `LayoutRightPaddedMapping::`*`static-padding-stride`*.

11 *Preconditions*:

(11.1) — If `extents_type::rank() > 1` is `true`, then `other.stride(extents_type::rank() - 2)` equals `other.extents().extent(extents_type::rank() - 1)`.

(11.2) — `other.required_span_size()` is representable as a value of type `index_type`.

12 *Effects*: Direct-non-list-initializes `extents_` with `other.extents()`.

```
template<class OtherExtents>
 constexpr explicit(extents_type::rank() > 0)
    mapping(const layout_stride::mapping<OtherExtents>& other) noexcept;
```

13 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

14 *Preconditions*:

(14.1) — If `extents_type::rank() > 0` is `true`, then for all r in the range $[0,$ `extents_type::rank()`$)$, `other.stride(`r`)` equals `other.extents().`*`rev-prod-of-extents`*`(`r`)`.

(14.2) — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2).

15 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

23.7.3.4.6.3 Observers [mdspan.layout.right.obs]

```
index_type required_span_size() const noexcept;
```

1 *Returns*: `extents().`*`fwd-prod-of-extents`*`(extents_type::rank())`.

```
template<class... Indices>
  constexpr index_type operator()(Indices... i) const noexcept;
```

2 *Constraints*:

(2.1) — `sizeof...(Indices) == extents_type::rank()` is `true`,

(2.2) — `(is_convertible_v<Indices, index_type> && ...)` is `true`, and

(2.3) — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is `true`.

3 *Preconditions*: `extents_type::`*`index-cast`*`(i)` is a multidimensional index in *`extents_`* (23.7.3.1).

4 *Effects*: Let `P` be a parameter pack such that

```
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
```

is `true`. Equivalent to:

```
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```
constexpr index_type stride(rank_type i) const noexcept;
```

5 *Constraints*: `extents_type::rank() > 0` is `true`.

6 *Preconditions*: `i < extents_type::rank()` is `true`.

7 *Returns*: `extents().`*`rev-prod-of-extents`*`(i)`.

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
```

8 *Constraints*: `extents_type::rank() == OtherExtents::rank()` is `true`.

9 *Effects*: Equivalent to: `return x.extents() == y.extents();`

23.7.3.4.7 Class template `layout_stride::mapping` [mdspan.layout.stride]

23.7.3.4.7.1 Overview [mdspan.layout.stride.overview]

1 `layout_stride` provides a layout mapping where the strides are user-defined.

```
namespace std {
  template<class Extents>
  class layout_stride::mapping {
  public:
    using extents_type = Extents;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using layout_type = layout_stride;

  private:
    static constexpr rank_type rank_ = extents_type::rank();     // exposition only

  public:
    // 23.7.3.4.7.3, constructors
    constexpr mapping() noexcept;
    constexpr mapping(const mapping&) noexcept = default;
    template<class OtherIndexType>
      constexpr mapping(const extents_type&, span<OtherIndexType, rank_>) noexcept;
    template<class OtherIndexType>
      constexpr mapping(const extents_type&, const array<OtherIndexType, rank_>&) noexcept;
    template<class StridedLayoutMapping>
      constexpr explicit(see below) mapping(const StridedLayoutMapping&) noexcept;

    constexpr mapping& operator=(const mapping&) noexcept = default;

    // 23.7.3.4.7.4, observers
    constexpr const extents_type& extents() const noexcept { return extents_; }
    constexpr array<index_type, rank_> strides() const noexcept { return strides_; }

    constexpr index_type required_span_size() const noexcept;

    template<class... Indices>
      constexpr index_type operator()(Indices...) const noexcept;

    static constexpr bool is_always_unique() noexcept { return true; }
    static constexpr bool is_always_exhaustive() noexcept { return false; }
    static constexpr bool is_always_strided() noexcept { return true; }

    static constexpr bool is_unique() noexcept { return true; }
    constexpr bool is_exhaustive() const noexcept;
    static constexpr bool is_strided() noexcept { return true; }

    constexpr index_type stride(rank_type i) const noexcept { return strides_[i]; }

    template<class OtherMapping>
      friend constexpr bool operator==(const mapping&, const OtherMapping&) noexcept;

  private:
    extents_type extents_{};                  // exposition only
    array<index_type, rank_> strides_{};      // exposition only

    // 23.7.3.7.6, submdspan mapping specialization
    template<class... SliceSpecifiers>
      constexpr auto submdspan-mapping-impl(SliceSpecifiers...) const        // exposition only
        -> see below;

    template<class... SliceSpecifiers>
      friend constexpr auto submdspan_mapping(
        const mapping& src, SliceSpecifiers... slices) {
          return src.submdspan-mapping-impl(slices...);
      }
  };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_stride::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

4 *Mandates*: If `Extents::rank_dynamic() == 0` is `true`, then the size of the multidimensional index space `Extents()` is representable as a value of type `typename Extents::index_type`.

23.7.3.4.7.2 Exposition-only helpers [mdspan.layout.stride.expo]

1 Let *`REQUIRED-SPAN-SIZE`*`(e, strides)` be:

(1.1) — `1`, if `e.rank() == 0` is `true`,

(1.2) — otherwise `0`, if the size of the multidimensional index space `e` is 0,

(1.3) — otherwise `1` plus the sum of products of `(e.extent(`r`) - 1)` and

`extents_type::`*`index-cast`*`(strides[`r`])`

for all r in the range $[0,$ `e.rank()`$)$.

2 Let *`OFFSET`*`(m)` be:

(2.1) — `m()`, if `e.rank() == 0` is `true`,

(2.2) — otherwise `0`, if the size of the multidimensional index space `e` is 0, (2.3) — otherwise `m(z...)` for a pack of integers `z` that is a multidimensional index in `m.extents()` and each element of `z` equals 0.

3 Let *`is-extents`* be the exposition-only variable template defined as follows:

```
template<class T>
  constexpr bool is-extents = false;                                    // exposition only
template<class IndexType, size_t... Args>
  constexpr bool is-extents<extents<IndexType, Args...>> = true;    // exposition only
```

4 Let *`layout-mapping-alike`* be the exposition-only concept defined as follows:

```
template<class M>
concept layout-mapping-alike = requires {                              // exposition only
  requires is-extents<typename M::extents_type>;
  { M::is_always_strided() } -> same_as<bool>;
  { M::is_always_exhaustive() } -> same_as<bool>;
  { M::is_always_unique() } -> same_as<bool>;
  bool_constant<M::is_always_strided()>::value;
  bool_constant<M::is_always_exhaustive()>::value;
  bool_constant<M::is_always_unique()>::value;
};
```

[*Note 1*: This concept checks that the functions `M::is_always_strided()`, `M::is_always_exhaustive()`, and `M::is_-always_unique()` exist, are constant expressions, and have a return type of `bool`. — *end note*]

23.7.3.4.7.3 Constructors [mdspan.layout.stride.cons]

```
constexpr mapping() noexcept;
```

1 *Preconditions*: `layout_right::mapping<extents_type>().required_span_size()` is representable as a value of type `index_type` (6.8.2).

2 *Effects*: Direct-non-list-initializes *`extents_`* with `extents_type()`, and for all d in the range $[0,$ *`rank_`*$)$, direct-non-list-initializes *`strides_`*`[`d`]` with `layout_right::mapping<extents_type>().stride(`d`)`.

```
template<class OtherIndexType>
  constexpr mapping(const extents_type& e, span<OtherIndexType, rank_> s) noexcept;
template<class OtherIndexType>
  constexpr mapping(const extents_type& e, const array<OtherIndexType, rank_>& s) noexcept;
```

3 *Constraints*:

(3.1) — `is_convertible_v<const OtherIndexType&, index_type>` is `true`, and

(3.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is `true`.

4 *Preconditions*:

(4.1) — The result of converting `s[`i`]` to `index_type` is greater than `0` for all i in the range $[0,$ *`rank_`*$)$.

(4.2) — *`REQUIRED-SPAN-SIZE`*`(e, s)` is representable as a value of type `index_type` (6.8.2).

(4.3) — If *`rank_`* is greater than 0, then there exists a permutation P of the integers in the range $[0,$ *`rank_`*$)$, such that `s[`p_i`] >= s[`p_{i-1}`] * e.extent(`p_{i-1}`)` is `true` for all i in the range $[1,$ *`rank_`*$)$, where p_i is the i^{th} element of P.

[*Note 1*: For `layout_stride`, this condition is necessary and sufficient for `is_unique()` to be `true`. — *end note*]

5 *Effects*: Direct-non-list-initializes *`extents_`* with `e`, and for all d in the range $[0,$ *`rank_`*$)$, direct-non-list-initializes `strides_[`d`]` with `as_const(s[`d`])`.

```
template<class StridedLayoutMapping>
  constexpr explicit(see below)
    mapping(const StridedLayoutMapping& other) noexcept;
```

6 *Constraints*:

(6.1) — *`layout-mapping-alike`*`<StridedLayoutMapping>` is satisfied.

(6.2) — `is_constructible_v<extents_type, typename StridedLayoutMapping::extents_type>` is `true`.

(6.3) — `StridedLayoutMapping::is_always_unique()` is `true`.

(6.4) — `StridedLayoutMapping::is_always_strided()` is `true`.

7 *Preconditions*:

(7.1) — `StridedLayoutMapping` meets the layout mapping requirements (23.7.3.4.2),

(7.2) — `other.stride(`r`) > 0` is `true` for every rank index r of `extents()`,

(7.3) — `other.required_span_size()` is representable as a value of type `index_type` (6.8.2), and

(7.4) — *`OFFSET`*`(other) == 0` is `true`.

8 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`, and for all d in the range $[0,$ *`rank_`*$)$, direct-non-list-initializes *`strides_`*`[`d`]` with `other.stride(`d`)`.

9 Remarks: The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<typename StridedLayoutMapping::extents_type, extents_type> &&
  (is-mapping-of<layout_left, StridedLayoutMapping> ||
   is-mapping-of<layout_right, StridedLayoutMapping> ||
   is-layout-left-padded-mapping-of<StridedLayoutMapping> ||
   is-layout-right-padded-mapping-of<StridedLayoutMapping> ||
   is-mapping-of<layout_stride, StridedLayoutMapping>))
```

23.7.3.4.7.4 Observers [mdspan.layout.stride.obs]

```
constexpr index_type required_span_size() const noexcept;
```

1 *Returns*: *`REQUIRED-SPAN-SIZE`*`(extents(), `*`strides_`*`)`.

```
template<class... Indices>
  constexpr index_type operator()(Indices... i) const noexcept;
```

2 *Constraints*:

(2.1) — `sizeof...(Indices) == `*`rank_`* is `true`,

(2.2) — `(is_convertible_v<Indices, index_type> && ...)` is `true`, and

(2.3) — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is `true`.

3 *Preconditions*: `extents_type::`*`index-cast`*`(i)` is a multidimensional index in *`extents_`* (23.7.3.1).

4 *Effects*: Let `P` be a parameter pack such that

```
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
```

is `true`. Equivalent to:

```
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```
constexpr bool is_exhaustive() const noexcept;
```

5 *Returns*:

(5.1) — `true` if *`rank_`* is 0.

(5.2) — Otherwise, `true` if there is a permutation P of the integers in the range $[0,$ *`rank_`*$)$ such that `stride(`p_0`)` equals 1, and `stride(`p_i`)` equals `stride(`p_{i-1}`) * extents().extent(`p_{i-1}`)` for i in the range $[1,$ *`rank_`*$)$, where p_i is the i^{th} element of P.

(5.3) — Otherwise, `false`.

```
template<class OtherMapping>
  friend constexpr bool operator==(const mapping& x, const OtherMapping& y) noexcept;
```

6 *Constraints*:

(6.1) — *`layout-mapping-alike`*`<OtherMapping>` is satisfied.

(6.2) — *`rank_`*` == OtherMapping::extents_type::rank()` is `true`.

(6.3) — `OtherMapping::is_always_strided()` is `true`.

7 *Preconditions*: `OtherMapping` meets the layout mapping requirements (23.7.3.4.3).

8 *Returns*: `true` if `x.extents() == y.extents()` is `true`, *`OFFSET`*`(y) == 0` is `true`, and each of `x.stride(`r`) == y.stride(`r`)` is `true` for r in the range $[0,$ `x.extents().rank()`$)$. Otherwise, `false`.

23.7.3.4.8 Class template `layout_left_padded::mapping` [mdspan.layout.leftpad]

23.7.3.4.8.1 Overview [mdspan.layout.leftpad.overview]

1 `layout_left_padded` provides a layout mapping that behaves like `layout_left::mapping`, except that the padding stride `stride(1)` can be greater than or equal to `extent(0)`.

```
namespace std {
  template<size_t PaddingValue>
  template<class Extents>
  class layout_left_padded<PaddingValue>::mapping {
  public:
    static constexpr size_t padding_value = PaddingValue;

    using extents_type = Extents;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using layout_type = layout_left_padded<PaddingValue>;

  private:
    static constexpr size_t rank_ = extents_type::rank();          // exposition only
    static constexpr size_t first-static-extent =                  // exposition only
      extents_type::static_extent(0);

    // 23.7.3.4.8.2, exposition-only members
    static constexpr size_t static-padding-stride = see below;  // exposition only

  public:
    // 23.7.3.4.8.3, constructors

    index_type stride-1 = static-padding-stride;                       // exposition only
    extents_type extents_{};                                           // exposition only
    // 23.7.3.7.6, submdspan mapping specialization
    template<class... SliceSpecifiers>
      constexpr auto submdspan-mapping-impl(SliceSpecifiers...) const      // exposition only
        -> see below;

    template<class... SliceSpecifiers>
      friend constexpr auto submdspan_mapping(const mapping& src, SliceSpecifiers... slices) {
      return src.submdspan-mapping-impl(slices...);
    }
  };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_left_padded::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

4 Throughout 23.7.3.4.8, let `P_rank` be the following size *`rank_`* parameter pack of `size_t` values:

(4.1) — the empty parameter pack, if *`rank_`* equals zero;

(4.2) — otherwise, `0zu`, if *`rank_`* equals one;

(4.3) — otherwise, the parameter pack `0zu`, `1zu`, ..., *`rank_`*`- 1`.

5 *Mandates*:

(5.1) — If `rank_dynamic() == 0` is `true`, then the size of the multidimensional index space `Extents()` is representable as a value of type `index_type`.

(5.2) — `padding_value` is representable as a value of type `index_type`.

(5.3) — If

(5.3.1) — *`rank_`* is greater than one,

(5.3.2) — `padding_value` does not equal `dynamic_extent`, and

(5.3.3) — *`first-static-extent`* does not equal `dynamic_extent`,

then *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value,` *`first-static-extent`*`)` is representable as a value of type `size_t`, and is representable as a value of type `index_type`.

(5.4) — If

(5.4.1) — *`rank_`* is greater than one,

(5.4.2) — `padding_value` does not equal `dynamic_extent`, and

(5.4.3) — `extents_type::static_extent(`k`)` does not equal `dynamic_extent` for all k in the range $[$`0`, `extents_type::rank()`$)$,

then the product of *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value, ext.static_extent(0))` and all values `ext.static_extent(`k`)` with k in the range of $[1,$ *`rank_`*$)$ is representable as a value of type `size_t`, and is representable as a value of type `index_type`.

23.7.3.4.8.2 Exposition-only members [mdspan.layout.leftpad.expo]

`static constexpr size_t` *`static-padding-stride`* `=` *`see below`*`;`

1 The value is

(1.1) — `0`, if *`rank_`* equals zero or one;

(1.2) — otherwise, `dynamic_extent`, if `padding_value` or *`first-static-extent`* equals `dynamic_extent`;

(1.3) — otherwise, the `size_t` value which is *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value,` *`first-static-extent`*`)`.

```
index_type stride-1 = static-padding-stride;
```

2 *Recommended practice*: Implementations should not store this value if *`static-padding-stride`* is not `dynamic_extent`.

[*Note 1*: Using `extents<index_type, `*`static-padding-stride`*`>` instead of `index_type` as the type of *`stride-1`* would achieve this. — *end note*]

23.7.3.4.8.3 Constructors [mdspan.layout.leftpad.cons]

```
constexpr mapping(const extents_type& ext);
```

1 *Preconditions*:

(1.1) — The size of the multidimensional index space `ext` is representable as a value of type `index_type`.

(1.2) — If *`rank_`* is greater than one and `padding_value` does not equal `dynamic_extent`, then *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value, ext.extent(0))` is representable as a value of type *`index_type`*.

(1.3) — If *`rank_`* is greater than one and `padding_value` does not equal `dynamic_extent`, then the product of *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value, ext.extent(0))` and all values `ext.extent(`k`)` with k in the range of $[1,$ *`rank_`*$)$ is representable as a value of type `index_type`.

2 *Effects*:

(2.1) — Direct-non-list-initializes *`extents_`* with `ext`; and

(2.2) — if *`rank_`* is greater than one, direct-non-list-initializes *`stride-1`*

(2.2.1) — with `ext.extent(0)` if padding_value is `dynamic_extent`,

(2.2.2) — otherwise with *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value, ext.extent(0))`.

```
template<class OtherIndexType>
constexpr mapping(const extents_type& ext, OtherIndexType pad);
```

3 *Constraints*:

(3.1) — `is_convertible_v<OtherIndexType, index_type>` is `true`.

(3.2) — `is_nothrow_constructible_v<index_type, OtherIndexType>` is `true`.

4 *Preconditions*:

(4.1) — `pad` is representable as a value of type `index_type`.

(4.2) — `extents_type::index-cast(pad)` is greater than zero.

(4.3) — If *`rank_`* is greater than one, then *`LEAST-MULTIPLE-AT-LEAST`*`(pad, ext.extent(0))` is representable as a value of type `index_type`.

(4.4) — If *`rank_`* is greater than one, then the product of *`LEAST-MULTIPLE-AT-LEAST`*`(pad, ext.extent(0))` and all values `ext.extent(`k`)` with k in the range of $[1,$ *`rank_`*$)$ is representable as a value of type `index_type`.

(4.5) — If `padding_value` is not equal to `dynamic_extent`, `padding_value` equals `extents_type::`*`index-cast`*`(pad)`.

5 *Effects*: Direct-non-list-initializes *`extents_`* with `ext`, and if *`rank_`* is greater than one, direct-non-list-initializes *`stride-1`* with *`LEAST-MULTIPLE-AT-LEAST`*`(pad, ext.extent(0))`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_left::mapping<OtherExtents>& other);
```

6 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

7 *Mandates*: If `OtherExtents::rank()` is greater than `1`, then

```
(static-padding-stride == dynamic_extent) ||
(OtherExtents::static_extent(0) == dynamic_extent) ||
(static-padding-stride == OtherExtents::static_extent(0))
```

is `true`.

8 *Preconditions*:

(8.1) — If `extents_type::rank() > 1` is `true` and `padding_value == dynamic_extent` is `false`, then `other.stride(1)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extents().extent(0)))
```

and

(8.2) — `other.required_span_size()` is representable as a value of type `index_type`.

9 *Effects*: Equivalent to `mapping(other.extents())`.

```
template<class OtherExtents>
  constexpr explicit(rank_ > 0)
    mapping(const layout_stride::mapping<OtherExtents>& other);
```

10 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

11 *Preconditions*:

(11.1) — If *`rank_`* is greater than 1 and `padding_value` does not equal `dynamic_extent`, then `other.stride(1)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extents().extent(0)))
```

(11.2) — If *`rank_`* is greater than 0, then `other.stride(0)` equals 1.

(11.3) — If *`rank_`* is greater than 2, then for all r in the range $[2,$ *`rank_`*$)$, `other.stride(r)` equals

```
(other.extents().fwd-prod-of-extents(r) / other.extents().extent(0)) * other.stride(1)
```

(11.4) — `other.required_span_size()` is representable as a value of type *`index_type`*.

12 *Effects*:

(12.1) — Direct-non-list-initializes *`extents_`* with `other.extents()` and

(12.2) — if *`rank_`* is greater than one, direct-non-list-initializes *`stride-1`* with `other.stride(1)`.

```
template<class LayoutLeftPaddedMapping>
  constexpr explicit(see below)
    mapping(const LayoutLeftPaddedMapping& other);
```

13 *Constraints*:

(13.1) — *`is-layout-left-padded-mapping-of`*`<LayoutLeftPaddedMapping>` is `true`.

(13.2) — `is_constructible_v<extents_type, typename LayoutLeftPaddedMapping::extents_type>` is `true`.

14 *Mandates*: If *`rank_`* is greater than 1, then

```
padding_value == dynamic_extent ||
LayoutLeftPaddedMapping::padding_value == dynamic_extent ||
padding_value == LayoutLeftPaddedMapping::padding_value
```

is `true`.

(14.1) — If *`rank_`* is greater than 1 and `padding_value` does not equal `dynamic_extent`, then `other.stride(1)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extent(0)))
```

(14.2) — `other.required_span_size()` is representable as a value of type `index_type`.

15 *Effects*:

(15.1) — Direct-non-list-initializes *`extents_`* with `other.extents()` and

(15.2) — if *`rank_`* is greater than one, direct-non-list-initializes *`stride-1`* with `other.stride(1)`.

16 *Remarks*: The expression inside `explicit` is equivalent to:

```
rank_> 1 &&
(padding_value != dynamic_extent ||
 LayoutLeftPaddedMapping::padding_value == dynamic_extent)
```

```
template<class LayoutRightPaddedMapping>
  constexpr explicit(see below)
    mapping(const LayoutRightPaddedMapping& other) noexcept;
```

17 *Constraints*:

(17.1) — *`is-layout-right-padded-mapping-of`*`<LayoutRightPaddedMapping>` is `true` or *`is-mapping-of`*`<layout_right, LayoutRightPaddedMapping>` is `true`.

(17.2) — *`rank_`* equals zero or one.

(17.3) — `is_constructible_v<extents_type, typename LayoutRightPaddedMapping::extents_-type>` is `true`.

18 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type`.

19 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

20 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<typename LayoutRightPaddedMapping::extents_type, extents_type>
```

[*Note 1*: Neither the input mapping nor the mapping to be constructed uses the padding stride in the rank-0 or rank-1 case, so the padding stride does not affect either the constraints or the preconditions. — *end note*]

23.7.3.4.8.4 Observers [mdspan.layout.leftpad.obs]

```
constexpr array<index_type, rank_> strides() const noexcept;
```

1 *Returns*: `array<index_type, `*`rank_`*`>({stride(P_rank)...})`.

```
constexpr index_type required_span_size() const noexcept;
```

2 *Returns*:

(2.1) — `0` if the multidimensional index space *`extents_`* is empty,

(2.2) — otherwise, `*this(((`*`extents_`*`(P_rank) - index_type(1))...)) + 1`.

```
template<class... Indices>
constexpr size_t operator()(Indices... idxs) const noexcept;
```

3 *Constraints*:

(3.1) — `sizeof...(Indices) == `*`rank_`* is `true`.

(3.2) — `(is_convertible_v<Indices, index_type> && ...)` is `true`.

(3.3) — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is `true`.

4 *Preconditions*: `extents_type::`*`index-cast`*`(idxs)` is a multidimensional index in `extents()` (23.7.3.1).

5 *Returns*: `((static_cast<index_type>(idxs) * stride(P_rank)) + ... + 0)`.

```
static constexpr bool is_always_exhaustive() noexcept;
```

6 *Returns*:

(6.1) — If *`rank_`* equals zero or one, then `true`;

(6.2) — otherwise, if neither *`static-padding-stride`* nor *`first-static-extent`* equal `dynamic_extent`, then *`static-padding-stride`*` == `*`first-static-extent`*;

(6.3) — otherwise, `false`.

```
constexpr bool is_exhaustive() const noexcept;
```

7 *Returns*: `true` if *`rank_`* equals zero or one; otherwise, `extents_.extent(0) == stride(1)`.

```
constexpr index_type stride(rank_type r) const noexcept;
```

8 *Preconditions*: `r` is smaller than *`rank_`*.

9 *Returns*:

(9.1) — If `r` equals zero: 1;

(9.2) — otherwise, if `r` equals one: *`stride-1`*;

(9.3) — otherwise, the product of *`stride-1`* and all values `extents_.extent(`*k*`)` with *k* in the range $[1, \texttt{r})$.

```
template<class LayoutLeftPaddedMapping>
  friend constexpr bool operator==(const mapping& x, const LayoutLeftPaddedMapping& y) noexcept;
```

10 *Constraints*:

(10.1) — *`is-layout-left-padded-mapping-of`*`<LayoutLeftPaddedMapping>` is `true`.

(10.2) — `LayoutLeftPaddedMapping::extents_type::rank() == rank_` is `true`.

11 *Returns*: `true` if `x.extents() == y.extents()` is `true` and *`rank_`* `< 2 || x.stride(1) == y.stride(1)` is `true`. Otherwise, `false`.

23.7.3.4.9 Class template `layout_right_padded::mapping` [mdspan.layout.rightpad]

23.7.3.4.9.1 Overview [mdspan.layout.rightpad.overview]

1 `layout_right_padded` provides a layout mapping that behaves like `layout_right::mapping`, except that the padding stride `stride(extents_type::rank() - 2)` can be greater than or equal to `extents_type::extent(extents_type::rank() - 1)`.

```
namespace std {
  template<size_t PaddingValue>
  template<class Extents>
  class layout_right_padded<PaddingValue>::mapping {
  public:
    static constexpr size_t padding_value = PaddingValue;

    using extents_type = Extents;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using layout_type = layout_right_padded<PaddingValue>;

  private:
    static constexpr size_t rank_ = extents_type::rank();     // exposition only
    static constexpr size_t last-static-extent =              // exposition only
      extents_type::static_extent(rank_ - 1);

    // 23.7.3.4.9.2, exposition-only members
    static constexpr size_t static-padding-stride = see below; // exposition only

  public:
    // 23.7.3.4.9.3, constructors
    constexpr mapping() noexcept : mapping(extents_type{}) {}
    constexpr mapping(const mapping&) noexcept = default;
    constexpr mapping(const extents_type&);
    template<class OtherIndexType>
      constexpr mapping(const extents_type&, OtherIndexType);

    template<class OtherExtents>
      constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
        mapping(const layout_right::mapping<OtherExtents>&);

        -> see below;

    template<class... SliceSpecifiers>
      friend constexpr auto submdspan_mapping(const mapping& src, SliceSpecifiers... slices) {
      return src.submdspan-mapping-impl(slices...);
    }
  };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_right_padded::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

4 Throughout 23.7.3.4.9, let `P_rank` be the following size *`rank_`* parameter pack of `size_t` values:

(4.1) — the empty parameter pack, if *`rank_`* equals zero;

(4.2) — otherwise, `0zu`, if *`rank_`* equals one;

(4.3) — otherwise, the parameter pack `0zu`, `1zu`, ..., *`rank_`*`- 1`.

5 *Mandates*:

(5.1) — If `rank_dynamic() == 0` is `true`, then the size of the multidimensional index space `Extents()` is representable as a value of type `index_type`.

(5.2) — `padding_value` is representable as a value of type `index_type`.

(5.3) — If

(5.3.1) — *`rank_`* is greater than one,

(5.3.2) — `padding_value` does not equal `dynamic_extent`, and

(5.3.3) — *`last-static-extent`* does not equal `dynamic_extent`,

then *`LEAST-MULTIPLE-AT-LEAST`*`(padding_value, `*`last-static-extent`*`)` is representable as a value of type `size_t`, and is representable as a value of type `index_type`.

(5.4) — If

(5.4.1) — *`rank_`* is greater than one,

(5.4.2) — `padding_value` does not equal `dynamic_extent`, and

(5.4.3) — `extents_type::static_extent(`k`)` does not equal `dynamic_extent` for all k in the range [`0`, *`rank_`*), then the product of *LEAST-MULTIPLE-AT-LEAST*(padding_value, ext.static_extent(*rank_* - 1)) and all values ext.static_extent(*k*) with *k* in the range of [0, *rank_* - 1) is representable as a value of type size_t, and is representable as a value of type index_type.

23.7.3.4.9.2 Exposition-only members [mdspan.layout.rightpad.expo]

```
static constexpr size_t static-padding-stride = see below;
```

1 The value is

(1.1) — 0, if *rank_* equals zero or one;

(1.2) — otherwise, dynamic_extent, if padding_value or *last-static-extent* equals dynamic_extent;

(1.3) — otherwise, the size_t value which is *LEAST-MULTIPLE-AT-LEAST*(padding_value, *last-static-extent*).

```
index_type stride-rm2 = static-padding-stride;
```

2 *Recommended practice*: Implementations should not store this value if *static-padding-stride* is not dynamic_extent.

[*Note 1*: Using extents<index_type, *static-padding-stride*> instead of index_type as the type of *stride-rm2* would achieve this. — *end note*]

23.7.3.4.9.3 Constructors [mdspan.layout.rightpad.cons]

```
constexpr mapping(const extents_type& ext);
```

1 *Preconditions*:

(1.1) — The size of the multidimensional index space ext is representable as a value of type index_type.

(1.2) — If *rank_* is greater than one and padding_value does not equal dynamic_extent, then *LEAST-MULTIPLE-AT-LEAST*(padding_value, ext.extent(*rank_* - 1)) is representable as a value of type *index_type*.

(1.3) — If *rank_* is greater than one and padding_value does not equal dynamic_extent, then the product of *LEAST-MULTIPLE-AT-LEAST*(padding_value, ext.extent(*rank_* - 1)) and all values ext.extent(*k*) with *k* in the range of [0, *rank_* - 1) is representable as a value of type index_type.

2 *Effects*:

(2.1) — Direct-non-list-initializes *extents_* with ext; and

(2.2) — if *rank_* is greater than one, direct-non-list-initializes *stride-rm2*

(2.2.1) — with ext.extent(*rank_* - 1) if padding_value is dynamic_extent,

(2.2.2) — otherwise with *LEAST-MULTIPLE-AT-LEAST*(padding_value, ext.extent(*rank_* - 1)).

```
template<class OtherIndexType>
constexpr mapping(const extents_type& ext, OtherIndexType pad);
```

3 *Constraints*:

(3.1) — is_convertible_v<OtherIndexType, index_type> is true.

(3.2) — is_nothrow_constructible_v<index_type, OtherIndexType> is true.

4 *Preconditions*:

(4.1) — pad is representable as a value of type index_type.

(4.2) — extents_type::*index-cast*(pad) is greater than zero.

(4.3) — If *rank_* is greater than one, then *LEAST-MULTIPLE-AT-LEAST*(pad, ext.extent(*rank_* - 1)) is representable as a value of type index_type.

(4.4) — If *rank_* is greater than one, then the product of *LEAST-MULTIPLE-AT-LEAST*(pad, ext.extent(*rank_* - 1)) and all values ext.extent(*k*) with *k* in the range of [0, *rank_* - 1) is representable as a value of type index_type.

(4.5) — If padding_value is not equal to dynamic_extent, padding_value equals extents_type::*index-cast*(pad).

5 *Effects*: Direct-non-list-initializes *`extents_`* with `ext`, and if *`rank_`* is greater than one, direct-non-list-initializes *`stride-rm2`* with *`LEAST-MULTIPLE-AT-LEAST`*`(pad, ext.extent(`*`rank_`*` - 1))`.

```
template<class OtherExtents>
  constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_right::mapping<OtherExtents>& other);
```

6 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

7 *Mandates*: If `OtherExtents::rank()` is greater than 1, then

```
(static-padding-stride == dynamic_extent) ||
(OtherExtents::static_extent(rank_ - 1) == dynamic_extent) ||
(static-padding-stride == OtherExtents::static_extent(rank_ - 1))
```

is `true`.

8 *Preconditions*:

(8.1) — If *`rank_`* `> 1` is `true` and `padding_value == dynamic_extent` is `false`, then `other.stride(`*`rank_`*` - 2)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extents().extent(rank_ - 1)))
```

and

(8.2) — `other.required_span_size()` is representable as a value of type `index_type`.

9 *Effects*: Equivalent to `mapping(other.extents())`.

```
template<class OtherExtents>
  constexpr explicit(rank_ > 0)
    mapping(const layout_stride::mapping<OtherExtents>& other);
```

10 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

11 *Preconditions*:

(11.1) — If *`rank_`* is greater than 1 and `padding_value` does not equal `dynamic_extent`, then `other.stride(`*`rank_`*` - 2)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extents().extent(rank_ - 1)))
```

(11.2) — If *`rank_`* is greater than 0, then other.stride(*`rank_`* - 1) equals 1.

(11.3) — If *`rank_`* is greater than 2, then for all r in the range $[0,$ *`rank_`* `- 2`$)$, `other.stride(`r`)` equals

```
(other.extents().rev-prod-of-extents(r) / other.extents().extent(rank_ - 1)) *
  other.stride(rank_ - 2)
```

(11.4) — `other.required_span_size()` is representable as a value of type `index_type`.

12 *Effects*:

(12.1) — Direct-non-list-initializes *`extents_`* with `other.extents()`; and

(12.2) — if *`rank_`* is greater than one, direct-non-list-initializes *`stride-rm2`* with `other.stride(`*`rank_`*` - 2)`.

```
template<class LayoutRightPaddedMapping>
  constexpr explicit(see below)
    mapping(const LayoutRightPaddedMapping& other);
```

13 *Constraints*:

(13.1) — *`is-layout-right-padded-mapping-of`*`<LayoutRightPaddedMapping>` is `true`.

(13.2) — `is_constructible_v<extents_type, typename LayoutRightPaddedMapping::extents_type>` is `true`.

14 *Mandates*: If *`rank_`* is greater than 1, then

```
padding_value == dynamic_extent ||
LayoutRightPaddedMapping::padding_value == dynamic_extent ||
padding_value == LayoutRightPaddedMapping::padding_value
```

is `true`.

15 *Preconditions*:

(15.1) — If *`rank_`* is greater than 1 and `padding_value` does not equal `dynamic_extent`, then `other.stride(`*`rank_`*` - 2)` equals

```
LEAST-MULTIPLE-AT-LEAST(padding_value,
                        extents_type::index-cast(other.extent(rank_ - 1)))
```

(15.2) — `other.required_span_size()` is representable as a value of type `index_type`.

16 *Effects*:

(16.1) — Direct-non-list-initializes *`extents_`* with `other.extents()`; and

(16.2) — if *`rank_`* is greater than one, direct-non-list-initializes *`stride-rm2`* with `other.stride(rank_ - 2)`.

17 *Remarks*: The expression inside `explicit` is equivalent to:

```
rank_ > 1 &&
(padding_value != dynamic_extent ||
 LayoutRightPaddedMapping::padding_value == dynamic_extent)
```

```
template<class LayoutLeftPaddedMapping>
  constexpr explicit(see below)
    mapping(const LayoutLeftPaddedMapping& other) noexcept;
```

18 *Constraints*:

(18.1) — *`is-layout-left-padded-mapping-of`*`<LayoutLeftPaddedMapping>` is `true` or *`is-mapping-of`*`<layout_left, LayoutLeftPaddedMapping>` is `true`.

(18.2) — *`rank_`* equals zero or one.

(18.3) — `is_constructible_v<extents_type, typename LayoutLeftPaddedMapping::extents_type>` is `true`.

19 *Preconditions*: `other.required_span_size()` is representable as a value of type `index_type`.

20 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

21 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<typename LayoutLeftPaddedMapping::extents_type, extents_type>
```

[*Note 1*: Neither the input mapping nor the mapping to be constructed uses the padding stride in the rank-0 or rank-1 case, so the padding stride affects neither the constraints nor the preconditions. — *end note*]

23.7.3.4.9.4 Observers [mdspan.layout.rightpad.obs]

```
constexpr array<index_type, rank_> strides() const noexcept;
```

1 *Returns*: `array<index_type, `*`rank_`*`>(stride(P_rank)...)`.

```
constexpr index_type required_span_size() const noexcept;
```

2 *Returns*: `0` if the multidimensional index space *`extents_`* is empty, otherwise `*this(((`*`extents_`*`(P_rank) - index_type(1))...)) + 1`.

```
template<class... Indices>
constexpr size_t operator()(Indices... idxs) const noexcept;
```

3 *Constraints*:

(3.1) — `sizeof...(Indices) == `*`rank_`* is `true`.

(3.2) — `(is_convertible_v<Indices, index_type> && ...)` is `true`.

(3.3) — `(is_nothrow_constructible_v<index_type, Indices> && ...)` is `true`.

4 *Preconditions*: `extents_type::`*`index-cast`*`(idxs)` is a multidimensional index in `extents()` (23.7.3.1).

5 *Returns*: `((static_cast<index_type>(idxs) * stride(P_rank)) + ... + 0)`.

```
static constexpr bool is_always_exhaustive() noexcept;
```

6 *Returns*:

(6.1) — If *rank_* equals zero or one, then `true`;

(6.2) — otherwise, if neither *static-padding-stride* nor *last-static-extent* equal `dynamic_extent`, then *static-padding-stride* `==` *last-static-extent*;

(6.3) — otherwise, `false`.

```
constexpr bool is_exhaustive() const noexcept;
```

7 *Returns*: `true` if *rank_* equals zero or one; otherwise,

```
extents_.extent(rank_ - 1) == stride(rank_ - 2)
```

```
constexpr index_type stride(rank_type r) const noexcept;
```

8 *Preconditions*: `r` is smaller than *rank_*.

9 *Returns*:

(9.1) — If `r` equals *rank_* `- 1`: `1`;

(9.2) — otherwise, if `r` equals *rank_* `- 2`: *stride-rm2*;

(9.3) — otherwise, the product of *stride-rm2* and all values `extents_.extent(`k`)` with k in the range of [`r + 1`, *rank_* `- 1`).

```
template<class LayoutRightPaddedMapping>
  friend constexpr bool operator==(const mapping& x, const LayoutRightPaddedMapping& y) noexcept;
```

10 *Constraints*:

(10.1) — *is-layout-right-padded-mapping-of*`<LayoutRightPaddedMapping>` is `true`.

(10.2) — `LayoutRightPaddedMapping::extents_type::rank() ==` *rank_* is `true`.

11 *Returns*: `true` if `x.extents() == y.extents()` is `true` and *rank_* `< 2 || x.stride(`*rank_* `- 2) == y.stride(`*rank_* `- 2)` is `true`. Otherwise, `false`.

23.7.3.5 Accessor policy [mdspan.accessor]

23.7.3.5.1 General [mdspan.accessor.general]

1 An *accessor policy* defines types and operations by which a reference to a single object is created from an abstract data handle to a number of such objects and an index.

2 A range of indices $[0, N)$ is an *accessible range* of a given data handle and an accessor if, for each i in the range, the accessor policy's `access` function produces a valid reference to an object.

3 In 23.7.3.5.2,

(3.1) — `A` denotes an accessor policy.

(3.2) — `a` denotes a value of type `A` or `const A`.

(3.3) — `p` denotes a value of type `A::data_handle_type` or `const A::data_handle_type`.

[*Note 1*: The type `A::data_handle_type` need not be dereferenceable. — *end note*]

(3.4) — `n`, `i`, and `j` each denote values of type `size_t`.

23.7.3.5.2 Requirements [mdspan.accessor.reqmts]

1 A type `A` meets the accessor policy requirements if

(1.1) — `A` models `copyable`,

(1.2) — `is_nothrow_move_constructible_v<A>` is `true`,

(1.3) — `is_nothrow_move_assignable_v<A>` is `true`,

(1.4) — `is_nothrow_swappable_v<A>` is `true`, and

(1.5) — the following types and expressions are well-formed and have the specified semantics.

```
typename A::element_type
```

2 *Result*: A complete object type that is not an abstract class type.

`typename A::data_handle_type`

3 *Result*: A type that models `copyable`, and for which `is_nothrow_move_constructible_v<A::data_handle_type>` is `true`, `is_nothrow_move_assignable_v<A::data_handle_type>` is `true`, and `is_nothrow_swappable_v<A::data_handle_type>` is `true`.

[*Note 1*: The type of `data_handle_type` need not be `element_type*`. — *end note*]

`typename A::reference`

4 *Result*: A type that models `common_reference_with<A::reference&&, A::element_type&>`.

[*Note 2*: The type of `reference` need not be `element_type&`. — *end note*]

`typename A::offset_policy`

5 *Result*: A type `OP` such that:

(5.1) — `OP` meets the accessor policy requirements,

(5.2) — `constructible_from<OP, const A&>` is modeled, and

(5.3) — `is_same_v<typename OP::element_type, typename A::element_type>` is `true`.

`a.access(p, i)`

6 *Result*: `A::reference`

7 *Remarks*: The expression is equality preserving.

8 [*Note 3*: Concrete accessor policies can impose preconditions for their `access` function. However, they might not. For example, an accessor where `p` is `span<A::element_type, dynamic_extent>` and `access(p, i)` returns `p[i % p.size()]` does not need to impose a precondition on `i`. — *end note*]

`a.offset(p, i)`

9 *Result*: `A::offset_policy::data_handle_type`

10 *Returns*: `q` such that for `b` being `A::offset_policy(a)`, and any integer `n` for which $[0, \texttt{n})$ is an accessible range of `p` and `a`:

(10.1) — $[0, \texttt{n} - \texttt{i})$ is an accessible range of `q` and `b`; and

(10.2) — `b.access(q, j)` provides access to the same element as `a.access(p, i + j)`, for every `j` in the range $[0, \texttt{n} - \texttt{i})$.

11 *Remarks*: The expression is equality-preserving.

23.7.3.5.3 Class template `default_accessor` [mdspan.accessor.default]

23.7.3.5.3.1 Overview [mdspan.accessor.default.overview]

```
namespace std {
  template<class ElementType>
  struct default_accessor {
    using offset_policy = default_accessor;
    using element_type = ElementType;
    using reference = ElementType&;
    using data_handle_type = ElementType*;

    constexpr default_accessor() noexcept = default;
    template<class OtherElementType>
      constexpr default_accessor(default_accessor<OtherElementType>) noexcept;
    constexpr reference access(data_handle_type p, size_t i) const noexcept;
    constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
  };
}
```

1 `default_accessor` meets the accessor policy requirements.

2 `ElementType` is required to be a complete object type that is neither an abstract class type nor an array type.

3 Each specialization of `default_accessor` is a trivially copyable type that models `semiregular`.

4 $[0, n)$ is an accessible range for an object `p` of type `data_handle_type` and an object of type `default_accessor` if and only if $[\texttt{p}, \texttt{p + } n)$ is a valid range.

23.7.3.5.3.2 Members [mdspan.accessor.default.members]

```
template<class OtherElementType>
  constexpr default_accessor(default_accessor<OtherElementType>) noexcept {}
```

1 *Constraints*: `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is `true`.

```
constexpr reference access(data_handle_type p, size_t i) const noexcept;
```

2 *Effects*: Equivalent to: `return p[i];`

```
constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
```

3 *Effects*: Equivalent to: `return p + i;`

23.7.3.5.4 Class template `aligned_accessor` [mdspan.accessor.aligned]

23.7.3.5.4.1 Overview [mdspan.accessor.aligned.overview]

```
namespace std {
  template<class ElementType, size_t ByteAlignment>
  struct aligned_accessor {
    using offset_policy = default_accessor<ElementType>;
    using element_type = ElementType;
    using reference = ElementType&;
    using data_handle_type = ElementType*;

    static constexpr size_t byte_alignment = ByteAlignment;

    constexpr aligned_accessor() noexcept = default;
    template<class OtherElementType, size_t OtherByteAlignment>
      constexpr aligned_accessor(
        aligned_accessor<OtherElementType, OtherByteAlignment>) noexcept;
    template<class OtherElementType>
      constexpr explicit aligned_accessor(default_accessor<OtherElementType>) noexcept;

    template<class OtherElementType>
      constexpr operator default_accessor<OtherElementType>() const noexcept;

    constexpr reference access(data_handle_type p, size_t i) const noexcept;

    constexpr typename offset_policy::data_handle_type offset(
      data_handle_type p, size_t i) const noexcept;
  };
}
```

1 *Mandates*:

(1.1) — `byte_alignment` is a power of two, and

(1.2) — `byte_alignment >= alignof(ElementType)` is `true`.

2 `aligned_accessor` meets the accessor policy requirements.

3 `ElementType` is required to be a complete object type that is neither an abstract class type nor an array type.

4 Each specialization of `aligned_accessor` is a trivially copyable type that models `semiregular`.

5 $[0, n)$ is an accessible range for an object `p` of type `data_handle_type` and an object of type `aligned_accessor` if and only if

(5.1) — [`p`, `p +` n) is a valid range, and,

(5.2) — if n is greater than zero, then `is_sufficiently_aligned<byte_alignment>(p)` is `true`.

6 [*Example 1*: The following function `compute` uses `is_sufficiently_aligned` to check whether a given `mdspan` with `default_accessor` has a data handle with sufficient alignment to be used with `aligned_accessor<float, 4 * sizeof(float)>`. If so, the function dispatches to a function `compute_using_fourfold_overalignment` that requires fourfold over-alignment of arrays, but can therefore use hardware-specific instructions, such as four-wide SIMD (Single Instruction Multiple Data) instructions. Otherwise, `compute` dispatches to a possibly less optimized function `compute_without_requiring_overalignment` that has no over-alignment requirement.

```
void compute_using_fourfold_overalignment(
  std::mdspan<float, std::dims<1>, std::layout_right,
    std::aligned_accessor<float, 4 * alignof(float)>> x);

void compute_without_requiring_overalignment(
  std::mdspan<float, std::dims<1>, std::layout_right> x);

void compute(std::mdspan<float, std::dims<1>> x) {
  constexpr auto byte_alignment = 4 * sizeof(float);
  auto accessor = std::aligned_accessor<float, byte_alignment>{};
  auto x_handle = x.data_handle();

  if (std::is_sufficiently_aligned<byte_alignment>(x_handle)) {
    compute_using_fourfold_overalignment(std::mdspan{x_handle, x.mapping(), accessor});
  } else {
    compute_without_requiring_overalignment(x);
  }
}
```

— *end example*]

23.7.3.5.4.2 Members [mdspan.accessor.aligned.members]

```
template<class OtherElementType, size_t OtherByteAlignment>
  constexpr aligned_accessor(aligned_accessor<OtherElementType, OtherByteAlignment>) noexcept;
```

1 *Constraints*:

(1.1) — `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is `true`.

(1.2) — `OtherByteAlignment >= byte_alignment` is `true`.

2 *Effects*: None.

```
template<class OtherElementType>
  constexpr explicit aligned_accessor(default_accessor<OtherElementType>) noexcept;
```

3 *Constraints*: `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is `true`.

4 *Effects*: None.

```
constexpr reference access(data_handle_type p, size_t i) const noexcept;
```

5 *Preconditions*: [`0`, `i + 1`) is an accessible range for `p` and `*this`.

6 *Effects*: Equivalent to: `return assume_aligned<byte_alignment>(p)[i];`

```
template<class OtherElementType>
  constexpr operator default_accessor<OtherElementType>() const noexcept;
```

7 *Constraints*: `is_convertible_v<element_type(*)[], OtherElementType(*)[]>` is `true`.

8 *Effects*: Equivalent to: `return {};`

```
constexpr typename offset_policy::data_handle_type
  offset(data_handle_type p, size_t i) const noexcept;
```

9 *Preconditions*: [`0`, `i + 1`) is an accessible range for `p` and `*this`.

10 *Effects*: Equivalent to: `return assume_aligned<byte_alignment>(p) + i;`

23.7.3.6 Class template `mdspan` [mdspan.mdspan]

23.7.3.6.1 Overview [mdspan.mdspan.overview]

1 `mdspan` is a view of a multidimensional array of elements.

```
namespace std {
  template<class ElementType, class Extents, class LayoutPolicy = layout_right,
           class AccessorPolicy = default_accessor<ElementType>>
  class mdspan {
  public:
    using extents_type = Extents;
    using layout_type = LayoutPolicy;
    using accessor_type = AccessorPolicy;
    using mapping_type = typename layout_type::template mapping<extents_type>;
    using element_type = ElementType;
    using value_type = remove_cv_t<element_type>;
    using index_type = typename extents_type::index_type;
    using size_type = typename extents_type::size_type;
    using rank_type = typename extents_type::rank_type;
    using data_handle_type = typename accessor_type::data_handle_type;
    using reference = typename accessor_type::reference;

    static constexpr rank_type rank() noexcept { return extents_type::rank(); }
    static constexpr rank_type rank_dynamic() noexcept { return extents_type::rank_dynamic(); }
    static constexpr size_t static_extent(rank_type r) noexcept
      { return extents_type::static_extent(r); }
    constexpr index_type extent(rank_type r) const noexcept { return extents().extent(r); }

    // 23.7.3.6.2, constructors
    constexpr mdspan();
    constexpr mdspan(const mdspan& rhs) = default;
    constexpr mdspan(mdspan&& rhs) = default;

    template<class... OtherIndexTypes>

                typename MappingType::layout_type, AccessorType>;
}
```

2 *Mandates*:

(2.1) — `ElementType` is a complete object type that is neither an abstract class type nor an array type,

(2.2) — `Extents` is a specialization of `extents`, and

(2.3) — `is_same_v<ElementType, typename AccessorPolicy::element_type>` is `true`.

3 `LayoutPolicy` shall meet the layout mapping policy requirements (23.7.3.4.3), and `AccessorPolicy` shall meet the accessor policy requirements (23.7.3.5.2).

4 Each specialization `MDS` of `mdspan` models `copyable` and

(4.1) — `is_nothrow_move_constructible_v<MDS>` is `true`,

(4.2) — `is_nothrow_move_assignable_v<MDS>` is `true`, and

(4.3) — `is_nothrow_swappable_v<MDS>` is `true`.

5 A specialization of `mdspan` is a trivially copyable type if its `accessor_type`, `mapping_type`, and `data_-handle_type` are trivially copyable types.

23.7.3.6.2 Constructors [mdspan.mdspan.cons]

```
constexpr mdspan();
```

1 *Constraints*:

(1.1) — `rank_dynamic() > 0` is `true`.

(1.2) — `is_default_constructible_v<data_handle_type>` is `true`.

(1.3) — `is_default_constructible_v<mapping_type>` is `true`.

(1.4) — `is_default_constructible_v<accessor_type>` is `true`.

2 *Preconditions*: $[0,$ *`map_`*`.required_span_size()`$)$ is an accessible range of *`ptr_`* and *`acc_`* for the values of *`map_`* and *`acc_`* after the invocation of this constructor.

3 *Effects*: Value-initializes *`ptr_`*, *`map_`*, and *`acc_`*.

```
template<class... OtherIndexTypes>
  constexpr explicit mdspan(data_handle_type p, OtherIndexTypes... exts);
```

4 Let `N` be `sizeof...(OtherIndexTypes)`.

5 *Constraints*:

(5.1) — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is `true`,

(5.2) — `(is_nothrow_constructible<index_type, OtherIndexTypes> && ...)` is `true`,

(5.3) — `N == rank() || N == rank_dynamic()` is `true`,

(5.4) — `is_constructible_v<mapping_type, extents_type>` is `true`, and

(5.5) — `is_default_constructible_v<accessor_type>` is `true`.

6 *Preconditions*: $[0,$ *`map_`*`.required_span_size()`$)$ is an accessible range of `p` and *`acc_`* for the values of *`map_`* and *`acc_`* after the invocation of this constructor.

7 *Effects*:

(7.1) — Direct-non-list-initializes *`ptr_`* with `std::move(p)`,

(7.2) — direct-non-list-initializes *`map_`* with `extents_type(static_cast<index_type>(std::move(exts))...)`, and

(7.3) — value-initializes *`acc_`*.

```
template<class OtherIndexType, size_t N>
  constexpr explicit(N != rank_dynamic())
    mdspan(data_handle_type p, span<OtherIndexType, N> exts);
template<class OtherIndexType, size_t N>
  constexpr explicit(N != rank_dynamic())
    mdspan(data_handle_type p, const array<OtherIndexType, N>& exts);
```

8 *Constraints*:

(8.1) — `is_convertible_v<const OtherIndexType&, index_type>` is `true`,

(8.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is `true`,

(8.3) — `N == rank() || N == rank_dynamic()` is `true`,

(8.4) — `is_constructible_v<mapping_type, extents_type>` is `true`, and

(8.5) — `is_default_constructible_v<accessor_type>` is `true`.

9 *Preconditions*: $[0,$ *map_*`.required_span_size()`$)$ is an accessible range of `p` and *acc_* for the values of *map_* and *acc_* after the invocation of this constructor.

10 *Effects*:

(10.1) — Direct-non-list-initializes *ptr_* with `std::move(p)`,

(10.2) — direct-non-list-initializes *map_* with `extents_type(exts)`, and

(10.3) — value-initializes *acc_*.

```
constexpr mdspan(data_handle_type p, const extents_type& ext);
```

11 *Constraints*:

(11.1) — `is_constructible_v<mapping_type, const extents_type&>` is `true`, and

(11.2) — `is_default_constructible_v<accessor_type>` is `true`.

12 *Preconditions*: $[0,$ *map_*`.required_span_size()`$)$ is an accessible range of `p` and *acc_* for the values of *map_* and *acc_* after the invocation of this constructor.

13 *Effects*:

(13.1) — Direct-non-list-initializes *ptr_* with `std::move(p)`,

(13.2) — direct-non-list-initializes *map_* with `ext`, and

(13.3) — value-initializes *acc_*.

```
constexpr mdspan(data_handle_type p, const mapping_type& m);
```

14 *Constraints*: `is_default_constructible_v<accessor_type>` is `true`.

15 *Preconditions*: $[0,$ `m.required_span_size()`$)$ is an accessible range of `p` and *acc_* for the value of *acc_* after the invocation of this constructor.

16 *Effects*:

(16.1) — Direct-non-list-initializes *ptr_* with `std::move(p)`,

(16.2) — direct-non-list-initializes *map_* with `m`, and

(16.3) — value-initializes *acc_*.

```
constexpr mdspan(data_handle_type p, const mapping_type& m, const accessor_type& a);
```

17 *Preconditions*: $[0,$ `m.required_span_size()`$)$ is an accessible range of `p` and `a`.

18 *Effects*:

(18.1) — Direct-non-list-initializes *ptr_* with `std::move(p)`,

(18.2) — direct-non-list-initializes *map_* with `m`, and

(18.3) — direct-non-list-initializes *acc_* with `a`.

```
template<class OtherElementType, class OtherExtents,
         class OtherLayoutPolicy, class OtherAccessor>
  constexpr explicit(see below)
    mdspan(const mdspan<OtherElementType, OtherExtents,
                        OtherLayoutPolicy, OtherAccessor>& other);
```

19 *Constraints*:

(19.1) — `is_constructible_v<mapping_type, const OtherLayoutPolicy::template mapping<OtherExtents>&>` is `true`, and

(19.2) — `is_constructible_v<accessor_type, const OtherAccessor&>` is `true`.

20 *Mandates*:

(20.1) — `is_constructible_v<data_handle_type, const OtherAccessor::data_handle_type&>` is `true`, and

(20.2) — `is_constructible_v<extents_type, OtherExtents>` is `true`.

21 *Preconditions*: $[0,$ *map_*`.required_span_size()`$)$ is an accessible range of *ptr_* and *acc_* for values of *ptr_*, *map_*, and *acc_* after the invocation of this constructor.

22 *Hardened preconditions*: For each rank index `r` of `extents_type`, `static_extent(r) == dynamic_-extent || static_extent(r) == other.extent(r)` is `true`.

23 *Effects*:

(23.1) — Direct-non-list-initializes *`ptr_`* with `other.`*`ptr_`*,

(23.2) — direct-non-list-initializes *`map_`* with `other.`*`map_`*, and

(23.3) — direct-non-list-initializes *`acc_`* with `other.`*`acc_`*.

24 *Remarks*: The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const OtherLayoutPolicy::template mapping<OtherExtents>&, mapping_type>
|| !is_convertible_v<const OtherAccessor&, accessor_type>
```

23.7.3.6.3 Members [mdspan.mdspan.members]

```
template<class... OtherIndexTypes>
  constexpr reference operator[](OtherIndexTypes... indices) const;
```

1 *Constraints*:

(1.1) — `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is `true`,

(1.2) — `(is_nothrow_constructible_v<index_type, OtherIndexTypes> && ...)` is `true`, and

(1.3) — `sizeof...(OtherIndexTypes) == rank()` is `true`.

2 Let `I` be `extents_type::`*`index-cast`*`(std::move(indices))`.

3 *Hardened preconditions*: `I` is a multidimensional index in `extents()`.

[*Note 1*: This implies that *`map_`*`(I) < `*`map_`*`.required_span_size()` is `true`. — *end note*]

4 *Effects*: Equivalent to:

```
return acc_.access(ptr_, map_(static_cast<index_type>(std::move(indices))...));
```

```
template<class OtherIndexType>
  constexpr reference operator[](span<OtherIndexType, rank()> indices) const;
template<class OtherIndexType>
  constexpr reference operator[](const array<OtherIndexType, rank()>& indices) const;
```

5 *Constraints*:

(5.1) — `is_convertible_v<const OtherIndexType&, index_type>` is `true`, and

(5.2) — `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is `true`.

6 *Effects*: Let `P` be a parameter pack such that

```
is_same_v<make_index_sequence<rank()>, index_sequence<P...>>
```

is `true`. Equivalent to:

```
return operator[](extents_type::index-cast(as_const(indices[P]))...);
```

```
constexpr size_type size() const noexcept;
```

7 *Preconditions*: The size of the multidimensional index space `extents()` is representable as a value of type `size_type` (6.8.2).

8 *Returns*: `extents().`*`fwd-prod-of-extents`*`(rank())`.

```
constexpr bool empty() const noexcept;
```

9 *Returns*: `true` if the size of the multidimensional index space `extents()` is 0, otherwise `false`.

```
friend constexpr void swap(mdspan& x, mdspan& y) noexcept;
```

10 *Effects*: Equivalent to:

```
swap(x.ptr_, y.ptr_);
swap(x.map_, y.map_);
swap(x.acc_, y.acc_);
```

23.7.3.7 `submdspan` [mdspan.sub]

23.7.3.7.1 Overview [mdspan.sub.overview]

1 The `submdspan` facilities create a new `mdspan` viewing a subset of elements of an existing input `mdspan`. The subset viewed by the created `mdspan` is determined by the `SliceSpecifier` arguments.

2 For each function defined in 23.7.3.7 that takes a parameter pack named `slices` as an argument:

(2.1) — let `index_type` be

(2.1.1) — `M::index_type` if the function is a member of a class `M`,

(2.1.2) — otherwise, `remove_reference_t<decltype(src)>::index_type` if the function has a parameter named `src`,

(2.1.3) — otherwise, the same type as the function's template argument `IndexType`;

(2.2) — let `rank` be the number of elements in `slices`;

(2.3) — let s_k be the k^{th} element of `slices`;

(2.4) — let S_k be the type of s_k; and

(2.5) — let *`map-rank`* be an `array<size_t, rank>` such that for each k in the range $[$`0`$,$ `rank`$)$, *`map-rank`*`[`k`]` equals:

(2.5.1) — `dynamic_extent` if S_k models `convertible_to<index_type>`,

(2.5.2) — otherwise, the number of types S_j with $j < k$ that do not model `convertible_to<index_type>`.

23.7.3.7.2 `strided_slice` [mdspan.sub.strided.slice]

1 `strided_slice` represents a set of `extent` regularly spaced integer indices. The indices start at `offset`, and increase by increments of `stride`.

```
namespace std {
  template<class OffsetType, class ExtentType, class StrideType>
  struct strided_slice {
    using offset_type = OffsetType;
    using extent_type = ExtentType;
    using stride_type = StrideType;

    [[no_unique_address]] offset_type offset{};
    [[no_unique_address]] extent_type extent{};
    [[no_unique_address]] stride_type stride{};
  };
}
```

2 `strided_slice` has the data members and special members specified above. It has no base classes or members other than those specified.

3 *Mandates*: `OffsetType`, `ExtentType`, and `StrideType` are signed or unsigned integer types, or model *`integral-constant-like`*.

[*Note 1*: `strided_slice{.offset = 1, .extent = 10, .stride = 3}` indicates the indices `1`, `4`, `7`, and `10`. Indices are selected from the half-open interval `[1, 1 + 10)`. — *end note*]

23.7.3.7.3 `submdspan_mapping_result` [mdspan.sub.map.result]

1 Specializations of `submdspan_mapping_result` are returned by overloads of `submdspan_mapping`.

```
namespace std {
  template<class LayoutMapping>
  struct submdspan_mapping_result {
    [[no_unique_address]] LayoutMapping mapping = LayoutMapping();
    size_t offset{};
  };
}
```

2 `submdspan_mapping_result` has the data members and special members specified above. It has no base classes or members other than those specified.

3 `LayoutMapping` shall meet the layout mapping requirements (23.7.3.4.3).

23.7.3.7.4 Exposition-only helpers [mdspan.sub.helpers]

```
template<class T>
  constexpr T de-ice(T val) { return val; }
template<integral-constant-like T>
  constexpr auto de-ice(T) { return T::value; }

template<class IndexType, size_t k, class... SliceSpecifiers>
  constexpr IndexType first_(SliceSpecifiers... slices);
```

1 *Mandates*: `IndexType` is a signed or unsigned integer type.

2 Let ϕ_k denote the following value:

(2.1) — s_k if S_k models `convertible_to<IndexType>`;

(2.2) — otherwise, `get<0>(`s_k`)` if S_k models *`index-pair-like`*`<IndexType>`;

(2.3) — otherwise, *`de-ice`*`(`s_k`.offset)` if S_k is a specialization of `strided_slice`;

(2.4) — otherwise, `0`.

3 *Preconditions*: ϕ_k is representable as a value of type `IndexType`.

4 *Returns*: `extents<IndexType>::`*`index-cast`*`(`ϕ_k`)`.

```
template<size_t k, class Extents, class... SliceSpecifiers>
  constexpr auto last_(const Extents& src, SliceSpecifiers... slices);
```

5 *Mandates*: `Extents` is a specialization of `extents`.

6 Let `index_type` be `typename Extents::index_type`.

7 Let λ_k denote the following value:

(7.1) — *`de-ice`*`(`s_k`) + 1` if S_k models `convertible_to<index_type>`; otherwise

(7.2) — `get<1>(`s_k`)` if S_k models *`index-pair-like`*`<index_type>`; otherwise

(7.3) — *`de-ice`*`(`s_k`.offset) + `*`de-ice`*`(`s_k`.extent)` if S_k is a specialization of `strided_slice`; otherwise

(7.4) — `src.extent(k)`.

8 *Preconditions*: λ_k is representable as a value of type `index_type`.

9 *Returns*: `Extents::`*`index-cast`*`(`λ_k`)`.

```
template<class IndexType, size_t N, class... SliceSpecifiers>
  constexpr array<IndexType, sizeof...(SliceSpecifiers)>
    src-indices(const array<IndexType, N>& indices, SliceSpecifiers... slices);
```

10 *Mandates*: `IndexType` is a signed or unsigned integer type.

11 *Returns*: An `array<IndexType, sizeof...(SliceSpecifiers)> src_idx` such that for each k in the range `[0, sizeof...(SliceSpecifiers))`, `src_idx[`k`]` equals

(11.1) — *`first_`*`<IndexType, `k`>(slices...)` for each k where *`map-rank`*`[`k`]` equals `dynamic_extent`,

(11.2) — otherwise, *`first_`*`<IndexType, `k`>(slices...) + indices[`*`map-rank`*`[`k`]]`.

23.7.3.7.5 `submdspan_extents` function [mdspan.sub.extents]

```
template<class IndexType, class... Extents, class... SliceSpecifiers>
  constexpr auto submdspan_extents(const extents<IndexType, Extents...>& src,
                                   SliceSpecifiers... slices);
```

1 *Constraints*: `sizeof...(slices)` equals `Extents::rank()`.

2 *Mandates*: For each rank index k of `src.extents()`, exactly one of the following is true:

(2.1) — S_k models `convertible_to<IndexType>`,

(2.2) — S_k models *`index-pair-like`*`<IndexType>`,

(2.3) — `is_convertible_v<`S_k`, full_extent_t>` is `true`, or

(2.4) — S_k is a specialization of `strided_slice`.

3 *Preconditions*: For each rank index k of `src.extents()`, all of the following are `true`:

(3.1) — if S_k is a specialization of `strided_slice`

(3.1.1) — s_k`.extent` $= 0$, or

(3.1.2) — s_k`.stride` > 0

(3.2) — $0 \leq$ *`first_`*`<IndexType,` k`>(slices...)` $\leq$ *`last_`*`<`k`>(src, slices...)` $\leq$ `src.extent(`k`)`

4 Let `SubExtents` be a specialization of `extents` such that:

(4.1) — `SubExtents::rank()` equals the number of k such that S_k does not model `convertible_to<IndexType>`; and

(4.2) — for each rank index k of `Extents` such that *`map-rank`*`[`k`] != dynamic_extent` is `true`, `SubExtents::static_extent(`*`map-rank`*`[`k`])` equals:

(4.2.1) — `Extents::static_extent(`k`)` if `is_convertible_v<`S_k`, full_extent_t>` is `true`; otherwise

(4.2.2) — *`de-ice`*`(tuple_element_t<1,` S_k`>()) -` *`de-ice`*`(tuple_element_t<0,` S_k`>())` if S_k models *`index-pair-like`*`<IndexType>`, and both `tuple_element_t<0,` S_k`>` and `tuple_element_t<1,` S_k`>` model *`integral-constant-like`*; otherwise

(4.2.3) — `0`, if S_k is a specialization of `strided_slice`, whose `extent_type` models *`integral-constant-like`*, for which `extent_type()` equals zero; otherwise

(4.2.4) — `1 + (`*`de-ice`*`(`S_k`::extent_type()) - 1) /` *`de-ice`*`(`S_k`::stride_type())`, if S_k is a specialization of `strided_slice` whose `extent_type` and `stride_type` model *`integral-constant-like`*;

(4.2.5) — otherwise, `dynamic_extent`.

5 *Returns*: A value `ext` of type `SubExtents` such that for each k for which *`map-rank`*`[`k`] != dynamic_extent` is `true`, `ext.extent(`*`map-rank`*`[`k`])` equals:

(5.1) — s_k`.extent == 0 ? 0 : 1 + (`*`de-ice`*`(`s_k`.extent) - 1) /` *`de-ice`*`(`s_k`.stride)` if S_k is a specialization of `strided_slice`,

(5.2) — otherwise, *`last_`*`<`k`>(src, slices...) -` *`first_`*`<IndexType,` k`>(slices...)`.

23.7.3.7.6 Specializations of `submdspan_mapping` [mdspan.sub.map]

23.7.3.7.6.1 Common [mdspan.sub.map.common]

1 The following elements apply to all functions in 23.7.3.7.6.

2 *Constraints*: `sizeof...(slices)` equals `extents_type::rank()`.

3 *Mandates*: For each rank index k of `extents()`, exactly one of the following is true:

(3.1) — S_k models `convertible_to<index_type>`,

(3.2) — S_k models *`index-pair-like`*`<index_type>`,

(3.3) — `is_convertible_v<`S_k`, full_extent_t>` is `true`, or

(3.4) — S_k is a specialization of `strided_slice`.

4 *Preconditions*: For each rank index k of `extents()`, all of the following are `true`:

(4.1) — if S_k is a specialization of `strided_slice`, s_k`.extent` is equal to zero or s_k`.stride` is greater than zero; and

(4.2) — $0 \leq$ *`first_`*`<index_type,` k`>(slices...)`
$\leq$ *`last_`*`<`k`>(extents(), slices...)`
$\leq$ `extents().extent(`k`)`

5 Let `sub_ext` be the result of `submdspan_extents(extents(), slices...)` and let `SubExtents` be `decltype(sub_ext)`.

6 Let `sub_strides` be an `array<SubExtents::index_type, SubExtents::rank()>` such that for each rank index k of `extents()` for which *`map-rank`*`[`k`]` is not `dynamic_extent`, `sub_strides[`*`map-rank`*`[`k`]]` equals:

(6.1) — `stride(k) *` *`de-ice`*`(`s_k`.stride)` if S_k is a specialization of `strided_slice` and s_k`.stride <` s_k`.extent` is `true`;

(6.2) — otherwise, `stride(`k`)`.

7 Let `P` be a parameter pack such that `is_same_v<make_index_sequence<rank()>, index_sequence<P...>>` is `true`.

8 If *`first_`*`<index_type, `k`>(slices...)` equals `extents().extent(`k`)` for any rank index k of `extents()`, then let `offset` be a value of type `size_t` equal to `(*this).required_span_size()`. Otherwise, let `offset` be a value of type `size_t` equal to `(*this)(`*`first_`*`<index_type, P>(slices...)...)`.

9 Given a layout mapping type `M`, a type `S` is a *unit-stride slice for `M`* if

(9.1) — `S` is a specialization of `strided_slice` where `S::stride_type` models *`integral-constant-like`* and `S::stride_type::value` equals `1`,

(9.2) — `S` models *`index-pair-like`*`<M::index_type>`, or

(9.3) — `is_convertible_v<S, full_extent_t>` is `true`.

23.7.3.7.6.2 `layout_left` specialization of `submdspan_mapping` [mdspan.sub.map.left]

```
template<class Extents>
template<class... SliceSpecifiers>
constexpr auto layout_left::mapping<Extents>::submdspan-mapping-impl(
      SliceSpecifiers... slices) const -> see below;
```

1 *Returns*:

(1.1) — `submdspan_mapping_result{*this, 0}`, if `Extents::rank() == 0` is `true`;

(1.2) — otherwise, `submdspan_mapping_result{layout_left::mapping(sub_ext), offset}`, if `SubExtents::rank() == 0` is `true`;

(1.3) — otherwise, `submdspan_mapping_result{layout_left::mapping(sub_ext), offset}`, if

(1.3.1) — for each k in the range `[0, SubExtents::rank() - 1)`), `is_convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.3.2) — for k equal to `SubExtents::rank() - 1`, S_k is a unit-stride slice for `mapping`;

[*Note 1*: If the above conditions are true, all S_k with k larger than `SubExtents::rank() - 1` are convertible to `index_type`. — *end note*]

(1.4) — otherwise,

```
submdspan_mapping_result{layout_left_padded<S_static>::mapping(sub_ext, stride(u + 1)),
                         offset}
```

if for a value u for which $u + 1$ is the smallest value p larger than zero for which S_p is a unit-stride slice for `mapping`, the following conditions are met:

(1.4.1) — S_0 is a unit-stride slice for `mapping`; and

(1.4.2) — for each k in the range `[`u` + 1, `u` + SubExtents::rank() - 1)`, `is_convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.4.3) — for k equal to u` + SubExtents::rank() - 1`, S_k is a unit-stride slice for `mapping`;

and where `S_static` is:

(1.4.4) — `dynamic_extent`, if `static_extent(`k`)` is `dynamic_extent` for any k in the range `[0, `u` + 1)`,

(1.4.5) — otherwise, the product of all values `static_extent(`k`)` for k in the range `[0, `u` + 1)`;

(1.5) — otherwise,

```
submdspan_mapping_result{layout_stride::mapping(sub_ext, sub_strides), offset}
```

23.7.3.7.6.3 `layout_right` specialization of `submdspan_mapping` [mdspan.sub.map.right]

```
template<class Extents>
template<class... SliceSpecifiers>
constexpr auto layout_right::mapping<Extents>::submdspan-mapping-impl(
      SliceSpecifiers... slices) const -> see below;
```

1 *Returns*:

(1.1) — `submdspan_mapping_result{*this, 0}`, if `Extents::rank() == 0` is `true`;

(1.2) — otherwise, `submdspan_mapping_result{layout_right::mapping(sub_ext), offset}`, if `SubExtents::rank() == 0` is `true`;

(1.3) — otherwise, `submdspan_mapping_result{layout_left::mapping(sub_ext), offset}`, if

(1.3.1) — for each k in the range [*rank_* - `SubExtents::rank()` + 1, *rank_*), `is_convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.3.2) — for k equal to *_rank* - `SubExtents::rank()`, S_k is a unit-stride slice for `mapping`;

[*Note 1*: If the above conditions are true, all S_k with $k <$ *_rank* - `SubExtents::rank()` are convertible to `index_type`. — *end note*]

(1.4) — otherwise,

```
submdspan_mapping_result{layout_right_padded<S_static>::mapping(sub_ext,
                                              stride(rank_ - u - 2)), offset}
```

if for a value u for which *rank_* $- u - 2$ is the largest value p smaller than *rank_* - 1 for which S_p is a unit-stride slice for `mapping`, the following conditions are met:

(1.4.1) — for k equal to *rank_* - 1, S_k is a unit-stride slice for `mapping`; and

(1.4.2) — for each k in the range [*rank_* - `SubExtents::rank()` - u + 1, *rank_* - u - 1), `is_convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.4.3) — for k equal to *rank_* - `SubExtents::rank()` - u, S_k is a unit-stride slice for `mapping`;

and where `S_static` is:

(1.4.4) — `dynamic_extent`, if `static_extent(`k`)` is `dynamic_extent` for any k in the range [*rank_* - u - 1, *rank_*),

(1.4.5) — otherwise, the product of all values `static_extent(`k`)` for k in the range [*rank_* - u - 1, *rank_*);

(1.5) — otherwise,

```
submdspan_mapping_result{layout_stride::mapping(sub_ext, sub_strides), offset}
```

23.7.3.7.6.4 `layout_stride` specialization of `submdspan_mapping` [mdspan.sub.map.stride]

```
template<class Extents>
template<class... SliceSpecifiers>
constexpr auto layout_stride::mapping<Extents>::submdspan-mapping-impl(
      SliceSpecifiers... slices) const -> see below;
```

1 *Returns*:

(1.1) — `submdspan_mapping_result{*this, 0}`, if `Extents::rank() == 0` is `true`;

(1.2) — otherwise,

```
submdspan_mapping_result{layout_stride::mapping(sub_ext, sub_strides), offset}
```

23.7.3.7.6.5 `layout_left_padded` specialization of `submdspan_mapping`[mdspan.sub.map.leftpad]

```
template<class Extents>
template<class... SliceSpecifiers>
constexpr auto layout_left_padded::mapping<Extents>::submdspan-mapping-impl(
    SliceSpecifiers... slices) const -> see below;
```

1 *Returns*:

(1.1) — `submdspan_mapping_result{*this, 0}`, if `Extents::rank() == 0` is `true`;

(1.2) — otherwise, `submdspan_mapping_result{layout_left::mapping(sub_ext), offset}`, if *rank_* `== 1` is `true` or `SubExtents::rank() == 0` is `true`;

(1.3) — otherwise, `submdspan_mapping_result{layout_left::mapping(sub_ext), offset}`, if

(1.3.1) — `SubExtents::rank() == 1` is `true` and

(1.3.2) — S_0 is a unit-stride slice for `mapping`;

(1.4) — otherwise,

```
submdspan_mapping_result{layout_left_padded<S_static>::mapping(sub_ext, stride(u + 1)),
                         offset}
```

if for a value u for which `u + 1` is the smallest value p larger than zero for which S_p is a unit-stride slice for `mapping`, the following conditions are met:

(1.4.1) — S_0 is a unit-stride slice for `mapping`; and

(1.4.2) — for each k in the range [`u + 1`, `u + SubExtents::rank() - 1`), `is_convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.4.3) — for k equal to `u + SubExtents::rank() - 1`, S_k is a unit-stride slice for `mapping`;

where `S_static` is:

(1.4.4) — `dynamic_extent`, if *`static-padding-stride`* is `dynamic_extent` or `static_extent(`k`)` is `dynamic_extent` for any k in the range [`1`, `u + 1`),

(1.4.5) — otherwise, the product of *`static-padding-stride`* and all values `static_extent(`k`)` for k in the range [`1`, `u + 1`);

(1.5) — otherwise,

```
submdspan_mapping_result{layout_stride::mapping(sub_ext, sub_strides), offset}
```

23.7.3.7.6.6 `layout_right_padded` specialization of `submdspan_mapping` [mdspan.sub.map.rightpad]

```
template<class Extents>
template<class... SliceSpecifiers>
constexpr auto layout_right_padded::mapping<Extents>::submdspan-mapping-impl(
    SliceSpecifiers... slices) const -> see below;
```

1 *Returns*:

(1.1) — `submdspan_mapping_result{*this, 0}`, if *`rank_`* `== 0` is `true`;

(1.2) — otherwise, `submdspan_mapping_result{layout_right::mapping(sub_ext), offset}`, if *`rank_`* `== 1` is `true` or `SubExtents::rank() == 0` is `true`;

(1.3) — otherwise, `submdspan_mapping_result{layout_right::mapping(sub_ext), offset}`, if

(1.3.1) — `SubExtents::rank() == 1` is `true` and

(1.3.2) — for k equal to *`rank_`* `- 1`, S_k is a unit-stride slice for `mapping`;

(1.4) — otherwise,

```
submdspan_mapping_result{layout_right_padded<S_static>::mapping(sub_ext,
                                    stride(rank_ - u - 2)), offset}
```

if for a value u for which *`rank_`* `- u - 2` is the largest value p smaller than *`rank_`* `- 1` for which S_p is a unit-stride slice for `mapping`, the following conditions are met:

(1.4.1) — for k equal to *`rank_`* `- 1`, S_k is a unit-stride slice for `mapping`; and

(1.4.2) — for each k in the range [*`rank_`* `- SubExtents::rank() - u + 1`, *`rank_`* `- u - 1`)), `is_-convertible_v<`S_k`, full_extent_t>` is `true`; and

(1.4.3) — for k equal to *`rank_`* `- SubExtents::rank() - u`, S_k is a unit-stride slice for `mapping`;

and where `S_static` is:

(1.4.4) — `dynamic_extent` if *`static-padding-stride`* is `dynamic_extent` or for any k in the range [*`rank_`* `- u - 1`, *`rank_`* `- 1`) `static_extent(`k`)` is `dynamic_extent`,

(1.4.5) — otherwise, the product of *`static-padding-stride`* and all values `static_extent(`k`)` with k in the range [*`rank_`* `- u - 1`, *`rank_`* `- 1`);

(1.5) — otherwise,

```
submdspan_mapping_result{layout_stride::mapping(sub_ext, sub_strides), offset}
```

23.7.3.7.7 submdspan function template [mdspan.sub.sub]

```
template<class ElementType, class Extents, class LayoutPolicy,
         class AccessorPolicy, class... SliceSpecifiers>
  constexpr auto submdspan(
    const mdspan<ElementType, Extents, LayoutPolicy, AccessorPolicy>& src,
    SliceSpecifiers... slices) -> see below;
```

1 Let `index_type` be `typename Extents::index_type`.

2 Let `sub_map_offset` be the result of `submdspan_mapping(src.mapping(), slices...)`.

[*Note 1*: This invocation of `submdspan_mapping` selects a function call via overload resolution on a candidate set that includes the lookup set found by argument-dependent lookup (6.5.4). — *end note*]

3 *Constraints*:

(3.1) — `sizeof...(slices)` equals `Extents::rank()`, and

(3.2) — the expression `submdspan_mapping(src.mapping(), slices...)` is well-formed when treated as an unevaluated operand.

4 *Mandates*:

(4.1) — `decltype(submdspan_mapping(src.mapping(), slices...))` is a specialization of `submdspan_mapping_result`.

(4.2) — `is_same_v<remove_cvref_t<decltype(sub_map_offset.mapping.extents())>, decltype(submdspan_extents(src.mapping(), slices...))>` is `true`.

(4.3) — For each rank index k of `src.extents()`, exactly one of the following is true:

(4.3.1) — S_k models `convertible_to<index_type>`,

(4.3.2) — S_k models *`index-pair-like`*`<index_type>`,

(4.3.3) — `is_convertible_v<`S_k`, full_extent_t>` is `true`, or

(4.3.4) — S_k is a specialization of `strided_slice`.

5 *Preconditions*:

(5.1) — For each rank index k of `src.extents()`, all of the following are `true`:

(5.1.1) — if S_k is a specialization of `strided_slice`

(5.1.1.1) — s_k`.extent` $= 0$, or

(5.1.1.2) — s_k`.stride` > 0

(5.1.2) — $0 \leq$ *`first_`*`<index_type, `k`>(slices...)` $\leq$ *`last_`*`<`k`>(src.extents(), slices...)` $\leq$ `src.extent(`k`)`

(5.2) — `sub_map_offset.mapping.extents() == submdspan_extents(src.mapping(), slices...)` is `true`; and

(5.3) — for each integer pack `I` which is a multidimensional index in `sub_map_offset.mapping.extents()`,

```
sub_map_offset.mapping(I...) + sub_map_offset.offset ==
  src.mapping()(src-indices(array{I...}, slices...))
```

is `true`.

[*Note 2*: These conditions ensure that the mapping returned by `submdspan_mapping` matches the algorithmically expected index-mapping given the slice specifiers. — *end note*]

6 *Effects*: Equivalent to:

```
auto sub_map_result = submdspan_mapping(src.mapping(), slices...);
return mdspan(src.accessor().offset(src.data(), sub_map_result.offset),
              sub_map_result.mapping,
              AccessorPolicy::offset_policy(src.accessor()));
```

7 [*Example 1*: Given a rank-3 `mdspan grid3d` representing a three-dimensional grid of regularly spaced points in a rectangular prism, the function `zero_surface` sets all elements on the surface of the 3-dimensional shape to zero. It does so by reusing a function `zero_2d` that takes a rank-2 `mdspan`.

```
// zero out all elements in an mdspan
template<class T, class E, class L, class A>
void zero_2d(mdspan<T, E, L, A> a) {
  static_assert(a.rank() == 2);
  for (int i = 0; i < a.extent(0); i++)
    for (int j = 0; j < a.extent(1); j++)
      a[i, j] = 0;
}

// zero out just the surface
template<class T, class E, class L, class A>
void zero_surface(mdspan<T, E, L, A> grid3d) {
  static_assert(grid3d.rank() == 3);
  zero_2d(submdspan(grid3d, 0, full_extent, full_extent));
  zero_2d(submdspan(grid3d, full_extent, 0, full_extent));
  zero_2d(submdspan(grid3d, full_extent, full_extent, 0));
  zero_2d(submdspan(grid3d, grid3d.extent(0) - 1, full_extent, full_extent));
  zero_2d(submdspan(grid3d, full_extent, grid3d.extent(1) - 1, full_extent));
  zero_2d(submdspan(grid3d, full_extent, full_extent, grid3d.extent(2) - 1));
}
```

— *end example*]

24 Iterators library [iterators]

24.1 General [iterators.general]

1 This Clause describes components that C++ programs may use to perform iterations over containers (Clause 23), streams (31.7), stream buffers (31.6), and other ranges (Clause 25).

2 The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 74.

Table 74 — Iterators library summary [tab:iterators.summary]

	Subclause	Header
24.3	Iterator requirements	`<iterator>`
24.4	Iterator primitives	
24.5	Iterator adaptors	
24.6	Stream iterators	
24.7	Range access	

24.2 Header `<iterator>` synopsis [iterator.synopsis]

```
#include <compare>              // see 17.12.1
#include <concepts>             // see 18.3

24.3 Iterator requirements [iterator.requirements]

24.3.1 General [iterator.requirements.general]

1 Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator `i` supports the expression `*i`, resulting in a value of some object type `T`, called the *value type* of the iterator. An output iterator `i` has a non-empty set of types that are *writable* to the iterator; for each such type `T`, the expression `*i = o` is valid where `o` is a value of type `T`. For every iterator type `X`, there is a corresponding signed integer-like type (24.3.4.4) called the *difference type* of the iterator.

2 Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators*, *random access iterators*, and *contiguous iterators*, as shown in Table 75.

Table 75 — Relations among iterator categories [tab:iterators.relations]

Contiguous	→ **Random Access**	→ **Bidirectional**	→ **Forward**	→ **Input**
				→ **Output**

3 The six categories of iterators correspond to the iterator concepts

(3.1) — `input_iterator` (24.3.4.9),

(3.2) — `output_iterator` (24.3.4.10),

(3.3) — `forward_iterator` (24.3.4.11),

(3.4) — `bidirectional_iterator` (24.3.4.12),

(3.5) — `random_access_iterator` (24.3.4.13), and

(3.6) — `contiguous_iterator` (24.3.4.14),

respectively. The generic term *iterator* refers to any type that models the `input_or_output_iterator` concept (24.3.4.6).

4 Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

5 Iterators that further meet the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.

6 In addition to the requirements in this subclause, the nested *typedef-name*s specified in 24.3.2.3 shall be provided for the iterator type.

[*Note 1*: Either the iterator type must provide the *typedef-name*s directly (in which case `iterator_traits` pick them up automatically), or an `iterator_traits` specialization must provide them. — *end note*]

7 Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a *past-the-end value*. Values of an iterator `i` for which the expression `*i` is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value,

the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the *Cpp17DefaultConstructible* requirements, using a value-initialized iterator as the source of a copy or move operation.

[*Note 2*: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — *end note*]

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

8 Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.[199]

9 An iterator and a sentinel denoting a range are comparable. A range [`i`, `s`) is empty if `i == s`; otherwise, [`i`, `s`) refers to the elements in the data structure starting with the element pointed to by `i` and up to but not including the element, if any, pointed to by the first iterator `j` such that `j == s`.

10 A sentinel `s` is called *reachable from* an iterator `i` if and only if there is a finite sequence of applications of the expression `++i` that makes `i == s`. If `s` is reachable from `i`, [`i`, `s`) denotes a *valid range*.

11 A *counted range* `i` + [0, `n`) is empty if `n == 0`; otherwise, `i` + [0, `n`) refers to the `n` elements in the data structure starting with the element pointed to by `i` and up to but not including the element, if any, pointed to by the result of `n` applications of `++i`. A counted range `i` + [0, `n`) is *valid* if and only if `n == 0`; or `n` is positive, `i` is dereferenceable, and `++i` + [0, `--n`) is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 For an iterator `i` of a type that models `contiguous_iterator` (24.3.4.14), library functions are permitted to replace [`i`, `s`) with [`to_address(i)`, `to_address(i + ranges::distance(i, s))`), and to replace `i` + [0, `n`) with [`to_address(i)`, `to_address(i + n)`).

[*Note 3*: This means a program cannot rely on any side effects of dereferencing a contiguous iterator `i`, because library functions might operate on pointers obtained by `to_address(i)` instead of operating on `i`. Similarly, a program cannot rely on any side effects of individual increments on a contiguous iterator `i`, because library functions might advance `i` only once. — *end note*]

14 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

15 Destruction of an iterator may invalidate pointers and references previously obtained from that iterator if its type does not meet the *Cpp17ForwardIterator* requirements and does not model `forward_iterator`.

16 An *invalid iterator* is an iterator that may be singular.[200]

17 Iterators meet the *constexpr iterator* requirements if all operations provided to meet iterator category requirements are constexpr functions.

[*Note 4*: For example, the types "pointer to `int`" and `reverse_iterator<int*>` meet the constexpr iterator requirements. — *end note*]

24.3.2 Associated types [iterator.assoc.types]

24.3.2.1 Incrementable traits [incrementable.traits]

1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if `WI` is the name of a type that models the `weakly_incrementable` concept (24.3.4.4), the type

```
iter_difference_t<WI>
```

be defined as the incrementable type's difference type.

```
namespace std {
  template<class> struct incrementable_traits { };
```

199) The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.

200) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

```
  template<class T>
    requires is_object_v<T>
  struct incrementable_traits<T*> {
    using difference_type = ptrdiff_t;
  };

  template<class I>
  struct incrementable_traits<const I>
    : incrementable_traits<I> { };

  template<class T>
    requires requires { typename T::difference_type; }
  struct incrementable_traits<T> {
    using difference_type = typename T::difference_type;
  };

  template<class T>
    requires (!requires { typename T::difference_type; } &&
              requires(const T& a, const T& b) { { a - b } -> integral; })
  struct incrementable_traits<T> {
    using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
  };

  template<class T>
    using iter_difference_t = see below;
}
```

2 Let R_{I} be `remove_cvref_t<I>`. The type `iter_difference_t<I>` denotes

(2.1) — `incrementable_traits<`R_{I}`>::difference_type` if `iterator_traits<`R_{I}`>` names a specialization generated from the primary template, and

(2.2) — `iterator_traits<`R_{I}`>::difference_type` otherwise.

3 Users may specialize `incrementable_traits` on program-defined types.

24.3.2.2 Indirectly readable traits [readable.traits]

1 To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if `R` is the name of a type that models the `indirectly_readable` concept (24.3.4.2), the type

```
iter_value_t<R>
```

be defined as the indirectly readable type's value type.

```
template<class> struct cond-value-type { };      // exposition only
template<class T>
  requires is_object_v<T>
struct cond-value-type<T> {
  using value_type = remove_cv_t<T>;
};

template<class T>
  concept has-member-value-type = requires { typename T::value_type; };          // exposition only

template<class T>
  concept has-member-element-type = requires { typename T::element_type; };      // exposition only

template<class> struct indirectly_readable_traits { };

template<class T>
struct indirectly_readable_traits<T*>
  : cond-value-type<T> { };
```

```
template<class I>
  requires is_array_v<I>
struct indirectly_readable_traits<I> {
  using value_type = remove_cv_t<remove_extent_t<I>>;
};

template<class I>
struct indirectly_readable_traits<const I>
  : indirectly_readable_traits<I> { };

template<has-member-value-type T>
struct indirectly_readable_traits<T>
  : cond-value-type<typename T::value_type> { };

template<has-member-element-type T>
struct indirectly_readable_traits<T>
  : cond-value-type<typename T::element_type> { };

template<has-member-value-type T>
  requires has-member-element-type<T>
struct indirectly_readable_traits<T> { };

template<has-member-value-type T>
  requires has-member-element-type<T> &&
           same_as<remove_cv_t<typename T::element_type>, remove_cv_t<typename T::value_type>>
struct indirectly_readable_traits<T>
  : cond-value-type<typename T::value_type> { };

template<class T> using iter_value_t = see below;
```

2 Let R_{I} be `remove_cvref_t<I>`. The type `iter_value_t<I>` denotes

(2.1) — `indirectly_readable_traits<`R_{I}`>::value_type` if `iterator_traits<`R_{I}`>` names a specialization generated from the primary template, and

(2.2) — `iterator_traits<`R_{I}`>::value_type` otherwise.

3 Class template `indirectly_readable_traits` may be specialized on program-defined types.

4 [*Note 1*: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `indirectly_readable` and have no associated value types. — *end note*]

5 [*Note 2*: Smart pointers like `shared_ptr<int>` are `indirectly_readable` and have an associated value type, but a smart pointer like `shared_ptr<void>` is not `indirectly_readable` and has no associated value type. — *end note*]

24.3.2.3 Iterator traits [iterator.traits]

1 To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if `I` is the type of an iterator, the type

```
iterator_traits<I>::iterator_category
```

be defined as the iterator's iterator category. In addition, the types

```
iterator_traits<I>::pointer
iterator_traits<I>::reference
```

shall be defined as the iterator's pointer and reference types; that is, for an iterator object `a` of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type `I` that does not support `operator->`. Additionally, in the case of an output iterator, the types

```
iterator_traits<I>::value_type
iterator_traits<I>::difference_type
iterator_traits<I>::reference
```

may be defined as `void`.

2 The definitions in this subclause make use of the following exposition-only concepts:

```
template<class I>
concept cpp17-iterator =
  requires(I i) {
    {   *i } -> can-reference;
    {  ++i } -> same_as<I&>;
    { *i++ } -> can-reference;
  } && copyable<I>;

template<class I>
concept cpp17-input-iterator =
  cpp17-iterator<I> && equality_comparable<I> && requires(I i) {
    typename incrementable_traits<I>::difference_type;
    typename indirectly_readable_traits<I>::value_type;
    typename common_reference_t<iter_reference_t<I>&&,
                                typename indirectly_readable_traits<I>::value_type&>;
    typename common_reference_t<decltype(*i++)&&,
                                typename indirectly_readable_traits<I>::value_type&>;
    requires signed_integral<typename incrementable_traits<I>::difference_type>;
  };

template<class I>
concept cpp17-forward-iterator =
  cpp17-input-iterator<I> && constructible_from<I> &&
  is_reference_v<iter_reference_t<I>> &&
  same_as<remove_cvref_t<iter_reference_t<I>>,
          typename indirectly_readable_traits<I>::value_type> &&
  requires(I i) {
    {  i++ } -> convertible_to<const I&>;
    { *i++ } -> same_as<iter_reference_t<I>>;
  };

template<class I>
concept cpp17-bidirectional-iterator =
  cpp17-forward-iterator<I> && requires(I i) {
    {  --i } -> same_as<I&>;
    {  i-- } -> convertible_to<const I&>;
    { *i-- } -> same_as<iter_reference_t<I>>;
  };

template<class I>
concept cpp17-random-access-iterator =
  cpp17-bidirectional-iterator<I> && totally_ordered<I> &&
  requires(I i, typename incrementable_traits<I>::difference_type n) {
    { i += n } -> same_as<I&>;
    { i -= n } -> same_as<I&>;
    { i +  n } -> same_as<I>;
    { n +  i } -> same_as<I>;
    { i -  n } -> same_as<I>;
    { i -  i } -> same_as<decltype(n)>;
    {  i[n]  } -> convertible_to<iter_reference_t<I>>;
  };
```

3 The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

(3.1) — If `I` has valid (13.10.3) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = typename I::iterator_category;
using value_type        = typename I::value_type;
using difference_type   = typename I::difference_type;
using pointer           = see below;
using reference         = typename I::reference;
```

If the *qualified-id* `I::pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

(3.2) — Otherwise, if `I` satisfies the exposition-only concept *`cpp17-input-iterator`*, `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = see below;
using value_type        = typename indirectly_readable_traits<I>::value_type;
using difference_type   = typename incrementable_traits<I>::difference_type;
using pointer           = see below;
using reference         = see below;
```

(3.2.1) — If the *qualified-id* `I::pointer` is valid and denotes a type, `pointer` names that type. Otherwise, if `decltype(declval<I&>().operator->())` is well-formed, then `pointer` names that type. Otherwise, `pointer` names `void`.

(3.2.2) — If the *qualified-id* `I::reference` is valid and denotes a type, `reference` names that type. Otherwise, `reference` names `iter_reference_t<I>`.

(3.2.3) — If the *qualified-id* `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:

(3.2.3.1) — `random_access_iterator_tag` if `I` satisfies *`cpp17-random-access-iterator`*, or otherwise

(3.2.3.2) — `bidirectional_iterator_tag` if `I` satisfies *`cpp17-bidirectional-iterator`*, or otherwise

(3.2.3.3) — `forward_iterator_tag` if `I` satisfies *`cpp17-forward-iterator`*, or otherwise

(3.2.3.4) — `input_iterator_tag`.

(3.3) — Otherwise, if `I` satisfies the exposition-only concept *`cpp17-iterator`*, then `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = output_iterator_tag;
using value_type        = void;
using difference_type   = see below;
using pointer           = void;
using reference         = void;
```

If the *qualified-id* `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

(3.4) — Otherwise, `iterator_traits<I>` has no members by any of the above names.

4 Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (24.3.4).

[*Example 1*: To indicate conformance to the `input_iterator` concept but a lack of conformance to the *Cpp17InputIterator* requirements (24.3.5.3), an `iterator_traits` specialization might have `iterator_concept` denote `input_iterator_tag` but not define `iterator_category`. — *end example*]

5 `iterator_traits` is specialized for pointers as

```
namespace std {
  template<class T>
    requires is_object_v<T>
  struct iterator_traits<T*> {
    using iterator_concept  = contiguous_iterator_tag;
    using iterator_category = random_access_iterator_tag;
    using value_type        = remove_cv_t<T>;
    using difference_type   = ptrdiff_t;
    using pointer           = T*;
    using reference         = T&;
  };
}
```

6 [*Example 2*: To implement a generic `reverse` function, a C++ program can do the following:

```
template<class BI>
void reverse(BI first, BI last) {
  typename iterator_traits<BI>::difference_type n =
    distance(first, last);
  --n;
  while(n > 0) {
    typename iterator_traits<BI>::value_type
     tmp = *first;
```

```
      *first++ = *--last;
      *last = tmp;
      n -= 2;
    }
  }
```

— *end example*]

24.3.3 Customization point objects [iterator.cust]

24.3.3.1 `ranges::iter_move` [iterator.cust.move]

1 The name `ranges::iter_move` denotes a customization point object (16.3.3.3.5). The expression `ranges::-iter_move(E)` for a subexpression `E` is expression-equivalent to:

(1.1) — `iter_move(E)`, if `E` has class or enumeration type and `iter_move(E)` is a well-formed expression when treated as an unevaluated operand, where the meaning of `iter_move` is established as-if by performing argument-dependent lookup only (6.5.4).

(1.2) — Otherwise, if the expression `*E` is well-formed:

(1.2.1) — if `*E` is an lvalue, `std::move(*E)`;

(1.2.2) — otherwise, `*E`.

(1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `ranges::iter_move(E)` appears in the immediate context of a template instantiation. — *end note*]

2 If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed, no diagnostic required.

24.3.3.2 `ranges::iter_swap` [iterator.cust.swap]

1 The name `ranges::iter_swap` denotes a customization point object (16.3.3.3.5) that exchanges the values (18.4.9) denoted by its arguments.

2 Let *`iter-exchange-move`* be the exposition-only function template:

```
template<class X, class Y>
  constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
             noexcept(*x = iter_move(y)));
```

3 *Effects*: Equivalent to:

```
iter_value_t<X> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

4 The expression `ranges::iter_swap(E1, E2)` for subexpressions `E1` and `E2` is expression-equivalent to:

(4.1) — `(void)iter_swap(E1, E2)`, if either `E1` or `E2` has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
  void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed, no diagnostic required.

[*Note 1*: This precludes calling unconstrained `std::iter_swap`. When the deleted overload is viable, program-defined overloads need to be more specialized (13.7.7.3) to be selected. — *end note*]

(4.2) — Otherwise, if the types of `E1` and `E2` each model `indirectly_readable`, and if the reference types of `E1` and `E2` model `swappable_with` (18.4.9), then `ranges::swap(*E1, *E2)`.

(4.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `indirectly_movable_storable<T1, T2>` and `indirectly_movable_storable<T2, T1>`, then `(void)(*E1 = `*`iter-exchange-move`*`(E2, E1))`, except that `E1` is evaluated only once.

(4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.

[*Note 2*: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. — *end note*]

24.3.4 Iterator concepts [iterator.concepts]

24.3.4.1 General [iterator.concepts.general]

1 For a type `I`, let *`ITER_TRAITS`*`(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, *`ITER_TRAITS`*`(I)` denotes `iterator_traits<I>`.

(1.1) — If the *qualified-id* *`ITER_TRAITS`*`(I)::iterator_concept` is valid and names a type, then *`ITER_CONCEPT`*`(I)` denotes that type.

(1.2) — Otherwise, if the *qualified-id* *`ITER_TRAITS`*`(I)::iterator_category` is valid and names a type, then *`ITER_CONCEPT`*`(I)` denotes that type.

(1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then *`ITER_CONCEPT`*`(I)` denotes `random_access_iterator_tag`.

(1.4) — Otherwise, *`ITER_CONCEPT`*`(I)` does not denote a type.

2 [*Note 1*: *`ITER_TRAITS`* enables independent syntactic determination of an iterator's category and concept. — *end note*]

[*Example 1*:

```
struct I {
  using value_type = int;
  using difference_type = int;

  int operator*() const;
  I& operator++();
  I operator++(int);
  I& operator--();
  I operator--(int);

  bool operator==(I) const;
};
```

`iterator_traits<I>::iterator_category` denotes `input_iterator_tag`, and *`ITER_CONCEPT`*`(I)` denotes `random_access_iterator_tag`. — *end example*]

24.3.4.2 Concept `indirectly_readable` [iterator.concept.readable]

1 Types that are indirectly readable by applying `operator*` model the `indirectly_readable` concept, including pointers, smart pointers, and iterators.

```
template<class In>
  concept indirectly-readable-impl =                    // exposition only
    requires(const In in) {
      typename iter_value_t<In>;
      typename iter_reference_t<In>;
      typename iter_rvalue_reference_t<In>;
      { *in } -> same_as<iter_reference_t<In>>;
      { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
    } &&
    common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
    common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
    common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;

template<class In>
  concept indirectly_readable =
    indirectly-readable-impl<remove_cvref_t<In>>;
```

2 Given a value `i` of type `I`, `I` models `indirectly_readable` only if the expression `*i` is equality-preserving.

24.3.4.3 Concept `indirectly_writable` [iterator.concept.writable]

1 The `indirectly_writable` concept specifies the requirements for writing a value into an iterator's referenced object.

```
template<class Out, class T>
  concept indirectly_writable =
    requires(Out&& o, T&& t) {
      *o = std::forward<T>(t);                          // not required to be equality-preserving
      *std::forward<Out>(o) = std::forward<T>(t);       // not required to be equality-preserving
      const_cast<const iter_reference_t<Out>&&>(*o) =
        std::forward<T>(t);                          // not required to be equality-preserving
      const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
        std::forward<T>(t);                          // not required to be equality-preserving
    };
```

2 Let `E` be an expression such that `decltype((E))` is `T`, and let `o` be a dereferenceable object of type `Out`. `Out` and `T` model `indirectly_writable<Out, T>` only if:

(2.1) — If `Out` and `T` model `indirectly_readable<Out> && same_as<iter_value_t<Out>, decay_t<T>>`, then `*o` after any above assignment is equal to the value of `E` before the assignment.

3 After evaluating any above assignment expression, `o` is not required to be dereferenceable.

4 If `E` is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.17).

5 [*Note 1*: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. — *end note*]

6 [*Note 2*: `indirectly_writable` has the awkward `const_cast` expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit `const` rvalue assignment. Consequently, an iterator type `I` that returns `std::string` by value does not model `indirectly_writable<I, std::string>`. — *end note*]

24.3.4.4 Concept `weakly_incrementable` [iterator.concept.winc]

1 The `weakly_incrementable` concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be `equality_comparable`.

```
template<class T>
  constexpr bool is-integer-like = see below;          // exposition only

template<class T>
  constexpr bool is-signed-integer-like = see below;   // exposition only

template<class I>
  concept weakly_incrementable =
    movable<I> &&
    requires(I i) {
      typename iter_difference_t<I>;
      requires is-signed-integer-like<iter_difference_t<I>>;
      { ++i } -> same_as<I&>;                        // not required to be equality-preserving
      i++;                                           // not required to be equality-preserving
    };
```

2 A type `I` is an *integer-class type* if it is in a set of implementation-defined types that behave as integer types do, as defined below.

[*Note 1*: An integer-class type is not necessarily a class type. — *end note*]

3 The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either -2^{N-1} to $2^{N-1} - 1$ (inclusive) for some integer N, in which case it is a *signed-integer-class type*, or 0 to $2^N - 1$ (inclusive) for some integer N, in which case it is an *unsigned-integer-class type*. In both cases, N is called the *width* of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.

4 A type `I` other than *cv* `bool` is *integer-like* if it models `integral<I>` or if it is an integer-class type. An integer-like type `I` is *signed-integer-like* if it models `signed_integral<I>` or if it is a signed-integer-class type. An integer-like type `I` is *unsigned-integer-like* if it models `unsigned_integral<I>` or if it is an unsigned-integer-class type.

5 For every integer-class type `I`, let `B(I)` be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as `I`.

[*Note 2*: The corresponding hypothetical specialization `numeric_limits<B(I)>` meets the requirements on `numeric_limits` specializations for integral types (17.3.5). — *end note*]

For every integral type `J`, let `B(J)` be the same type as `J`.

6 Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type

are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo 2^N, where N is the width of the destination type.

7 Let `a` be an object of integer-class type `I`, let `b` be an object of integer-like type `I2` such that the expression `b` is implicitly convertible to `I`, let `x` and `y` be, respectively, objects of type `B(I)` and `B(I2)` as described above that represent the same values as `a` and `b`, and let `c` be an lvalue of any integral type.

(7.1) — The expressions `a++` and `a--` shall be prvalues of type `I` whose values are equal to that of `a` prior to the evaluation of the expressions. The expression `a++` shall modify the value of `a` by adding `1` to it. The expression `a--` shall modify the value of `a` by subtracting `1` from it.

(7.2) — The expressions `++a`, `--a`, and `&a` shall be expression-equivalent to `a += 1`, `a -= 1`, and `addressof(a)`, respectively.

(7.3) — For every *unary-operator* `@` other than `&` for which the expression `@x` is well-formed, `@a` shall also be well-formed and have the same value, effects, and value category as `@x`. If `@x` has type `bool`, so too does `@a`; if `@x` has type `B(I)`, then `@a` has type `I`.

(7.4) — For every assignment operator `@=` for which `c @= x` is well-formed, `c @= a` shall also be well-formed and shall have the same value and effects as `c @= x`. The expression `c @= a` shall be an lvalue referring to `c`.

(7.5) — For every assignment operator `@=` for which `x @= y` is well-formed, `a @= b` shall also be well-formed and shall have the same effects as `x @= y`, except that the value that would be stored into `x` is stored into `a`. The expression `a @= b` shall be an lvalue referring to `a`.

(7.6) — For every non-assignment binary operator `@` for which `x @ y` and `y @ x` are well-formed, `a @ b` and `b @ a` shall also be well-formed and shall have the same value, effects, and value category as `x @ y` and `y @ x`, respectively. If `x @ y` or `y @ x` has type `B(I)`, then `a @ b` or `b @ a`, respectively, has type `I`; if `x @ y` or `y @ x` has type `B(I2)`, then `a @ b` or `b @ a`, respectively, has type `I2`; if `x @ y` or `y @ x` has any other type, then `a @ b` or `b @ a`, respectively, has that type.

8 An expression `E` of integer-class type `I` is contextually convertible to `bool` as if by `bool(E != I(0))`.

9 All integer-class types model `regular` (18.6) and `three_way_comparable<strong_ordering>` (17.12.4).

10 A value-initialized object of integer-class type has value 0.

11 For every (possibly cv-qualified) integer-class type `I`, `numeric_limits<I>` is specialized such that each static data member `m` has the same value as `numeric_limits<B(I)>::m`, and each static member function `f` returns `I(numeric_limits<B(I)>::f())`.

12 For any two integer-like types `I1` and `I2`, at least one of which is an integer-class type, `common_type_t<I1, I2>` denotes an integer-class type whose width is not less than that of `I1` or `I2`. If both `I1` and `I2` are signed-integer-like types, then `common_type_t<I1, I2>` is also a signed-integer-like type.

13 *`is-integer-like`*`<I>` is `true` if and only if `I` is an integer-like type. *`is-signed-integer-like`*`<I>` is `true` if and only if `I` is a signed-integer-like type.

14 Let `i` be an object of type `I`. When `i` is in the domain of both pre- and post-increment, `i` is said to be *incrementable*. `I` models `weakly_incrementable<I>` only if:

(14.1) — The expressions `++i` and `i++` have the same domain.

(14.2) — If `i` is incrementable, then both `++i` and `i++` advance `i` to the next element.

(14.3) — If `i` is incrementable, then `addressof(++i)` is equal to `addressof(i)`.

15 *Recommended practice*: The implementation of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.

[*Note 3*: For `weakly_incrementable` types, `a` equals `b` does not imply that `++a` equals `++b`. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

24.3.4.5 Concept `incrementable` [iterator.concept.inc]

1 The `incrementable` concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is

required to be `equality_comparable`.

[*Note 1*: This supersedes the annotations on the increment expressions in the definition of `weakly_incrementable`. — *end note*]

```
template<class I>
  concept incrementable =
    regular<I> &&
    weakly_incrementable<I> &&
    requires(I i) {
      { i++ } -> same_as<I>;
    };
```

2 Let `a` and `b` be incrementable objects of type `I`. `I` models `incrementable` only if:

(2.1) — If `bool(a == b)` then `bool(a++ == b)`.

(2.2) — If `bool(a == b)` then `bool(((void)a++, a) == ++b)`.

3 [*Note 2*: The requirement that `a` equals `b` implies `++a` equals `++b` (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model `incrementable`. — *end note*]

24.3.4.6 Concept `input_or_output_iterator` [iterator.concept.iterator]

1 The `input_or_output_iterator` concept forms the basis of the iterator concept taxonomy; every iterator models `input_or_output_iterator`. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (24.3.4.7), to read (24.3.4.9) or write (24.3.4.10) values, or to provide a richer set of iterator movements (24.3.4.11, 24.3.4.12, 24.3.4.13).

```
template<class I>
  concept input_or_output_iterator =
    requires(I i) {
      { *i } -> can-reference;
    } &&
    weakly_incrementable<I>;
```

2 [*Note 1*: Unlike the *Cpp17Iterator* requirements, the `input_or_output_iterator` concept does not require copyability. — *end note*]

24.3.4.7 Concept `sentinel_for` [iterator.concept.sentinel]

1 The `sentinel_for` concept specifies the relationship between an `input_or_output_iterator` type and a `semiregular` type whose values denote a range.

```
template<class S, class I>
  concept sentinel_for =
    semiregular<S> &&
    input_or_output_iterator<I> &&
    weakly-equality-comparable-with<S, I>;       // see 18.5.4
```

2 Let `s` and `i` be values of type `S` and `I` such that $[i, s)$ denotes a range. Types `S` and `I` model `sentinel_for<S, I>` only if:

(2.1) — `i == s` is well-defined.

(2.2) — If `bool(i != s)` then `i` is dereferenceable and $[++i, s)$ denotes a range.

(2.3) — `assignable_from<I&, S>` is either modeled or not satisfied.

3 The domain of `==` is not static. Given an iterator `i` and sentinel `s` such that $[i, s)$ denotes a range and `i != s`, `i` and `s` are not required to continue to denote a range after incrementing any other iterator equal to `i`. Consequently, `i == s` is no longer required to be well-defined.

24.3.4.8 Concept `sized_sentinel_for` [iterator.concept.sizedsentinel]

1 The `sized_sentinel_for` concept specifies requirements on an `input_or_output_iterator` type `I` and a corresponding `sentinel_for<I>` that allow the use of the `-` operator to compute the distance between them in constant time.

```
template<class S, class I>
  concept sized_sentinel_for =
    sentinel_for<S, I> &&
    !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
    requires(const I& i, const S& s) {
      { s - i } -> same_as<iter_difference_t<I>>;
      { i - s } -> same_as<iter_difference_t<I>>;
    };
```

2 Let `i` be an iterator of type `I`, and `s` a sentinel of type `S` such that [`i`, `s`) denotes a range. Let N be the smallest number of applications of `++i` necessary to make `bool(i == s)` be `true`. `S` and `I` model `sized_sentinel_for<S, I>` only if:

(2.1) — If N is representable by `iter_difference_t<I>`, then `s - i` is well-defined and equals N.

(2.2) — If $-N$ is representable by `iter_difference_t<I>`, then `i - s` is well-defined and equals $-N$.

```
template<class S, class I>
  constexpr bool disable_sized_sentinel_for = false;
```

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_sentinel_for` for cv-unqualified non-array object types `S` and `I` if `S` and/or `I` is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

4 [*Note 1*: `disable_sized_sentinel_for` allows use of sentinels and iterators with the library that satisfy but do not in fact model `sized_sentinel_for`. — *end note*]

5 [*Example 1*: The `sized_sentinel_for` concept is modeled by pairs of `random_access_iterators` (24.3.4.13) and by counted iterators and their sentinels (24.5.7.1). — *end example*]

24.3.4.9 Concept `input_iterator` [iterator.concept.input]

1 The `input_iterator` concept defines requirements for a type whose referenced values can be read (from the requirement for `indirectly_readable` (24.3.4.2)) and which can be both pre- and post-incremented.

[*Note 1*: Unlike the *Cpp17InputIterator* requirements (24.3.5.3), the `input_iterator` concept does not need equality comparison since iterators are typically compared to sentinels. — *end note*]

```
template<class I>
  concept input_iterator =
    input_or_output_iterator<I> &&
    indirectly_readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```

24.3.4.10 Concept `output_iterator` [iterator.concept.output]

1 The `output_iterator` concept defines requirements for a type that can be used to write values (from the requirement for `indirectly_writable` (24.3.4.3)) and which can be both pre- and post-incremented.

[*Note 1*: Output iterators are not required to model `equality_comparable`. — *end note*]

```
template<class I, class T>
  concept output_iterator =
    input_or_output_iterator<I> &&
    indirectly_writable<I, T> &&
    requires(I i, T&& t) {
      *i++ = std::forward<T>(t);        // not required to be equality-preserving
    };
```

2 Let `E` be an expression such that `decltype((E))` is `T`, and let `i` be a dereferenceable object of type `I`. `I` and `T` model `output_iterator<I, T>` only if `*i++ = E;` has effects equivalent to:

```
*i = E;
++i;
```

3 *Recommended practice*: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

24.3.4.11 Concept `forward_iterator` [iterator.concept.forward]

1 The `forward_iterator` concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```
template<class I>
  concept forward_iterator =
    input_iterator<I> &&
    derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
    incrementable<I> &&
    sentinel_for<I, I>;
```

2 The domain of == for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[*Note 1*: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — *end note*]

3 Pointers and references obtained from a forward iterator into a range [i, s) shall remain valid while [i, s) continues to denote a range.

4 Two dereferenceable iterators a and b of type X offer the *multi-pass guarantee* if

(4.1) — a == b implies ++a == ++b and

(4.2) — the expression ((void)[](X x){++x;}(a), *a) is equivalent to the expression *a.

5 [*Note 2*: The requirement that a == b implies ++a == ++b and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — *end note*]

24.3.4.12 Concept bidirectional_iterator [iterator.concept.bidir]

1 The bidirectional_iterator concept adds the ability to move an iterator backward as well as forward.

```
template<class I>
  concept bidirectional_iterator =
    forward_iterator<I> &&
    derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
      { --i } -> same_as<I&>;
      { i-- } -> same_as<I>;
    };
```

2 A bidirectional iterator r is decrementable if and only if there exists some q such that ++q == r. Decrementable iterators r shall be in the domain of the expressions --r and r--.

3 Let a and b be equal objects of type I. I models bidirectional_iterator only if:

(3.1) — If a and b are decrementable, then all of the following are true:

(3.1.1) — addressof(--a) == addressof(a)

(3.1.2) — bool(a-- == b)

(3.1.3) — after evaluating both a-- and --b, bool(a == b) is still true

(3.1.4) — bool(++(--a) == b)

(3.2) — If a and b are incrementable, then bool(--(++a) == b).

24.3.4.13 Concept random_access_iterator [iterator.concept.random.access]

1 The random_access_iterator concept adds support for constant-time advancement with +=, +, -=, and -, as well as the computation of distance in constant time with -. Random access iterators also support array notation via subscripting.

```
template<class I>
  concept random_access_iterator =
    bidirectional_iterator<I> &&
    derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
    totally_ordered<I> &&
    sized_sentinel_for<I, I> &&
    requires(I i, const I j, const iter_difference_t<I> n) {
      { i += n } -> same_as<I&>;
      { j +  n } -> same_as<I>;
      { n +  j } -> same_as<I>;
      { i -= n } -> same_as<I&>;
      { j -  n } -> same_as<I>;
      { j[n] } -> same_as<iter_reference_t<I>>;
    };
```

2 Let `a` and `b` be valid iterators of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, let `D` be `iter_difference_t<I>`, and let `n` denote a value of type `D`. `I` models `random_access_iterator` only if:

(2.1) — `(a += n)` is equal to `b`.

(2.2) — `addressof(a += n)` is equal to `addressof(a)`.

(2.3) — `(a + n)` is equal to `(a += n)`.

(2.4) — For any two positive values `x` and `y` of type `D`, if `(a + D(x + y))` is valid, then `(a + D(x + y))` is equal to `((a + x) + y)`.

(2.5) — `(a + D(0))` is equal to `a`.

(2.6) — If `(a + D(n - 1))` is valid, then `(a + n)` is equal to `[](I c){ return ++c; }(a + D(n - 1))`.

(2.7) — `(b += D(-n))` is equal to `a`.

(2.8) — `(b -= n)` is equal to `a`.

(2.9) — `addressof(b -= n)` is equal to `addressof(b)`.

(2.10) — `(b - n)` is equal to `(b -= n)`.

(2.11) — If `b` is dereferenceable, then `a[n]` is valid and is equal to `*b`.

(2.12) — `bool(a <= b)` is `true`.

24.3.4.14 Concept `contiguous_iterator` [iterator.concept.contiguous]

1 The `contiguous_iterator` concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
  concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I& i) {
      { to_address(i) } -> same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

2 Let `a` and `b` be dereferenceable iterators and `c` be a non-dereferenceable iterator of type `I` such that `b` is reachable from `a` and `c` is reachable from `b`, and let `D` be `iter_difference_t<I>`. The type `I` models `contiguous_iterator` only if

(2.1) — `to_address(a) == addressof(*a)`,

(2.2) — `to_address(b) == to_address(a) + D(b - a)`,

(2.3) — `to_address(c) == to_address(a) + D(c - a)`,

(2.4) — `to_address(I{})` is well-defined,

(2.5) — `ranges::iter_move(a)` has the same type, value category, and effects as `std::move(*a)`, and

(2.6) — if `ranges::iter_swap(a, b)` is well-formed, it has effects equivalent to `ranges::swap(*a, *b)`.

24.3.5 C++17 iterator requirements [iterator.cpp17]

24.3.5.1 General [iterator.cpp17.general]

1 In the following sections, `a` and `b` denote values of type `X` or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively, `n` denotes a value of `difference_type`, `u`, `tmp`, and `m` denote identifiers, `r` denotes a value of `X&`, `t` denotes a value of value type `T`, `o` denotes a value of some type that is writable to the output iterator.

[*Note 1*: For an iterator type `X` there must be an instantiation of `iterator_traits<X>` (24.3.2.3). — *end note*]

24.3.5.2 *Cpp17Iterator* [iterator.iterators]

1 The *Cpp17Iterator* requirements form the basis of the iterator taxonomy; every iterator meets the *Cpp17-Iterator* requirements. This set of requirements specifies operations for dereferencing and incrementing an

iterator. Most algorithms will require additional operations to read (24.3.5.3) or write (24.3.5.4) values, or to provide a richer set of iterator movements (24.3.5.5, 24.3.5.6, 24.3.5.7).

2 A type `X` meets the *Cpp17Iterator* requirements if

(2.1) — `X` meets the *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Swappable*, and *Cpp17Destructible* requirements (16.4.4.2, 16.4.4.3), and

(2.2) — `iterator_traits<X>::difference_type` is a signed integer type or `void`, and

(2.3) — the expressions in Table 76 are valid and have the indicated semantics.

Table 76 — *Cpp17Iterator* requirements [tab:iterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`*r`	unspecified		*Preconditions*: `r` is dereferenceable.
`++r`	`X&`		

24.3.5.3 Input iterators [input.iterators]

1 A class or pointer type `X` meets the requirements of an input iterator for the value type `T` if `X` meets the *Cpp17Iterator* (24.3.5.2) and *Cpp17EqualityComparable* (Table 28) requirements and the expressions in Table 77 are valid and have the indicated semantics.

2 In Table 77, the term *the domain of* `==` is used in the ordinary mathematical sense to denote the set of values over which `==` is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

[*Example 1*: The call `find(a,b,x)` is defined only if the value of `a` has the property p defined as follows: `b` has property p and a value `i` has property p if (`*i==x`) or if (`*i!=x` and `++i` has property p). — *end example*]

Table 77 — *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) [tab:inputiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`a != b`	`decltype(a != b)` models *`boolean-testable`*	`!(a == b)`	*Preconditions*: (`a`, `b`) is in the domain of `==`.
`*a`	`reference`, convertible to `T`		*Preconditions*: `a` is dereferenceable. The expression `(void)*a, *a` is equivalent to `*a`. If `a == b` and (`a`, `b`) is in the domain of `==` then `*a` is equivalent to `*b`.
`a->m`		`(*a).m`	*Preconditions*: `a` is dereferenceable.

Table 77 — *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`++r`	`X&`		*Preconditions*: `r` is dereferenceable. *Postconditions*: `r` is dereferenceable or `r` is past-the-end; any copies of the previous value of `r` are no longer required to be dereferenceable nor to be in the domain of `==`.
`(void)r++`			equivalent to `(void)++r`

`*r++`	convertible to `T`	`{ T tmp = *r;`
		`++r;`
		`return tmp; }`	

3 *Recommended practice*: The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.

[*Note 1*: For input iterators, `a == b` does not imply `++a == ++b`. (Equality does not guarantee the substitution property or referential transparency.) Value type `T` is not required to be a *Cpp17CopyAssignable* type (Table 34). Such an algorithm can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

24.3.5.4 Output iterators [output.iterators]

1 A class or pointer type `X` meets the requirements of an output iterator if `X` meets the *Cpp17Iterator* requirements (24.3.5.2) and the expressions in Table 78 are valid and have the indicated semantics.

Table 78 — *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*) [tab:outputiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`*r = o`	result is not used		*Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.
`++r`	`X&`		`addressof(r) == addressof(++r)`. *Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.
`r++`	convertible to `const X&`	`{ X tmp = r; ++r; return tmp; }`	*Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.
`*r++ = o`	result is not used		*Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.

2 *Recommended practice*: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[*Note 1*: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined. — *end note*]

24.3.5.5 Forward iterators [forward.iterators]

1 A class or pointer type `X` meets the *Cpp17ForwardIterator* requirements if

(1.1) — `X` meets the *Cpp17InputIterator* requirements (24.3.5.3),

(1.2) — `X` meets the *Cpp17DefaultConstructible* requirements (16.4.4.2),

(1.3) — if `X` is a mutable iterator, `reference` is a reference to `T`; if `X` is a constant iterator, `reference` is a reference to `const T`,

(1.4) — the expressions in Table 79 are valid and have the indicated semantics, and

(1.5) — objects of type `X` offer the multi-pass guarantee, described below.

2 The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

[*Note 1*: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — *end note*]

3 Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if

(3.1) — `a == b` implies `++a == ++b` and

(3.2) — `X` is a pointer type or the expression `(void)++X(a), *a` is equivalent to the expression `*a`.

4 [*Note 2*: The requirement that `a == b` implies `++a == ++b` (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — *end note*]

Table 79 — *Cpp17ForwardIterator* requirements (in addition to *Cpp17InputIterator*) [tab:forwarditerator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition

`r++`	convertible to `const X&`	`{ X tmp = r;`
		`++r;`
		`return tmp; }`	

`*r++`	`reference`		

5 If `a` and `b` are equal, then either `a` and `b` are both dereferenceable or else neither is dereferenceable.

6 If `a` and `b` are both dereferenceable, then `a == b` if and only if `*a` and `*b` are bound to the same object.

24.3.5.6 Bidirectional iterators [bidirectional.iterators]

1 A class or pointer type `X` meets the requirements of a bidirectional iterator if, in addition to meeting the *Cpp17ForwardIterator* requirements, the following expressions are valid as shown in Table 80.

Table 80 — *Cpp17BidirectionalIterator* requirements (in addition to *Cpp17ForwardIterator*) [tab:bidirectionaliterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`--r`	`X&`		*Preconditions*: there exists `s` such that `r == ++s`. *Postconditions*: `r` is dereferenceable. `--(++r) == r`. `--r == --s` implies `r == s`. `addressof(r) == addressof(--r)`.

`r--`	convertible to `const X&`	`{ X tmp = r;`
		`--r;`
		`return tmp; }`	

`*r--`	`reference`		

2 [*Note 1*: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — *end note*]

24.3.5.7 Random access iterators [random.access.iterators]

1 A class or pointer type `X` meets the requirements of a random access iterator if, in addition to meeting the *Cpp17BidirectionalIterator* requirements, the following expressions are valid as shown in Table 81.

Table 81 — *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) [tab:randomaccessiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition

`r += n`	`X&`	`{ difference_type m = n;`
		`if (m >= 0)`
		`while (m--)`
		`++r;`
		`else`
		`while (m++)`
		`--r;`
		`return r; }`	

`a + n`
`n + a`
	`X`	`{ X tmp = a;`
		`return tmp += n; }`
			`a + n == n + a`.

`r -= n`	`X&`	`return r += -n;`	*Preconditions*: the absolute value of `n` is in the range of representable values of `difference_type`.

`a - n`	`X`	`{ X tmp = a;`
		`return tmp -= n; }`	

`b - a`	`difference_-type`	`return n;`	*Preconditions*: there exists a value `n` of type `difference_type` such that `a + n == b`. `b == a + (b - a)`.
`a[n]`	convertible to `reference`	`*(a + n)`	
`a < b`	`decltype(a < b)` models *`boolean-test-able`*	*Effects*: Equivalent to: `return b - a > 0;`	`<` is a total ordering relation
`a > b`	`decltype(a > b)` models *`boolean-test-able`*	`b < a`	`>` is a total ordering relation opposite to `<`.
`a >= b`	`decltype(a >= b)` models *`boolean-test-able`*	`!(a < b)`	
`a <= b`	`decltype(a <= b)` models *`boolean-test-able`*	`!(a > b)`	

24.3.6 Indirect callable requirements [indirectcallable]

24.3.6.1 General [indirectcallable.general]

1 There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

24.3.6.2 Indirect callable traits [indirectcallable.traits]

1 To implement algorithms taking projections, it is necessary to determine the projected type of an iterator's value type. For the exposition-only alias template *`indirect-value-t`*, *`indirect-value-t`*`<T>` denotes

(1.1) — `invoke_result_t<Proj&, `*`indirect-value-t`*`<I>>` if `T` names `projected<I, Proj>`, and

(1.2) — `iter_value_t<T>&` otherwise.

24.3.6.3 Indirect callables [indirectcallable.indirectinvocable]

1 The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

```
namespace std {
  template<class F, class I>
    concept indirectly_unary_invocable =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      invocable<F&, indirect-value-t<I>> &&
      invocable<F&, iter_reference_t<I>> &&
      common_reference_with<
        invoke_result_t<F&, indirect-value-t<I>>,
        invoke_result_t<F&, iter_reference_t<I>>>;

  template<class F, class I>
    concept indirectly_regular_unary_invocable =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      regular_invocable<F&, indirect-value-t<I>> &&
      regular_invocable<F&, iter_reference_t<I>> &&
      common_reference_with<
        invoke_result_t<F&, indirect-value-t<I>>,
        invoke_result_t<F&, iter_reference_t<I>>>;

  template<class F, class I>
    concept indirect_unary_predicate =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      predicate<F&, indirect-value-t<I>> &&
      predicate<F&, iter_reference_t<I>>;

  template<class F, class I1, class I2>
    concept indirect_binary_predicate =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      predicate<F&, indirect-value-t<I1>, indirect-value-t<I2>> &&
      predicate<F&, indirect-value-t<I1>, iter_reference_t<I2>> &&
      predicate<F&, iter_reference_t<I1>, indirect-value-t<I2>> &&
      predicate<F&, iter_reference_t<I1>, iter_reference_t<I2>>;

  template<class F, class I1, class I2 = I1>
    concept indirect_equivalence_relation =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      equivalence_relation<F&, indirect-value-t<I1>, indirect-value-t<I2>> &&
      equivalence_relation<F&, indirect-value-t<I1>, iter_reference_t<I2>> &&
      equivalence_relation<F&, iter_reference_t<I1>, indirect-value-t<I2>> &&
      equivalence_relation<F&, iter_reference_t<I1>, iter_reference_t<I2>>;

  template<class F, class I1, class I2 = I1>
    concept indirect_strict_weak_order =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      strict_weak_order<F&, indirect-value-t<I1>, indirect-value-t<I2>> &&
      strict_weak_order<F&, indirect-value-t<I1>, iter_reference_t<I2>> &&
      strict_weak_order<F&, iter_reference_t<I1>, indirect-value-t<I2>> &&
      strict_weak_order<F&, iter_reference_t<I1>, iter_reference_t<I2>>;
}
```

24.3.6.4 Class template `projected` [projected]

1 Class template `projected` is used to constrain algorithms that accept callable objects and projections (3.44). It combines an `indirectly_readable` type `I` and a callable object type `Proj` into a new `indirectly_readable` type whose `reference` type is the result of applying `Proj` to the `iter_reference_t` of `I`.

```
namespace std {
  template<class I, class Proj>
  struct projected-impl {                               // exposition only
    struct type {                                       // exposition only
      using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
      using difference_type = iter_difference_t<I>;     // present only if I
                                                        // models weakly_incrementable
      indirect_result_t<Proj&, I> operator*() const;    // not defined
    };
  };

  template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
    using projected = projected-impl<I, Proj>::type;
}
```

24.3.7 Common algorithm requirements [alg.req]

24.3.7.1 General [alg.req.general]

1 There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between `indirectly_readable` and `indirectly_writable` types: `indirectly_movable`, `indirectly_copyable`, and `indirectly_swappable`. There are three relational concepts for rearrangements: `permutable`, `mergeable`, and `sortable`. There is one relational concept for comparing values from different sequences: `indirectly_comparable`.

2 [*Note 1*: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (22.10.9). — *end note*]

24.3.7.2 Concept `indirectly_movable` [alg.req.ind.move]

1 The `indirectly_movable` concept specifies the relationship between an `indirectly_readable` type and an `indirectly_writable` type between which values may be moved.

```
template<class In, class Out>
  concept indirectly_movable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

2 The `indirectly_movable_storable` concept augments `indirectly_movable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type.

```
template<class In, class Out>
  concept indirectly_movable_storable =
    indirectly_movable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>> &&
    movable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

3 Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_movable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.17).

24.3.7.3 Concept `indirectly_copyable` [alg.req.ind.copy]

1 The `indirectly_copyable` concept specifies the relationship between an `indirectly_readable` type and an `indirectly_writable` type between which values may be copied.

```
template<class In, class Out>
  concept indirectly_copyable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_reference_t<In>>;
```

2 The `indirectly_copyable_storable` concept augments `indirectly_copyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type. It also requires the capability to make copies of values.

```
template<class In, class Out>
  concept indirectly_copyable_storable =
    indirectly_copyable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>&> &&
    indirectly_writable<Out, const iter_value_t<In>&> &&
    indirectly_writable<Out, iter_value_t<In>&&> &&
    indirectly_writable<Out, const iter_value_t<In>&&> &&
    copyable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_reference_t<In>>;
```

3 Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_copyable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(*i);
```

`obj` is equal to the value previously denoted by `*i`. If `iter_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.17).

24.3.7.4 Concept `indirectly_swappable` [alg.req.ind.swap]

1 The `indirectly_swappable` concept specifies a swappable relationship between the values referenced by two `indirectly_readable` types.

```
template<class I1, class I2 = I1>
  concept indirectly_swappable =
    indirectly_readable<I1> && indirectly_readable<I2> &&
    requires(const I1 i1, const I2 i2) {
      ranges::iter_swap(i1, i1);
      ranges::iter_swap(i2, i2);
      ranges::iter_swap(i1, i2);
      ranges::iter_swap(i2, i1);
    };
```

24.3.7.5 Concept `indirectly_comparable` [alg.req.ind.cmp]

1 The `indirectly_comparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template<class I1, class I2, class R, class P1 = identity,
         class P2 = identity>
  concept indirectly_comparable =
    indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

24.3.7.6 Concept `permutable` [alg.req.permutable]

1 The `permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template<class I>
  concept permutable =
    forward_iterator<I> &&
    indirectly_movable_storable<I, I> &&
    indirectly_swappable<I, I>;
```

24.3.7.7 Concept `mergeable` [alg.req.mergeable]

1 The `mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template<class I1, class I2, class Out, class R = ranges::less,
         class P1 = identity, class P2 = identity>
  concept mergeable =
    input_iterator<I1> &&
    input_iterator<I2> &&
    weakly_incrementable<Out> &&
    indirectly_copyable<I1, Out> &&
    indirectly_copyable<I2, Out> &&
    indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

24.3.7.8 Concept `sortable` [alg.req.sortable]

1 The `sortable` concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```
template<class I, class R = ranges::less, class P = identity>
  concept sortable =
    permutable<I> &&
    indirect_strict_weak_order<R, projected<I, P>>;
```

24.4 Iterator primitives [iterator.primitives]

24.4.1 General [iterator.primitives.general]

1 To simplify the use of iterators, the library provides several classes and functions.

24.4.2 Standard iterator tags [std.iterator.tags]

1 It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator's behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (24.3.4).

```
namespace std {
  struct output_iterator_tag { };
  struct input_iterator_tag { };
  struct forward_iterator_tag: public input_iterator_tag { };
  struct bidirectional_iterator_tag: public forward_iterator_tag { };
  struct random_access_iterator_tag: public bidirectional_iterator_tag { };
  struct contiguous_iterator_tag: public random_access_iterator_tag { };
}
```

2 [*Example 1*: A program-defined iterator `BinaryTreeIterator` can be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
  using iterator_category = bidirectional_iterator_tag;
  using difference_type   = ptrdiff_t;
  using value_type        = T;
  using pointer           = T*;
  using reference         = T&;
};
```

— *end example*]

3 [*Example 2*: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
  evolve(first, last,
    typename iterator_traits<BidirectionalIterator>::iterator_category());
}

template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
  bidirectional_iterator_tag) {
  // more generic, but less efficient algorithm
}
```

```
template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
  random_access_iterator_tag) {
  // more efficient, but less generic algorithm
}
```

— *end example*]

24.4.3 Iterator operations [iterator.operations]

1 Since only random access iterators provide `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```
template<class InputIterator, class Distance>
  constexpr void advance(InputIterator& i, Distance n);
```

2 *Preconditions*: `n` is negative only for bidirectional iterators.

3 *Effects*: Increments `i` by `n` if `n` is non-negative, and decrements `i` by `-n` otherwise.

```
template<class InputIterator>
  constexpr typename iterator_traits<InputIterator>::difference_type
    distance(InputIterator first, InputIterator last);
```

4 *Preconditions*: `last` is reachable from `first`, or `InputIterator` meets the *Cpp17RandomAccessIterator* requirements and `first` is reachable from `last`.

5 *Effects*: If `InputIterator` meets the *Cpp17RandomAccessIterator* requirements, returns `(last - first)`; otherwise, increments `first` until `last` is reached and returns the number of increments.

```
template<class InputIterator>
  constexpr InputIterator next(InputIterator x,
    typename iterator_traits<InputIterator>::difference_type n = 1);
```

6 *Effects*: Equivalent to: `advance(x, n); return x;`

```
template<class BidirectionalIterator>
  constexpr BidirectionalIterator prev(BidirectionalIterator x,
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

7 *Effects*: Equivalent to: `advance(x, -n); return x;`

24.4.4 Range iterator operations [range.iter.ops]

24.4.4.1 General [range.iter.ops.general]

1 The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

[*Example 1*: `ranges::advance` uses the `+` operator to move a `random_access_iterator` forward `n` steps in constant time. For an iterator type that does not model `random_access_iterator`, `ranges::advance` instead performs `n` individual increments with the `++` operator. — *end example*]

2 The entities defined in 24.4.4 are algorithm function objects (16.3.3.4).

24.4.4.2 `ranges::advance` [range.iter.op.advance]

```
template<input_or_output_iterator I>
  constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 *Preconditions*: If `I` does not model `bidirectional_iterator`, `n` is not negative.

2 *Effects*:

(2.1) — If `I` models `random_access_iterator`, equivalent to `i += n`.

(2.2) — Otherwise, if `n` is non-negative, increments `i` by `n`.

(2.3) — Otherwise, decrements `i` by `-n`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr void ranges::advance(I& i, S bound);
```

3 *Preconditions*: Either `assignable_from<I&, S> || sized_sentinel_for<S, I>` is modeled, or [`i`, `bound`) denotes a range.

4 *Effects*:

(4.1) — If `I` and `S` model `assignable_from<I&, S>`, equivalent to `i = std::move(bound)`.

(4.2) — Otherwise, if `S` and `I` model `sized_sentinel_for<S, I>`, equivalent to `ranges::advance(i, bound - i)`.

(4.3) — Otherwise, while `bool(i != bound)` is `true`, increments `i`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```

5 *Preconditions*: If `n > 0`, [`i`, `bound`) denotes a range. If `n == 0`, [`i`, `bound`) or [`bound`, `i`) denotes a range. If `n < 0`, [`bound`, `i`) denotes a range, `I` models `bidirectional_iterator`, and `I` and `S` model `same_as<I, S>`.

6 *Effects*:

(6.1) — If `S` and `I` model `sized_sentinel_for<S, I>`:

(6.1.1) — If $|$`n`$| \geq |$`bound - i`$|$, equivalent to `ranges::advance(i, bound)`.

(6.1.2) — Otherwise, equivalent to `ranges::advance(i, n)`.

(6.2) — Otherwise,

(6.2.1) — if `n` is non-negative, while `bool(i != bound)` is `true`, increments `i` but at most `n` times.

(6.2.2) — Otherwise, while `bool(i != bound)` is `true`, decrements `i` but at most `-n` times.

7 *Returns*: `n -` M, where M is the difference between the ending and starting positions of `i`.

24.4.4.3 `ranges::distance` [range.iter.op.distance]

```
template<class I, sentinel_for<I> S>
  requires (!sized_sentinel_for<S, I>)
  constexpr iter_difference_t<I> ranges::distance(I first, S last);
```

1 *Preconditions*: [`first`, `last`) denotes a range.

2 *Effects*: Increments `first` until `last` is reached and returns the number of increments.

```
template<class I, sized_sentinel_for<decay_t<I>> S>
  constexpr iter_difference_t<decay_t<I>> ranges::distance(I&& first, S last);
```

3 *Effects*: Equivalent to: `return last - static_cast<const decay_t<I>&>(first);`

```
template<range R>
  constexpr range_difference_t<R> ranges::distance(R&& r);
```

4 *Effects*: If `R` models `sized_range`, equivalent to:

```
return static_cast<range_difference_t<R>>(ranges::size(r));       // 25.3.10
```

Otherwise, equivalent to:

```
return ranges::distance(ranges::begin(r), ranges::end(r));        // 25.3
```

24.4.4.4 `ranges::next` [range.iter.op.next]

```
template<input_or_output_iterator I>
  constexpr I ranges::next(I x);
```

1 *Effects*: Equivalent to: `++x; return x;`

```
template<input_or_output_iterator I>
  constexpr I ranges::next(I x, iter_difference_t<I> n);
```

2 *Effects*: Equivalent to: `ranges::advance(x, n); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr I ranges::next(I x, S bound);
```

3 *Effects*: Equivalent to: `ranges::advance(x, bound); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);
```

4 *Effects*: Equivalent to: `ranges::advance(x, n, bound); return x;`

24.4.4.5 `ranges::prev` [range.iter.op.prev]

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x);
```

1 *Effects*: Equivalent to: `--x; return x;`

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x, iter_difference_t<I> n);
```

2 *Effects*: Equivalent to: `ranges::advance(x, -n); return x;`

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);
```

3 *Effects*: Equivalent to: `ranges::advance(x, -n, bound); return x;`

24.5 Iterator adaptors [predef.iterators]

24.5.1 Reverse iterators [reverse.iterators]

24.5.1.1 General [reverse.iterators.general]

1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

24.5.1.2 Class template `reverse_iterator` [reverse.iterator]

```
namespace std {
  template<class Iterator>
  class reverse_iterator {
  public:
    using iterator_type     = Iterator;
    using iterator_concept  = see below;
    using iterator_category = see below;
    using value_type        = iter_value_t<Iterator>;
    using difference_type   = iter_difference_t<Iterator>;
    using pointer           = typename iterator_traits<Iterator>::pointer;
    using reference         = iter_reference_t<Iterator>;

    constexpr reverse_iterator();
    constexpr explicit reverse_iterator(Iterator x);
    template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
    template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

    constexpr Iterator base() const;
    constexpr reference operator*() const;
    constexpr pointer   operator->() const requires see below;

    constexpr reverse_iterator& operator++();
    constexpr reverse_iterator  operator++(int);
    constexpr reverse_iterator& operator--();
    constexpr reverse_iterator  operator--(int);

    constexpr reverse_iterator  operator+ (difference_type n) const;
    constexpr reverse_iterator& operator+=(difference_type n);
    constexpr reverse_iterator  operator- (difference_type n) const;
    constexpr reverse_iterator& operator-=(difference_type n);
    constexpr unspecified operator[](difference_type n) const;
    friend constexpr iter_rvalue_reference_t<Iterator>
      iter_move(const reverse_iterator& i) noexcept(see below);
    template<indirectly_swappable<Iterator> Iterator2>
      friend constexpr void
        iter_swap(const reverse_iterator& x,
                  const reverse_iterator<Iterator2>& y) noexcept(see below);

  protected:
    Iterator current;
  };
}
```

1 The member *typedef-name* `iterator_concept` denotes

(1.1) — `random_access_iterator_tag` if `Iterator` models `random_access_iterator`, and

(1.2) — `bidirectional_iterator_tag` otherwise.

2 The member *typedef-name* `iterator_category` denotes

(2.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and

(2.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

24.5.1.3 Requirements [reverse.iter.requirements]

1 The template parameter `Iterator` shall either meet the requirements of a *Cpp17BidirectionalIterator* (24.3.5.6) or model `bidirectional_iterator` (24.3.4.12).

2 Additionally, `Iterator` shall either meet the requirements of a *Cpp17RandomAccessIterator* (24.3.5.7) or model `random_access_iterator` (24.3.4.13) if the definitions of any of the members

(2.1) — `operator+`, `operator-`, `operator+=`, `operator-=` (24.5.1.7), or

(2.2) — `operator[]` (24.5.1.6),

or the non-member operators (24.5.1.8)

(2.3) — `operator<`, `operator>`, `operator<=`, `operator>=`, `operator-`, or `operator+` (24.5.1.9)

are instantiated (13.9.2).

24.5.1.4 Construction and assignment [reverse.iter.cons]

```
constexpr reverse_iterator();
```

1 *Effects*: Value-initializes `current`.

```
constexpr explicit reverse_iterator(Iterator x);
```

2 *Effects*: Initializes `current` with `x`.

```
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
```

3 *Constraints*: `is_same_v<U, Iterator>` is `false` and `const U&` models `convertible_to<Iterator>`.

4 *Effects*: Initializes `current` with `u.current`.

```
template<class U>
  constexpr reverse_iterator&
    operator=(const reverse_iterator<U>& u);
```

5 *Constraints*: `is_same_v<U, Iterator>` is `false`, `const U&` models `convertible_to<Iterator>`, and `assignable_from<Iterator&, const U&>` is modeled.

6 *Effects*: Assigns `u.current` to `current`.

7 *Returns*: `*this`.

24.5.1.5 Conversion [reverse.iter.conv]

```
constexpr Iterator base() const;
```

1 *Returns*: `current`.

24.5.1.6 Element access [reverse.iter.elem]

```
constexpr reference operator*() const;
```

1 *Effects*: As if by:

```
Iterator tmp = current;
return *--tmp;
```

```
constexpr pointer operator->() const
  requires (is_pointer_v<Iterator> ||
            requires(const Iterator i) { i.operator->(); });
```

2 *Effects*:

(2.1) — If `Iterator` is a pointer type, equivalent to: `return prev(current);`

(2.2) — Otherwise, equivalent to: `return prev(current).operator->();`

```
constexpr unspecified operator[](difference_type n) const;
```

3 *Returns*: `current[-n - 1]`.

24.5.1.7 Navigation [reverse.iter.nav]

```
constexpr reverse_iterator operator+(difference_type n) const;
```

1 *Returns*: `reverse_iterator(current - n)`.

```
constexpr reverse_iterator operator-(difference_type n) const;
```

2 *Returns*: `reverse_iterator(current + n)`.

```
constexpr reverse_iterator& operator++();
```

3 *Effects*: As if by: `--current;`

4 *Returns*: `*this`.

```
constexpr reverse_iterator operator++(int);
```

5 *Effects*: As if by:

```
reverse_iterator tmp = *this;
--current;
return tmp;
```

```
constexpr reverse_iterator& operator--();
```

6 *Effects*: As if by `++current`.

7 *Returns*: `*this`.

```
constexpr reverse_iterator operator--(int);
```

8 *Effects*: As if by:

```
reverse_iterator tmp = *this;
++current;
return tmp;
```

```
constexpr reverse_iterator& operator+=(difference_type n);
```

9 *Effects*: As if by: `current -= n;`

10 *Returns*: `*this`.

```
constexpr reverse_iterator& operator-=(difference_type n);
```

11 *Effects*: As if by: `current += n;`

12 *Returns*: `*this`.

24.5.1.8 Comparisons [reverse.iter.cmp]

```
template<class Iterator1, class Iterator2>
  constexpr bool operator==(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1 *Constraints*: `x.base() == y.base()` is well-formed and convertible to `bool`.

2 *Returns*: `x.base() == y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

3 *Constraints*: `x.base() != y.base()` is well-formed and convertible to `bool`.

4 *Returns*: `x.base() != y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator<(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

5 *Constraints*: `x.base() > y.base()` is well-formed and convertible to `bool`.

6 *Returns*: `x.base() > y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

7 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

8 *Returns*: `x.base() < y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator<=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

9 *Constraints*: `x.base() >= y.base()` is well-formed and convertible to `bool`.

10 *Returns*: `x.base() >= y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator>=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

11 *Constraints*: `x.base() <= y.base()` is well-formed and convertible to `bool`.

12 *Returns*: `x.base() <= y.base()`.

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
  constexpr compare_three_way_result_t<Iterator1, Iterator2>
    operator<=>(const reverse_iterator<Iterator1>& x,
                const reverse_iterator<Iterator2>& y);
```

13 *Returns*: `y.base() <=> x.base()`.

14 [*Note 1*: The argument order in the *Returns*: element is reversed because this is a reverse iterator. — *end note*]

24.5.1.9 Non-member functions [reverse.iter.nonmember]

```
template<class Iterator1, class Iterator2>
  constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

1 *Returns*: `y.base() - x.base()`.

```
template<class Iterator>
  constexpr reverse_iterator<Iterator> operator+(
    iter_difference_t<Iterator> n,
    const reverse_iterator<Iterator>& x);
```

2 *Returns*: `reverse_iterator<Iterator>(x.base() - n)`.

```
friend constexpr iter_rvalue_reference_t<Iterator>
  iter_move(const reverse_iterator& i) noexcept(see below);
```

3 *Effects*: Equivalent to:

```
auto tmp = i.base();
return ranges::iter_move(--tmp);
```

4 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))
```

```
template<indirectly_swappable<Iterator> Iterator2>
  friend constexpr void
    iter_swap(const reverse_iterator& x,
              const reverse_iterator<Iterator2>& y) noexcept(see below);
```

5 *Effects*: Equivalent to:

```
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);
```

6 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))
```

```
template<class Iterator>
  constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

7 *Returns*: `reverse_iterator<Iterator>(i)`.

24.5.2 Insert iterators [insert.iterators]

24.5.2.1 General [insert.iterators.general]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range [`first`, `last`) to be copied into a range starting with result. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite* mode.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. `operator*` returns the insert iterator itself. The assignment `operator=(const T& x)` is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator` inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

24.5.2.2 Class template `back_insert_iterator` [back.insert.iterator]

24.5.2.2.1 General [back.insert.iter.general]

```
namespace std {
  template<class Container>
  class back_insert_iterator {
  protected:
    Container* container;

  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using container_type    = Container;

    constexpr explicit back_insert_iterator(Container& x);
    constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

    constexpr back_insert_iterator& operator*();
    constexpr back_insert_iterator& operator++();
    constexpr back_insert_iterator  operator++(int);
  };
}
```

24.5.2.2.2 Operations [back.insert.iter.ops]

```
constexpr explicit back_insert_iterator(Container& x);
```

1 *Effects*: Initializes `container` with `addressof(x)`.

```
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by: `container->push_back(value);`

3 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by: `container->push_back(std::move(value));`

5 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator  operator++(int);
```

7 *Returns*: `*this`.

24.5.2.2.3 `back_inserter` [back.inserter]

```
template<class Container>
  constexpr back_insert_iterator<Container> back_inserter(Container& x);
```

1 *Returns*: `back_insert_iterator<Container>(x)`.

24.5.2.3 Class template `front_insert_iterator` [front.insert.iterator]

24.5.2.3.1 General [front.insert.iter.general]

```
  namespace std {
    template<class Container>
    class front_insert_iterator {
    protected:
      Container* container;

    public:
      using iterator_category = output_iterator_tag;
      using value_type        = void;
      using difference_type   = ptrdiff_t;
      using pointer           = void;
      using reference         = void;
      using container_type    = Container;
      constexpr explicit front_insert_iterator(Container& x);
      constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
      constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

      constexpr front_insert_iterator& operator*();
      constexpr front_insert_iterator& operator++();
      constexpr front_insert_iterator  operator++(int);
    };
  }
```

24.5.2.3.2 Operations [front.insert.iter.ops]

```
constexpr explicit front_insert_iterator(Container& x);
```

1 *Effects*: Initializes `container` with `addressof(x)`.

```
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by: `container->push_front(value);`

3 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by: `container->push_front(std::move(value));`

5 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator  operator++(int);
```

7 *Returns*: `*this`.

24.5.2.3.3 `front_inserter` [front.inserter]

```
template<class Container>
  constexpr front_insert_iterator<Container> front_inserter(Container& x);
```

1 *Returns*: `front_insert_iterator<Container>(x)`.

24.5.2.4 Class template `insert_iterator` [insert.iterator]

24.5.2.4.1 General [insert.iter.general]

```
namespace std {
  template<class Container>
  class insert_iterator {
  protected:
    Container* container;
    ranges::iterator_t<Container> iter;

  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using container_type    = Container;

    constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
    constexpr insert_iterator& operator=(const typename Container::value_type& value);
    constexpr insert_iterator& operator=(typename Container::value_type&& value);

    constexpr insert_iterator& operator*();
    constexpr insert_iterator& operator++();
    constexpr insert_iterator& operator++(int);
    };
  }
```

24.5.2.4.2 Operations [insert.iter.ops]

```
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
```

1 *Effects*: Initializes `container` with `addressof(x)` and `iter` with `i`.

```
constexpr insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by:

```
iter = container->insert(iter, value);
++iter;
```

3 *Returns*: `*this`.

```
constexpr insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by:

```
iter = container->insert(iter, std::move(value));
++iter;
```

5 *Returns*: `*this`.

```
constexpr insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
```

7 *Returns*: `*this`.

24.5.2.4.3 `inserter` [inserter]

```
template<class Container>
  constexpr insert_iterator<Container>
    inserter(Container& x, ranges::iterator_t<Container> i);
```

1 *Returns*: `insert_iterator<Container>(x, i)`.

24.5.3 Constant iterators and sentinels [const.iterators]

24.5.3.1 General [const.iterators.general]

1 Class template `basic_const_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to a type such that the adapted iterator is a constant iterator (24.3). Some generic algorithms can be called with constant iterators to avoid mutation.

2 Specializations of `basic_const_iterator` are constant iterators.

24.5.3.2 Alias templates [const.iterators.alias]

```
template<indirectly_readable It>
  using iter_const_reference_t =
    common_reference_t<const iter_value_t<It>&&, iter_reference_t<It>>;

template<class It>
  concept constant-iterator =                                          // exposition only
    input_iterator<It> && same_as<iter_const_reference_t<It>, iter_reference_t<It>>;

template<input_iterator I>
  using const_iterator = see below;
```

1 *Result*: If `I` models *`constant-iterator`*, `I`. Otherwise, `basic_const_iterator<I>`.

```
template<semiregular S>
  using const_sentinel = see below;
```

2 *Result*: If `S` models `input_iterator`, `const_iterator<S>`. Otherwise, `S`.

24.5.3.3 Class template basic_const_iterator [const.iterators.iterator]

```
namespace std {
  template<class I>
    concept not-a-const-iterator = see below;                  // exposition only

  template<indirectly_readable I>
    using iter-const-rvalue-reference-t =                      // exposition only
      common_reference_t<const iter_value_t<I>&&, iter_rvalue_reference_t<I>>;

  template<input_iterator Iterator>
  class basic_const_iterator {
    Iterator current_ = Iterator();                            // exposition only
    using reference = iter_const_reference_t<Iterator>;        // exposition only
    using rvalue-reference =                                   // exposition only
      iter-const-rvalue-reference-t<Iterator>;

  public:
    using iterator_concept = see below;
    using iterator_category = see below;  // not always present
    using value_type = iter_value_t<Iterator>;
    using difference_type = iter_difference_t<Iterator>;

    basic_const_iterator() requires default_initializable<Iterator> = default;
    constexpr basic_const_iterator(Iterator current);
    template<convertible_to<Iterator> U>
      constexpr basic_const_iterator(basic_const_iterator<U> current);
    template<different-from<basic_const_iterator> T>
      requires convertible_to<T, Iterator>
      constexpr basic_const_iterator(T&& current);

    constexpr const Iterator& base() const & noexcept;
    constexpr Iterator base() &&;

    constexpr reference operator*() const;
    constexpr const auto* operator->() const
      requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
               same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;

    constexpr basic_const_iterator& operator++();
    constexpr void operator++(int);
    constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;

    constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
    constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;

      {
        return static_cast<rvalue-reference>(ranges::iter_move(i.current_));
      }
  };
}
```

1 Given some type `I`, the concept ***not-a-const-iterator*** is defined as `false` if `I` is a specialization of `basic_const_iterator` and `true` otherwise.

24.5.3.4 Member types [const.iterators.types]

1 `basic_const_iterator<Iterator>::iterator_concept` is defined as follows:

(1.1) — If `Iterator` models `contiguous_iterator`, then `iterator_concept` denotes `contiguous_iterator_tag`.

(1.2) — Otherwise, if `Iterator` models `random_access_iterator`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.3) — Otherwise, if `Iterator` models `bidirectional_iterator`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.4) — Otherwise, if `Iterator` models `forward_iterator`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.5) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if `Iterator` models `forward_iterator`. In that case, `basic_const_iterator<Iterator>::iterator_category` denotes the type `iterator_traits<Iterator>::iterator_category`.

24.5.3.5 Operations [const.iterators.ops]

```
constexpr basic_const_iterator(Iterator current);
```

1 *Effects*: Initializes *`current_`* with `std::move(current)`.

```
template<convertible_to<Iterator> U>
  constexpr basic_const_iterator(basic_const_iterator<U> current);
```

2 *Effects*: Initializes *`current_`* with `std::move(current.`*`current_`*`)`.

```
template<different-from<basic_const_iterator> T>
  requires convertible_to<T, Iterator>
  constexpr basic_const_iterator(T&& current);
```

3 *Effects*: Initializes *`current_`* with `std::forward<T>(current)`.

```
constexpr const Iterator& base() const & noexcept;
```

4 *Effects*: Equivalent to: `return` *`current_`*`;`

```
constexpr Iterator base() &&;
```

5 *Effects*: Equivalent to: `return std::move(`*`current_`*`);`

```
constexpr reference operator*() const;
```

6 *Effects*: Equivalent to: `return static_cast<`*`reference`*`>(*`*`current_`*`);`

```
constexpr const auto* operator->() const
  requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
           same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;
```

7 *Returns*: If `Iterator` models `contiguous_iterator`, `to_address(`*`current_`*`)`; otherwise, `addressof(*`*`current_`*`)`.

```
constexpr basic_const_iterator& operator++();
```

8 *Effects*: Equivalent to:

```
  ++current_;
  return *this;
```

```
constexpr void operator++(int);
```

9 *Effects*: Equivalent to: `++`*`current_`*`;`

```
constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;
```

10 *Effects*: Equivalent to:

```
  auto tmp = *this;
  ++*this;
  return tmp;
```

```
constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
```

11 *Effects*: Equivalent to:

```
  --current_;
  return *this;
```

```
constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;
```

12 *Effects*: Equivalent to:

```
  auto tmp = *this;
  --*this;
  return tmp;
```

```
constexpr basic_const_iterator& operator+=(difference_type n)
  requires random_access_iterator<Iterator>;
constexpr basic_const_iterator& operator-=(difference_type n)
  requires random_access_iterator<Iterator>;
```

13 Let *op* be the operator.

14 *Effects*: Equivalent to:

```
  current_ op n;
  return *this;
```

```
constexpr reference operator[](difference_type n) const requires random_access_iterator<Iterator>
```

15 *Effects*: Equivalent to: `return static_cast<reference>(current_[n]);`

```
template<sentinel_for<Iterator> S>
  constexpr bool operator==(const S& s) const;
```

16 *Effects*: Equivalent to: `return current_ == s;`

```
template<not-a-const-iterator CI>
  requires constant-iterator<CI> && convertible_to<Iterator const&, CI>
constexpr operator CI() const &;
```

17 *Returns*: `current_`.

```
template<not-a-const-iterator CI>
  requires constant-iterator<CI> && convertible_to<Iterator, CI>
constexpr operator CI() &&;
```

18 *Returns*: `std::move(current_)`.

```
constexpr bool operator<(const basic_const_iterator& y) const
  requires random_access_iterator<Iterator>;
constexpr bool operator>(const basic_const_iterator& y) const
  requires random_access_iterator<Iterator>;
constexpr bool operator<=(const basic_const_iterator& y) const
  requires random_access_iterator<Iterator>;
constexpr bool operator>=(const basic_const_iterator& y) const
  requires random_access_iterator<Iterator>;
constexpr auto operator<=>(const basic_const_iterator& y) const
  requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;
```

19 Let *op* be the operator.

20 *Effects*: Equivalent to: `return current_ op y.current_;`

```
template<different-from<basic_const_iterator> I>
  constexpr bool operator<(const I& y) const
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different-from<basic_const_iterator> I>
  constexpr bool operator>(const I& y) const
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different-from<basic_const_iterator> I>
  constexpr bool operator<=(const I& y) const
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
```

```
template<different-from<basic_const_iterator> I>
  constexpr bool operator>=(const I& y) const
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<different-from<basic_const_iterator> I>
  constexpr auto operator<=>(const I& y) const
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I> &&
             three_way_comparable_with<Iterator, I>;
```

21 Let *op* be the operator.

22 *Effects*: Equivalent to: `return current_ op y;`

```
template<not-a-const-iterator I>
  friend constexpr bool operator<(const I& x, const basic_const_iterator& y)
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
  friend constexpr bool operator>(const I& x, const basic_const_iterator& y)
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
  friend constexpr bool operator<=(const I& x, const basic_const_iterator& y)
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
template<not-a-const-iterator I>
  friend constexpr bool operator>=(const I& x, const basic_const_iterator& y)
    requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
```

23 Let *op* be the operator.

24 *Effects*: Equivalent to: `return x op y.current_;`

```
friend constexpr basic_const_iterator operator+(const basic_const_iterator& i, difference_type n)
  requires random_access_iterator<Iterator>;
friend constexpr basic_const_iterator operator+(difference_type n, const basic_const_iterator& i)
  requires random_access_iterator<Iterator>;
```

25 *Effects*: Equivalent to: `return basic_const_iterator(i.current_ + n);`

```
friend constexpr basic_const_iterator operator-(const basic_const_iterator& i, difference_type n)
  requires random_access_iterator<Iterator>;
```

26 *Effects*: Equivalent to: `return basic_const_iterator(i.current_ - n);`

```
template<sized_sentinel_for<Iterator> S>
  constexpr difference_type operator-(const S& y) const;
```

27 *Effects*: Equivalent to: `return current_ - y;`

```
template<not-a-const-iterator S>
  requires sized_sentinel_for<S, Iterator>
  friend constexpr difference_type operator-(const S& x, const basic_const_iterator& y);
```

28 *Effects*: Equivalent to: `return x - y.current_;`

24.5.4 Move iterators and sentinels [move.iterators]

24.5.4.1 General [move.iterators.general]

1 Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

2 [*Example 1*:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end());          // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                  make_move_iterator(s.end())); // moves strings into v2
```

— *end example*]

24.5.4.2 Class template move_iterator [move.iterator]

```
namespace std {
  template<class Iterator>
  class move_iterator {
  public:
    using iterator_type     = Iterator;
    using iterator_concept  = see below;
    using iterator_category = see below;                    // not always present
    using value_type        = iter_value_t<Iterator>;
    using difference_type   = iter_difference_t<Iterator>;
    using pointer           = Iterator;
    using reference         = iter_rvalue_reference_t<Iterator>;

    constexpr move_iterator();
    constexpr explicit move_iterator(Iterator i);
    template<class U> constexpr move_iterator(const move_iterator<U>& u);
    template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

    constexpr const Iterator& base() const & noexcept;
    constexpr Iterator base() &&;
    constexpr reference operator*() const;

    constexpr move_iterator& operator++();
    constexpr auto operator++(int);
    constexpr move_iterator& operator--();
    constexpr move_iterator operator--(int);

    constexpr move_iterator operator+(difference_type n) const;
    constexpr move_iterator& operator+=(difference_type n);
    constexpr move_iterator operator-(difference_type n) const;
    constexpr move_iterator& operator-=(difference_type n);
    constexpr reference operator[](difference_type n) const;

    template<sentinel_for<Iterator> S>
      friend constexpr bool
        operator==(const move_iterator& x, const move_sentinel<S>& y);
    template<sized_sentinel_for<Iterator> S>
      friend constexpr iter_difference_t<Iterator>
        operator-(const move_sentinel<S>& x, const move_iterator& y);
    template<sized_sentinel_for<Iterator> S>
      friend constexpr iter_difference_t<Iterator>
        operator-(const move_iterator& x, const move_sentinel<S>& y);
    friend constexpr iter_rvalue_reference_t<Iterator>
      iter_move(const move_iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current)));
    template<indirectly_swappable<Iterator> Iterator2>
      friend constexpr void
        iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
          noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

  private:
    Iterator current;     // exposition only
  };
}
```

1 The member *typedef-name* `iterator_concept` is defined as follows:

(1.1) — If `Iterator` models `random_access_iterator`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.2) — Otherwise, if `Iterator` models `bidirectional_iterator`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.3) — Otherwise, if `Iterator` models `forward_iterator`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if the *qualified-id* `iterator_traits<Iterator>::iterator_category` is valid and denotes a type. In that case, `iterator_category` denotes

(2.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and

(2.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

24.5.4.3 Requirements [move.iter.requirements]

1 The template parameter `Iterator` shall either meet the *Cpp17InputIterator* requirements (24.3.5.3) or model `input_iterator` (24.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the *Cpp17BidirectionalIterator* requirements (24.3.5.6) or model `bidirectional_iterator` (24.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) or model `random_access_iterator` (24.3.4.13).

24.5.4.4 Construction and assignment [move.iter.cons]

```
constexpr move_iterator();
```

1 *Effects*: Value-initializes `current`.

```
constexpr explicit move_iterator(Iterator i);
```

2 *Effects*: Initializes `current` with `std::move(i)`.

```
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

3 *Constraints*: `is_same_v<U, Iterator>` is `false` and `const U&` models `convertible_to<Iterator>`.

4 *Effects*: Initializes `current` with `u.current`.

```
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

5 *Constraints*: `is_same_v<U, Iterator>` is `false`, `const U&` models `convertible_to<Iterator>`, and `assignable_from<Iterator&, const U&>` is modeled.

6 *Effects*: Assigns `u.current` to `current`.

7 *Returns*: `*this`.

24.5.4.5 Conversion [move.iter.op.conv]

```
constexpr const Iterator& base() const & noexcept;
```

1 *Returns*: `current`.

```
constexpr Iterator base() &&;
```

2 *Returns*: `std::move(current)`.

24.5.4.6 Element access [move.iter.elem]

```
constexpr reference operator*() const;
```

1 *Effects*: Equivalent to: `return ranges::iter_move(current);`

```
constexpr reference operator[](difference_type n) const;
```

2 *Effects*: Equivalent to: `return ranges::iter_move(current + n);`

24.5.4.7 Navigation [move.iter.nav]

```
constexpr move_iterator& operator++();
```

1 *Effects*: As if by `++current`.

2 *Returns*: `*this`.

```
constexpr auto operator++(int);
```

3 *Effects*: If `Iterator` models `forward_iterator`, equivalent to:

```
move_iterator tmp = *this;
++current;
return tmp;
```

Otherwise, equivalent to `++current`.

```
constexpr move_iterator& operator--();
```

4 *Effects*: As if by `--current`.

5 *Returns*: `*this`.

```
constexpr move_iterator operator--(int);
```

6 *Effects*: As if by:

```
move_iterator tmp = *this;
--current;
return tmp;
```

```
constexpr move_iterator operator+(difference_type n) const;
```

7 *Returns*: `move_iterator(current + n)`.

```
constexpr move_iterator& operator+=(difference_type n);
```

8 *Effects*: As if by: `current += n;`

9 *Returns*: `*this`.

```
constexpr move_iterator operator-(difference_type n) const;
```

10 *Returns*: `move_iterator(current - n)`.

```
constexpr move_iterator& operator-=(difference_type n);
```

11 *Effects*: As if by: `current -= n;`

12 *Returns*: `*this`.

24.5.4.8 Comparisons [move.iter.op.comp]

```
template<class Iterator1, class Iterator2>
  constexpr bool operator==(const move_iterator<Iterator1>& x,
                            const move_iterator<Iterator2>& y);
template<sentinel_for<Iterator> S>
  friend constexpr bool operator==(const move_iterator& x,
                                   const move_sentinel<S>& y);
```

1 *Constraints*: `x.base() == y.base()` is well-formed and convertible to `bool`.

2 *Returns*: `x.base() == y.base()`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

4 *Returns*: `x.base() < y.base()`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

5 *Constraints*: `y.base() < x.base()` is well-formed and convertible to `bool`.

6 *Returns*: `y < x`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

7 *Constraints*: `y.base() < x.base()` is well-formed and convertible to `bool`.

8 *Returns*: `!(y < x)`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

9 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

10 *Returns*: `!(x < y)`.

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
  constexpr compare_three_way_result_t<Iterator1, Iterator2>
    operator<=>(const move_iterator<Iterator1>& x,
                const move_iterator<Iterator2>& y);
```

11 *Returns*: `x.base() <=> y.base()`.

24.5.4.9 Non-member functions [move.iter.nonmember]

```
template<class Iterator1, class Iterator2>
  constexpr auto operator-(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
      -> decltype(x.base() - y.base());
template<sized_sentinel_for<Iterator> S>
  friend constexpr iter_difference_t<Iterator>
    operator-(const move_sentinel<S>& x, const move_iterator& y);
template<sized_sentinel_for<Iterator> S>
  friend constexpr iter_difference_t<Iterator>
    operator-(const move_iterator& x, const move_sentinel<S>& y);
```

1 *Returns*: `x.base() - y.base()`.

```
template<class Iterator>
  constexpr move_iterator<Iterator>
    operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);
```

2 *Constraints*: `x.base() + n` is well-formed and has type `Iterator`.

3 *Returns*: `x + n`.

```
friend constexpr iter_rvalue_reference_t<Iterator>
  iter_move(const move_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)));
```

4 *Effects*: Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<Iterator> Iterator2>
  friend constexpr void
    iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
      noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

5 *Effects*: Equivalent to: `ranges::iter_swap(x.current, y.current)`.

```
template<class Iterator>
  constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
```

6 *Returns*: `move_iterator<Iterator>(std::move(i))`.

24.5.4.10 Class template `move_sentinel` [move.sentinel]

1 Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` model `sentinel_for<S, I>`, `move_sentinel<S>` and `move_iterator<I>` model `sentinel_for<move_sentinel<S>, move_iterator<I>>` as well.

2 [*Example 1*: A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```
  template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
           indirect_unary_predicate<I> Pred>
    requires indirectly_movable<I, O>
  void move_if(I first, S last, O out, Pred pred) {
    ranges::copy_if(move_iterator<I>{std::move(first)}, move_sentinel<S>{last},
                    std::move(out), pred);
  }
```

— *end example*]

```
namespace std {
  template<semiregular S>
  class move_sentinel {
  public:
    constexpr move_sentinel();
    constexpr explicit move_sentinel(S s);
    template<class S2>
      requires convertible_to<const S2&, S>
        constexpr move_sentinel(const move_sentinel<S2>& s);
    template<class S2>
      requires assignable_from<S&, const S2&>
        constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

    constexpr S base() const;

  private:
    S last;       // exposition only
  };
}
```

24.5.4.11 Operations [move.sent.ops]

```
constexpr move_sentinel();
```

1 *Effects*: Value-initializes `last`. If `is_trivially_default_constructible_v<S>` is `true`, then this constructor is a `constexpr` constructor.

```
constexpr explicit move_sentinel(S s);
```

2 *Effects*: Initializes `last` with `std::move(s)`.

```
template<class S2>
  requires convertible_to<const S2&, S>
    constexpr move_sentinel(const move_sentinel<S2>& s);
```

3 *Effects*: Initializes `last` with `s.last`.

```
template<class S2>
  requires assignable_from<S&, const S2&>
    constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```

4 *Effects*: Equivalent to: `last = s.last; return *this;`

```
constexpr S base() const;
```

5 *Returns*: `last`.

24.5.5 Common iterators [iterators.common]

24.5.5.1 Class template `common_iterator` [common.iterator]

1 Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

2 [*Note 1*: The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — *end note*]

3 [*Example 1*:

```
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
```

— *end example*]

```
namespace std {
  template<input_or_output_iterator I, sentinel_for<I> S>
    requires (!same_as<I, S> && copyable<I>)
  class common_iterator {
  public:
    constexpr common_iterator() requires default_initializable<I> = default;
    constexpr common_iterator(I i);
    constexpr common_iterator(S s);
    template<class I2, class S2>
      requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
        constexpr common_iterator(const common_iterator<I2, S2>& x);

    template<class I2, class S2>
      requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
               assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
        constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

    constexpr decltype(auto) operator*();
    constexpr decltype(auto) operator*() const
      requires dereferenceable<const I>;
    constexpr auto operator->() const
      requires see below;

    constexpr common_iterator& operator++();
    constexpr decltype(auto) operator++(int);

    template<class I2, sentinel_for<I> S2>
      requires sentinel_for<S, I2>
    friend constexpr bool operator==(
      const common_iterator& x, const common_iterator<I2, S2>& y);
    template<class I2, sentinel_for<I> S2>
      requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
    friend constexpr bool operator==(
      const common_iterator& x, const common_iterator<I2, S2>& y);

    template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
      requires sized_sentinel_for<S, I2>
    friend constexpr iter_difference_t<I2> operator-(
      const common_iterator& x, const common_iterator<I2, S2>& y);

    friend constexpr decltype(auto) iter_move(const common_iterator& i)
      noexcept(noexcept(ranges::iter_move(declval<const I&>())))
        requires input_iterator<I>;
    template<indirectly_swappable<I> I2, class S2>
      friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
        noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));

  private:
    variant<I, S> v_;    // exposition only
  };

  template<class I, class S>
  struct incrementable_traits<common_iterator<I, S>> {
    using difference_type = iter_difference_t<I>;
  };

  template<input_iterator I, class S>
  struct iterator_traits<common_iterator<I, S>> {
    using iterator_concept = see below;
    using iterator_category = see below;   // not always present
    using value_type = iter_value_t<I>;
    using difference_type = iter_difference_t<I>;
    using pointer = see below;
    using reference = iter_reference_t<I>;
  };
}
```

24.5.5.2 Associated types [common.iter.types]

1 The nested *typedef-name* `iterator_category` of the specialization of `iterator_traits` for `common_iterator<I, S>` is defined if and only if `iter_difference_t<I>` is an integral type. In that case, `iterator_category` denotes `forward_iterator_tag` if the *qualified-id* `iterator_traits<I>::iterator_category` is valid and denotes a type that models `derived_from<forward_iterator_tag>`; otherwise it denotes `input_iterator_tag`.

2 The remaining nested *typedef-names* of the specialization of `iterator_traits` for `common_iterator<I, S>` are defined as follows:

(2.1) — `iterator_concept` denotes `forward_iterator_tag` if `I` models `forward_iterator`; otherwise it denotes `input_iterator_tag`.

(2.2) — Let `a` denote an lvalue of type `const common_iterator<I, S>`. If the expression `a.operator->()` is well-formed, then `pointer` denotes `decltype(a.operator->())`. Otherwise, `pointer` denotes `void`.

24.5.5.3 Constructors and conversions [common.iter.const]

```
constexpr common_iterator(I i);
```

1 *Effects*: Initializes `v_` as if by `v_{in_place_type<I>, std::move(i)}`.

```
constexpr common_iterator(S s);
```

2 *Effects*: Initializes `v_` as if by `v_{in_place_type<S>, std::move(s)}`.

```
template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
    constexpr common_iterator(const common_iterator<I2, S2>& x);
```

3 *Preconditions*: `x.v_.valueless_by_exception()` is `false`.

4 *Effects*: Initializes `v_` as if by `v_{in_place_index<`*i*`>, get<`*i*`>(x.v_)}`, where *i* is `x.v_.index()`.

```
template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
           assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
    constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);
```

5 *Preconditions*: `x.v_.valueless_by_exception()` is `false`.

6 *Effects*: Equivalent to:

(6.1) — If `v_.index() == x.v_.index()`, then `get<`*i*`>(v_) = get<`*i*`>(x.v_)`.

(6.2) — Otherwise, `v_.emplace<`*i*`>(get<`*i*`>(x.v_))`.

where *i* is `x.v_.index()`.

7 *Returns*: `*this`.

24.5.5.4 Accessors [common.iter.access]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
  requires dereferenceable<const I>;
```

1 *Preconditions*: `holds_alternative<I>(v_)` is `true`.

2 *Effects*: Equivalent to: `return *get<I>(v_);`

```
constexpr auto operator->() const
  requires see below;
```

3 The expression in the *requires-clause* is equivalent to:

```
indirectly_readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
 is_reference_v<iter_reference_t<I>> ||
 constructible_from<iter_value_t<I>, iter_reference_t<I>>)
```

4 *Preconditions*: `holds_alternative<I>(v_)` is `true`.

5 *Effects*:

(5.1) — If `I` is a pointer type or if the expression `get<I>(v_).operator->()` is well-formed, equivalent to: `return get<I>(v_);`

(5.2) — Otherwise, if `iter_reference_t<I>` is a reference type, equivalent to:

```
auto&& tmp = *get<I>(v_);
return addressof(tmp);
```

(5.3) — Otherwise, equivalent to: `return proxy(*get<I>(v_));` where *proxy* is the exposition-only class:

```
class proxy {
  iter_value_t<I> keep_;
  constexpr proxy(iter_reference_t<I>&& x)
    : keep_(std::move(x)) {}
public:
  constexpr const iter_value_t<I>* operator->() const noexcept {
    return addressof(keep_);
  }
};
```

24.5.5.5 Navigation [common.iter.nav]

```
constexpr common_iterator& operator++();
```

1 *Preconditions*: `holds_alternative<I>(v_)` is `true`.

2 *Effects*: Equivalent to `++get<I>(v_)`.

3 *Returns*: `*this`.

```
constexpr decltype(auto) operator++(int);
```

4 *Preconditions*: `holds_alternative<I>(v_)` is `true`.

5 *Effects*: If `I` models `forward_iterator`, equivalent to:

```
common_iterator tmp = *this;
++*this;
return tmp;
```

Otherwise, if `requires(I& i) { { *i++ } -> can-reference; }` is `true` or

```
indirectly_readable<I> && constructible_from<iter_value_t<I>, iter_reference_t<I>> &&
move_constructible<iter_value_t<I>>
```

is `false`, equivalent to:

```
return get<I>(v_)++;
```

Otherwise, equivalent to:

```
postfix-proxy p(**this);
++*this;
return p;
```

where *postfix-proxy* is the exposition-only class:

```
class postfix-proxy {
  iter_value_t<I> keep_;
  constexpr postfix-proxy(iter_reference_t<I>&& x)
    : keep_(std::forward<iter_reference_t<I>>(x)) {}
public:
  constexpr const iter_value_t<I>& operator*() const noexcept {
    return keep_;
  }
};
```

24.5.5.6 Comparisons [common.iter.cmp]

```
template<class I2, sentinel_for<I> S2>
  requires sentinel_for<S, I2>
friend constexpr bool operator==(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

1 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

2 *Returns*: `true` if *i* `==` *j*, and otherwise `get<`*i*`>(x.v_) == get<`*j*`>(y.v_)`, where *i* is `x.v_.index()` and *j* is `y.v_.index()`.

```
template<class I2, sentinel_for<I> S2>
  requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

3 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

4 *Returns*: `true` if *i* and *j* are each `1`, and otherwise `get<`*i*`>(x.v_) == get<`*j*`>(y.v_)`, where *i* is `x.v_.index()` and *j* is `y.v_.index()`.

```
template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
  requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

5 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

6 *Returns*: `0` if *i* and *j* are each `1`, and otherwise `get<`*i*`>(x.v_) - get<`*j*`>(y.v_)`, where *i* is `x.v_.index()` and *j* is `y.v_.index()`.

24.5.5.7 Customizations [common.iter.cust]

```
friend constexpr decltype(auto) iter_move(const common_iterator& i)
  noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires input_iterator<I>;
```

1 *Preconditions*: `holds_alternative<I>(i.v_)` is `true`.

2 *Effects*: Equivalent to: `return ranges::iter_move(get<I>(i.v_));`

```
template<indirectly_swappable<I> I2, class S2>
  friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));
```

3 *Preconditions*: `holds_alternative<I>(x.v_)` and `holds_alternative<I2>(y.v_)` are each `true`.

4 *Effects*: Equivalent to `ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_))`.

24.5.6 Default sentinel [default.sentinel]

```
namespace std {
  struct default_sentinel_t { };
}
```

1 Class `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (24.5.7.1)).

24.5.7 Counted iterators [iterators.counted]

24.5.7.1 Class template `counted_iterator` [counted.iterator]

1 Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_sentinel` in calls to generic algorithms to operate on a range of *N* elements starting at a given position without needing to know the end position a priori.

2 [*Example 1*:

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

— *end example*]

3 Two values `i1` and `i2` of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if there exists some integer *n* such that `next(i1.base(), i1.count() + n)` and `next(i2.base(), i2.count() + n)` refer to the same (possibly past-the-end) element.

```
namespace std {
  template<input_or_output_iterator I>
  class counted_iterator {
  public:
    using iterator_type = I;
    using value_type = iter_value_t<I>;                         // present only
                         // if I models indirectly_readable
    using difference_type = iter_difference_t<I>;
    using iterator_concept = typename I::iterator_concept;      // present only
                         // if the qualified-id I::iterator_concept is valid and denotes a type
    using iterator_category = typename I::iterator_category;    // present only
                         // if the qualified-id I::iterator_category is valid and denotes a type
    constexpr counted_iterator() requires default_initializable<I> = default;
    constexpr counted_iterator(I x, iter_difference_t<I> n);
    template<class I2>
      requires convertible_to<const I2&, I>
        constexpr counted_iterator(const counted_iterator<I2>& x);

    template<class I2>
      requires assignable_from<I&, const I2&>
        constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

    constexpr const I& base() const & noexcept;
    constexpr I base() &&;
    constexpr iter_difference_t<I> count() const noexcept;
    constexpr decltype(auto) operator*();
    constexpr decltype(auto) operator*() const
      requires dereferenceable<const I>;

    constexpr auto operator->() const noexcept
      requires contiguous_iterator<I>;

    constexpr counted_iterator& operator++();
    constexpr decltype(auto) operator++(int);
    constexpr counted_iterator operator++(int)
      requires forward_iterator<I>;
    constexpr counted_iterator& operator--()
      requires bidirectional_iterator<I>;
    constexpr counted_iterator operator--(int)
      requires bidirectional_iterator<I>;

    constexpr counted_iterator operator+(iter_difference_t<I> n) const
      requires random_access_iterator<I>;
    friend constexpr counted_iterator operator+(
      iter_difference_t<I> n, const counted_iterator& x)
        requires random_access_iterator<I>;
    constexpr counted_iterator& operator+=(iter_difference_t<I> n)
      requires random_access_iterator<I>;

    constexpr counted_iterator operator-(iter_difference_t<I> n) const
      requires random_access_iterator<I>;
    template<common_with<I> I2>
      friend constexpr iter_difference_t<I2> operator-(
        const counted_iterator& x, const counted_iterator<I2>& y);
    friend constexpr iter_difference_t<I> operator-(
      const counted_iterator& x, default_sentinel_t);
    friend constexpr iter_difference_t<I> operator-(
      default_sentinel_t, const counted_iterator& y);
    constexpr counted_iterator& operator-=(iter_difference_t<I> n)
      requires random_access_iterator<I>;

    constexpr decltype(auto) operator[](iter_difference_t<I> n) const
      requires random_access_iterator<I>;

    template<common_with<I> I2>
      friend constexpr bool operator==(
        const counted_iterator& x, const counted_iterator<I2>& y);
    friend constexpr bool operator==(
      const counted_iterator& x, default_sentinel_t);

    template<common_with<I> I2>
      friend constexpr strong_ordering operator<=>(
        const counted_iterator& x, const counted_iterator<I2>& y);

    friend constexpr decltype(auto) iter_move(const counted_iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current)))
        requires input_iterator<I>;
    template<indirectly_swappable<I> I2>
      friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
        noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

  private:
    I current = I();                    // exposition only
    iter_difference_t<I> length = 0;    // exposition only
  };

  template<input_iterator I>
    requires same_as<ITER_TRAITS(I), iterator_traits<I>>    // see 24.3.4.1
  struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
    using pointer = conditional_t<contiguous_iterator<I>,
                                  add_pointer_t<iter_reference_t<I>>, void>;
  };
}
```

24.5.7.2 Constructors and conversions [counted.iter.const]

```
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

1 *Preconditions*: `n >= 0`.

2 *Effects*: Initializes `current` with `std::move(i)` and `length` with `n`.

```
template<class I2>
  requires convertible_to<const I2&, I>
    constexpr counted_iterator(const counted_iterator<I2>& x);
```

3 *Effects*: Initializes `current` with `x.current` and `length` with `x.length`.

```
template<class I2>
  requires assignable_from<I&, const I2&>
    constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
```

4 *Effects*: Assigns `x.current` to `current` and `x.length` to `length`.

5 *Returns*: `*this`.

24.5.7.3 Accessors [counted.iter.access]

```
constexpr const I& base() const & noexcept;
```

1 *Effects*: Equivalent to: `return current;`

```
constexpr I base() &&;
```

2 *Returns*: `std::move(current)`.

```
constexpr iter_difference_t<I> count() const noexcept;
```

3 *Effects*: Equivalent to: `return length;`

24.5.7.4 Element access [counted.iter.elem]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
  requires dereferenceable<const I>;
```

1 *Preconditions*: `length > 0` is `true`.

2 *Effects*: Equivalent to: `return *current;`

```
constexpr auto operator->() const noexcept
  requires contiguous_iterator<I>;
```

3 *Effects*: Equivalent to: `return to_address(current);`

```
constexpr decltype(auto) operator[](iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

4 *Preconditions*: `n < length`.

5 *Effects*: Equivalent to: `return current[n];`

24.5.7.5 Navigation [counted.iter.nav]

```
constexpr counted_iterator& operator++();
```

1 *Preconditions*: `length > 0`.

2 *Effects*: Equivalent to:

```
++current;
--length;
return *this;
```

```
constexpr decltype(auto) operator++(int);
```

3 *Preconditions*: `length > 0`.

4 *Effects*: Equivalent to:

```
--length;
try { return current++; }
catch(...) { ++length; throw; }
```

```
constexpr counted_iterator operator++(int)
  requires forward_iterator<I>;
```

5 *Effects*: Equivalent to:

```
counted_iterator tmp = *this;
++*this;
return tmp;
```

```
constexpr counted_iterator& operator--()
  requires bidirectional_iterator<I>;
```

6 *Effects*: Equivalent to:

```
--current;
++length;
return *this;
```

```
constexpr counted_iterator operator--(int)
  requires bidirectional_iterator<I>;
```

7 *Effects*: Equivalent to:

```
counted_iterator tmp = *this;
--*this;
return tmp;
```

```
constexpr counted_iterator operator+(iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

8 *Effects*: Equivalent to: `return counted_iterator(current + n, length - n);`

```
friend constexpr counted_iterator operator+(
  iter_difference_t<I> n, const counted_iterator& x)
    requires random_access_iterator<I>;
```

9 *Effects*: Equivalent to: `return x + n;`

```
constexpr counted_iterator& operator+=(iter_difference_t<I> n)
  requires random_access_iterator<I>;
```

10 *Preconditions*: `n <= length`.

11 *Effects*: Equivalent to:

```
current += n;
length -= n;
return *this;
```

```
constexpr counted_iterator operator-(iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

12 *Effects*: Equivalent to: `return counted_iterator(current - n, length + n);`

```
template<common_with<I> I2>
  friend constexpr iter_difference_t<I2> operator-(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

13 *Preconditions*: `x` and `y` refer to elements of the same sequence (24.5.7.1).

14 *Effects*: Equivalent to: `return y.length - x.length;`

```
friend constexpr iter_difference_t<I> operator-(
  const counted_iterator& x, default_sentinel_t);
```

15 *Effects*: Equivalent to: `return -x.length;`

```
friend constexpr iter_difference_t<I> operator-(
  default_sentinel_t, const counted_iterator& y);
```

16 *Effects*: Equivalent to: `return y.length;`

```
constexpr counted_iterator& operator-=(iter_difference_t<I> n)
  requires random_access_iterator<I>;
```

17 *Preconditions*: `-n <= length`.

18 *Effects*: Equivalent to:

```
current -= n;
length += n;
return *this;
```

24.5.7.6 Comparisons [counted.iter.cmp]

```
template<common_with<I> I2>
  friend constexpr bool operator==(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

1 *Preconditions*: `x` and `y` refer to elements of the same sequence (24.5.7.1).

2 *Effects*: Equivalent to: `return x.length == y.length;`

```
friend constexpr bool operator==(
  const counted_iterator& x, default_sentinel_t);
```

3 *Effects*: Equivalent to: `return x.length == 0;`

```
template<common_with<I> I2>
  friend constexpr strong_ordering operator<=>(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

4 *Preconditions*: `x` and `y` refer to elements of the same sequence (24.5.7.1).

5 *Effects*: Equivalent to: `return y.length <=> x.length;`

6 [*Note 1*: The argument order in the *Effects*: element is reversed because `length` counts down, not up. — *end note*]

24.5.7.7 Customizations [counted.iter.cust]

```
friend constexpr decltype(auto)
  iter_move(const counted_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)))
    requires input_iterator<I>;
```

1 *Preconditions*: `i.length > 0` is `true`.

2 *Effects*: Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<I> I2>
  friend constexpr void
    iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
      noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

3 *Preconditions*: Both `x.length > 0` and `y.length > 0` are `true`.

4 *Effects*: Equivalent to `ranges::iter_swap(x.current, y.current)`.

24.5.8 Unreachable sentinel [unreachable.sentinel]

1 Class `unreachable_sentinel_t` can be used with any `weakly_incrementable` type to denote the "upper bound" of an unbounded interval.

2 [*Example 1*:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable_sentinel` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch. — *end example*]

```
namespace std {
  struct unreachable_sentinel_t {
    template<weakly_incrementable I>
      friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
      { return false; }
  };
}
```

24.6 Stream iterators [stream.iterators]

24.6.1 General [stream.iterators.general]

1 To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[*Example 1*:

```
partial_sum(istream_iterator<double, char>(cin),
  istream_iterator<double, char>(),
  ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from `cin`, and prints the partial sums onto `cout`. — *end example*]

24.6.2 Class template istream_iterator [istream.iterator]

24.6.2.1 General [istream.iterator.general]

1 The class template `istream_iterator` is an input iterator (24.3.5.3) that reads successive elements from the input stream for which it was constructed.

```
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>,
           class Distance = ptrdiff_t>
  class istream_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type        = T;
    using difference_type   = Distance;
    using pointer           = const T*;
    using reference         = const T&;
    using char_type         = charT;
    using traits_type       = traits;
    using istream_type      = basic_istream<charT,traits>;

    constexpr istream_iterator();
    constexpr istream_iterator(default_sentinel_t);
    istream_iterator(istream_type& s);
    constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
    ~istream_iterator() = default;
    istream_iterator& operator=(const istream_iterator&) = default;

    const T& operator*() const;
    const T* operator->() const;
    istream_iterator& operator++();
    istream_iterator  operator++(int);

    friend bool operator==(const istream_iterator& i, default_sentinel_t);

  private:
    basic_istream<charT,traits>* in_stream; // exposition only
    T value;                                // exposition only
  };
}
```

2 The type `T` shall meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

24.6.2.2 Constructors and destructor [istream.iterator.cons]

```
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

1 *Effects*: Constructs the end-of-stream iterator, value-initializing `value`.

2 *Postconditions*: `in_stream == nullptr` is `true`.

3 *Remarks*: If the initializer `T()` in the declaration `auto x = T();` is a constant initializer (7.7), then these constructors are `constexpr` constructors.

```
istream_iterator(istream_type& s);
```

4 *Effects*: Initializes `in_stream` with `addressof(s)`, value-initializes `value`, and then calls `operator++()`.

```
constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
```

5 *Effects*: Initializes `in_stream` with `x.in_stream` and initializes `value` with `x.value`.

6 *Remarks*: An invocation of this constructor may be used in a core constant expression if and only if the initialization of `value` from `x.value` is a constant subexpression (3.15). The exception specification is equivalent to `is_nothrow_copy_constructible_v<T>`.

```
~istream_iterator() = default;
```

7 *Remarks*: If `is_trivially_destructible_v<T>` is `true`, then this destructor is trivial.

24.6.2.3 Operations [istream.iterator.ops]

```
const T& operator*() const;
```

1 *Preconditions*: `in_stream != nullptr` is `true`.

2 *Returns*: `value`.

```
const T* operator->() const;
```

3 *Preconditions*: `in_stream != nullptr` is `true`.

4 *Returns*: `addressof(value)`.

```
istream_iterator& operator++();
```

5 *Preconditions*: `in_stream != nullptr` is `true`.

6 *Effects*: Equivalent to:

```
if (!(*in_stream >> value))
  in_stream = nullptr;
```

7 *Returns*: `*this`.

```
istream_iterator operator++(int);
```

8 *Preconditions*: `in_stream != nullptr` is `true`.

9 *Effects*: Equivalent to:

```
istream_iterator tmp = *this;
++*this;
return tmp;
```

```
template<class T, class charT, class traits, class Distance>
  bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
                  const istream_iterator<T,charT,traits,Distance>& y);
```

10 *Returns*: `x.in_stream == y.in_stream`.

```
friend bool operator==(const istream_iterator& i, default_sentinel_t);
```

11 *Returns*: `!i.in_stream`.

24.6.3 Class template `ostream_iterator` [ostream.iterator]

24.6.3.1 General [ostream.iterator.general]

1 `ostream_iterator` writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written.

```
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>>
  class ostream_iterator {
  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using char_type         = charT;
    using traits_type       = traits;
    using ostream_type      = basic_ostream<charT,traits>;

    ostream_iterator(ostream_type& s);
    ostream_iterator(ostream_type& s, const charT* delimiter);
    ostream_iterator(const ostream_iterator& x);
    ~ostream_iterator();
    ostream_iterator& operator=(const ostream_iterator&) = default;
    ostream_iterator& operator=(const T& value);
```

```
      ostream_iterator& operator*();
      ostream_iterator& operator++();
      ostream_iterator& operator++(int);

    private:
      basic_ostream<charT,traits>* out_stream;            // exposition only
      const charT* delim;                                 // exposition only
    };
  }
```

24.6.3.2 Constructors and destructor [ostream.iterator.cons.des]

`ostream_iterator(ostream_type& s);`

1 *Effects*: Initializes `out_stream` with `addressof(s)` and `delim` with `nullptr`.

`ostream_iterator(ostream_type& s, const charT* delimiter);`

2 *Effects*: Initializes `out_stream` with `addressof(s)` and `delim` with `delimiter`.

24.6.3.3 Operations [ostream.iterator.ops]

`ostream_iterator& operator=(const T& value);`

1 *Effects*: As if by:

```
*out_stream << value;
if (delim)
  *out_stream << delim;
return *this;
```

`ostream_iterator& operator*();`

2 *Returns*: `*this`.

```
ostream_iterator& operator++();
ostream_iterator& operator++(int);
```

3 *Returns*: `*this`.

24.6.4 Class template `istreambuf_iterator` [istreambuf.iterator]

24.6.4.1 General [istreambuf.iterator.general]

1 The class template `istreambuf_iterator` defines an input iterator (24.3.5.3) that reads successive *characters* from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```
  namespace std {
    template<class charT, class traits = char_traits<charT>>
    class istreambuf_iterator {
    public:
      using iterator_category = input_iterator_tag;
      using value_type        = charT;
      using difference_type   = typename traits::off_type;
      using pointer           = unspecified;
      using reference         = charT;
      using char_type         = charT;
      using traits_type       = traits;
      using int_type          = typename traits::int_type;
      using streambuf_type    = basic_streambuf<charT,traits>;
      using istream_type      = basic_istream<charT,traits>;
      // 24.6.4.2, class istreambuf_iterator::proxy
      class proxy;                          // exposition only

      constexpr istreambuf_iterator() noexcept;
      constexpr istreambuf_iterator(default_sentinel_t) noexcept;
      istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
      ~istreambuf_iterator() = default;
      istreambuf_iterator(istream_type& s) noexcept;
      istreambuf_iterator(streambuf_type* s) noexcept;
      istreambuf_iterator(const proxy& p) noexcept;
      istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
      charT operator*() const;
      istreambuf_iterator& operator++();
      proxy operator++(int);
      bool equal(const istreambuf_iterator& b) const;

      friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

    private:
      streambuf_type* sbuf_;              // exposition only
    };
  }
```

24.6.4.2 Class `istreambuf_iterator::`*`proxy`* [istreambuf.iterator.proxy]

1 Class `istreambuf_iterator<charT,traits>::`*`proxy`* is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_-iterator<charT, traits>::`*`proxy`* provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```
namespace std {
  template<class charT, class traits>
  class istreambuf_iterator<charT, traits>::proxy { // exposition only
    charT keep_;
    basic_streambuf<charT,traits>* sbuf_;
    proxy(charT c, basic_streambuf<charT,traits>* sbuf)
      : keep_(c), sbuf_(sbuf) { }
  public:
    charT operator*() { return keep_; }
  };
}
```

24.6.4.3 Constructors [istreambuf.iterator.cons]

1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```
constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
```

2 *Effects*: Initializes `sbuf_` with `nullptr`.

```
istreambuf_iterator(istream_type& s) noexcept;
```

3 *Effects*: Initializes `sbuf_` with `s.rdbuf()`.

```
istreambuf_iterator(streambuf_type* s) noexcept;
```

4 *Effects*: Initializes `sbuf_` with `s`.

```
istreambuf_iterator(const proxy& p) noexcept;
```

5 *Effects*: Initializes `sbuf_` with `p.sbuf_`.

24.6.4.4 Operations [istreambuf.iterator.ops]

```
charT operator*() const;
```

1 *Returns*: The character obtained via the `streambuf` member `sbuf_->sgetc()`.

```
istreambuf_iterator& operator++();
```

2 *Effects*: As if by `sbuf_->sbumpc()`.

3 *Returns*: `*this`.

```
proxy operator++(int);
```

4 *Returns*: `proxy(sbuf_->sbumpc(), sbuf_)`.

```
bool equal(const istreambuf_iterator& b) const;
```

5 *Returns*: `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```
template<class charT, class traits>
  bool operator==(const istreambuf_iterator<charT,traits>& a,
                  const istreambuf_iterator<charT,traits>& b);
```

6 *Returns*: `a.equal(b)`.

```
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

7 *Returns*: `i.equal(s)`.

24.6.5 Class template `ostreambuf_iterator` [ostreambuf.iterator]

24.6.5.1 General [ostreambuf.iterator.general]

1 The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed.

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class ostreambuf_iterator {
  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using char_type         = charT;
    using traits_type       = traits;
    using streambuf_type    = basic_streambuf<charT,traits>;
    using ostream_type      = basic_ostream<charT,traits>;

    ostreambuf_iterator(ostream_type& s) noexcept;
    ostreambuf_iterator(streambuf_type* s) noexcept;
    ostreambuf_iterator& operator=(charT c);

    ostreambuf_iterator& operator*();
    ostreambuf_iterator& operator++();
    ostreambuf_iterator& operator++(int);
    bool failed() const noexcept;

  private:
    streambuf_type* sbuf_;                // exposition only
  };
}
```

24.6.5.2 Constructors [ostreambuf.iter.cons]

```
ostreambuf_iterator(ostream_type& s) noexcept;
```

1 *Preconditions*: `s.rdbuf()` is not a null pointer.

2 *Effects*: Initializes `sbuf_` with `s.rdbuf()`.

```
ostreambuf_iterator(streambuf_type* s) noexcept;
```

3 *Preconditions*: `s` is not a null pointer.

4 *Effects*: Initializes `sbuf_` with `s`.

24.6.5.3 Operations [ostreambuf.iter.ops]

```
ostreambuf_iterator& operator=(charT c);
```

1 *Effects*: If `failed()` yields `false`, calls `sbuf_->sputc(c)`; otherwise has no effect.

2 *Returns*: `*this`.

```
ostreambuf_iterator& operator*();
```

3 *Returns*: `*this`.

```
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
```

4 *Returns*: `*this`.

```
bool failed() const noexcept;
```

5 *Returns*: `true` if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or `false` otherwise.

24.7 Range access [iterator.range]

1 In addition to being available via inclusion of the `<iterator>` header, the function templates in 24.7 are available when any of the following headers are included: `<array>` (23.3.2), `<deque>` (23.3.4), `<flat_map>` (23.6.7), `<flat_set>` (23.6.10), `<forward_list>` (23.3.6), `<inplace_vector>` (23.3.15), `<list>` (23.3.10), `<map>` (23.4.2), `<regex>` (28.6.3), `<set>` (23.4.5), `<span>` (23.7.2.1), `<string>` (27.4.2), `<string_view>` (27.3.2), `<unordered_map>` (23.5.2), `<unordered_set>` (23.5.5), and `<vector>` (23.3.12).

```
template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
```

2 *Returns*: `c.begin()`.

```
template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
```

3 *Returns*: `c.end()`.

```
template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
```

4 *Returns*: `array`.

```
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
```

5 *Returns*: `array + N`.

```
template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
  -> decltype(std::begin(c));
```

6 *Returns*: `std::begin(c)`.

```
template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
  -> decltype(std::end(c));
```

7 *Returns*: `std::end(c)`.

```
template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
```

8 *Returns*: `c.rbegin()`.

```
template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
```

9 *Returns*: `c.rend()`.

```
template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
```

10 *Returns*: `reverse_iterator<T*>(array + N)`.

```
template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
```

11 *Returns*: `reverse_iterator<T*>(array)`.

```
template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
```

12 *Returns*: `reverse_iterator<const E*>(il.end())`.

```
template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
```

13 *Returns*: `reverse_iterator<const E*>(il.begin())`.

```
template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
```

14 *Returns*: `std::rbegin(c)`.

```
template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
```

15 *Returns*: `std::rend(c)`.

```
template<class C> constexpr auto size(const C& c) -> decltype(c.size());
```

16 *Returns*: `c.size()`.

```
template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
```

17 *Returns*: `N`.

```
template<class C> constexpr auto ssize(const C& c)
  -> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;
```

18 *Effects*: Equivalent to:

```
return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());
```

```
template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;
```

19 *Returns*: `N`.

```
template<class C> constexpr auto empty(const C& c) -> decltype(c.empty());
```

20 *Returns*: `c.empty()`.

```
template<class T, size_t N> constexpr bool empty(const T (&array)[N]) noexcept;
```

21 *Returns*: `false`.

```
template<class E> constexpr bool empty(initializer_list<E> il) noexcept;
```

22 *Returns*: `il.size() == 0`.

```
template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
```

23 *Returns*: `c.data()`.

```
template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
```

24 *Returns*: `array`.

```
template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
```

25 *Returns*: `il.begin()`.

25 Ranges library [ranges]

25.1 General [ranges.general]

1 This Clause describes components for dealing with ranges of elements.

2 The following subclauses describe range and view requirements, and components for range primitives and range generators as summarized in Table 82.

Table 82 — Ranges library summary [tab:range.summary]

	Subclause	Header
25.3	Range access	`<ranges>`
25.4	Requirements	
25.5	Range utilities	
25.6	Range factories	
25.7	Range adaptors	
25.8	Range generators	`<generator>`

25.2 Header `<ranges>` synopsis [ranges.syn]

```
// mostly freestanding
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2
#include <iterator>             // see 24.2

namespace std::ranges {

  template<input_range First, forward_range... Vs>
    requires (view<First> && ... && view<Vs>)
  class cartesian_product_view;

  namespace views { inline constexpr unspecified cartesian_product = unspecified; }

  // 25.7.34, cache latest view
  template<input_range V>
    requires view<V>
  class cache_latest_view;

  namespace views { inline constexpr unspecified cache_latest = unspecified; }

  // 25.7.35, to input view
  template<input_range V>
    requires view<V>
  class to_input_view;

  template<class V>
    constexpr bool enable_borrowed_range<to_input_view<V>> =
      enable_borrowed_range<V>;

  namespace views { inline constexpr unspecified to_input = unspecified; }
}

namespace std {
  namespace views = ranges::views;

  template<class T> struct tuple_size;
  template<size_t I, class T> struct tuple_element;
```

```
    template<class I, class S, ranges::subrange_kind K>
    struct tuple_size<ranges::subrange<I, S, K>>
      : integral_constant<size_t, 2> {};
    template<class I, class S, ranges::subrange_kind K>
    struct tuple_element<0, ranges::subrange<I, S, K>> {
      using type = I;
    };
    template<class I, class S, ranges::subrange_kind K>
    struct tuple_element<1, ranges::subrange<I, S, K>> {
      using type = S;
    };
    template<class I, class S, ranges::subrange_kind K>
    struct tuple_element<0, const ranges::subrange<I, S, K>> {
      using type = I;
    };
    template<class I, class S, ranges::subrange_kind K>
    struct tuple_element<1, const ranges::subrange<I, S, K>> {
      using type = S;
    };

    struct from_range_t { explicit from_range_t() = default; };
    inline constexpr from_range_t from_range{};
  }
```

1 Within this Clause, for an integer-like type `X` (24.3.4.4), *`make-unsigned-like-t`*`<X>` denotes `make_unsigned_t<X>` if `X` is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as `X`. For an expression `x` of type `X`, *`to-unsigned-like`*`(x)` is `x` explicitly converted to *`make-unsigned-like-t`*`<X>`.

2 Also within this Clause, *`make-signed-like-t`*`<X>` for an integer-like type `X` denotes `make_signed_t<X>` if `X` is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as `X`.

25.3 Range access [range.access]

25.3.1 General [range.access.general]

1 In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 25.3 are available when the header `<iterator>` (24.2) is included.

2 Within 25.3, the *reified object* of a subexpression `E` denotes

(2.1) — the same object as `E` if `E` is a glvalue, or

(2.2) — the result of applying the temporary materialization conversion (7.3.5) to `E` otherwise.

25.3.2 `ranges::begin` [range.access.begin]

1 The name `ranges::begin` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::begin(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::begin(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `T` is an array type, `ranges::begin(E)` is expression-equivalent to `t + 0`.

(2.4) — Otherwise, if `auto(t.begin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::begin(E)` is expression-equivalent to `auto(t.begin())`.

(2.5) — Otherwise, if `T` is a class or enumeration type and `auto(begin(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `begin` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::begin(E)` is expression-equivalent to that expression.

(2.6) — Otherwise, `ranges::begin(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::begin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

25.3.3 `ranges::end` [range.access.end]

1 The name `ranges::end` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::end(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `T` is an array of unknown bound, `ranges::end(E)` is ill-formed.

(2.4) — Otherwise, if `T` is an array, `ranges::end(E)` is expression-equivalent to `t + extent_v<T>`.

(2.5) — Otherwise, if `auto(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` then `ranges::end(E)` is expression-equivalent to `auto(t.end())`.

(2.6) — Otherwise, if `T` is a class or enumeration type and `auto(end(t))` is a valid expression whose type models `sentinel_for<iterator_t<T>>` where the meaning of `end` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::end(E)` is expression-equivalent to that expression.

(2.7) — Otherwise, `ranges::end(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::end(E)` is a valid expression, the types `S` and `I` of `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`. — *end note*]

25.3.4 `ranges::cbegin` [range.access.cbegin]

1 The name `ranges::cbegin` denotes a customization point object (16.3.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::cbegin(E)` is ill-formed.

(1.2) — Otherwise, let `U` be `ranges::begin(`*`possibly-const-range`*`(t))`. `ranges::cbegin(E)` is expression-equivalent to `const_iterator<decltype(U)>(U)`.

2 [*Note 1*: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator` and *`constant-iterator`*. — *end note*]

25.3.5 `ranges::cend` [range.access.cend]

1 The name `ranges::cend` denotes a customization point object (16.3.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::cend(E)` is ill-formed.

(1.2) — Otherwise, let `U` be `ranges::end(`*`possibly-const-range`*`(t))`. `ranges::cend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.

2 [*Note 1*: Whenever `ranges::cend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models *`constant-iterator`*. — *end note*]

25.3.6 `ranges::rbegin` [range.access.rbegin]

1 The name `ranges::rbegin` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::rbegin(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `rbegin` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rbegin(E)` is expression-equivalent to that expression.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (24.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.

(2.6) — Otherwise, `ranges::rbegin(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

25.3.7 `ranges::rend` [range.access.rend]

1 The name `ranges::rend` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::rend(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.rend())` is a valid expression whose type models `sentinel_for<decltype( ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rend(t))` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` where the meaning of `rend` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rend(E)` is expression-equivalent to that expression.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (24.3.4.12), then `ranges::rend(E)` is expression-equivalent to `make_reverse_iterator(ranges::begin(t))`.

(2.6) — Otherwise, `ranges::rend(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::rend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — *end note*]

25.3.8 `ranges::crbegin` [range.access.crbegin]

1 The name `ranges::crbegin` denotes a customization point object (16.3.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::crbegin(E)` is ill-formed.

(1.2) — Otherwise, let `U` be `ranges::rbegin(`*`possibly-const-range`*`(t))`. `ranges::crbegin(E)` is expression-equivalent to `const_iterator<decltype(U)>(U)`.

2 [*Note 1*: Whenever `ranges::crbegin(E)` is a valid expression, its type models `input_or_output_iterator` and *`constant-iterator`*. — *end note*]

25.3.9 `ranges::crend` [range.access.crend]

1 The name `ranges::crend` denotes a customization point object (16.3.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::crend(E)` is ill-formed.

(1.2) — Otherwise, let `U` be `ranges::rend(`*`possibly-const-range`*`(t))`. `ranges::crend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.

2 [*Note 1*: Whenever `ranges::crend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::crend(E)` and `ranges::crbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models *`constant-iterator`*. — *end note*]

25.3.10 `ranges::size` [range.prim.size]

1 The name `ranges::size` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `T` is an array of unknown bound (9.3.4.5), `ranges::size(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type, `ranges::size(E)` is expression-equivalent to `auto(extent_v<T>)`.

(2.3) — Otherwise, if `disable_sized_range<remove_cv_t<T>>` (25.4.3) is `false` and `auto(t.size())` is a valid expression of integer-like type (24.3.4.4), `ranges::size(E)` is expression-equivalent to `auto(t.size())`.

(2.4) — Otherwise, if `T` is a class or enumeration type, `disable_sized_range<remove_cv_t<T>>` is `false` and `auto(size(t))` is a valid expression of integer-like type where the meaning of `size` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::size(E)` is expression-equivalent to that expression.

(2.5) — Otherwise, if *`to-unsigned-like`*`(ranges::end(t) - ranges::begin(t))` (25.2) is a valid expression and the types `I` and `S` of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (24.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to *`to-unsigned-like`*`(ranges::end(t) - ranges::begin(t))`.

(2.6) — Otherwise, `ranges::size(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::size(E)` is a valid expression, its type is integer-like. — *end note*]

25.3.11 `ranges::ssize` [range.prim.ssize]

1 The name `ranges::ssize` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. If `ranges::size(t)` is ill-formed, `ranges::ssize(E)` is ill-formed. Otherwise let `D` be *`make-signed-like-t`*`<decltype(ranges::size(t))>`, or `ptrdiff_t` if it is wider than that type; `ranges::ssize(E)` is expression-equivalent to `static_cast<D>(ranges::size(t))`.

25.3.12 `ranges::reserve_hint` [range.prim.size.hint]

1 The name `ranges::reserve_hint` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `ranges::size(E)` is a valid expression, `ranges::reserve_hint(E)` is expression-equivalent to `ranges::size(E)`.

(2.2) — Otherwise, if `auto(t.reserve_hint())` is a valid expression of integer-like type (24.3.4.4), `ranges::reserve_hint(E)` is expression-equivalent to `auto(t.reserve_hint())`.

(2.3) — Otherwise, if `T` is a class or enumeration type and `auto(reserve_hint(t))` is a valid expression of integer-like type where the meaning of `reserve_hint` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::reserve_hint(E)` is expression-equivalent to that expression.

(2.4) — Otherwise, `ranges::reserve_hint(E)` is ill-formed.

[*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::reserve_hint(E)` appears in the immediate context of a template instantiation. — *end note*]

[*Note 2*: Whenever `ranges::reserve_hint(E)` is a valid expression, its type is integer-like. — *end note*]

25.3.13 Approximately sized ranges [range.approximately.sized]

1 The `approximately_sized_range` concept refines `range` with the requirement that an approximation of the number of elements in the range can be determined in amortized constant time using `ranges::reserve_hint`.

```
template<class T>
  concept approximately_sized_range =
    range<T> && requires(T& t) { ranges::reserve_hint(t); };
```

2 Given an lvalue `t` of type `remove_reference_t<T>`, `T` models `approximately_sized_range` only if

(2.1) — `ranges::reserve_hint(t)` is amortized $\mathcal{O}(1)$, does not modify `t`, and has a value that is not negative and is representable in `range_difference_t<T>`, and

(2.2) — if `iterator_t<T>` models `forward_iterator`, `ranges::reserve_hint(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

[*Note 1*: `ranges::reserve_hint(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, it is possible for `ranges::reserve_hint(t)` to be well-defined for an `approximately_sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t)`. — *end note*]

25.3.14 `ranges::empty` [range.prim.empty]

1 The name `ranges::empty` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `T` is an array of unknown bound (9.3.4.5), `ranges::empty(E)` is ill-formed.

(2.2) — Otherwise, if `bool(t.empty())` is a valid expression, `ranges::empty(E)` is expression-equivalent to `bool(t.empty())`.

(2.3) — Otherwise, if `(ranges::size(t) == 0)` is a valid expression, `ranges::empty(E)` is expression-equivalent to `(ranges::size(t) == 0)`.

(2.4) — Otherwise, if `bool(ranges::begin(t) == ranges::end(t))` is a valid expression and the type of `ranges::begin(t)` models `forward_iterator`, `ranges::empty(E)` is expression-equivalent to `bool(ranges::begin(t) == ranges::end(t))`.

(2.5) — Otherwise, `ranges::empty(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — *end note*]

25.3.15 `ranges::data` [range.prim.data]

1 The name `ranges::data` denotes a customization point object (16.3.3.3.5).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::data(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::data(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.data())` is a valid expression of pointer to object type, `ranges::data(E)` is expression-equivalent to `auto(t.data())`.

(2.4) — Otherwise, if `ranges::begin(t)` is a valid expression whose type models `contiguous_iterator`, `ranges::data(E)` is expression-equivalent to `to_address(ranges::begin(t))`.

(2.5) — Otherwise, `ranges::data(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type. — *end note*]

25.3.16 `ranges::cdata` [range.prim.cdata]

```
template<class T>
constexpr auto as-const-pointer(const T* p) noexcept { return p; }  // exposition only
```

1 The name `ranges::cdata` denotes a customization point object (16.3.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::cdata(E)` is ill-formed.

(1.2) — Otherwise, `ranges::cdata(E)` is expression-equivalent to *`as-const-pointer`*`(ranges::data(`*`possibly-const-range`*`(t)))`.

2 [*Note 1*: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to constant object type. — *end note*]

25.4 Range requirements [range.req]

25.4.1 General [range.req.general]

1 Ranges are an abstraction that allows a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `input_or_output_iterator` (24.3.4.6). Calling `ranges::end` on a range returns an object whose type `S`, together with the type `I` of the object returned by `ranges::begin`, models `sentinel_for<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

2 The `range` concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `sized_range` concept refines `range` with the requirement that `ranges::size` be amortized $\mathcal{O}(1)$. The `view` concept specifies requirements on a `range` type to provide operations with predictable complexity.

3 Several refinements of `range` group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `random_access_iterator` (24.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

25.4.2 Ranges [range.range]

1 The `range` concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```
template<class T>
  concept range =
    requires(T& t) {
      ranges::begin(t);          // sometimes equality-preserving (see below)
      ranges::end(t);
    };
```

2 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `range` only if

(2.1) — `[ranges::begin(t),ranges::end(t))` denotes a range (24.3.1),

(2.2) — both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and

(2.3) — if the type of `ranges::begin(t)` models `forward_iterator`, `ranges::begin(t)` is equality-preserving.

3 [*Note 1*: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a range whose iterator type models `forward_iterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `forward_iterator`, it is possible for repeated calls to not return equal values or to not be well-defined. — *end note*]

```
template<class T>
  concept borrowed_range =
    range<T> && (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

4 Let `U` be `remove_reference_t<T>` if `T` is an rvalue reference type, and `T` otherwise. Given a variable `u` of type `U`, `T` models `borrowed_range` only if the validity of iterators obtained from `u` is not tied to the lifetime of that variable.

5 [*Note 2*: Since the validity of iterators is not tied to the lifetime of a variable whose type models `borrowed_range`, a function with a parameter of such a type can return iterators obtained from it without danger of dangling. — *end note*]

```
template<class>
  constexpr bool enable_borrowed_range = false;
```

6 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_borrowed_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

7 [*Example 1*: Each specialization `S` of class template `subrange` (25.5.4) models `borrowed_range` because

(7.1) — `enable_borrowed_range<S>` is specialized to have the value `true`, and

(7.2) — `S`'s iterators do not have validity tied to the lifetime of an `S` object because they are "borrowed" from some other range.

— *end example*]

25.4.3 Sized ranges [range.sized]

1 The `sized_range` concept refines `approximately_sized_range` with the requirement that the number of elements in the range can be determined in amortized constant time using `ranges::size`.

```
template<class T>
  concept sized_range =
    approximately_sized_range<T> && requires(T& t) { ranges::size(t); };
```

2 Given an lvalue `t` of type `remove_reference_t<T>`, `T` models `sized_range` only if

(2.1) — `ranges::size(t)` is amortized $\mathcal{O}(1)$, does not modify `t`, and is equal to `ranges::distance( ranges::begin(t), ranges::end(t))`, and

(2.2) — if `iterator_t<T>` models `forward_iterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

[*Note 1*: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, it is possible for `ranges::size(t)` to be well-defined for a `sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t)`. — *end note*]

```
template<class>
  constexpr bool disable_sized_range = false;
```

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

4 [*Note 2*: `disable_sized_range` allows use of `range` types with the library that satisfy but do not in fact model `sized_range`. — *end note*]

25.4.4 Views [range.view]

1 The `view` concept specifies the requirements of a `range` type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (25.7).

```
template<class T>
  concept view =
    range<T> && movable<T> && enable_view<T>;
```

2 `T` models `view` only if

(2.1) — `T` has $\mathcal{O}(1)$ move construction; and

(2.2) — move assignment of an object of type `T` is no more complex than destruction followed by move construction; and

(2.3) — if N copies and/or moves are made from an object of type `T` that contained M elements, then those N objects have $\mathcal{O}(N + M)$ destruction; and

(2.4) — `copy_constructible<T>` is `false`, or `T` has $\mathcal{O}(1)$ copy construction; and

(2.5) — `copyable<T>` is `false`, or copy assignment of an object of type `T` is no more complex than destruction followed by copy construction.

3 [*Note 1*: The constraints on copying and moving imply that a moved-from object of type `T` has $\mathcal{O}(1)$ destruction. — *end note*]

4 [*Example 1*: Examples of views are:

(4.1) — A `range` type that wraps a pair of iterators.

(4.2) — A `range` type that holds its elements by `shared_ptr` and shares ownership with all its copies.

(4.3) — A `range` type that generates its elements on demand.

A container such as `vector<string>` does not meet the semantic requirements of `view` since copying the container copies all of the elements, which cannot be done in constant time. — *end example*]

5 Since the difference between `range` and `view` is largely semantic, the two are differentiated with the help of `enable_view`.

```
template<class T>
  constexpr bool is-derived-from-view-interface = see below;            // exposition only
template<class T>
  constexpr bool enable_view =
    derived_from<T, view_base> || is-derived-from-view-interface<T>;
```

6 For a type `T`, *`is-derived-from-view-interface`*`<T>` is `true` if and only if `T` has exactly one public base class `view_interface<U>` for some type `U` and `T` has no base classes of type `view_interface<V>` for any other type `V`.

7 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_view` to `true` for cv-unqualified program-defined types that model `view`, and `false` for types that do not. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

25.4.5 Other range refinements [range.refinements]

1 The `output_range` concept specifies requirements of a `range` type for which `ranges::begin` returns a model of `output_iterator` (24.3.4.10). `input_range`, `forward_range`, `bidirectional_range`, and `random_access_-range` are defined similarly.

```
template<class R, class T>
  concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;

template<class T>
  concept input_range =
    range<T> && input_iterator<iterator_t<T>>;

template<class T>
  concept forward_range =
    input_range<T> && forward_iterator<iterator_t<T>>;

template<class T>
  concept bidirectional_range =
    forward_range<T> && bidirectional_iterator<iterator_t<T>>;

template<class T>
  concept random_access_range =
    bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

2 `contiguous_range` additionally requires that the `ranges::data` customization point object (25.3.15) is usable with the range.

```
template<class T>
  concept contiguous_range =
    random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
    requires(T& t) {
      { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
    };
```

3 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `contiguous_range` only if `to_address(ranges::begin(t)) == ranges::data(t)` is `true`.

4 The `common_range` concept specifies requirements of a `range` type for which `ranges::begin` and `ranges::end` return objects of the same type.

[*Example 1*: The standard containers (Clause 23) model `common_range`. — *end example*]

```
template<class T>
  concept common_range =
    range<T> && same_as<iterator_t<T>, sentinel_t<T>>;

template<class R>
  constexpr bool is-initializer-list = see below;                // exposition only
```

5 For a type `R`, *`is-initializer-list`*`<R>` is `true` if and only if `remove_cvref_t<R>` is a specialization of `initializer_list`.

6 The `viewable_range` concept specifies the requirements of a `range` type that can be converted to a view safely.

```
template<class T>
  concept viewable_range =
    range<T> &&
    ((view<remove_cvref_t<T>> && constructible_from<remove_cvref_t<T>, T>) ||
     (!view<remove_cvref_t<T>> &&
      (is_lvalue_reference_v<T> || (movable<remove_reference_t<T>> && !is-initializer-list<T>))));
```

7 The `constant_range` concept specifies the requirements of a `range` type whose elements are not modifiable.

```
template<class T>
  concept constant_range =
    input_range<T> && constant-iterator<iterator_t<T>>;
```

25.5 Range utilities [range.utility]

25.5.1 General [range.utility.general]

1 The components in 25.5 are general utilities for representing and manipulating ranges.

25.5.2 Helper concepts [range.utility.helpers]

1 Many of the types in 25.5 are specified in terms of the following exposition-only concepts:

```
template<class R>
  concept simple-view =                                   // exposition only
    view<R> && range<const R> &&
    same_as<iterator_t<R>, iterator_t<const R>> &&
    same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
  concept has-arrow =                                     // exposition only
    input_iterator<I> && (is_pointer_v<I> || requires(const I i) { i.operator->(); });

template<class T, class U>
  concept different-from =                                // exposition only
    !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;

template<class R>
  concept range-with-movable-references =                 // exposition only
    input_range<R> && move_constructible<range_reference_t<R>> &&
    move_constructible<range_rvalue_reference_t<R>>;
```

25.5.3 View interface [view.interface]

25.5.3.1 General [view.interface.general]

1 The class template `view_interface` is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```
namespace std::ranges {
  template<class D>
    requires is_class_v<D> && same_as<D, remove_cv_t<D>>
  class view_interface {
  private:
    constexpr D& derived() noexcept {                 // exposition only
```

```
      return static_cast<D&>(*this);
    }
    constexpr const D& derived() const noexcept {    // exposition only
      return static_cast<const D&>(*this);
    }

  public:
    constexpr bool empty() requires sized_range<D> || forward_range<D> {
      if constexpr (sized_range<D>)
        return ranges::size(derived()) == 0;
      else
        return ranges::begin(derived()) == ranges::end(derived());
    }
    constexpr bool empty() const requires sized_range<const D> || forward_range<const D> {
      if constexpr (sized_range<const D>)
        return ranges::size(derived()) == 0;
      else
        return ranges::begin(derived()) == ranges::end(derived());
    }

    constexpr auto cbegin() requires input_range<D> {
      return ranges::cbegin(derived());
    }
    constexpr auto cbegin() const requires input_range<const D> {
      return ranges::cbegin(derived());
    }
    constexpr auto cend() requires input_range<D> {
      return ranges::cend(derived());
    }
    constexpr auto cend() const requires input_range<const D> {
      return ranges::cend(derived());
    }

    constexpr explicit operator bool()
      requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }
    constexpr explicit operator bool() const
      requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }

    constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
      return to_address(ranges::begin(derived()));
    }
    constexpr auto data() const
      requires range<const D> && contiguous_iterator<iterator_t<const D>> {
        return to_address(ranges::begin(derived()));
      }

    constexpr auto size() requires forward_range<D> &&
      sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
        return to-unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
      }
    constexpr auto size() const requires forward_range<const D> &&
      sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
        return to-unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
      }

    constexpr decltype(auto) front() requires forward_range<D>;
    constexpr decltype(auto) front() const requires forward_range<const D>;

    constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
    constexpr decltype(auto) back() const
      requires bidirectional_range<const D> && common_range<const D>;

    template<random_access_range R = D>
      constexpr decltype(auto) operator[](range_difference_t<R> n) {
        return ranges::begin(derived())[n];
      }
    template<random_access_range R = const D>
      constexpr decltype(auto) operator[](range_difference_t<R> n) const {
        return ranges::begin(derived())[n];
      }
  };
}
```

2 The template parameter `D` for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, `D` shall be complete, and model both `derived_from<view_interface<D>>` and `view`.

25.5.3.2 Members [view.interface.members]

```
constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;
```

1 *Preconditions*: `!empty()` is `true`.

2 *Effects*: Equivalent to: `return *ranges::begin(derived());`

```
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
  requires bidirectional_range<const D> && common_range<const D>;
```

3 *Preconditions*: `!empty()` is `true`.

4 *Effects*: Equivalent to: `return *ranges::prev(ranges::end(derived()));`

25.5.4 Sub-ranges [range.subrange]

25.5.4.1 General [range.subrange.general]

1 The `subrange` class template combines together an iterator and a sentinel into a single object that models the `view` concept. Additionally, it models the `sized_range` concept when the final template parameter is `subrange_kind::sized`.

```
namespace std::ranges {
  template<class From, class To>
    concept uses-nonqualification-pointer-conversion =       // exposition only
      is_pointer_v<From> && is_pointer_v<To> &&
      !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;

  template<class From, class To>
    concept convertible-to-non-slicing =                     // exposition only
      convertible_to<From, To> &&
      !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

  template<class T, class U, class V>
    concept pair-like-convertible-from =                     // exposition only
      !range<T> && !is_reference_v<T> && pair-like<T> &&
      constructible_from<T, U, V> &&
      convertible-to-non-slicing<U, tuple_element_t<0, T>> &&
      convertible_to<V, tuple_element_t<1, T>>;

  template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K =
      sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
    requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
  class subrange : public view_interface<subrange<I, S, K>> {
  private:
    static constexpr bool StoreSize =                        // exposition only
      K == subrange_kind::sized && !sized_sentinel_for<S, I>;
    I begin_ = I();                                           // exposition only
    S end_ = S();                                             // exposition only
    make-unsigned-like-t<iter_difference_t<I>> size_ = 0;     // exposition only; present only
                                                              // if StoreSize is true
  public:
    subrange() requires default_initializable<I> = default;

    constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

    constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
                       make-unsigned-like-t<iter_difference_t<I>> n)
      requires (K == subrange_kind::sized);

    template<different-from<subrange> R>
      requires borrowed_range<R> &&
               convertible-to-non-slicing<iterator_t<R>, I> &&
               convertible_to<sentinel_t<R>, S>
    constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);

    template<borrowed_range R>
      requires convertible-to-non-slicing<iterator_t<R>, I> &&
               convertible_to<sentinel_t<R>, S>
    constexpr subrange(R&& r, make-unsigned-like-t<iter_difference_t<I>> n)
      requires (K == subrange_kind::sized)
        : subrange{ranges::begin(r), ranges::end(r), n} {}

    template<different-from<subrange> PairLike>
      requires pair-like-convertible-from<PairLike, const I&, const S&>
    constexpr operator PairLike() const;

    constexpr I begin() const requires copyable<I>;
    constexpr I begin() requires (!copyable<I>);
    constexpr S end() const;

    constexpr bool empty() const;
    constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
      requires (K == subrange_kind::sized);

    constexpr subrange next(iter_difference_t<I> n = 1) const &
      requires forward_iterator<I>;
    constexpr subrange next(iter_difference_t<I> n = 1) &&;
    constexpr subrange prev(iter_difference_t<I> n = 1) const
      requires bidirectional_iterator<I>;
    constexpr subrange& advance(iter_difference_t<I> n);
  };

  template<input_or_output_iterator I, sentinel_for<I> S>
    subrange(I, S) -> subrange<I, S>;

  template<input_or_output_iterator I, sentinel_for<I> S>
    subrange(I, S, make-unsigned-like-t<iter_difference_t<I>>) ->
      subrange<I, S, subrange_kind::sized>;

  template<borrowed_range R>
    subrange(R&&) ->
      subrange<iterator_t<R>, sentinel_t<R>,
               (sized_range<R> || sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)
                 ? subrange_kind::sized : subrange_kind::unsized>;

  template<borrowed_range R>
    subrange(R&&, make-unsigned-like-t<range_difference_t<R>>) ->
      subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;
}
```

25.5.4.2 Constructors and conversions [range.subrange.ctor]

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
```

1 *Preconditions*: [i, s) is a valid range.

2 *Effects*: Initializes *begin_* with std::move(i) and *end_* with s.

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
                   make-unsigned-like-t<iter_difference_t<I>> n)
  requires (K == subrange_kind::sized);
```

3 *Preconditions*: [i, s) is a valid range, and n == *to-unsigned-like*(ranges::distance(i, s)) is true.

4 *Effects*: Initializes *begin_* with std::move(i) and *end_* with s. If *StoreSize* is true, initializes *size_* with n.

5 [*Note 1*: Accepting the length of the range and storing it to later return from size() enables subrange to model sized_range even when it stores an iterator and sentinel that do not model sized_sentinel_for. — *end note*]

```
template<different-from<subrange> R>
  requires borrowed_range<R> &&
           convertible-to-non-slicing<iterator_t<R>, I> &&
           convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6 *Effects*: Equivalent to:

(6.1) — If *StoreSize* is true, subrange(r, static_cast<decltype(*size_*)>(ranges::size(r))).

(6.2) — Otherwise, subrange(ranges::begin(r), ranges::end(r)).

```
template<different-from<subrange> PairLike>
  requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

7 *Effects*: Equivalent to: return PairLike(*begin_*, *end_*);

25.5.4.3 Accessors [range.subrange.access]

```
constexpr I begin() const requires copyable<I>;
```

1 *Effects*: Equivalent to: return *begin_*;

```
constexpr I begin() requires (!copyable<I>);
```

2 *Effects*: Equivalent to: return std::move(*begin_*);

```
constexpr S end() const;
```

3 *Effects*: Equivalent to: return *end_*;

```
constexpr bool empty() const;
```

4 *Effects*: Equivalent to: return *begin_* == *end_*;

```
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
  requires (K == subrange_kind::sized);
```

5 *Effects*:

(5.1) — If *StoreSize* is true, equivalent to: return *size_*;

(5.2) — Otherwise, equivalent to: return *to-unsigned-like*(*end_* - *begin_*);

```
constexpr subrange next(iter_difference_t<I> n = 1) const &
  requires forward_iterator<I>;
```

6 *Effects*: Equivalent to:

```
auto tmp = *this;
tmp.advance(n);
return tmp;
```

```
constexpr subrange next(iter_difference_t<I> n = 1) &&;
```

7 *Effects*: Equivalent to:

```
advance(n);
return std::move(*this);
```

```
constexpr subrange prev(iter_difference_t<I> n = 1) const
  requires bidirectional_iterator<I>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
tmp.advance(-n);
return tmp;
```

```
constexpr subrange& advance(iter_difference_t<I> n);
```

9 *Effects*: Equivalent to:

```
if constexpr (bidirectional_iterator<I>) {
  if (n < 0) {
    ranges::advance(begin_, n);
    if constexpr (StoreSize)
      size_ += to-unsigned-like(-n);
    return *this;
  }
}

auto d = n - ranges::advance(begin_, n, end_);
if constexpr (StoreSize)
  size_ -= to-unsigned-like(d);
return *this;
```

```
template<size_t N, class I, class S, subrange_kind K>
  requires ((N == 0 && copyable<I>) || N == 1)
  constexpr auto get(const subrange<I, S, K>& r);
template<size_t N, class I, class S, subrange_kind K>
  requires (N < 2)
  constexpr auto get(subrange<I, S, K>&& r);
```

10 *Effects*: Equivalent to:

```
if constexpr (N == 0)
  return r.begin();
else
  return r.end();
```

25.5.5 Dangling iterator handling [range.dangling]

1 The type `dangling` is used together with the template aliases `borrowed_iterator_t` and `borrowed_-subrange_t`. When an algorithm that typically returns an iterator into, or a subrange of, a range argument is called with an rvalue range argument that does not model `borrowed_range` (25.4.2), the return value possibly refers to a range whose lifetime has ended. In such cases, the type `dangling` is returned instead of an iterator or subrange.

```
namespace std::ranges {
  struct dangling {
    constexpr dangling() noexcept = default;
    constexpr dangling(auto&&...) noexcept {}
  };
}
```

2 [*Example 1*:

```
vector<int> f();
auto result1 = ranges::find(f(), 42);                          // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42);                          // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
```

```
auto result3 = ranges::find(ranges::subrange{vec}, 42);                // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);
```

The call to `ranges::find` at #1 returns `ranges::dangling` since `f()` is an rvalue `vector`; it is possible for the `vector` to be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue `vec` and specializations of `subrange` model `borrowed_range`. *— end example*]

3 For a type `R` that models `range`:

(3.1) — if `R` models `borrowed_range`, then `borrowed_iterator_t<R>` denotes `iterator_t<R>`, and `borrowed_subrange_t<R>` denotes `subrange<iterator_t<R>>`;

(3.2) — otherwise, both `borrowed_iterator_t<R>` and `borrowed_subrange_t<R>` denote `dangling`.

25.5.6 Class template `elements_of` [range.elementsof]

Specializations of `elements_of` encapsulate a range and act as a tag in overload sets to disambiguate when a range should be treated as a sequence rather than a single value.

[*Example 1*:

```
template<bool YieldElements>
generator<any> f(ranges::input_range auto&& r) {
  if constexpr (YieldElements)
    co_yield ranges::elements_of(r);        // yield each element of r
  else
    co_yield r;                             // yield r as a single value
}
```

— end example]

```
namespace std::ranges {
  template<range R, class Allocator = allocator<byte>>
  struct elements_of {
    [[no_unique_address]] R range;
    [[no_unique_address]] Allocator allocator = Allocator();
  };

  template<class R, class Allocator = allocator<byte>>
    elements_of(R&&, Allocator = Allocator()) -> elements_of<R&&, Allocator>;
}
```

25.5.7 Range conversions [range.utility.conv]

25.5.7.1 General [range.utility.conv.general]

1 The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a `from_range_t` tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.

2 `ranges::to` is applied recursively, allowing the conversion of a range of ranges.

[*Example 1*:

```
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();
// words is vector<string>{"the", "quick", "brown", "fox"}
```

— end example]

3 Let *`reservable-container`* be defined as follows:

```
template<class Container>
constexpr bool reservable-container =          // exposition only
  sized_range<Container> &&
  requires(Container& c, range_size_t<Container> n) {
    c.reserve(n);
    { c.capacity() } -> same_as<decltype(n)>;
    { c.max_size() } -> same_as<decltype(n)>;
  };
```

4 Let *`container-appendable`* be defined as follows:

```
template<class Container, class Ref>
constexpr bool container-appendable =           // exposition only
  requires(Container& c, Ref&& ref) {
    requires (requires { c.emplace_back(std::forward<Ref>(ref)); } ||
              requires { c.push_back(std::forward<Ref>(ref)); } ||
              requires { c.emplace(c.end(), std::forward<Ref>(ref)); } ||
              requires { c.insert(c.end(), std::forward<Ref>(ref)); });
  };
```

5 Let *container-append* be defined as follows:

```
template<class Container>
constexpr auto container-append(Container& c) {                    // exposition only
  return [&c]<class Ref>(Ref&& ref) {
    if constexpr (requires { c.emplace_back(declval<Ref>()); })
      c.emplace_back(std::forward<Ref>(ref));
    else if constexpr (requires { c.push_back(declval<Ref>()); })
      c.push_back(std::forward<Ref>(ref));
    else if constexpr (requires { c.emplace(c.end(), declval<Ref>()); })
      c.emplace(c.end(), std::forward<Ref>(ref));
    else
      c.insert(c.end(), std::forward<Ref>(ref));
  };
}
```

25.5.7.2 ranges::to [range.utility.conv.to]

```
template<class C, input_range R, class... Args> requires (!view<C>)
  constexpr C to(R&& r, Args&&... args);
```

1 *Mandates*: `C` is a cv-unqualified class type.

2 *Returns*: An object of type `C` constructed from the elements of `r` in the following manner:

(2.1) — If `C` does not satisfy `input_range` or `convertible_to<range_reference_t<R>, range_value_t<C>>` is `true`:

(2.1.1) — If `constructible_from<C, R, Args...>` is `true`:

```
C(std::forward<R>(r), std::forward<Args>(args)...)
```

(2.1.2) — Otherwise, if `constructible_from<C, from_range_t, R, Args...>` is `true`:

```
C(from_range, std::forward<R>(r), std::forward<Args>(args)...)
```

(2.1.3) — Otherwise, if

(2.1.3.1) — `common_range<R>` is `true`,

(2.1.3.2) — the *qualified-id* `iterator_traits<iterator_t<R>>::iterator_category` is valid and denotes a type that models `derived_from<input_iterator_tag>`, and

(2.1.3.3) — `constructible_from<C, iterator_t<R>, sentinel_t<R>, Args...>` is `true`:

```
C(ranges::begin(r), ranges::end(r), std::forward<Args>(args)...)
```

(2.1.4) — Otherwise, if

(2.1.4.1) — `constructible_from<C, Args...>` is `true`, and

(2.1.4.2) — *container-appendable*`<C, range_reference_t<R>>` is `true`:

```
C c(std::forward<Args>(args)...);
if constexpr (approximately_sized_range<R> && reservable-container<C>)
  c.reserve(static_cast<range_size_t<C>>(ranges::reserve_hint(r)));
ranges::for_each(r, container-append(c));
```

(2.1.5) — Otherwise, the program is ill-formed.

(2.2) — Otherwise, if `input_range<range_reference_t<R>>` is `true`:

```
to<C>(ref_view(r) | views::transform([](auto&& elem) {
  return to<range_value_t<C>>(std::forward<decltype(elem)>(elem));
}), std::forward<Args>(args)...);
```

(2.3) — Otherwise, the program is ill-formed.

```
template<template<class...> class C, input_range R, class... Args>
  constexpr auto to(R&& r, Args&&... args);
```

3 Let *input-iterator* be an exposition-only type:

```
struct input-iterator {                              // exposition only
  using iterator_category = input_iterator_tag;
  using value_type = range_value_t<R>;
  using difference_type = ptrdiff_t;
  using pointer = add_pointer_t<range_reference_t<R>>;
  using reference = range_reference_t<R>;
  reference operator*() const;
  pointer operator->() const;
  input-iterator& operator++();
  input-iterator operator++(int);
  bool operator==(const input-iterator&) const;
};
```

[*Note 1*: `input-iterator` meets the syntactic requirements of *Cpp17InputIterator*. — *end note*]

4 Let *DEDUCE_EXPR* be defined as follows:

(4.1) — `C(declval<R>(), declval<Args>()...)` if that is a valid expression,

(4.2) — otherwise, `C(from_range, declval<R>(), declval<Args>()...)` if that is a valid expression,

(4.3) — otherwise,

```
C(declval<input-iterator>(), declval<input-iterator>(), declval<Args>()...)
```

if that is a valid expression,

(4.4) — otherwise, the program is ill-formed.

5 *Returns*: `to<decltype(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args)...)`.

25.5.7.3 `ranges::to` adaptors [range.utility.conv.adaptors]

```
template<class C, class... Args> requires (!view<C>)
  constexpr auto to(Args&&... args);
template<template<class...> class C, class... Args>
  constexpr auto to(Args&&... args);
```

1 *Mandates*: For the first overload, `C` is a cv-unqualified class type.

2 *Returns*: A range adaptor closure object (25.7.2) `f` that is a perfect forwarding call wrapper (22.10.4) with the following properties:

(2.1) — It has no target object.

(2.2) — Its bound argument entities `bound_args` consist of objects of types `decay_t<Args>...` direct-non-list-initialized with `std::forward<Args>(args)...`, respectively.

(2.3) — Its call pattern is `to<C>(r, bound_args...)`, where `r` is the argument used in a function call expression of `f`.

25.6 Range factories [range.factories]

25.6.1 General [range.factories.general]

1 Subclause 25.6 defines *range factories*, which are utilities to create a view.

2 Range factories are declared in namespace `std::ranges::views`.

25.6.2 Empty view [range.empty]

25.6.2.1 Overview [range.empty.overview]

1 `empty_view` produces a view of no elements of a particular type.

2 [*Example 1*:

```
auto e = views::empty<int>;
static_assert(ranges::empty(e));
static_assert(0 == e.size());
```

— *end example*]

25.6.2.2 Class template `empty_view` [range.empty.view]

```
namespace std::ranges {
  template<class T>
    requires is_object_v<T>
  class empty_view : public view_interface<empty_view<T>> {
  public:
    static constexpr T* begin() noexcept { return nullptr; }
    static constexpr T* end() noexcept { return nullptr; }
    static constexpr T* data() noexcept { return nullptr; }
    static constexpr size_t size() noexcept { return 0; }
    static constexpr bool empty() noexcept { return true; }
  };
}
```

25.6.3 Single view [range.single]

25.6.3.1 Overview [range.single.overview]

1 `single_view` produces a view that contains exactly one element of a specified value.

2 The name `views::single` denotes a customization point object (16.3.3.3.5). Given a subexpression `E`, the expression `views::single(E)` is expression-equivalent to `single_view<decay_t<decltype((E))>>(E)`.

3 [*Example 1*:

```
for (int i : views::single(4))
  cout << i;          // prints 4
```

— *end example*]

25.6.3.2 Class template `single_view` [range.single.view]

```
namespace std::ranges {
  template<move_constructible T>
    requires is_object_v<T>
  class single_view : public view_interface<single_view<T>> {
  private:
    movable-box<T> value_;              // exposition only (see 25.7.3)

  public:
    single_view() requires default_initializable<T> = default;
    constexpr explicit single_view(const T& t) requires copy_constructible<T>;
    constexpr explicit single_view(T&& t);
    template<class... Args>
      requires constructible_from<T, Args...>
    constexpr explicit single_view(in_place_t, Args&&... args);

    constexpr T* begin() noexcept;
    constexpr const T* begin() const noexcept;
    constexpr T* end() noexcept;
    constexpr const T* end() const noexcept;
    static constexpr bool empty() noexcept;
    static constexpr size_t size() noexcept;
    constexpr T* data() noexcept;
    constexpr const T* data() const noexcept;
  };

  template<class T>
    single_view(T) -> single_view<T>;
}
```

```
constexpr explicit single_view(const T& t) requires copy_constructible<T>;
```

1 *Effects*: Initializes *`value_`* with `t`.

```
constexpr explicit single_view(T&& t);
```

2 *Effects*: Initializes *`value_`* with `std::move(t)`.

```
template<class... Args>
  requires constructible_from<T, Args...>
constexpr explicit single_view(in_place_t, Args&&... args);
```

3 *Effects*: Initializes *value_* as if by *value_*`{in_place, std::forward<Args>(args)...}`.

```
constexpr T* begin() noexcept;
constexpr const T* begin() const noexcept;
```

4 *Effects*: Equivalent to: `return data();`

```
constexpr T* end() noexcept;
constexpr const T* end() const noexcept;
```

5 *Effects*: Equivalent to: `return data() + 1;`

```
static constexpr bool empty() noexcept;
```

6 *Effects*: Equivalent to: `return false;`

```
static constexpr size_t size() noexcept;
```

7 *Effects*: Equivalent to: `return 1;`

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

8 *Effects*: Equivalent to: `return` *value_*`.operator->();`

25.6.4 Iota view [range.iota]

25.6.4.1 Overview [range.iota.overview]

1 `iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

2 The name `views::iota` denotes a customization point object (16.3.3.3.5). Given subexpressions `E` and `F`, the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view<decay_t<decltype((E))>>(E)` and `iota_view(E, F)`, respectively.

3 [*Example 1*:

```
for (int i : views::iota(1, 10))
  cout << i << ' '; // prints 1 2 3 4 5 6 7 8 9
```

— *end example*]

25.6.4.2 Class template iota_view [range.iota.view]

```
namespace std::ranges {
  template<class I>
    concept decrementable = see below;    // exposition only

  template<class I>
    concept advanceable = see below;      // exposition only

  template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
  class iota_view : public view_interface<iota_view<W, Bound>> {
  private:
    // 25.6.4.3, class iota_view::iterator
    struct iterator;                      // exposition only

    // 25.6.4.4, class iota_view::sentinel
    struct sentinel;                      // exposition only

    W value_ = W();                       // exposition only
    Bound bound_ = Bound();               // exposition only

  public:
    iota_view() requires default_initializable<W> = default;
    constexpr explicit iota_view(W value);
    constexpr explicit iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
    constexpr explicit iota_view(iterator first, see below last);

    constexpr iterator begin() const;
    constexpr auto end() const;
    constexpr iterator end() const requires same_as<W, Bound>;

    constexpr bool empty() const;
    constexpr auto size() const requires see below;
  };

  template<class W, class Bound>
    requires (!is-integer-like<W> || !is-integer-like<Bound> ||
              (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
    iota_view(W, Bound) -> iota_view<W, Bound>;
}
```

1 Let *`IOTA-DIFF-T`*`(W)` be defined as follows:

(1.1) — If `W` is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<W>)` is greater than `sizeof(W)`, then *`IOTA-DIFF-T`*`(W)` denotes `iter_difference_t<W>`.

(1.2) — Otherwise, *`IOTA-DIFF-T`*`(W)` is a signed integer type of width greater than the width of `W` if such a type exists.

(1.3) — Otherwise, *`IOTA-DIFF-T`*`(W)` is an unspecified signed-integer-like type (24.3.4.4) of width not less than the width of `W`.

[*Note 1*: It is unspecified whether this type satisfies `weakly_incrementable`. — *end note*]

2 The exposition-only *`decrementable`* concept is equivalent to:

```
template<class I>
  concept decrementable =                  // exposition only
    incrementable<I> && requires(I i) {
      { --i } -> same_as<I&>;
      { i-- } -> same_as<I>;
    };
```

3 When an object is in the domain of both pre- and post-decrement, the object is said to be *decrementable*.

4 Let `a` and `b` be equal objects of type `I`. `I` models *`decrementable`* only if

(4.1) — If `a` and `b` are decrementable, then the following are all true:

(4.1.1) — `addressof(--a) == addressof(a)`

(4.1.2) — `bool(a-- == b)`

(4.1.3) — `bool(((void)a--, a) == --b)`

(4.1.4) — `bool(++(--a) == b)`.

(4.2) — If `a` and `b` are incrementable, then `bool(--(++a) == b)`.

5 The exposition-only *`advanceable`* concept is equivalent to:

```
template<class I>
  concept advanceable =                    // exposition only
    decrementable<I> && totally_ordered<I> &&
    requires(I i, const I j, const IOTA-DIFF-T(I) n) {
      { i += n } -> same_as<I&>;
      { i -= n } -> same_as<I&>;
      I(j + n);
      I(n + j);
      I(j - n);
      { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
    };
```

Let `D` be *`IOTA-DIFF-T`*`(I)`. Let `a` and `b` be objects of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, for some value `n` of type `D`. `I` models *`advanceable`* only if

(5.1) — `(a += n)` is equal to `b`.

(5.2) — `addressof(a += n)` is equal to `addressof(a)`.

(5.3) — `I(a + n)` is equal to `(a += n)`.

(5.4) — For any two positive values `x` and `y` of type `D`, if `I(a + D(x + y))` is well-defined, then `I(a + D(x + y))` is equal to `I(I(a + x) + y)`.

(5.5) — `I(a + D(0))` is equal to `a`.

(5.6) — If `I(a + D(n - 1))` is well-defined, then `I(a + n)` is equal to `[](I c) { return ++c; }(I(a + D(n - 1)))`.

(5.7) — `(b += -n)` is equal to `a`.

(5.8) — `(b -= n)` is equal to `a`.

(5.9) — `addressof(b -= n)` is equal to `addressof(b)`.

(5.10) — `I(b - n)` is equal to `(b -= n)`.

(5.11) — `D(b - a)` is equal to `n`.

(5.12) — `D(a - b)` is equal to `D(-n)`.

(5.13) — `bool(a <= b)` is `true`.

```
constexpr explicit iota_view(W value);
```

6 *Preconditions*: `Bound` denotes `unreachable_sentinel_t` or `Bound()` is reachable from `value`. When `W` and `Bound` model `totally_ordered_with`, then `bool(value <= Bound())` is `true`.

7 *Effects*: Initializes *`value_`* with `value`.

```
constexpr explicit iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

8 *Preconditions*: `Bound` denotes `unreachable_sentinel_t` or `bound` is reachable from `value`. When `W` and `Bound` model `totally_ordered_with`, then `bool(value <= bound)` is `true`.

9 *Effects*: Initializes *`value_`* with `value` and *`bound_`* with `bound`.

```
constexpr explicit iota_view(iterator first, see below last);
```

10 *Effects*: Equivalent to:

(10.1) — If `same_as<W, Bound>` is `true`, `iota_view(first.value_, last.value_)`.

(10.2) — Otherwise, if `Bound` denotes `unreachable_sentinel_t`, `iota_view(first.value_, last)`.

(10.3) — Otherwise, `iota_view(first.value_, last.bound_)`.

11 *Remarks*: The type of `last` is:

(11.1) — If `same_as<W, Bound>` is `true`, *`iterator`*.

(11.2) — Otherwise, if `Bound` denotes `unreachable_sentinel_t`, `Bound`.

(11.3) — Otherwise, *`sentinel`*.

```
constexpr iterator begin() const;
```

12 *Effects*: Equivalent to: `return iterator{value_};`

```
constexpr auto end() const;
```

13 *Effects*: Equivalent to:

```
if constexpr (same_as<Bound, unreachable_sentinel_t>)
  return unreachable_sentinel;
else
  return sentinel{bound_};
```

```
constexpr iterator end() const requires same_as<W, Bound>;
```

14 *Effects*: Equivalent to: `return iterator{bound_};`

```
constexpr bool empty() const;
```

15 *Effects*: Equivalent to: `return value_ == bound_;`

```
constexpr auto size() const requires see below;
```

16 *Effects*: Equivalent to:

```
if constexpr (is-integer-like<W> && is-integer-like<Bound>)
  return (value_ < 0)
    ? ((bound_ < 0)
      ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
      : to-unsigned-like(bound_) + to-unsigned-like(-value_))
    : to-unsigned-like(bound_) - to-unsigned-like(value_);
else
  return to-unsigned-like(bound_ - value_);
```

17 *Remarks*: The expression in the *requires-clause* is equivalent to:

```
(same_as<W, Bound> && advanceable<W>) || (is-integer-like<W> && is-integer-like<Bound>) ||
  sized_sentinel_for<Bound, W>
```

25.6.4.3 Class iota_view::*iterator* [range.iota.iterator]

```
namespace std::ranges {
  template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
  struct iota_view<W, Bound>::iterator {
  private:
    W value_ = W();             // exposition only

  public:
    using iterator_concept = see below;
    using iterator_category = input_iterator_tag;       // present only if W models incrementable and
                                                        // IOTA-DIFF-T(W) is an integral type
    using value_type = W;
    using difference_type = IOTA-DIFF-T(W);

    iterator() requires default_initializable<W> = default;
    constexpr explicit iterator(W value);

    constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires incrementable<W>;

    constexpr iterator& operator--() requires decrementable<W>;
    constexpr iterator operator--(int) requires decrementable<W>;

    constexpr iterator& operator+=(difference_type n)
      requires advanceable<W>;
    constexpr iterator& operator-=(difference_type n)
      requires advanceable<W>;
    constexpr W operator[](difference_type n) const
      requires advanceable<W>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<W>;

    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires totally_ordered<W>;
    friend constexpr bool operator>(const iterator& x, const iterator& y)
      requires totally_ordered<W>;
    friend constexpr bool operator<=(const iterator& x, const iterator& y)
      requires totally_ordered<W>;
    friend constexpr bool operator>=(const iterator& x, const iterator& y)
      requires totally_ordered<W>;
    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires totally_ordered<W> && three_way_comparable<W>;
    friend constexpr iterator operator+(iterator i, difference_type n)
      requires advanceable<W>;
    friend constexpr iterator operator+(difference_type n, iterator i)
      requires advanceable<W>;

    friend constexpr iterator operator-(iterator i, difference_type n)
      requires advanceable<W>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires advanceable<W>;
  };
}
```

1 *`iterator`*`::iterator_concept` is defined as follows:

(1.1) — If `W` models *`advanceable`*, then `iterator_concept` is `random_access_iterator_tag`.

(1.2) — Otherwise, if `W` models *`decrementable`*, then `iterator_concept` is `bidirectional_iterator_tag`.

(1.3) — Otherwise, if `W` models `incrementable`, then `iterator_concept` is `forward_iterator_tag`.

(1.4) — Otherwise, `iterator_concept` is `input_iterator_tag`.

2 [*Note 1*: Overloads for `iter_move` and `iter_swap` are omitted intentionally. — *end note*]

```
constexpr explicit iterator(W value);
```

3 *Effects*: Initializes *`value_`* with `value`.

```
constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
```

4 *Effects*: Equivalent to: `return value_;`

5 [*Note 2*: The `noexcept` clause is needed by the default `iter_move` implementation. — *end note*]

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++value_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires incrementable<W>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires decrementable<W>;
```

9 *Effects*: Equivalent to:

```
--value_;
return *this;
```

```
constexpr iterator operator--(int) requires decrementable<W>;
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type n)
  requires advanceable<W>;
```

11 *Effects*: Equivalent to:

```
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
  if (n >= difference_type(0))
    value_ += static_cast<W>(n);
```

```
      else
        value_ -= static_cast<W>(-n);
    } else {
      value_ += n;
    }
    return *this;
```

```
constexpr iterator& operator-=(difference_type n)
  requires advanceable<W>;
```

12 *Effects*: Equivalent to:

```
    if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
      if (n >= difference_type(0))
        value_ -= static_cast<W>(n);
      else
        value_ += static_cast<W>(-n);
    } else {
      value_ -= n;
    }
    return *this;
```

```
constexpr W operator[](difference_type n) const
  requires advanceable<W>;
```

13 *Effects*: Equivalent to: `return W(value_ + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<W>;
```

14 *Effects*: Equivalent to: `return x.value_ == y.value_;`

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

15 *Effects*: Equivalent to: `return x.value_ < y.value_;`

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

16 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

17 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

18 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires totally_ordered<W> && three_way_comparable<W>;
```

19 *Effects*: Equivalent to: `return x.value_ <=> y.value_;`

```
friend constexpr iterator operator+(iterator i, difference_type n)
  requires advanceable<W>;
```

20 *Effects*: Equivalent to:

```
    i += n;
    return i;
```

```
friend constexpr iterator operator+(difference_type n, iterator i)
  requires advanceable<W>;
```

21 *Effects*: Equivalent to: `return i + n;`

```
friend constexpr iterator operator-(iterator i, difference_type n)
  requires advanceable<W>;
```

22 *Effects*: Equivalent to:

```
i -= n;
return i;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires advanceable<W>;
```

23 *Effects*: Equivalent to:

```
using D = difference_type;
if constexpr (is-integer-like<W>) {
  if constexpr (is-signed-integer-like<W>)
    return D(D(x.value_) - D(y.value_));
  else
    return (y.value_ > x.value_)
      ? D(-D(y.value_ - x.value_))
      : D(x.value_ - y.value_);
} else {
  return x.value_ - y.value_;
}
```

25.6.4.4 Class iota_view::*sentinel* [range.iota.sentinel]

```
namespace std::ranges {
  template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
  struct iota_view<W, Bound>::sentinel {
  private:
    Bound bound_ = Bound();      // exposition only

  public:
    sentinel() = default;
    constexpr explicit sentinel(Bound bound);

    friend constexpr bool operator==(const iterator& x, const sentinel& y);

    friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
      requires sized_sentinel_for<Bound, W>;
    friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
      requires sized_sentinel_for<Bound, W>;
  };
}
```

```
constexpr explicit sentinel(Bound bound);
```

1 *Effects*: Initializes *bound_* with bound.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

2 *Effects*: Equivalent to: `return x.value_ == y.bound_;`

```
friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
  requires sized_sentinel_for<Bound, W>;
```

3 *Effects*: Equivalent to: `return x.value_ - y.bound_;`

```
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
  requires sized_sentinel_for<Bound, W>;
```

4 *Effects*: Equivalent to: `return -(y - x);`

25.6.5 Repeat view [range.repeat]

25.6.5.1 Overview [range.repeat.overview]

1 `repeat_view` generates a sequence of elements by repeatedly producing the same value.

2 The name `views::repeat` denotes a customization point object (16.3.3.3.5). Given subexpressions `E` and `F`, the expressions `views::repeat(E)` and `views::repeat(E, F)` are expression-equivalent to `repeat_view<decay_t<decltype((E))>>(E)` and `repeat_view(E, F)`, respectively.

3 [*Example 1*:

```
for (int i : views::repeat(17, 4))
  cout << i << ' ';
// prints 17 17 17 17
```

— *end example*]

25.6.5.2 Class template `repeat_view` [range.repeat.view]

```
namespace std::ranges {
  template<class T>
    concept integer-like-with-usable-difference-type =  // exposition only
      is-signed-integer-like<T> || (is-integer-like<T> && weakly_incrementable<T>);

  template<move_constructible T, semiregular Bound = unreachable_sentinel_t>
    requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
              (integer-like-with-usable-difference-type<Bound> ||
               same_as<Bound, unreachable_sentinel_t>))
  class repeat_view : public view_interface<repeat_view<T, Bound>> {
  private:
    // 25.6.5.3, class repeat_view::iterator
    struct iterator;                              // exposition only

    movable-box<T> value_;                        // exposition only, see 25.7.3
    Bound bound_ = Bound();                       // exposition only

  public:
    repeat_view() requires default_initializable<T> = default;

    constexpr explicit repeat_view(const T& value, Bound bound = Bound())
      requires copy_constructible<T>;
    constexpr explicit repeat_view(T&& value, Bound bound = Bound());
    template<class... TArgs, class... BoundArgs>
      requires constructible_from<T, TArgs...> &&
               constructible_from<Bound, BoundArgs...>
    constexpr explicit repeat_view(piecewise_construct_t,
      tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{});

    constexpr iterator begin() const;
    constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
    constexpr unreachable_sentinel_t end() const noexcept;

    constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);
  };

  template<class T, class Bound = unreachable_sentinel_t>
    repeat_view(T, Bound = Bound()) -> repeat_view<T, Bound>;
}
```

```
constexpr explicit repeat_view(const T& value, Bound bound = Bound())
  requires copy_constructible<T>;
```

1 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `bound` ≥ 0.

2 *Effects*: Initializes *`value_`* with `value` and *`bound_`* with `bound`.

```
constexpr explicit repeat_view(T&& value, Bound bound = Bound());
```

3 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `bound` ≥ 0.

4 *Effects*: Initializes *`value_`* with `std::move(value)` and *`bound_`* with `bound`.

```
template<class... TArgs, class... BoundArgs>
  requires constructible_from<T, TArgs...> &&
           constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
  tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{});
```

5 *Effects*: Initializes *`value_`* with `make_from_tuple<T>(std::move(value_args))` and initializes *`bound_`* with `make_from_tuple<Bound>(std::move(bound_args))`. The behavior is undefined if `Bound` is not `unreachable_sentinel_t` and *`bound_`* is negative.

```
constexpr iterator begin() const;
```

6 *Effects*: Equivalent to: `return` *`iterator`*`(addressof(*`*`value_`*`));`

```
constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
```

7 *Effects*: Equivalent to: `return` *`iterator`*`(addressof(*`*`value_`*`),` *`bound_`*`);`

```
constexpr unreachable_sentinel_t end() const noexcept;
```

8 *Effects*: Equivalent to: `return unreachable_sentinel;`

```
constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);
```

9 *Effects*: Equivalent to: `return` *`to-unsigned-like`*`(`*`bound_`*`);`

25.6.5.3 Class repeat_view::*iterator* [range.repeat.iterator]

```
namespace std::ranges {
  template<move_constructible T, semiregular Bound>
    requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
              (integer-like-with-usable-difference-type<Bound> ||
               same_as<Bound, unreachable_sentinel_t>))
  class repeat_view<T, Bound>::iterator {
  private:
    using index-type =                          // exposition only
      conditional_t<same_as<Bound, unreachable_sentinel_t>, ptrdiff_t, Bound>;
    const T* value_ = nullptr;                  // exposition only
    index-type current_ = index-type();         // exposition only

    constexpr explicit iterator(const T* value, index-type b = index-type());    // exposition only

  public:
    using iterator_concept = random_access_iterator_tag;
    using iterator_category = random_access_iterator_tag;
    using value_type = T;
    using difference_type = see below;

    iterator() = default;

    constexpr const T& operator*() const noexcept;

    constexpr iterator& operator++();
    constexpr iterator operator++(int);

    constexpr iterator& operator--();
    constexpr iterator operator--(int);

    constexpr iterator& operator+=(difference_type n);
    constexpr iterator& operator-=(difference_type n);
    constexpr const T& operator[](difference_type n) const noexcept;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr auto operator<=>(const iterator& x, const iterator& y);

    friend constexpr iterator operator+(iterator i, difference_type n);
    friend constexpr iterator operator+(difference_type n, iterator i);
```

```
      friend constexpr iterator operator-(iterator i, difference_type n);
      friend constexpr difference_type operator-(const iterator& x, const iterator& y);
    };
  }
```

1 If `is-signed-integer-like<index-type>` is `true`, the member *typedef-name* `difference_type` denotes `index-type`. Otherwise, it denotes `IOTA-DIFF-T(index-type)` (25.6.4.2).

```
constexpr explicit iterator(const T* value, index-type b = index-type());
```

2 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `b` ≥ 0.

3 *Effects*: Initializes `value_` with `value` and `current_` with `b`.

```
constexpr const T& operator*() const noexcept;
```

4 *Effects*: Equivalent to: `return *value_;`

```
constexpr iterator& operator++();
```

5 *Effects*: Equivalent to:

```
++current_;
return *this;
```

```
constexpr iterator operator++(int);
```

6 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--();
```

7 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `current_` > 0.

8 *Effects*: Equivalent to:

```
--current_;
return *this;
```

```
constexpr iterator operator--(int);
```

9 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type n);
```

10 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `current_` $+$ `n` ≥ 0.

11 *Effects*: Equivalent to:

```
current_ += n;
return *this;
```

```
constexpr iterator& operator-=(difference_type n);
```

12 *Preconditions*: If `Bound` is not `unreachable_sentinel_t`, `current_` $-$ `n` ≥ 0.

13 *Effects*: Equivalent to:

```
current_ -= n;
return *this;
```

```
constexpr const T& operator[](difference_type n) const noexcept;
```

14 *Effects*: Equivalent to: `return *(*this + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

15 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y);
```

16 *Effects*: Equivalent to: `return x.current_ <=> y.current_;`

```
friend constexpr iterator operator+(iterator i, difference_type n);
friend constexpr iterator operator+(difference_type n, iterator i);
```

17 *Effects*: Equivalent to:

```
i += n;
return i;
```

```
friend constexpr iterator operator-(iterator i, difference_type n);
```

18 *Effects*: Equivalent to:

```
i -= n;
return i;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y);
```

19 *Effects*: Equivalent to:

```
return static_cast<difference_type>(x.current_) - static_cast<difference_type>(y.current_);
```

25.6.6 Istream view [range.istream]

25.6.6.1 Overview [range.istream.overview]

1 `basic_istream_view` models `input_range` and reads (using `operator>>`) successive elements from its corresponding input stream.

2 The name `views::istream<T>` denotes a customization point object (16.3.3.3.5). Given a type `T` and a subexpression `E` of type `U`, if `U` models `derived_from<basic_istream<typename U::char_type, typename U::traits_type>>`, then the expression `views::istream<T>(E)` is expression-equivalent to `basic_istream_view<T, typename U::char_type, typename U::traits_type>(E)`; otherwise, `views::istream<T>(E)` is ill-formed.

3 [*Example 1*:

```
auto ints = istringstream{"0 1  2   3     4"};
ranges::copy(views::istream<int>(ints), ostream_iterator<int>{cout, "-"});
// prints 0-1-2-3-4-
```

— *end example*]

25.6.6.2 Class template `basic_istream_view` [range.istream.view]

```
namespace std::ranges {
  template<class Val, class CharT, class Traits>
    concept stream-extractable =                // exposition only
      requires(basic_istream<CharT, Traits>& is, Val& t) {
        is >> t;
      };

  template<movable Val, class CharT, class Traits = char_traits<CharT>>
    requires default_initializable<Val> &&
             stream-extractable<Val, CharT, Traits>
  class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
  public:
    constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

    constexpr auto begin() {
      *stream_ >> value_;
      return iterator{*this};
    }

    constexpr default_sentinel_t end() const noexcept;

  private:
    // 25.6.6.3, class basic_istream_view::iterator
    struct iterator;                            // exposition only
    basic_istream<CharT, Traits>* stream_;       // exposition only
    Val value_ = Val();                          // exposition only
  };
}
```

`constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);`

1 *Effects*: Initializes *stream_* with `addressof(stream)`.

`constexpr default_sentinel_t end() const noexcept;`

2 *Effects*: Equivalent to: `return default_sentinel;`

25.6.6.3 Class basic_istream_view::*iterator* [range.istream.iterator]

```
namespace std::ranges {
  template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
             stream-extractable<Val, CharT, Traits>
  class basic_istream_view<Val, CharT, Traits>::iterator {
  public:
    using iterator_concept = input_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = Val;

    constexpr explicit iterator(basic_istream_view& parent) noexcept;

    iterator(const iterator&) = delete;
    iterator(iterator&&) = default;

    iterator& operator=(const iterator&) = delete;
    iterator& operator=(iterator&&) = default;

    iterator& operator++();
    void operator++(int);

    Val& operator*() const;

    friend bool operator==(const iterator& x, default_sentinel_t);

  private:
    basic_istream_view* parent_;                                // exposition only
  };
}
```

`constexpr explicit iterator(basic_istream_view& parent) noexcept;`

1 *Effects*: Initializes *parent_* with `addressof(parent)`.

`iterator& operator++();`

2 *Effects*: Equivalent to:

```
*parent_->stream_ >> parent_->value_;
return *this;
```

`void operator++(int);`

3 *Effects*: Equivalent to `++*this`.

`Val& operator*() const;`

4 *Effects*: Equivalent to: `return parent_->value_;`

`friend bool operator==(const iterator& x, default_sentinel_t);`

5 *Effects*: Equivalent to: `return !*x.parent_->stream_;`

25.7 Range adaptors [range.adaptors]

25.7.1 General [range.adaptors.general]

1 Subclause 25.7 defines *range adaptors*, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

2 Range adaptors are declared in namespace `std::ranges::views`.

3 The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

4 [*Example 1*:

```
vector<int> ints{0,1,2,3,4,5};
auto even = [](int i) { return 0 == i % 2; };
auto square = [](int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
  cout << i << ' '; // prints 0 4 16
}
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even)));
```

— *end example*]

25.7.2 Range adaptor objects [range.adaptor.object]

1 A *range adaptor closure object* is a unary function object that accepts a range argument. For a range adaptor closure object `C` and an expression `R` such that `decltype((R))` models `range`, the following expressions are equivalent:

```
C(R)
R | C
```

Given an additional range adaptor closure object `D`, the expression `C | D` produces another range adaptor closure object `E`. `E` is a perfect forwarding call wrapper (22.10.4) with the following properties:

(1.1) — Its target object is an object `d` of type `decay_t<decltype((D))>` direct-non-list-initialized with `D`.

(1.2) — It has one bound argument entity, an object `c` of type `decay_t<decltype((C))>` direct-non-list-initialized with `C`.

(1.3) — Its call pattern is `d(c(arg))`, where `arg` is the argument used in a function call expression of `E`.

The expression `C | D` is well-formed if and only if the initializations of the state entities of `E` are all well-formed.

2 Given an object `t` of type `T`, where

(2.1) — `t` is a unary function object that accepts a range argument,

(2.2) — `T` models `derived_from<range_adaptor_closure<T>>`,

(2.3) — `T` has no other base classes of type `range_adaptor_closure<U>` for any other type `U`, and

(2.4) — `T` does not model `range`

then the implementation ensures that `t` is a range adaptor closure object.

3 The template parameter `D` for `range_adaptor_closure` may be an incomplete type. If an expression of type *cv* `D` is used as an operand to the `|` operator, `D` shall be complete and model `derived_from<range_-adaptor_closure<D>>`. The behavior of an expression involving an object of type *cv* `D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined `operator|` function.

4 If an expression of type *cv* `U` is used as an operand to the `|` operator, where `U` has a base class of type `range_adaptor_closure<T>` for some type `T` other than `U`, the behavior is undefined.

5 The behavior of a program that adds a specialization for `range_adaptor_closure` is undefined.

6 A *range adaptor object* is a customization point object (16.3.3.3.5) that accepts a `viewable_range` as its first argument and returns a view.

7 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

8 If a range adaptor object `adaptor` accepts more than one argument, then let `range` be an expression such that `decltype((range))` models `viewable_range`, let `args...` be arguments such that `adaptor(range, args...)` is a well-formed expression as specified in the rest of subclause 25.7, and let `BoundArgs` be a

pack that denotes `decay_t<decltype((args))>...`. The expression `adaptor(args...)` produces a range adaptor closure object `f` that is a perfect forwarding call wrapper (22.10.4) with the following properties:

(8.1) — Its target object is a copy of `adaptor`.

(8.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decltype((args))>(args)...`, respectively.

(8.3) — Its call pattern is `adaptor(r, bound_args...)`, where `r` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

25.7.3 Movable wrapper [range.move.wrap]

1 Many types in this subclause are specified in terms of an exposition-only class template *`movable-box`*. *`movable-box`*`<T>` behaves exactly like `optional<T>` with the following differences:

(1.1) — *`movable-box`*`<T>` constrains its type parameter `T` with `move_constructible<T> && is_object_v<T>`.

(1.2) — The default constructor of *`movable-box`*`<T>` is equivalent to:

```
constexpr movable-box() noexcept(is_nothrow_default_constructible_v<T>)
    requires default_initializable<T>
  : movable-box{in_place} {}
```

(1.3) — If `copyable<T>` is not modeled, the copy assignment operator is equivalent to:

```
constexpr movable-box& operator=(const movable-box& that)
  noexcept(is_nothrow_copy_constructible_v<T>)
  requires copy_constructible<T> {
  if (this != addressof(that)) {
    if (that) emplace(*that);
    else reset();
  }
  return *this;
}
```

(1.4) — If `movable<T>` is not modeled, the move assignment operator is equivalent to:

```
constexpr movable-box& operator=(movable-box&& that)
  noexcept(is_nothrow_move_constructible_v<T>) {
  if (this != addressof(that)) {
    if (that) emplace(std::move(*that));
    else reset();
  }
  return *this;
}
```

2 *Recommended practice*:

(2.1) — If `copy_constructible<T>` is `true`, *`movable-box`*`<T>` should store only a `T` if either `T` models `copyable`, or `is_nothrow_move_constructible_v<T> && is_nothrow_copy_constructible_v<T>` is `true`.

(2.2) — Otherwise, *`movable-box`*`<T>` should store only a `T` if either `T` models `movable` or `is_nothrow_move_constructible_v<T>` is `true`.

25.7.4 Non-propagating cache [range.nonprop.cache]

1 Some types in 25.7 are specified in terms of an exposition-only class template *`non-propagating-cache`*. *`non-propagating-cache`*`<T>` behaves exactly like `optional<T>` with the following differences:

(1.1) — *`non-propagating-cache`*`<T>` constrains its type parameter `T` with `is_object_v<T>`.

(1.2) — The copy constructor is equivalent to:

```
constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
```

(1.3) — The move constructor is equivalent to:

```
constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
  other.reset();
}
```

(1.4) — The copy assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
  if (addressof(other) != this)
    reset();
  return *this;
}
```

(1.5) — The move assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(non-propagating-cache&& other) noexcept {
  reset();
  other.reset();
  return *this;
}
```

(1.6) — *non-propagating-cache*`<T>` has an additional member function template specified as follows:

```
template<class I>
  constexpr T& emplace-deref(const I& i);     // exposition only
```

Mandates: The declaration `T t(*i);` is well-formed for some invented variable `t`.

[*Note 1*: If `*i` is a prvalue of type *cv* `T`, there is no requirement that it is movable (9.5.1). — *end note*]

Effects: Calls `reset()`. Then direct-non-list-initializes the contained value with `*i`.

Postconditions: `*this` contains a value.

Returns: A reference to the new contained value.

Throws: Any exception thrown by the initialization of the contained value.

Remarks: If an exception is thrown during the initialization of `T`, `*this` does not contain a value, and the previous value (if any) has been destroyed.

2 [*Note 2*: *non-propagating-cache* enables an input view to temporarily cache values as it is iterated over. — *end note*]

25.7.5 Range adaptor helpers [range.adaptor.helpers]

```
namespace std::ranges {
  template<class F, class Tuple>
  constexpr auto tuple-transform(F&& f, Tuple&& t) { // exposition only
    return apply([&]<class... Ts>(Ts&&... elements) {
      return tuple<invoke_result_t<F&, Ts>...>(invoke(f, std::forward<Ts>(elements))...);
    }, std::forward<Tuple>(t));
  }

  template<class F, class Tuple>
  constexpr void tuple-for-each(F&& f, Tuple&& t) { // exposition only
    apply([&]<class... Ts>(Ts&&... elements) {
      (static_cast<void>(invoke(f, std::forward<Ts>(elements))), ...);
    }, std::forward<Tuple>(t));
  }

  template<class T>
  constexpr T& as-lvalue(T&& t) {                    // exposition only
    return static_cast<T&>(t);
  }

  template<bool Const, class... Views>
    concept all-random-access =                      // exposition only
      (random_access_range<maybe-const<Const, Views>> && ...);
  template<bool Const, class... Views>
    concept all-bidirectional =                      // exposition only
      (bidirectional_range<maybe-const<Const, Views>> && ...);
  template<bool Const, class... Views>
    concept all-forward =                            // exposition only
      (forward_range<maybe-const<Const, Views>> && ...);
}
```

25.7.6 All view [range.all]

25.7.6.1 General [range.all.general]

1 `views::all` returns a view that includes all elements of its range argument.

2 The name `views::all` denotes a range adaptor object (25.7.2). Given a subexpression `E`, the expression `views::all(E)` is expression-equivalent to:

(2.1) — *`decay-copy`*`(E)` if the decayed type of `E` models `view`.

(2.2) — Otherwise, `ref_view{E}` if that expression is well-formed.

(2.3) — Otherwise, `owning_view{E}`.

25.7.6.2 Class template `ref_view` [range.ref.view]

1 `ref_view` is a view of the elements of some other range.

```
namespace std::ranges {
  template<range R>
    requires is_object_v<R>
  class ref_view : public view_interface<ref_view<R>> {
  private:
    R* r_;                          // exposition only

  public:
    template<different-from<ref_view> T>
      requires see below
    constexpr ref_view(T&& t);

    constexpr R& base() const { return *r_; }

    constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
    constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

    constexpr bool empty() const
      requires requires { ranges::empty(*r_); }
    { return ranges::empty(*r_); }

    constexpr auto size() const requires sized_range<R>
    { return ranges::size(*r_); }

    constexpr auto reserve_hint() const requires approximately_sized_range<R>
    { return ranges::reserve_hint(*r_); }

    constexpr auto data() const requires contiguous_range<R>
    { return ranges::data(*r_); }
  };

  template<class R>
    ref_view(R&) -> ref_view<R>;
}
```

```
template<different-from<ref_view> T>
  requires see below
constexpr ref_view(T&& t);
```

2 *Effects*: Initializes *`r_`* with `addressof(static_cast<R&>(std::forward<T>(t)))`.

3 *Remarks*: Let *`FUN`* denote the exposition-only functions

```
void FUN(R&);
void FUN(R&&) = delete;
```

The expression in the *requires-clause* is equivalent to:

```
convertible_to<T, R&> && requires { FUN(declval<T>()); }
```

25.7.6.3 Class template `owning_view` [range.owning.view]

1 `owning_view` is a move-only view of the elements of some other range.

```
namespace std::ranges {
  template<range R>
    requires movable<R> && (!is-initializer-list<R>) // see 25.4.5
  class owning_view : public view_interface<owning_view<R>> {
  private:
    R r_ = R();           // exposition only

  public:
    owning_view() requires default_initializable<R> = default;
    constexpr owning_view(R&& t);

    owning_view(owning_view&&) = default;
    owning_view& operator=(owning_view&&) = default;

    constexpr R& base() & noexcept { return r_; }
    constexpr const R& base() const & noexcept { return r_; }
    constexpr R&& base() && noexcept { return std::move(r_); }
    constexpr const R&& base() const && noexcept { return std::move(r_); }

    constexpr iterator_t<R> begin() { return ranges::begin(r_); }
    constexpr sentinel_t<R> end() { return ranges::end(r_); }

    constexpr auto begin() const requires range<const R>
    { return ranges::begin(r_); }
    constexpr auto end() const requires range<const R>
    { return ranges::end(r_); }

    constexpr bool empty() requires requires { ranges::empty(r_); }
    { return ranges::empty(r_); }
    constexpr bool empty() const requires requires { ranges::empty(r_); }
    { return ranges::empty(r_); }

    constexpr auto size() requires sized_range<R>
    { return ranges::size(r_); }
    constexpr auto size() const requires sized_range<const R>
    { return ranges::size(r_); }

    constexpr auto reserve_hint() requires approximately_sized_range<R>
    { return ranges::reserve_hint(r_); }
    constexpr auto reserve_hint() const requires approximately_sized_range<const R>
    { return ranges::reserve_hint(r_); }

    constexpr auto data() requires contiguous_range<R>
    { return ranges::data(r_); }
    constexpr auto data() const requires contiguous_range<const R>
    { return ranges::data(r_); }
  };
}
```

`constexpr owning_view(R&& t);`

2 *Effects*: Initializes *r_* with `std::move(t)`.

25.7.7 As rvalue view [range.as.rvalue]

25.7.7.1 Overview [range.as.rvalue.overview]

1 `as_rvalue_view` presents a view of an underlying sequence with the same behavior as the underlying sequence except that its elements are rvalues. Some generic algorithms can be called with an `as_rvalue_view` to replace copying with moving.

2 The name `views::as_rvalue` denotes a range adaptor object (25.7.2). Let `E` be an expression and let `T` be `decltype((E))`. The expression `views::as_rvalue(E)` is expression-equivalent to:

(2.1) — `views::all(E)` if `T` models `input_range` and `same_as<range_rvalue_reference_t<T>, range_reference_t<T>>` is `true`.

(2.2) — Otherwise, `as_rvalue_view(E)`.

3 [*Example 1*:

```
vector<string> words = {"the", "quick", "brown", "fox", "ate", "a", "pterodactyl"};
vector<string> new_words;
ranges::copy(words | views::as_rvalue, back_inserter(new_words));
  // moves each string from words into new_words
```

— *end example*]

25.7.7.2 Class template as_rvalue_view [range.as.rvalue.view]

```
namespace std::ranges {
  template<view V>
    requires input_range<V>
  class as_rvalue_view : public view_interface<as_rvalue_view<V>> {
    V base_ = V();        // exposition only

  public:
    as_rvalue_view() requires default_initializable<V> = default;
    constexpr explicit as_rvalue_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>)
    { return move_iterator(ranges::begin(base_)); }
    constexpr auto begin() const requires range<const V>
    { return move_iterator(ranges::begin(base_)); }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (common_range<V>) {
        return move_iterator(ranges::end(base_));
      } else {
        return move_sentinel(ranges::end(base_));
      }
    }
    constexpr auto end() const requires range<const V> {
      if constexpr (common_range<const V>) {
        return move_iterator(ranges::end(base_));
      } else {
        return move_sentinel(ranges::end(base_));
      }
    }

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }

    constexpr auto reserve_hint() requires approximately_sized_range<V>
    { return ranges::reserve_hint(base_); }
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>
    { return ranges::reserve_hint(base_); }
  };

  template<class R>
    as_rvalue_view(R&&) -> as_rvalue_view<views::all_t<R>>;
}
```

`constexpr explicit as_rvalue_view(V base);`

1 *Effects*: Initializes *`base_`* with `std::move(base)`.

25.7.8 Filter view [range.filter]

25.7.8.1 Overview [range.filter.overview]

1 `filter_view` presents a view of the elements of an underlying sequence that satisfy a predicate.

2 The name `views::filter` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `P`, the expression `views::filter(E, P)` is expression-equivalent to `filter_view(E, P)`.

3 [*Example 1*:

```
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
auto evens = views::filter(is, [](int i) { return 0 == i % 2; });
for (int i : evens)
  cout << i << ' '; // prints 0 2 4 6
```

— *end example*]

25.7.8.2 Class template `filter_view` [range.filter.view]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view : public view_interface<filter_view<V, Pred>> {
  private:
    V base_ = V();                                  // exposition only
    movable-box<Pred> pred_;                        // exposition only

    // 25.7.8.3, class filter_view::iterator
    class iterator;                                 // exposition only

    // 25.7.8.4, class filter_view::sentinel
    class sentinel;                                 // exposition only

  public:
    filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr explicit filter_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr iterator begin();
    constexpr auto end() {
      if constexpr (common_range<V>)
        return iterator{*this, ranges::end(base_)};
      else
        return sentinel{*this};
    }
  };

  template<class R, class Pred>
    filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
}
```

`constexpr explicit filter_view(V base, Pred pred);`

1 *Effects*: Initializes *`base_`* with `std::move(base)` and initializes *`pred_`* with `std::move(pred)`.

`constexpr const Pred& pred() const;`

2 *Effects*: Equivalent to: `return *pred_;`

`constexpr iterator begin();`

3 *Preconditions*: *`pred_`*`.has_value()` is `true`.

4 *Returns*: `{*this, ranges::find_if(base_, ref(*pred_))}`.

5 *Remarks*: In order to provide the amortized constant time complexity required by the `range` concept when `filter_view` models `forward_range`, this function caches the result within the `filter_view` for use on subsequent calls.

25.7.8.3 Class `filter_view::`*`iterator`* [range.filter.iterator]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view<V, Pred>::iterator {
  private:
    iterator_t<V> current_ = iterator_t<V>();    // exposition only
    filter_view* parent_ = nullptr;              // exposition only

  public:
    using iterator_concept  = see below;
    using iterator_category = see below;         // not always present
    using value_type        = range_value_t<V>;
    using difference_type   = range_difference_t<V>;

    iterator() requires default_initializable<iterator_t<V>> = default;
    constexpr iterator(filter_view& parent, iterator_t<V> current);

    constexpr const iterator_t<V>& base() const & noexcept;
    constexpr iterator_t<V> base() &&;
    constexpr range_reference_t<V> operator*() const;
    constexpr iterator_t<V> operator->() const
      requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;

    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<V>;

    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<iterator_t<V>>;

    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current_)));

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<V>>;
  };
}
```

1 Modification of the element a `filter_view::`*`iterator`* denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 *`iterator`*`::iterator_concept` is defined as follows:

(2.1) — If `V` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(2.2) — Otherwise, if `V` models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(2.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

3 The member *typedef-name* `iterator_category` is defined if and only if `V` models `forward_range`. In that case, *`iterator`*`::iterator_category` is defined as follows:

(3.1) — Let `C` denote the type `iterator_traits<iterator_t<V>>::iterator_category`.

(3.2) — If `C` models `derived_from<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.

(3.3) — Otherwise, if `C` models `derived_from<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.

(3.4) — Otherwise, `iterator_category` denotes `C`.

```
constexpr iterator(filter_view& parent, iterator_t<V> current);
```

4 *Effects*: Initializes *current_* with `std::move(current)` and *parent_* with `addressof(parent)`.

```
constexpr const iterator_t<V>& base() const & noexcept;
```

5 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator_t<V> base() &&;
```

6 *Effects*: Equivalent to: `return std::move(current_);`

```
constexpr range_reference_t<V> operator*() const;
```

7 *Effects*: Equivalent to: `return *current_;`

```
constexpr iterator_t<V> operator->() const
  requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
```

8 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator& operator++();
```

9 *Effects*: Equivalent to:

```
current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
                           ref(*parent_->pred_));
return *this;
```

```
constexpr void operator++(int);
```

10 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires forward_range<V>;
```

11 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<V>;
```

12 *Effects*: Equivalent to:

```
do
  --current_;
while (!invoke(*parent_->pred_, *current_));
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<V>;
```

13 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<V>>;
```

14 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

15 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<V>>;
```

16 *Effects*: Equivalent to `ranges::iter_swap(x.current_, y.current_)`.

25.7.8.4 Class `filter_view::`*`sentinel`* [range.filter.sentinel]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view<V, Pred>::sentinel {
  private:
    sentinel_t<V> end_ = sentinel_t<V>();        // exposition only

  public:
    sentinel() = default;
    constexpr explicit sentinel(filter_view& parent);

    constexpr sentinel_t<V> base() const;

    friend constexpr bool operator==(const iterator& x, const sentinel& y);
  };
}
```

`constexpr explicit sentinel(filter_view& parent);`

1 *Effects*: Initializes *`end_`* with `ranges::end(parent.`*`base_`*`)`.

`constexpr sentinel_t<V> base() const;`

2 *Effects*: Equivalent to: `return `*`end_`*`;`

`friend constexpr bool operator==(const iterator& x, const sentinel& y);`

3 *Effects*: Equivalent to: `return x.`*`current_`*` == y.`*`end_`*`;`

25.7.9 Transform view [range.transform]

25.7.9.1 Overview [range.transform.overview]

1 `transform_view` presents a view of an underlying sequence after applying a transformation function to each element.

2 The name `views::transform` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::transform(E, F)` is expression-equivalent to `transform_view(E, F)`.

3 [*Example 1*:

```
vector<int> is{ 0, 1, 2, 3, 4 };
auto squares = views::transform(is, [](int i) { return i * i; });
for (int i : squares)
  cout << i << ' '; // prints 0 1 4 9 16
```

— *end example*]

25.7.9.2 Class template `transform_view` [range.transform.view]

```
namespace std::ranges {
  template<input_range V, move_constructible F>
    requires view<V> && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<V>> &&
             can-reference<invoke_result_t<F&, range_reference_t<V>>>
  class transform_view : public view_interface<transform_view<V, F>> {
  private:
    // 25.7.9.3, class template transform_view::iterator
    template<bool> struct iterator;              // exposition only

    // 25.7.9.4, class template transform_view::sentinel
    template<bool> struct sentinel;              // exposition only

    V base_ = V();                               // exposition only
    movable-box<F> fun_;                         // exposition only

  public:
    transform_view() requires default_initializable<V> && default_initializable<F> = default;
    constexpr explicit transform_view(V base, F fun);
    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr iterator<false> begin();
    constexpr iterator<true> begin() const
      requires range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;

    constexpr sentinel<false> end();
    constexpr iterator<false> end() requires common_range<V>;
    constexpr sentinel<true> end() const
      requires range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;
    constexpr iterator<true> end() const
      requires common_range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V>
    { return ranges::size(base_); }

    constexpr auto reserve_hint() requires approximately_sized_range<V>
    { return ranges::reserve_hint(base_); }
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>
    { return ranges::reserve_hint(base_); }
  };

  template<class R, class F>
    transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;
}
```

```
constexpr explicit transform_view(V base, F fun);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and *fun_* with `std::move(fun)`.

```
constexpr iterator<false> begin();
```

2 *Effects*: Equivalent to:

```
return iterator<false>{*this, ranges::begin(base_)};
```

```
constexpr iterator<true> begin() const
  requires range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

3 *Effects*: Equivalent to:

```
return iterator<true>{*this, ranges::begin(base_)};
```

```
constexpr sentinel<false> end();
```

4 *Effects*: Equivalent to:

```
return sentinel<false>{ranges::end(base_)};
```

```
constexpr iterator<false> end() requires common_range<V>;
```

5 *Effects*: Equivalent to:

```
return iterator<false>{*this, ranges::end(base_)};
```

```
constexpr sentinel<true> end() const
  requires range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

6 *Effects*: Equivalent to:

```
return sentinel<true>{ranges::end(base_)};
```

```
constexpr iterator<true> end() const
  requires common_range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

7 *Effects*: Equivalent to:

```
  return iterator<true>{*this, ranges::end(base_)};
```

25.7.9.3 Class template transform_view::*iterator* [range.transform.iterator]

```
namespace std::ranges {
  template<input_range V, move_constructible F>
    requires view<V> && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<V>> &&
             can-reference<invoke_result_t<F&, range_reference_t<V>>>
  template<bool Const>
  class transform_view<V, F>::iterator {
  private:
    using Parent = maybe-const<Const, transform_view>;          // exposition only
    using Base = maybe-const<Const, V>;                          // exposition only
    iterator_t<Base> current_ = iterator_t<Base>();              // exposition only
    Parent* parent_ = nullptr;                                   // exposition only

  public:
    using iterator_concept  = see below;
    using iterator_category = see below;                         // not always present
    using value_type        =
      remove_cvref_t<invoke_result_t<maybe-const<Const, F>&, range_reference_t<Base>>>;
    using difference_type   = range_difference_t<Base>;

    iterator() requires default_initializable<iterator_t<Base>> = default;
    constexpr iterator(Parent& parent, iterator_t<Base> current);

}
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *Base* models random_access_range, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *Base* models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *Base* models forward_range, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member *typedef-name* iterator_category is defined if and only if *Base* models forward_range. In that case, *iterator*::iterator_category is defined as follows: Let C denote the type iterator_traits<iterator_t<*Base*>>::iterator_category.

(2.1) — If is_reference_v<invoke_result_t<*maybe-const*<Const, F>&, range_reference_t<*Base*>>> is true, then

(2.1.1) — if C models derived_from<contiguous_iterator_tag>, iterator_category denotes random_access_iterator_tag;

(2.1.2) — otherwise, iterator_category denotes C.

(2.2) — Otherwise, iterator_category denotes input_iterator_tag.

```
constexpr iterator(Parent& parent, iterator_t<Base> current);
```

3 *Effects*: Initializes *current_* with std::move(current) and *parent_* with addressof(parent).

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

4 *Effects*: Initializes *current_* with std::move(i.*current_*) and *parent_* with i.*parent_*.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

5 *Effects*: Equivalent to: return *current_*;

```
constexpr iterator_t<Base> base() &&;
```

6 *Effects*: Equivalent to: return std::move(*current_*);

```
constexpr iterator& operator++();
```

7 *Effects*: Equivalent to:

```
++current_;
return *this;
```

```
constexpr void operator++(int);
```

8 *Effects*: Equivalent to `++current_`.

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

9 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

10 *Effects*: Equivalent to:

```

friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

5 *Effects*: Equivalent to: `return x.current_ - y.end_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const sentinel& y, const iterator<OtherConst>& x);
```

6 *Effects*: Equivalent to: `return y.end_ - x.current_;`

25.7.10 Take view [range.take]

25.7.10.1 Overview [range.take.overview]

1 `take_view` produces a view of the first N elements from another view, or all the elements if the adapted view contains fewer than N.

2 The name `views::take` denotes a range adaptor object (25.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::take(E, F)` is ill-formed. Otherwise, the expression `views::take(E, F)` is expression-equivalent to:

- (2.1) — If `T` is a specialization of `empty_view` (25.6.2.2), then `((void)F, decay-copy(E))`, except that the evaluations of `E` and `F` are indeterminately sequenced.
- (2.2) — Otherwise, if `T` models `random_access_range` and `sized_range` and is a specialization of `span` (23.7.2.2), `basic_string_view` (27.3), or `subrange` (25.5.4), then `U(ranges::begin(E), ranges::begin(E) + std::min<D>(ranges::distance(E), F))`, except that `E` is evaluated only once, where `U` is a type determined as follows:
  - (2.2.1) — if `T` is a specialization of `span`, then `U` is `span<typename T::element_type>`;
  - (2.2.2) — otherwise, if `T` is a specialization of `basic_string_view`, then `U` is `T`;
  - (2.2.3) — otherwise, `T` is a specialization of `subrange`, and `U` is `subrange<iterator_t<T>>`;
- (2.3) — otherwise, if `T` is a specialization of `iota_view` (25.6.4.2) that models `random_access_range` and `sized_range`, then `iota_view(*ranges::begin(E), *(ranges::begin(E) + std::min<D>(ranges::distance(E), F)))`, except that `E` is evaluated only once.
- (2.4) — Otherwise, if `T` is a specialization of `repeat_view` (25.6.5.2):
  - (2.4.1) — if `T` models `sized_range`, then

    ```
    views::repeat(*E.value_, std::min<D>(ranges::distance(E), F))
    ```

    except that `E` is evaluated only once;
  - (2.4.2) — otherwise, `views::repeat(*E.value_, static_cast<D>(F))`.
- (2.5) — Otherwise, `take_view(E, F)`.

3 [*Example 1*:

```
vector<int> is{0,1,2,3,4,5,6,7,8,9};
for (int i : is | views::take(5))
  cout << i << ' '; // prints 0 1 2 3 4
```

— *end example*]

25.7.10.2 Class template `take_view` [range.take.view]

```
namespace std::ranges {
  template<view V>
  class take_view : public view_interface<take_view<V>> {
  private:
```

```
  V base_ = V();                                              // exposition only
  range_difference_t<V> count_ = 0;                           // exposition only

  // 25.7.10.3, class template take_view::sentinel
  template<bool> class sentinel;                              // exposition only

```

```
      friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);

      template<bool OtherConst = !Const>
        requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
      friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
    };
  }
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects*: Initializes *end_* with end.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes *end_* with `std::move(s.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 *Effects*: Equivalent to: `return end_;`

```
friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);

template<bool OtherConst = !Const>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
```

4 *Effects*: Equivalent to: `return y.count() == 0 || y.base() == x.end_;`

25.7.11 Take while view [range.take.while]

25.7.11.1 Overview [range.take.while.overview]

1 Given a unary predicate `pred` and a view `r`, `take_while_view` produces a view of the range [`ranges::begin(r)`, `ranges::find_if_not(r, pred)`).

2 The name `views::take_while` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::take_while(E, F)` is expression-equivalent to `take_while_view(E, F)`.

3 [*Example 1*:

```
auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
auto small = [](const auto x) noexcept { return x < 5; };
auto small_ints = views::istream<int>(input) | views::take_while(small);
for (const auto i : small_ints) {
  cout << i << ' ';                         // prints 0 1 2 3 4
}
auto i = 0;
input >> i;
cout << i;                                  // prints 6
```

— *end example*]

25.7.11.2 Class template take_while_view [range.take.while.view]

```
namespace std::ranges {
  template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
             indirect_unary_predicate<const Pred, iterator_t<V>>
  class take_while_view : public view_interface<take_while_view<V, Pred>> {
    // 25.7.11.3, class template take_while_view::sentinel
    template<bool> class sentinel;                      // exposition only

    V base_ = V();                                      // exposition only
    movable-box<Pred> pred_;                            // exposition only

  public:
    take_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr explicit take_while_view(V base, Pred pred);
```

```
      constexpr V base() const & requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }

      constexpr const Pred& pred() const;

      constexpr auto begin() requires (!simple-view<V>)
      { return ranges::begin(base_); }

      constexpr auto begin() const
        requires range<const V> &&
                 indirect_unary_predicate<const Pred, iterator_t<const V>>
      { return ranges::begin(base_); }

      constexpr auto end() requires (!simple-view<V>)
      { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }

      constexpr auto end() const
        requires range<const V> &&
                 indirect_unary_predicate<const Pred, iterator_t<const V>>
      { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
    };

    template<class R, class Pred>
      take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
  }
```

`constexpr explicit take_while_view(V base, Pred pred);`

1 *Effects*: Initializes *base_* with `std::move(base)` and *pred_* with `std::move(pred)`.

`constexpr const Pred& pred() const;`

2 *Effects*: Equivalent to: `return *pred_;`

25.7.11.3 Class template take_while_view::*sentinel* [range.take.while.sentinel]

```
  namespace std::ranges {
    template<view V, class Pred>
      requires input_range<V> && is_object_v<Pred> &&

      friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x,
                                       const sentinel& y);
    };
  }
```

`constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);`

1 *Effects*: Initializes *end_* with `end` and *pred_* with `pred`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `std::move(s.end_)` and `pred_` with `s.pred_`.

```
friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

template<bool OtherConst = !Const>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x,
                                 const sentinel& y);
```

3 *Effects*: Equivalent to: `return y.end_ == x || !invoke(*y.pred_, *x);`

25.7.12 Drop view [range.drop]

25.7.12.1 Overview [range.drop.overview]

1 `drop_view` produces a view excluding the first *N* elements from another view, or an empty range if the adapted view contains fewer than *N* elements.

2 The name `views::drop` denotes a range adaptor object (25.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::drop(E, F)` is ill-formed. Otherwise, the expression `views::drop(E, F)` is expression-equivalent to:

(2.1) — If `T` is a specialization of `empty_view` (25.6.2.2), then `((void)F, decay-copy(E))`, except that the evaluations of `E` and `F` are indeterminately sequenced.

(2.2) — Otherwise, if `T` models `random_access_range` and `sized_range` and is

(2.2.1) — a specialization of `span` (23.7.2.2),

(2.2.2) — a specialization of `basic_string_view` (27.3),

(2.2.3) — a specialization of `iota_view` (25.6.4.2), or

(2.2.4) — a specialization of `subrange` (25.5.4) where `T::StoreSize` is `false`,

then `U(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E))`, except that `E` is evaluated only once, where `U` is `span<typename T::element_type>` if `T` is a specialization of `span` and `T` otherwise.

(2.3) — Otherwise, if `T` is a specialization of `subrange` that models `random_access_range` and `sized_range`, then `T(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E), to-unsigned-like(ranges::distance(E) - std::min<D>(ranges::distance(E), F)))`, except that `E` and `F` are each evaluated only once.

(2.4) — Otherwise, if `T` is a specialization of `repeat_view` (25.6.5.2):

(2.4.1) — if `T` models `sized_range`, then

```
views::repeat(*E.value_, ranges::distance(E) - std::min<D>(ranges::distance(E), F))
```

except that `E` is evaluated only once;

(2.4.2) — otherwise, `((void)F, decay-copy(E))`, except that the evaluations of `E` and `F` are indeterminately sequenced.

(2.5) — Otherwise, `drop_view(E, F)`.

3 [*Example 1*:

```
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
  cout << i << ' ';                              // prints 5 6 7 8 9
}
```

— *end example*]

25.7.12.2 Class template `drop_view` [range.drop.view]

```
namespace std::ranges {
  template<view V>
  class drop_view : public view_interface<drop_view<V>> {
  public:
    drop_view() requires default_initializable<V> = default;
    constexpr explicit drop_view(V base, range_difference_t<V> count);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin()
      requires (!(simple-view<V> &&
                  random_access_range<const V> && sized_range<const V>));
    constexpr auto begin() const
      requires random_access_range<const V> && sized_range<const V>;

    constexpr auto end() requires (!simple-view<V>)
    { return ranges::end(base_); }

    constexpr auto end() const requires range<const V>
    { return ranges::end(base_); }

    constexpr auto size() requires sized_range<V> {
      const auto s = ranges::size(base_);
      const auto c = static_cast<decltype(s)>(count_);
      return s < c ? 0 : s - c;
    }

    constexpr auto size() const requires sized_range<const V> {
      const auto s = ranges::size(base_);
      const auto c = static_cast<decltype(s)>(count_);
      return s < c ? 0 : s - c;
    }

    constexpr auto reserve_hint() requires approximately_sized_range<V> {
      const auto s = static_cast<range_difference_t<cV>>(ranges::reserve_hint(base_));
      return to-unsigned-like(s < count_ ? 0 : s - count_);
    }

    constexpr auto reserve_hint() const requires approximately_sized_range<const V> {
      const auto s = static_cast<range_difference_t<const V>>(ranges::reserve_hint(base_));
      return to-unsigned-like(s < count_ ? 0 : s - count_);
    }

  private:
    V base_ = V();                              // exposition only
    range_difference_t<V> count_ = 0;           // exposition only
  };

  template<class R>
    drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;
}
```

```
constexpr explicit drop_view(V base, range_difference_t<V> count);
```

1 *Preconditions*: `count >= 0` is `true`.

2 *Effects*: Initializes *`base_`* with `std::move(base)` and *`count_`* with `count`.

```
constexpr auto begin()
  requires (!(simple-view<V> &&
              random_access_range<const V> && sized_range<const V>));
constexpr auto begin() const
  requires random_access_range<const V> && sized_range<const V>;
```

3 *Returns*: `ranges::next(ranges::begin(base_), count_, ranges::end(base_))`.

4 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_view` models `forward_range`, the first overload caches the result within the `drop_view` for use on subsequent calls.

[*Note 1*: Without this, applying a `reverse_view` over a `drop_view` would have quadratic iteration complexity. — *end note*]

25.7.13 Drop while view [range.drop.while]

25.7.13.1 Overview [range.drop.while.overview]

1 Given a unary predicate `pred` and a view `r`, `drop_while_view` produces a view of the range [`ranges::find_if_not(r, pred)`, `ranges::end(r)`).

2 The name `views::drop_while` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::drop_while(E, F)` is expression-equivalent to `drop_while_view(E, F)`.

3 [*Example 1*:

```
constexpr auto source = "  \t   \t   \t   hello there"sv;
auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
auto skip_ws = views::drop_while(source, is_invisible);
for (auto c : skip_ws) {
  cout << c;                                // prints hello there with no leading space
}
```

— *end example*]

25.7.13.2 Class template `drop_while_view` [range.drop.while.view]

```
namespace std::ranges {
  template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
             indirect_unary_predicate<const Pred, iterator_t<V>>
  class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
  public:
    drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr explicit drop_while_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr auto begin();

    constexpr auto end() { return ranges::end(base_); }

  private:
    V base_ = V();                                      // exposition only
    movable-box<Pred> pred_;                            // exposition only
  };

  template<class R, class Pred>
    drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}
```

`constexpr explicit drop_while_view(V base, Pred pred);`

1 *Effects*: Initializes *`base_`* with `std::move(base)` and *`pred_`* with `std::move(pred)`.

`constexpr const Pred& pred() const;`

`constexpr auto begin();`

3 *Preconditions*: *`pred_`*`.has_value()` is `true`.

4 *Returns*: `ranges::find_if_not(base_, cref(*pred_))`.

5 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_while_view` models `forward_range`, the first call caches the result within the `drop_while_view` for use on subsequent calls.

[*Note 1*: Without this, applying a `reverse_view` over a `drop_while_view` would have quadratic iteration complexity. — *end note*]

25.7.14 Join view [range.join]

25.7.14.1 Overview [range.join.overview]

1 `join_view` flattens a view of ranges into a view.

2 The name `views::join` denotes a range adaptor object (25.7.2). Given a subexpression `E`, the expression `views::join(E)` is expression-equivalent to `join_view<views::all_t<decltype((E))>>{E}`.

3 [*Example 1*:

```
vector<string> ss{"hello", " ", "world", "!"};
for (char ch : ss | views::join)
  cout << ch;                                    // prints hello world!
```

— *end example*]

25.7.14.2 Class template `join_view` [range.join.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V> && input_range<range_reference_t<V>>
  class join_view : public view_interface<join_view<V>> {
  private:
    using InnerRng = range_reference_t<V>;                  // exposition only

    // 25.7.14.3, class template join_view::iterator
    template<bool Const>
      struct iterator;                                      // exposition only

    // 25.7.14.4, class template join_view::sentinel
    template<bool Const>
      struct sentinel;                                      // exposition only

    V base_ = V();                                          // exposition only

    non-propagating-cache<iterator_t<V>> outer_;           // exposition only, present only
                                                            // when !forward_range<V>
    non-propagating-cache<remove_cv_t<InnerRng>> inner_;   // exposition only, present only
                                                            // if is_reference_v<InnerRng> is false

  public:
    join_view() requires default_initializable<V> = default;
    constexpr explicit join_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() {
      if constexpr (forward_range<V>) {
        constexpr bool use_const = simple-view<V> &&
                                   is_reference_v<InnerRng>;
        return iterator<use_const>{*this, ranges::begin(base_)};
      } else {
        outer_ = ranges::begin(base_);
        return iterator<false>{*this};
      }
    }

    constexpr auto begin() const
      requires forward_range<const V> &&
               is_reference_v<range_reference_t<const V>> &&
               input_range<range_reference_t<const V>>
    { return iterator<true>{*this, ranges::begin(base_)}; }
    constexpr auto end() {
      if constexpr (forward_range<V> &&
                    is_reference_v<InnerRng> && forward_range<InnerRng> &&
                    common_range<V> && common_range<InnerRng>)

    constexpr OuterIter& outer();                               // exposition only
    constexpr const OuterIter& outer() const;                   // exposition only

    constexpr iterator(Parent& parent, OuterIter outer)
      requires forward_range<Base>;                             // exposition only
    constexpr explicit iterator(Parent& parent)
      requires (!forward_range<Base>);                          // exposition only

  public:
    using iterator_concept  = see below;
    using iterator_category = see below;                        // not always present
    using value_type        = range_value_t<range_reference_t<Base>>;
```

```
      using difference_type   = see below;

      iterator() = default;
      constexpr iterator(iterator<!Const> i)
        requires Const &&
                 convertible_to<iterator_t<V>, OuterIter> &&
                 convertible_to<iterator_t<InnerRng>, InnerIter>;

      constexpr decltype(auto) operator*() const { return **inner_; }

      constexpr InnerIter operator->() const
        requires has-arrow<InnerIter> && copyable<InnerIter>;

      constexpr iterator& operator++();
      constexpr void operator++(int);
      constexpr iterator operator++(int)
        requires ref-is-glvalue && forward_range<Base> &&
                 forward_range<range_reference_t<Base>>;

      constexpr iterator& operator--()
        requires ref-is-glvalue && bidirectional_range<Base> &&
                 bidirectional_range<range_reference_t<Base>> &&
                 common_range<range_reference_t<Base>>;

      constexpr iterator operator--(int)
        requires ref-is-glvalue && bidirectional_range<Base> &&
                 bidirectional_range<range_reference_t<Base>> &&
                 common_range<range_reference_t<Base>>;

      friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires ref-is-glvalue && forward_range<Base> &&
                 equality_comparable<iterator_t<range_reference_t<Base>>>;

      friend constexpr decltype(auto) iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(*i.inner_))) {
        return ranges::iter_move(*i.inner_);
      }

      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))
        requires indirectly_swappable<InnerIter>;
    };
  }
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *ref-is-glvalue* is true, *Base* models bidirectional_range, and range_reference_t<*Base*> models both bidirectional_range and common_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.2) — Otherwise, if *ref-is-glvalue* is true and *Base* and range_reference_t<*Base*> each model forward_range, then iterator_concept denotes forward_iterator_tag.

(1.3) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member *typedef-name* iterator_category is defined if and only if *ref-is-glvalue* is true, *Base* models forward_range, and range_reference_t<*Base*> models forward_range. In that case, *iterator*::iterator_category is defined as follows:

(2.1) — Let *OUTERC* denote iterator_traits<iterator_t<*Base*>>::iterator_category, and let *INNERC* denote iterator_traits<iterator_t<range_reference_t<*Base*>>>::iterator_category.

(2.2) — If *OUTERC* and *INNERC* each model derived_from<bidirectional_iterator_tag> and range_reference_t<*Base*> models common_range, iterator_category denotes bidirectional_iterator_tag.

(2.3) — Otherwise, if *OUTERC* and *INNERC* each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.

(2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

3 *`iterator`*`::difference_type` denotes the type:

```
common_type_t<
  range_difference_t<Base>,
  range_difference_t<range_reference_t<Base>>>
```

4 `join_view` iterators use the *`satisfy`* function to skip over empty inner ranges.

```
constexpr OuterIter& outer();
constexpr const OuterIter& outer() const;
```

5 *Returns*: *`outer_`* if *`Base`* models `forward_range`; otherwise, `*`*`parent_`*`->`*`outer_`*.

```
constexpr void satisfy();
```

6 *Effects*: Equivalent to:

```
auto update_inner = [this](const iterator_t<Base>& x) -> auto&& {
  if constexpr (ref-is-glvalue)      // *x is a reference
    return *x;
  else
    return parent_->inner_.emplace-deref(x);
};

for (; outer() != ranges::end(parent_->base_); ++outer()) {
  auto&& inner = update_inner(outer());
  inner_ = ranges::begin(inner);
  if (*inner_ != ranges::end(inner))
    return;
}
if constexpr (ref-is-glvalue)
  inner_.reset();
```

```
constexpr iterator(Parent& parent, OuterIter outer)
  requires forward_range<Base>;
```

7 *Effects*: Initializes *`outer_`* with `std::move(outer)` and *`parent_`* with `addressof(parent)`; then calls *`satisfy`*`()`.

```
constexpr explicit iterator(Parent& parent)
  requires (!forward_range<Base>);
```

8 *Effects*: Initializes *`parent_`* with `addressof(parent)`; then calls *`satisfy`*`()`.

```
constexpr iterator(iterator<!Const> i)
  requires Const &&
           convertible_to<iterator_t<V>, OuterIter> &&
           convertible_to<iterator_t<InnerRng>, InnerIter>;
```

9 *Effects*: Initializes *`outer_`* with `std::move(i.`*`outer_`*`)`, *`inner_`* with `std::move(i.`*`inner_`*`)`, and *`parent_`* with `i.`*`parent_`*.

10 [*Note 1*: `Const` can only be `true` when *`Base`* models `forward_range`. — *end note*]

```
constexpr InnerIter operator->() const
  requires has-arrow<InnerIter> && copyable<InnerIter>;
```

11 *Effects*: Equivalent to: `return *`*`inner_`*`;`

```
constexpr iterator& operator++();
```

12 Let *`inner-range`* be:

(12.1) — If *`ref-is-glvalue`* is `true`, `*`*`outer`*`()`.

(12.2) — Otherwise, `*`*`parent_`*`->`*`inner_`*.

13 *Effects*: Equivalent to:

```
if (++*inner_ == ranges::end(as-lvalue(inner-range))) {
  ++outer();
  satisfy();
}
return *this;
```

```
constexpr void operator++(int);
```

14 *Effects*: Equivalent to: `++*this`.

```
constexpr iterator operator++(int)
  requires ref-is-glvalue && forward_range<Base> &&
           forward_range<range_reference_t<Base>>;
```

15 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--()
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional_range<range_reference_t<Base>> &&
           common_range<range_reference_t<Base>>;
```

16 *Effects*: Equivalent to:

```
if (outer_ == ranges::end(parent_->base_))
  inner_ = ranges::end(as-lvalue(*--outer_));
while (*inner_ == ranges::begin(as-lvalue(*outer_)))
  *inner_ = ranges::end(as-lvalue(*--outer_));
--*inner_;
return *this;
```

```
constexpr iterator operator--(int)
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional_range<range_reference_t<Base>> &&
           common_range<range_reference_t<Base>>;
```

17 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires ref-is-glvalue && forward_range<Base> &&
           equality_comparable<iterator_t<range_reference_t<Base>>>;
```

18 *Effects*: Equivalent to: `return x.outer_ == y.outer_ && x.inner_ == y.inner_;`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))
  requires indirectly_swappable<InnerIter>;
```

19 *Effects*: Equivalent to: `return ranges::iter_swap(*x.inner_, *y.inner_);`

25.7.14.4 Class template `join_view::sentinel` [range.join.sentinel]

```
namespace std::ranges {
  template<input_range V>
    requires view<V> && input_range<range_reference_t<V>>
  template<bool Const>
  struct join_view<V>::sentinel {
  private:
    using Parent = maybe-const<Const, join_view>;       // exposition only
    using Base = maybe-const<Const, V>;                  // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();          // exposition only
  public:
    sentinel() = default;

    constexpr explicit sentinel(Parent& parent);
    constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    template<bool OtherConst>
      requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
  };
}
```

```
constexpr explicit sentinel(Parent& parent);
```

1 *Effects*: Initializes *end_* with `ranges::end(parent.`*base_*`)`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes *end_* with `std::move(s.`*end_*`)`.

```
template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.`*outer*`() == y.`*end_*`;`

25.7.15 Join with view [range.join.with]

25.7.15.1 Overview [range.join.with.overview]

1 `join_with_view` takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.

2 The name `views::join_with` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::join_with(E, F)` is expression-equivalent to `join_with_view(E, F)`.

3 [*Example 1*:

```
  vector<string> vs = {"the", "quick", "brown", "fox"};
  for (char c : vs | views::join_with('-')) {
    cout << c;
  }
  // The above prints the-quick-brown-fox
```

— *end example*]

25.7.15.2 Class template `join_with_view` [range.join.with.view]

```
namespace std::ranges {

                 bidirectional-common<InnerBase> && bidirectional-common<PatternBase>;

      friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires ref-is-glvalue && forward_range<Base> &&
                 equality_comparable<InnerIter>;

      friend constexpr decltype(auto) iter_move(const iterator& x) {
        using rvalue_reference = common_reference_t<
          iter_rvalue_reference_t<InnerIter>,
          iter_rvalue_reference_t<PatternIter>>;
        return visit<rvalue_reference>(ranges::iter_move, x.inner_it_);
      }

      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        requires indirectly_swappable<InnerIter, PatternIter> {
        visit(ranges::iter_swap, x.inner_it_, y.inner_it_);
      }
    };
  }
```

1 *`iterator`*`::iterator_concept` is defined as follows:

(1.1) — If *`ref-is-glvalue`* is `true`, *`Base`* models `bidirectional_range`, and *`InnerBase`* and *`PatternBase`* each model *`bidirectional-common`*, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.2) — Otherwise, if *`ref-is-glvalue`* is `true` and *`Base`* and *`InnerBase`* each model `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if *`ref-is-glvalue`* is `true`, and *`Base`* and *`InnerBase`* each model `forward_range`. In that case, *`iterator`*`::iterator_category` is defined as follows:

(2.1) — Let *OUTERC* denote `iterator_traits<`*`OuterIter`*`>::iterator_category`, let *INNERC* denote `iterator_traits<`*`InnerIter`*`>::iterator_category`, and let *PATTERNC* denote `iterator_traits<`*`PatternIter`*`>::iterator_category`.

(2.2) — If

```
is_reference_v<common_reference_t<iter_reference_t<InnerIter>,
                                  iter_reference_t<PatternIter>>>
```

is `false`, `iterator_category` denotes `input_iterator_tag`.

(2.3) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model `derived_from<bidirectional_iterator_tag>` and *`InnerBase`* and *`PatternBase`* each model `common_range`, `iterator_category` denotes `bidirectional_iterator_tag`.

(2.4) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.

(2.5) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

3 *`iterator`*`::value_type` denotes the type:

```
common_type_t<iter_value_t<InnerIter>, iter_value_t<PatternIter>>
```

4 *`iterator`*`::difference_type` denotes the type:

```
  common_type_t<
    iter_difference_t<OuterIter>,
    iter_difference_t<InnerIter>,
    iter_difference_t<PatternIter>>
```

```
constexpr OuterIter& outer();
constexpr const OuterIter& outer() const;
```

5 *Returns*: `outer_it_` if *Base* models `forward_range`; otherwise, `*parent_->outer_it_`.

```
constexpr auto& update-inner();
```

6 *Effects*: Equivalent to:

```
if constexpr (ref-is-glvalue)
  return as-lvalue(*outer());
else
  return parent_->inner_.emplace-deref(outer());
```

```
constexpr auto& get-inner();
```

7 *Effects*: Equivalent to:

```
if constexpr (ref-is-glvalue)
  return as-lvalue(*outer());
else
  return *parent_->inner_;
```

```
constexpr void satisfy();
```

8 *Effects*: Equivalent to:

```
while (true) {
  if (inner_it_.index() == 0) {
    if (std::get<0>(inner_it_) != ranges::end(parent_->pattern_))
      break;
    inner_it_.template emplace<1>(ranges::begin(update-inner()));
  } else {
    if (std::get<1>(inner_it_) != ranges::end(get-inner()))
      break;
    if (++outer() == ranges::end(parent_->base_)) {
      if constexpr (ref-is-glvalue)
        inner_it_.template emplace<0>();
      break;
    }
    inner_it_.template emplace<0>(ranges::begin(parent_->pattern_));
  }
}
```

[*Note 1*: `join_with_view` iterators use the *satisfy* function to skip over empty inner ranges. — *end note*]

```
constexpr iterator(Parent& parent, OuterIter outer)
  requires forward_range<Base>;
constexpr explicit iterator(Parent& parent)
  requires (!forward_range<Base>);
```

9 *Effects*: Initializes `parent_` with `addressof(parent)`. For the first overload, also initializes `outer_it_` with `std::move(outer)`. Then, equivalent to:

```
if (outer() != ranges::end(parent_->base_)) {
  inner_it_.template emplace<1>(ranges::begin(update-inner()));
  satisfy();
}
```

```
constexpr iterator(iterator<!Const> i)
    requires Const && convertible_to<iterator_t<V>, OuterIter> &&
             convertible_to<iterator_t<InnerRng>, InnerIter> &&
             convertible_to<iterator_t<Pattern>, PatternIter>;
```

10 *Effects*: Initializes `outer_it_` with `std::move(i.outer_it_)` and `parent_` with `i.parent_`. Then, equivalent to:

```
if (i.inner_it_.index() == 0)
  inner_it_.template emplace<0>(std::get<0>(std::move(i.inner_it_)));
else
  inner_it_.template emplace<1>(std::get<1>(std::move(i.inner_it_)));
```

11 [*Note 2*: `Const` can only be `true` when *`Base`* models `forward_range`. — *end note*]

```
constexpr decltype(auto) operator*() const;
```

12 *Effects*: Equivalent to:

```
using reference =
  common_reference_t<iter_reference_t<InnerIter>, iter_reference_t<PatternIter>>;
return visit([](auto& it) -> reference { return *it; }, inner_it_);
```

```
constexpr iterator& operator++();
```

13 *Effects*: Equivalent to:

```
visit([](auto& it){ ++it; }, inner_it_);
satisfy();
return *this;
```

```
constexpr void operator++(int);
```

14 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int)
  requires ref-is-glvalue && forward_iterator<OuterIter> && forward_iterator<InnerIter>;
```

15 *Effects*: Equivalent to:

```
iterator tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--()
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional-common<InnerBase> && bidirectional-common<PatternBase>;
```

16 *Effects*: Equivalent to:

```
if (outer_it_ == ranges::end(parent_->base_)) {
  auto&& inner = *--outer_it_;
  inner_it_.template emplace<1>(ranges::end(inner));
}

while (true) {
  if (inner_it_.index() == 0) {
    auto& it = std::get<0>(inner_it_);
    if (it == ranges::begin(parent_->pattern_)) {
      auto&& inner = *--outer_it_;
      inner_it_.template emplace<1>(ranges::end(inner));
    } else {
      break;
    }
  } else {
    auto& it = std::get<1>(inner_it_);
    auto&& inner = *outer_it_;
    if (it == ranges::begin(inner)) {
      inner_it_.template emplace<0>(ranges::end(parent_->pattern_));
    } else {
      break;
    }
  }
}
visit([](auto& it){ --it; }, inner_it_);
return *this;
```

```
constexpr iterator operator--(int)
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional-common<InnerBase> && bidirectional-common<PatternBase>;
```

17 *Effects*: Equivalent to:

```
iterator tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires ref-is-glvalue && forward_range<Base> &&
           equality_comparable<InnerIter>;
```

18 *Effects*: Equivalent to:

```
return x.outer_it_ == y.outer_it_ && x.inner_it_ == y.inner_it_;
```

25.7.15.4 Class template `join_with_view::sentinel` [range.join.with.sentinel]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && input_range<range_reference_t<V>>
          && view<Pattern> && concatable<range_reference_t<V>, Pattern>
  template<bool Const>
  class join_with_view<V, Pattern>::sentinel {
    using Parent = maybe-const<Const, join_with_view>;   // exposition only
    using Base = maybe-const<Const, V>;                  // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();          // exposition only

    constexpr explicit sentinel(Parent& parent);         // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    template<bool OtherConst>
      requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
  };
}
```

```
constexpr explicit sentinel(Parent& parent);
```

1 *Effects*: Initializes *end_* with `ranges::end(parent.base_)`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes *end_* with `std::move(s.end_)`.

```
template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.outer() == y.end_;`

25.7.16 Lazy split view [range.lazy.split]

25.7.16.1 Overview [range.lazy.split.overview]

1 `lazy_split_view` takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

2 The name `views::lazy_split` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::lazy_split(E, F)` is expression-equivalent to `lazy_split_view(E, F)`.

3 [*Example 1*:

```
string str{"the quick brown fox"};
```

```
for (auto word : str | views::lazy_split(' ')) {
  for (char ch : word)
    cout << ch;
  cout << '*';
}
// The above prints the*quick*brown*fox*
```

— *end example*]

25.7.16.2 Class template lazy_split_view [range.lazy.split.view]

```
namespace std::ranges {
  template<auto> struct require-constant;                     // exposition only

  template<class R>
  concept tiny-range =                                        // exposition only

      requires forward_range<Base>;

    friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
  };
}
```

1 Many of the specifications in 25.7.16 refer to the notional member *current* of `outer-iterator`. *current* is equivalent to `current_` if `V` models `forward_range`, and `*parent_->current_` otherwise.

```
constexpr explicit outer-iterator(Parent& parent)
  requires (!forward_range<Base>);
```

2 *Effects*: Initializes `parent_` with `addressof(parent)`.

```
constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
  requires forward_range<Base>;
```

3 *Effects*: Initializes `parent_` with `addressof(parent)` and `current_` with `std::move(current)`.

```
constexpr outer-iterator(outer-iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

4 *Effects*: Initializes `parent_` with `i.parent_`, `current_` with `std::move(i.current_)`, and `trailing_empty_` with `i.trailing_empty_`.

```
constexpr value_type operator*() const;
```

5 *Effects*: Equivalent to: `return value_type{*this};`

```
constexpr outer-iterator& operator++();
```

6 *Effects*: Equivalent to:

```
const auto end = ranges::end(parent_->base_);
if (current == end) {
  trailing_empty_ = false;
  return *this;
}
const auto [pbegin, pend] = subrange{parent_->pattern_};
if (pbegin == pend) ++current;
else if constexpr (tiny-range<Pattern>) {
  current = ranges::find(std::move(current), end, *pbegin);
  if (current != end) {
    ++current;
    if (current == end)
      trailing_empty_ = true;
  }
}
```

```
      else {
        do {
          auto [b, p] = ranges::mismatch(current, end, pbegin, pend);
          if (p == pend) {
            current = b;
            if (current == end)
              trailing_empty_ = true;
            break;              // The pattern matched; skip it
          }
        } while (++current != end);
      }
      return *this;
```

```
friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y)
  requires forward_range<Base>;
```

7 *Effects*: Equivalent to:

```
return x.current_ == y.current_ && x.trailing_empty_ == y.trailing_empty_;
```

```
friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
```

8 *Effects*: Equivalent to:

```
return x.current == ranges::end(x.parent_->base_) && !x.trailing_empty_;
```

25.7.16.4 Class lazy_split_view::*outer-iterator*::value_type [range.lazy.split.outer.value]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
             indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&

    constexpr default_sentinel_t end() const noexcept;
  };
}
```

```
constexpr explicit value_type(outer-iterator i);
```

1 *Effects*: Initializes *i_* with `std::move(i)`.

```
constexpr inner-iterator<Const> begin() const;
```

2 *Effects*: Equivalent to: `return inner-iterator<Const>{i_};`

```
constexpr default_sentinel_t end() const noexcept;
```

3 *Effects*: Equivalent to: `return default_sentinel;`

25.7.16.5 Class template lazy_split_view::*inner-iterator* [range.lazy.split.inner]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
             indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
             (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct lazy_split_view<V, Pattern>::inner-iterator {
  private:
    using Base = maybe-const<Const, V>;                      // exposition only
```

```
      outer-iterator<Const> i_ = outer-iterator<Const>();      // exposition only
      bool incremented_ = false;                               // exposition only

    public:
      using iterator_concept  = typename outer-iterator<Const>::iterator_concept;

      using iterator_category = see below;                     // present only if Base
                                                               // models forward_range
      using value_type        = range_value_t<Base>;
      using difference_type   = range_difference_t<Base>;

      inner-iterator() = default;
      constexpr explicit inner-iterator(outer-iterator<Const> i);

      constexpr const iterator_t<Base>& base() const & noexcept;
      constexpr iterator_t<Base> base() && requires forward_range<V>;

      constexpr decltype(auto) operator*() const { return *i_.current; }

      constexpr inner-iterator& operator++();
      constexpr decltype(auto) operator++(int) {
        if constexpr (forward_range<Base>) {
          auto tmp = *this;
          ++*this;
          return tmp;
        } else
          ++*this;
      }

      friend constexpr bool operator==(const inner-iterator& x, const inner-iterator& y)
        requires forward_range<Base>;

      friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);

      friend constexpr decltype(auto) iter_move(const inner-iterator& i)
      noexcept(noexcept(ranges::iter_move(i.i_.current))) {
        return ranges::iter_move(i.i_.current);
      }

      friend constexpr void iter_swap(const inner-iterator& x, const inner-iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
        requires indirectly_swappable<iterator_t<Base>>;
    };
  }
```

1 If `Base` does not model `forward_range` there is no member `iterator_category`. Otherwise, the *typedef-name* `iterator_category` denotes:

(1.1) — `forward_iterator_tag` if `iterator_traits<iterator_t<Base>>::iterator_category` models `derived_from<forward_iterator_tag>`;

(1.2) — otherwise, `iterator_traits<iterator_t<Base>>::iterator_category`.

```
constexpr explicit inner-iterator(outer-iterator<Const> i);
```

2 *Effects*: Initializes `i_` with `std::move(i)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

3 *Effects*: Equivalent to: `return i_.current;`

```
constexpr iterator_t<Base> base() && requires forward_range<V>;
```

4 *Effects*: Equivalent to: `return std::move(i_.current);`

```
constexpr inner-iterator& operator++();
```

5 *Effects*: Equivalent to:

```
        incremented_ = true;
        if constexpr (!forward_range<Base>) {
          if constexpr (Pattern::size() == 0) {
            return *this;
          }
        }
        ++i_.current;
        return *this;
```

```
friend constexpr bool operator==(const inner-iterator& x, const inner-iterator& y)
  requires forward_range<Base>;
```

6 *Effects*: Equivalent to: `return x.i_.current == y.i_.current;`

```
friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);
```

7 *Effects*: Equivalent to:

```
        auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
        auto end = ranges::end(x.i_.parent_->base_);
        if constexpr (tiny-range<Pattern>) {
          const auto & cur = x.i_.current;
          if (cur == end) return true;
          if (pcur == pend) return x.incremented_;
          return *cur == *pcur;
        } else {
          auto cur = x.i_.current;
          if (cur == end) return true;
          if (pcur == pend) return x.incremented_;
          do {
            if (*cur != *pcur) return false;
            if (++pcur == pend) return true;
          } while (++cur != end);
          return false;
        }
```

```
friend constexpr void iter_swap(const inner-iterator& x, const inner-iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
  requires indirectly_swappable<iterator_t<Base>>;
```

8 *Effects*: Equivalent to `ranges::iter_swap(x.i_.current, y.i_.current)`.

25.7.17 Split view [range.split]

25.7.17.1 Overview [range.split.overview]

1 `split_view` takes a view and a delimiter, and splits the view into `subrange`s on the delimiter. The delimiter can be a single element or a view of elements.

2 The name `views::split` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::split(E, F)` is expression-equivalent to `split_view(E, F)`.

3 [*Example 1*:

```
  string str{"the quick brown fox"};
  for (auto word : views::split(str, ' ')) {
    cout << string_view(word) << '*';
  }
  // The above prints the*quick*brown*fox*
```

— *end example*]

25.7.17.2 Class template `split_view` [range.split.view]

```
  namespace std::ranges {
    template<forward_range V, forward_range Pattern>
      requires view<V> && view<Pattern> &&
               indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
    class split_view : public view_interface<split_view<V, Pattern>> {
    private:
      V base_ = V();                              // exposition only
      Pattern pattern_ = Pattern();                 // exposition only

      // 25.7.17.3, class split_view::iterator
      struct iterator;                              // exposition only

      // 25.7.17.4, class split_view::sentinel
      struct sentinel;                              // exposition only

    public:
      split_view()
        requires default_initializable<V> && default_initializable<Pattern> = default;
      constexpr explicit split_view(V base, Pattern pattern);

      template<forward_range R>
        requires constructible_from<V, views::all_t<R>> &&
                 constructible_from<Pattern, single_view<range_value_t<R>>>
      constexpr explicit split_view(R&& r, range_value_t<R> e);

      constexpr V base() const & requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }

      constexpr iterator begin();

      constexpr auto end() {
        if constexpr (common_range<V>) {
          return iterator{*this, ranges::end(base_), {}};
        } else {
          return sentinel{*this};
        }
      }

      constexpr subrange<iterator_t<V>> find-next(iterator_t<V>); // exposition only
    };

    template<class R, class P>
      split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;

    template<forward_range R>
      split_view(R&&, range_value_t<R>)
        -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;
  }
```

```
constexpr explicit split_view(V base, Pattern pattern);
```

1 *Effects*: Initializes `base_` with `std::move(base)`, and `pattern_` with `std::move(pattern)`.

```
template<forward_range R>
  requires constructible_from<V, views::all_t<R>> &&
           constructible_from<Pattern, single_view<range_value_t<R>>>
constexpr explicit split_view(R&& r, range_value_t<R> e);
```

2 *Effects*: Initializes `base_` with `views::all(std::forward<R>(r))`, and `pattern_` with `views::single(std::move(e))`.

```
constexpr iterator begin();
```

3 *Returns*: `{*this, ranges::begin(base_), find-next(ranges::begin(base_))}`.

4 *Remarks*: In order to provide the amortized constant time complexity required by the `range` concept, this function caches the result within the `split_view` for use on subsequent calls.

```
constexpr subrange<iterator_t<V>> find-next(iterator_t<V> it);
```

5 *Effects*: Equivalent to:

```
  auto [b, e] = ranges::search(subrange(it, ranges::end(base_)), pattern_);
  if (b != ranges::end(base_) && ranges::empty(pattern_)) {
    ++b;
    ++e;
  }
  return {b, e};
```

25.7.17.3 Class split_view::*iterator* [range.split.iterator]

```
namespace std::ranges {
  template<forward_range V, forward_range Pattern>

    constexpr iterator operator++(int);

    friend constexpr bool operator==(const iterator& x, const iterator& y);
  };
}
```

`constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);`

1 *Effects*: Initializes *parent_* with addressof(parent), *cur_* with std::move(current), and *next_* with std::move(next).

`constexpr iterator_t<V> base() const;`

2 *Effects*: Equivalent to: return *cur_*;

`constexpr value_type operator*() const;`

3 *Effects*: Equivalent to: return {*cur_*, *next_*.begin()};

`constexpr iterator& operator++();`

4 *Effects*: Equivalent to:

```
cur_ = next_.begin();
if (cur_ != ranges::end(parent_->base_)) {
  cur_ = next_.end();
  if (cur_ == ranges::end(parent_->base_)) {
    trailing_empty_ = true;
    next_ = {cur_, cur_};
  } else {
    next_ = parent_->find-next(cur_);
  }
} else {
  trailing_empty_ = false;
}
return *this;
```

```
constexpr iterator operator++(int);
```

5 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

6 *Effects*: Equivalent to:

```
return x.cur_ == y.cur_ && x.trailing_empty_ == y.trailing_empty_;
```

25.7.17.4 Class split_view::*sentinel* [range.split.sentinel]

```
namespace std::ranges {
  template<forward_range V, forward_range Pattern>

```

```
constexpr explicit sentinel(split_view& parent);
```

1 *Effects*: Initializes *end_* with `ranges::end(parent.base_)`.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

2 *Effects*: Equivalent to: `return x.cur_ == y.end_ && !x.trailing_empty_;`

25.7.18 Concat view [range.concat]

25.7.18.1 Overview [range.concat.overview]

1 `concat_view` presents a view that concatenates all the underlying ranges.

2 The name `views::concat` denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions `Es...`, the expression `views::concat(Es...)` is expression-equivalent to

(2.1) — `views::all(Es...)` if `Es` is a pack with only one element whose type models `input_range`,

(2.2) — otherwise, `concat_view(Es...)`.

[*Example 1*:

```
vector<int> v1{1, 2, 3}, v2{4, 5}, v3{};
array a{6, 7, 8};
auto s = views::single(9);
for (auto&& i : views::concat(v1, v2, v3, a, s)) {
  print("{} ", i);       // prints 1 2 3 4 5 6 7 8 9
}
```

— *end example*]

25.7.18.2 Class template concat_view [range.concat.view]

```
namespace std::ranges {
  template<class... Rs>
  using concat-reference-t = common_reference_t<range_reference_t<Rs>...>;        // exposition only
  template<class... Rs>
  using concat-value-t = common_type_t<range_value_t<Rs>...>;                     // exposition only
  template<class... Rs>
  using concat-rvalue-reference-t =                                               // exposition only
    common_reference_t<range_rvalue_reference_t<Rs>...>;
    template<class... Rs>
      concept concat-indirectly-readable = see below;     // exposition only
    template<class... Rs>
      concept concatable = see below;                     // exposition only
    template<bool Const, class... Rs>
      concept concat-is-random-access = see below;        // exposition only
    template<bool Const, class... Rs>
      concept concat-is-bidirectional = see below;        // exposition only

    template<input_range... Views>
      requires (view<Views> && ...) && (sizeof...(Views) > 0) &&
               concatable<Views...>
    class concat_view : public view_interface<concat_view<Views...>> {

      tuple<Views...> views_;                                            // exposition only

      // 25.7.18.3, class template concat_view::iterator
      template<bool> class iterator;                                     // exposition only

    public:
      constexpr concat_view() = default;
      constexpr explicit concat_view(Views... views);

      constexpr iterator<false> begin() requires (!(simple-view<Views> && ...));
      constexpr iterator<true> begin() const
        requires (range<const Views> && ...) && concatable<const Views...>;

      constexpr auto end() requires (!(simple-view<Views> && ...));
      constexpr auto end() const
        requires (range<const Views> && ...) && concatable<const Views...>;

      constexpr auto size() requires (sized_range<Views> && ...);
      constexpr auto size() const requires (sized_range<const Views> && ...);
    };

    template<class... R>
      concat_view(R&&...) -> concat_view<views::all_t<R>...>;
  }

template<class... Rs>
  concept concat-indirectly-readable = see below;                          // exposition only
```

1 The exposition-only *concat-indirectly-readable* concept is equivalent to:

```
template<class Ref, class RRef, class It>
  concept concat-indirectly-readable-impl =                          // exposition only
    requires (const It it) {
      { *it } -> convertible_to<Ref>;
      { ranges::iter_move(it) } -> convertible_to<RRef>;
    };

template<class... Rs>
  concept concat-indirectly-readable =                               // exposition only
    common_reference_with<concat-reference-t<Rs...>&&,
                          concat-value-t<Rs...>&> &&
    common_reference_with<concat-reference-t<Rs...>&&,
                          concat-rvalue-reference-t<Rs...>&&> &&
    common_reference_with<concat-rvalue-reference-t<Rs...>&&,
                          concat-value-t<Rs...> const&> &&
    (concat-indirectly-readable-impl<concat-reference-t<Rs...>,
                                     concat-rvalue-reference-t<Rs...>,
                                     iterator_t<Rs>> && ...);
```

```
template<class... Rs>
  concept concatable = see below;                                        // exposition only
```

2 The exposition-only *concatable* concept is equivalent to:

```
template<class... Rs>
  concept concatable = requires {                                        // exposition only
    typename concat-reference-t<Rs...>;
    typename concat-value-t<Rs...>;
    typename concat-rvalue-reference-t<Rs...>;
  } && concat-indirectly-readable<Rs...>;
```

```
template<bool Const, class... Rs>
  concept concat-is-random-access = see below;                           // exposition only
```

3 Let `Fs` be the pack that consists of all elements of `Rs` except the last element, then *concat-is-random-access* is equivalent to:

```
template<bool Const, class... Rs>
  concept concat-is-random-access =                                      // exposition only
    all-random-access<Const, Rs...> &&
    (common_range<maybe-const<Const, Fs>> && ...);
```

```
template<bool Const, class... Rs>
  concept concat-is-bidirectional = see below;                           // exposition only
```

4 Let `Fs` be the pack that consists of all elements of `Rs` except the last element, then *concat-is-bidirectional* is equivalent to:

```
template<bool Const, class... Rs>
  concept concat-is-bidirectional =                                      // exposition only
    all-bidirectional<Const, Rs...> &&
    (common_range<maybe-const<Const, Fs>> && ...);
```

```
constexpr explicit concat_view(Views... views);
```

5 *Effects*: Initializes *views_* with `std::move(views)...`.

```
constexpr iterator<false> begin() requires (!(simple-view<Views> && ...));
constexpr iterator<true> begin() const
  requires (range<const Views> && ...) && concatable<const Views...>;
```

6 *Effects*: Let *is-const* be `true` for the const-qualified overload, and `false` otherwise. Equivalent to:

```
iterator<is-const> it(this, in_place_index<0>, ranges::begin(std::get<0>(views_)));
it.template satisfy<0>();
return it;
```

```
constexpr auto end() requires (!(simple-view<Views> && ...));
constexpr auto end() const
  requires (range<const Views> && ...) && concatable<const Views...>;
```

7 *Effects*: Let *is-const* be `true` for the const-qualified overload, and `false` otherwise. Equivalent to:

```
constexpr auto N = sizeof...(Views);
if constexpr (common_range<maybe-const<is-const, Views...[N - 1]>>) {
  return iterator<is-const>(this, in_place_index<N - 1>,
                            ranges::end(std::get<N - 1>(views_)));
} else {
  return default_sentinel;
}
```

```
constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);
```

8 *Effects*: Equivalent to:

```
return apply(
  [](auto... sizes) {
    using CT = make-unsigned-like-t<common_type_t<decltype(sizes)...>>;
    return (CT(sizes) + ...);
  },
      tuple-transform(ranges::size, views_));
```

25.7.18.3 Class concat_view::*iterator* [range.concat.iterator]

```
namespace std::ranges {
  template<input_range... Views>

```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *concat-is-random-access*<Const, Views...> is modeled, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *concat-is-bidirectional*<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *all-forward*<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member *typedef-name* iterator_category is defined if and only if *all-forward*<Const, Views...> is modeled. In that case, *iterator*::iterator_category is defined as follows:

(2.1) — If is_reference_v<*concat-reference-t*<*maybe-const*<Const, Views>...>> is false, then iterator_category denotes input_iterator_tag.

(2.2) — Otherwise, let Cs denote the pack of types iterator_traits<iterator_t<*maybe-const*<Const, Views>>>::iterator_category....

(2.2.1) — If (derived_from<Cs, random_access_iterator_tag> && ...) && *concat-is-random-access*<Const, Views...> is true, iterator_category denotes random_access_iterator_tag.

(2.2.2) — Otherwise, if (derived_from<Cs, bidirectional_iterator_tag> && ...) && *concat-is-bidirectional*<Const, Views...> is true, iterator_category denotes bidirectional_iterator_tag.

(2.2.3) — Otherwise, if (derived_from<Cs, forward_iterator_tag> && ...) is true, iterator_category denotes forward_iterator_tag.

(2.2.4) — Otherwise, iterator_category denotes input_iterator_tag.

```
template<size_t N>
  constexpr void satisfy();
```

3 *Effects*: Equivalent to:

```
if constexpr (N < (sizeof...(Views) - 1)) {
  if (std::get<N>(it_) == ranges::end(std::get<N>(parent_->views_))) {
    it_.template emplace<N + 1>(ranges::begin(std::get<N + 1>(parent_->views_)));
    satisfy<N + 1>();
  }
}
```

```
template<size_t N>
  constexpr void prev();
```

4 *Effects*: Equivalent to:

```
if constexpr (N == 0) {
  --std::get<0>(it_);
} else {
  if (std::get<N>(it_) == ranges::begin(std::get<N>(parent_->views_))) {

33 *Preconditions*: `x.it_.valueless_by_exception()` and `y.it_.valueless_by_exception()` are each `false`.

34 *Effects*: Let i_x denote `x.it_.index()` and i_y denote `y.it_.index()`.

(34.1) — If i_x `>` i_y, let d_y be `ranges::distance(std::get<`i_y`>(y.it_), ranges::end(std::get<`i_y`>(y.parent_->views_)))`, d_x be `ranges::distance(ranges::begin(std::get<`i_x`>(x.parent_->views_)), std::get<`i_x`>(x.it_))`. Let s denote the sum of the sizes of all the ranges `std::get<`i`>(x.parent_->views_)` for every integer i in the range $[i_y$ `+ 1`$, i_x)$ if there is any, and `0` otherwise, of type `difference_type`, equivalent to:

```
return dy + s + dx;
```

(34.2) — otherwise, if i_x `<` i_y is `true`, equivalent to:

```
return -(y - x);
```

(34.3) — otherwise, equivalent to:

```
return std::get<ix>(x.it_) - std::get<iy>(y.it_);
```

```
friend constexpr difference_type operator-(const iterator& x, default_sentinel_t)
  requires see below;
```

35 *Preconditions*: `x.it_.valueless_by_exception()` is `false`.

36 *Effects*: Let i_x denote `x.it_.index()`, d_x be `ranges::distance(std::get<`i_x`>(x.it_), ranges::end(std::get<`i_x`>(x.parent_->views_)))`. Let s denote the sum of the sizes of all the ranges `std::get<`i`>(x.parent_->views_)` for every integer i in the range $[i_x$ `+ 1, sizeof...(Views)`$)$ if there is any, and `0` otherwise, of type difference_type, equivalent to:

```
return -(dx + s);
```

37 *Remarks*: Let `Fs` be the pack that consists of all elements of `Views` except the first element, the expression in the *requires-clause* is equivalent to:

```
(sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                    iterator_t<maybe-const<Const, Views>>> && ...) &&
(sized_range<maybe-const<Const, Fs>> && ...)
```

```
friend constexpr difference_type operator-(default_sentinel_t, const iterator& x)
  requires see below;
```

38 *Effects*: Equivalent to:

```
return -(x - default_sentinel);
```

39 *Remarks*: Let `Fs` be the pack that consists of all elements of `Views` except the first element, the expression in the *requires-clause* is equivalent to:

```
(sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                    iterator_t<maybe-const<Const, Views>>> && ...) &&
(sized_range<maybe-const<Const, Fs>> && ...)
```

```
friend constexpr decltype(auto) iter_move(const iterator& it) noexcept(see below);
```

40 *Preconditions*: `it.it_.valueless_by_exception()` is `false`.

41 *Effects*: Equivalent to:

```
return std::visit([](const auto& i)
                  -> concat-rvalue-reference-t<maybe-const<Const, Views>...> {
                    return ranges::iter_move(i);
                  },
                  it.it_);
```

42 *Remarks*: The exception specification is equivalent to:

```
((is_nothrow_invocable_v<decltype(ranges::iter_move),
                         const iterator_t<maybe-const<Const, Views>>&> &&
  is_nothrow_convertible_v<range_rvalue_reference_t<maybe-const<Const, Views>>,
                           concat-rvalue-reference-t<maybe-const<Const, Views>...>>) &&
 ...)
```

```
friend constexpr void iter_swap(const iterator& x, const iterator& y) noexcept(see below)
  requires see below;
```

43 *Preconditions*: `x.it_.valueless_by_exception()` and `y.it_.valueless_by_exception()` are each `false`.

44 *Effects*: Equivalent to:

```
std::visit([&](const auto& it1, const auto& it2) {
             if constexpr (is_same_v<decltype(it1), decltype(it2)>) {
               ranges::iter_swap(it1, it2);
             } else {
               ranges::swap(*x, *y);
             }
           },
           x.it_, y.it_);
```

45 *Remarks*: The exception specification is equivalent to

```
(noexcept(ranges::swap(*x, *y)) && ... && noexcept(ranges::iter_swap(its, its)))
```

where `its` is a pack of lvalues of type `const iterator_t<maybe-const<Const, Views>>` respectively.

The expression in the *requires-clause* is equivalent to

```
swappable_with<iter_reference_t<iterator>, iter_reference_t<iterator>> &&
(... && indirectly_swappable<iterator_t<maybe-const<Const, Views>>>)
```

25.7.19 Counted view [range.counted]

1 A counted view presents a view of the elements of the counted range (24.3.1) `i` + [0, `n`) for an iterator `i` and non-negative integer `n`.

2 The name `views::counted` denotes a customization point object (16.3.3.3.5). Let `E` and `F` be expressions, let `T` be `decay_t<decltype((E))>`, and let `D` be `iter_difference_t<T>`. If `decltype((F))` does not model `convertible_to<D>`, `views::counted(E, F)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `views::counted(E, F)` appears in the immediate context of a template instantiation. — *end note*]

Otherwise, `views::counted(E, F)` is expression-equivalent to:

(2.1) — If `T` models `contiguous_iterator`, then `span(to_address(E), static_cast<size_t>(static_cast<D>(F)))`.

(2.2) — Otherwise, if `T` models `random_access_iterator`, then `subrange(E, E + static_cast<D>(F))`, except that `E` is evaluated only once.

(2.3) — Otherwise, `subrange(counted_iterator(E, F), default_sentinel)`.

25.7.20 Common view [range.common]

25.7.20.1 Overview [range.common.overview]

1 `common_view` takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.

2 [*Note 1*: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — *end note*]

3 The name `views::common` denotes a range adaptor object (25.7.2). Given a subexpression `E`, the expression `views::common(E)` is expression-equivalent to:

(3.1) — `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.

(3.2) — Otherwise, `common_view{E}`.

4 [*Example 1*:

```
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
  auto&& common = views::common(r);
  auto cnt = count(common.begin(), common.end());
  // ...
}
```

— *end example*]

25.7.20.2 Class template common_view [range.common.view]

```
namespace std::ranges {
  template<view V>
    requires (!common_range<V> && copyable<iterator_t<V>>)
  class common_view : public view_interface<common_view<V>> {
  private:
    V base_ = V();    // exposition only

  public:
    common_view() requires default_initializable<V> = default;

    constexpr explicit common_view(V r);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>) {
      if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_);
      else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
    }

    constexpr auto begin() const requires range<const V> {
      if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_);
      else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
    }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_) + ranges::distance(base_);
      else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_) + ranges::distance(base_);
      else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
    }

    constexpr auto size() requires sized_range<V> {
      return ranges::size(base_);
    }
    constexpr auto size() const requires sized_range<const V> {
      return ranges::size(base_);
    }
```

```
      constexpr auto reserve_hint() requires approximately_sized_range<V> {
        return ranges::reserve_hint(base_);
      }
      constexpr auto reserve_hint() const requires approximately_sized_range<const V> {
        return ranges::reserve_hint(base_);
      }
    };

    template<class R>
      common_view(R&&) -> common_view<views::all_t<R>>;
  }
```

`constexpr explicit common_view(V base);`

1 *Effects*: Initializes *base_* with `std::move(base)`.

25.7.21 Reverse view [range.reverse]

25.7.21.1 Overview [range.reverse.overview]

1 `reverse_view` takes a bidirectional view and produces another view that iterates the same elements in reverse order.

2 The name `views::reverse` denotes a range adaptor object (25.7.2). Given a subexpression `E`, the expression `views::reverse(E)` is expression-equivalent to:

(2.1) — If the type of `E` is a (possibly cv-qualified) specialization of `reverse_view`, then `E.base()`.

(2.2) — Otherwise, if the type of `E` is *cv* `subrange<reverse_iterator<I>, reverse_iterator<I>, K>` for some iterator type `I` and value `K` of type `subrange_kind`,

(2.2.1) — if `K` is `subrange_kind::sized`, then `subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())`;

(2.2.2) — otherwise, `subrange<I, I, K>(E.end().base(), E.begin().base())`.

However, in either case `E` is evaluated only once.

(2.3) — Otherwise, `reverse_view{E}`.

3 [*Example 1*:

```
vector<int> is {0,1,2,3,4};
for (int i : is | views::reverse)
  cout << i << ' ';   // prints 4 3 2 1 0
```

— *end example*]

25.7.21.2 Class template reverse_view [range.reverse.view]

```
namespace std::ranges {
  template<view V>
    requires bidirectional_range<V>
  class reverse_view : public view_interface<reverse_view<V>> {
  private:
    V base_ = V();    // exposition only

  public:
    reverse_view() requires default_initializable<V> = default;

    constexpr explicit reverse_view(V r);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr reverse_iterator<iterator_t<V>> begin();
    constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
    constexpr auto begin() const requires common_range<const V>;

    constexpr reverse_iterator<iterator_t<V>> end();
    constexpr auto end() const requires common_range<const V>;
```

```
      constexpr auto size() requires sized_range<V> {
        return ranges::size(base_);
      }

      constexpr auto size() const requires sized_range<const V> {
        return ranges::size(base_);
      }

      constexpr auto reserve_hint() requires approximately_sized_range<V> {
        return ranges::reserve_hint(base_);
      }
      constexpr auto reserve_hint() const requires approximately_sized_range<const V> {
        return ranges::reserve_hint(base_);
      }
    };

    template<class R>
      reverse_view(R&&) -> reverse_view<views::all_t<R>>;
  }
```

```
constexpr explicit reverse_view(V base);
```

1 *Effects*: Initializes *base_* with `std::move(base)`.

```
constexpr reverse_iterator<iterator_t<V>> begin();
```

2 *Returns*:

```
make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))
```

3 *Remarks*: In order to provide the amortized constant time complexity required by the `range` concept, this function caches the result within the `reverse_view` for use on subsequent calls.

```
constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;
```

4 *Effects*: Equivalent to: `return make_reverse_iterator(ranges::end(base_));`

```
constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;
```

5 *Effects*: Equivalent to: `return make_reverse_iterator(ranges::begin(base_));`

25.7.22 As const view [range.as.const]

25.7.22.1 Overview [range.as.const.overview]

1 `as_const_view` presents a view of an underlying sequence as constant. That is, the elements of an `as_const_view` cannot be modified.

2 The name `views::as_const` denotes a range adaptor object (25.7.2). Let `E` be an expression, let `T` be `decltype((E))`, and let `U` be `remove_cvref_t<T>`. The expression `views::as_const(E)` is expression-equivalent to:

(2.1) — If `views::all_t<T>` models `constant_range`, then `views::all(E)`.

(2.2) — Otherwise, if `U` denotes `empty_view<X>` for some type `X`, then `auto(views::empty<const X>)`.

(2.3) — Otherwise, if `U` denotes `span<X, Extent>` for some type `X` and some extent `Extent`, then `span<const X, Extent>(E)`.

(2.4) — Otherwise, if `U` denotes `ref_view<X>` for some type `X` and `const X` models `constant_range`, then `ref_view(static_cast<const X&>(E.base()))`.

(2.5) — Otherwise, if `E` is an lvalue, `const U` models `constant_range`, and `U` does not model `view`, then `ref_view(static_cast<const U&>(E))`.

(2.6) — Otherwise, `as_const_view(E)`.

3 [*Example 1*:

```
template<constant_range R>
void cant_touch_this(R&&);
```

```
vector<char> hammer = {'m', 'c'};
span<char> beat = hammer;
cant_touch_this(views::as_const(beat));          // will not modify the elements of hammer
```

— *end example*]

25.7.22.2 Class template as_const_view [range.as.const.view]

```
namespace std::ranges {
  template<view V>
    requires input_range<V>
  class as_const_view : public view_interface<as_const_view<V>> {
    V base_ = V();        // exposition only

  public:
    as_const_view() requires default_initializable<V> = default;
    constexpr explicit as_const_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>) { return ranges::cbegin(base_); }
    constexpr auto begin() const requires range<const V> { return ranges::cbegin(base_); }

    constexpr auto end() requires (!simple-view<V>) { return ranges::cend(base_); }
    constexpr auto end() const requires range<const V> { return ranges::cend(base_); }

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }

    constexpr auto reserve_hint() requires approximately_sized_range<V>
    { return ranges::reserve_hint(base_); }
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>
    { return ranges::reserve_hint(base_); }
  };

  template<class R>
    as_const_view(R&&) -> as_const_view<views::all_t<R>>;
}
```

`constexpr explicit as_const_view(V base);`

1 *Effects*: Initializes *base_* with `std::move(base)`.

25.7.23 Elements view [range.elements]

25.7.23.1 Overview [range.elements.overview]

1 `elements_view` takes a view of tuple-like values and a `size_t`, and produces a view with a value-type of the N^{th} element of the adapted view's value-type.

2 The name `views::elements<N>` denotes a range adaptor object (25.7.2). Given a subexpression `E` and constant expression `N`, the expression `views::elements<N>(E)` is expression-equivalent to `elements_-view<views::all_t<decltype((E))>, N>{E}`.

[*Example 1*:

```
auto historical_figures = map{
  pair{"Lovelace"sv, 1815},
  {"Turing"sv, 1912},
  {"Babbage"sv, 1791},
  {"Hamilton"sv, 1936}
};

auto names = historical_figures | views::elements<0>;
for (auto&& name : names) {
  cout << name << ' ';          // prints Babbage Hamilton Lovelace Turing
}
```

```
auto birth_years = historical_figures | views::elements<1>;
for (auto&& born : birth_years) {
  cout << born << ' ';          // prints 1791 1936 1815 1912
}
```

— end example]

3 `keys_view` is an alias for `elements_view<R, 0>`, and is useful for extracting keys from associative containers.

[*Example 2*:

```
auto names = historical_figures | views::keys;
for (auto&& name : names) {
  cout << name << ' ';          // prints Babbage Hamilton Lovelace Turing
}
```

— end example]

4 `values_view` is an alias for `elements_view<R, 1>`, and is useful for extracting values from associative containers.

[*Example 3*:

```
auto is_even = [](const auto x) { return x % 2 == 0; };
cout << ranges::count_if(historical_figures | views::values, is_even);  // prints 2
```

— end example]

25.7.23.2 Class template `elements_view` [range.elements.view]

```
namespace std::ranges {
  template<class T, size_t N>
  concept has-tuple-element =                    // exposition only
    tuple-like<T> && N < tuple_size_v<T>;

  template<class T, size_t N>
  concept returnable-element =                   // exposition only
    is_reference_v<T> || move_constructible<tuple_element_t<N, T>>;

  template<input_range V, size_t N>
    requires view<V> && has-tuple-element<range_value_t<V>, N> &&
             has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
             returnable-element<range_reference_t<V>, N>
  class elements_view : public view_interface<elements_view<V, N>> {
  public:
    elements_view() requires default_initializable<V> = default;
    constexpr explicit elements_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>)
    { return iterator<false>(ranges::begin(base_)); }

    constexpr auto begin() const requires range<const V>
    { return iterator<true>(ranges::begin(base_)); }

      friend constexpr difference_type operator-(const iterator& x, const iterator& y)
        requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
    };
  }
```

1 The member *typedef-name* `iterator_concept` is defined as follows:

(1.1) — If *`Base`* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.2) — Otherwise, if *`Base`* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.3) — Otherwise, if *`Base`* models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if *`Base`* models `forward_range`. In that case, `iterator_category` is defined as follows: Let `C` denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

(2.1) — If `std::get<N>(*current_)` is an rvalue, `iterator_category` denotes `input_iterator_tag`.

```

6 *Effects*: Equivalent to: `return x.end_ - y.current_;`

25.7.24 Enumerate view [range.enumerate]

25.7.24.1 Overview [range.enumerate.overview]

1 `enumerate_view` is a view whose elements represent both the position and value from a sequence of elements.

2 The name `views::enumerate` denotes a range adaptor object (25.7.2). Given a subexpression `E`, the expression `views::enumerate(E)` is expression-equivalent to `enumerate_view<views::all_t<decltype((E))>>(E)`.

[*Example 1*:

```
  vector<int> vec{ 1, 2, 3 };
  for (auto [index, value] : views::enumerate(vec))
    cout << index << ":" << value << ' ';          // prints 0:1 1:2 2:3
```

— *end example*]

25.7.24.2 Class template `enumerate_view` [range.enumerate.view]

```
  namespace std::ranges {
    template<view V>
      requires range-with-movable-references<V>
    class enumerate_view : public view_interface<enumerate_view<V>> {
      V base_ = V();                                    // exposition only

      // 25.7.24.3, class template enumerate_view::iterator
      template<bool Const>
        class iterator;                                 // exposition only

      // 25.7.24.4, class template enumerate_view::sentinel
      template<bool Const>
        class sentinel;                                 // exposition only
    public:
      constexpr enumerate_view() requires default_initializable<V> = default;

```

6 *Effects*: Equivalent to: `return x.end_ - y.current_;`

25.7.25 Zip view [range.zip]

25.7.25.1 Overview [range.zip.overview]

1 `zip_view` takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.

2 The name `views::zip` denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions `Es...`, the expression `views::zip(Es...)` is expression-equivalent to

(2.1) — `auto(views::empty<tuple<>>)` if `Es` is an empty pack,

(2.2) — otherwise, `zip_view<views::all_t<decltype((Es))>...>(Es...)`.

[*Example 1*:

```
vector v = {1, 2};
list l = {'a', 'b', 'c'};

auto z = views::zip(v, l);
range_reference_t<decltype(z)> f = z.front();    // f is a tuple<int&, char&>
                                                 // that refers to the first element of v and l

for (auto&& [x, y] : z) {
  cout << '(' << x << ", " << y << ") ";         // prints (1, a) (2, b)
}
```

— *end example*]

25.7.25.2 Class template zip_view [range.zip.view]

```
namespace std::ranges {
  template<class... Rs>
  concept zip-is-common =                              // exposition only
    (sizeof...(Rs) == 1 && (common_range<Rs> && ...)) ||
    (!(bidirectional_range<Rs> && ...) && (common_range<Rs> && ...)) ||
    ((random_access_range<Rs> && ...) && (sized_range<Rs> && ...));
  template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
  class zip_view : public view_interface<zip_view<Views...>> {
    tuple<Views...> views_;              // exposition only

    // 25.7.25.3, class template zip_view::iterator
    template<bool> class iterator;       // exposition only

    // 25.7.25.4, class template zip_view::sentinel
    template<bool> class sentinel;       // exposition only

  public:
    zip_view() = default;
    constexpr explicit zip_view(Views... views);

    constexpr auto begin() requires (!(simple-view<Views> && ...)) {
      return iterator<false>(tuple-transform(ranges::begin, views_));
    }
    constexpr auto begin() const requires (range<const Views> && ...) {
      return iterator<true>(tuple-transform(ranges::begin, views_));
    }

    constexpr auto end() requires (!(simple-view<Views> && ...)) {
      if constexpr (!zip-is-common<Views...>) {
        return sentinel<false>(tuple-transform(ranges::end, views_));
      } else if constexpr ((random_access_range<Views> && ...)) {
        return begin() + iter_difference_t<iterator<false>>(size());
      } else {
        return iterator<false>(tuple-transform(ranges::end, views_));
      }
    }

    constexpr auto end() const requires (range<const Views> && ...) {
      if constexpr (!zip-is-common<const Views...>) {
        return sentinel<true>(tuple-transform(ranges::end, views_));
      } else if constexpr ((random_access_range<const Views> && ...)) {
        return begin() + iter_difference_t<iterator<true>>(size());
      } else {

      }
    }

    constexpr auto size() requires (sized_range<Views> && ...);
    constexpr auto size() const requires (sized_range<const Views> && ...);
  };

  template<class... Rs>
    zip_view(Rs&&...) -> zip_view<views::all_t<Rs>...>;
}
```

1 Two `zip_view` objects have the same underlying sequence if and only if the corresponding elements of *`views_`* are equal (18.2) and have the same underlying sequence.

[*Note 1*: In particular, comparison of iterators obtained from `zip_view` objects that do not have the same underlying sequence is not required to produce meaningful results (24.3.4.11). — *end note*]

```
constexpr explicit zip_view(Views... views);
```

2 *Effects*: Initializes *`views_`* with `std::move(views)...`.

```
constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);
```

3 *Effects*: Equivalent to:

```
  return apply([](auto... sizes) {
    using CT = make-unsigned-like-t<common_type_t<decltype(sizes)...>>;
```

```
        return ranges::min({CT(sizes)...});
      }, tuple-transform(ranges::size, views_));
```

25.7.25.3 Class template zip_view::*iterator* [range.zip.iterator]

```
namespace std::ranges {
  template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
  template<bool Const>
  class zip_view<Views...>::iterator {
    tuple<iterator_t<maybe-const<Const, Views>>...> current_;       // exposition only
    constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>...>);
                                                                         // exposition only
  public:
    using iterator_category = input_iterator_tag;                        // not always present
    using iterator_concept  = see below;
    using value_type = tuple<range_value_t<maybe-const<Const, Views>>...>;
    using difference_type = common_type_t<range_difference_t<maybe-const<Const, Views>>...>;

    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

    constexpr auto operator*() const;
    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires all-forward<Const, Views...>;

    constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
    constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;

    constexpr iterator& operator+=(difference_type x)
      requires all-random-access<Const, Views...>;
    constexpr iterator& operator-=(difference_type x)
      requires all-random-access<Const, Views...>;

    constexpr auto operator[](difference_type n) const
      requires all-random-access<Const, Views...>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires all-random-access<Const, Views...>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires all-random-access<Const, Views...>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires all-random-access<Const, Views...>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires all-random-access<Const, Views...>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
                                   iterator_t<maybe-const<Const, Views>>> && ...);

    friend constexpr auto iter_move(const iterator& i) noexcept(see below);

    friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
      requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
  };
}
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *all-random-access*<Const, Views...> is modeled, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *all-bidirectional*<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *all-forward*<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 *iterator*::iterator_category is present if and only if *all-forward*<Const, Views...> is modeled.

3 If the invocation of any non-const member function of *iterator* exits via an exception, the iterator acquires a singular value.

```
constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>...> current);
```

4 *Effects*: Initializes *current_* with std::move(current).

```
constexpr iterator(iterator<!Const> i)
  requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);
```

5 *Effects*: Initializes *current_* with std::move(i.*current_*).

```
constexpr auto operator*() const;
```

6 *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

7 *Effects*: Equivalent to:

```
tuple-for-each([](auto& i) { ++i; }, current_);
return *this;
```

```
constexpr void operator++(int);
```

8 *Effects*: Equivalent to ++*this.

```
constexpr iterator operator++(int) requires all-forward<Const, Views...>;
```

9 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
```

10 *Effects*: Equivalent to:

```
tuple-for-each([](auto& i) { --i; }, current_);
return *this;
```

```
constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;
```

11 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires all-random-access<Const, Views...>;
```

12 *Effects*: Equivalent to:

```
tuple-for-each([&]<class I>(I& i) { i += iter_difference_t<I>(x); }, current_);
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
  requires all-random-access<Const, Views...>;
```

13 *Effects*: Equivalent to:

```
tuple-for-each([&]<class I>(I& i) { i -= iter_difference_t<I>(x); }, current_);
return *this;
```

```
constexpr auto operator[](difference_type n) const
  requires all-random-access<Const, Views...>;
```

14 *Effects*: Equivalent to:

```
return tuple-transform([&]<class I>(I& i) -> decltype(auto) {
  return i[iter_difference_t<I>(n)];
}, current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);
```

15 *Returns*:

(15.1) — `x.current_ == y.current_` if `all-bidirectional<Const, Views...>` is `true`.

(15.2) — Otherwise, `true` if there exists an integer $0 \leq i <$ `sizeof...(Views)` such that `bool(std::get<i>(x.current_) == std::get<i>(y.current_))` is `true`.

[*Note 1*: This allows `zip_view` to model `common_range` when all constituent views model `common_range`. — *end note*]

(15.3) — Otherwise, `false`.

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires all-random-access<Const, Views...>;
```

16 *Returns*: `x.current_ <=> y.current_`.

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires all-random-access<Const, Views...>;
```

17 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires all-random-access<Const, Views...>;
```

18 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
                               iterator_t<maybe-const<Const, Views>>> && ...);
```

19 Let *DIST*(i) be `difference_type(std::get<i>(x.current_) - std::get<i>(y.current_))`.

20 *Returns*: The value with the smallest absolute value among *DIST*(n) for all integers $0 \leq n <$ `sizeof...(Views)`.

```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
```

21 *Effects*: Equivalent to:

```
return tuple-transform(ranges::iter_move, i.current_);
```

22 *Remarks*: The exception specification is equivalent to:

```
(noexcept(ranges::iter_move(declval<const iterator_t<maybe-const<Const,
                                                    Views>>&>())) && ...) &&
(is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const,
                                                               Views>>> && ...)
```

```
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
```

23 *Effects*: For every integer $0 \leq i <$ `sizeof...(Views)`, performs:

```
ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
```

24 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

```
noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_)))
```

for every integer $0 \leq i <$ `sizeof...(Views)`.

25.7.25.4 Class template `zip_view::sentinel` [range.zip.sentinel]

```
namespace std::ranges {
  template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
  template<bool Const>
  class zip_view<Views...>::sentinel {
    tuple<sentinel_t<maybe-const<Const, Views>>...> end_;              // exposition only
    constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);
                                                                         // exposition only
  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);

    template<bool OtherConst>
      requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                             iterator_t<maybe-const<OtherConst, Views>>> && ...)
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                                   iterator_t<maybe-const<OtherConst, Views>>> && ...)
    friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                                   iterator_t<maybe-const<OtherConst, Views>>> && ...)
    friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
      operator-(const sentinel& y, const iterator<OtherConst>& x);
  };
}
```

```
constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);
```

1 *Effects*: Initializes *end_* with end.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);
```

2 *Effects*: Initializes *end_* with `std::move(i.end_)`.

```
template<bool OtherConst>
  requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                         iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Returns*: `true` if there exists an integer $0 \leq i <$ `sizeof...(Views)` such that `bool(std::get<i>(x.current_) == std::get<i>(y.end_))` is `true`. Otherwise, `false`.

```
template<bool OtherConst>
  requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                               iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 Let `D` be the return type. Let *DIST*(*i*) be `D(std::get<i>(x.current_) - std::get<i>(y.end_))`.

5 *Returns*: The value with the smallest absolute value among *DIST*(*n*) for all integers $0 \leq n <$ `sizeof...(Views)`.

```
template<bool OtherConst>
  requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                               iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
  operator-(const sentinel& y, const iterator<OtherConst>& x);
```

6 *Effects*: Equivalent to: `return -(x - y);`

25.7.26 Zip transform view [range.zip.transform]

25.7.26.1 Overview [range.zip.transform.overview]

1 `zip_transform_view` takes an invocable object and any number of views and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} elements of all views.

2 The name `views::zip_transform` denotes a customization point object (16.3.3.3.5). Let `F` be a subexpression, and let `Es...` be a pack of subexpressions.

(2.1) — If `Es` is an empty pack, let `FD` be `decay_t<decltype((F))>`.

(2.1.1) — If `move_constructible<FD> && regular_invocable<FD&>` is `false`, or if `decay_t<invoke_result_t<FD&>>` is not an object type, `views::zip_transform(F, Es...)` is ill-formed.

(2.1.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to

```
((void)F, auto(views::empty<decay_t<invoke_result_t<FD&>>>))
```

(2.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to `zip_transform_view(F, Es...)`.

3 [*Example 1*:

```
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip_transform(plus(), v1, v2)) {
  cout << i << ' ';       // prints 5 7
}
```

— *end example*]

25.7.26.2 Class template zip_transform_view [range.zip.transform.view]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  class zip_transform_view : public view_interface<zip_transform_view<F, Views...>> {
    movable-box<F> fun_;                  // exposition only
    zip_view<Views...> zip_;              // exposition only

    using InnerView = zip_view<Views...>;   // exposition only
    template<bool Const>
      using ziperator = iterator_t<maybe-const<Const, InnerView>>;       // exposition only
    template<bool Const>
      using zentinel = sentinel_t<maybe-const<Const, InnerView>>;        // exposition only

    // 25.7.26.3, class template zip_transform_view::iterator
    template<bool> class iterator;        // exposition only

    // 25.7.26.4, class template zip_transform_view::sentinel
    template<bool> class sentinel;        // exposition only

  public:
    zip_transform_view() = default;

    constexpr explicit zip_transform_view(F fun, Views... views);

    constexpr auto begin() { return iterator<false>(*this, zip_.begin()); }
    constexpr auto begin() const
      requires range<const InnerView> &&
               regular_invocable<const F&, range_reference_t<const Views>...> {
      return iterator<true>(*this, zip_.begin());
    }

    constexpr auto end() {
      if constexpr (common_range<InnerView>) {
        return iterator<false>(*this, zip_.end());
      } else {
        return sentinel<false>(zip_.end());
      }
    }

    constexpr auto end() const
      requires range<const InnerView> &&
               regular_invocable<const F&, range_reference_t<const Views>...> {
      if constexpr (common_range<const InnerView>) {
        return iterator<true>(*this, zip_.end());
      } else {
        return sentinel<true>(zip_.end());
      }
    }

    constexpr auto size() requires sized_range<InnerView> {
      return zip_.size();
    }

    constexpr auto size() const requires sized_range<const InnerView> {
      return zip_.size();
    }
  };

  template<class F, class... Rs>
    zip_transform_view(F, Rs&&...) -> zip_transform_view<F, views::all_t<Rs>...>;
}
```

```
constexpr explicit zip_transform_view(F fun, Views... views);
```

1 *Effects*: Initializes *fun_* with `std::move(fun)` and *zip_* with `std::move(views)...`.

25.7.26.3 Class template `zip_transform_view::iterator` [range.zip.transform.iterator]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  template<bool Const>
  class zip_transform_view<F, Views...>::iterator {
    using Parent = maybe-const<Const, zip_transform_view>;      // exposition only
    using Base = maybe-const<Const, InnerView>;                 // exposition only
    Parent* parent_ = nullptr;                                  // exposition only
    ziperator<Const> inner_;                                    // exposition only

    constexpr iterator(Parent& parent, ziperator<Const> inner);   // exposition only

  public:
    using iterator_category = see below;                        // not always present
    using iterator_concept  = typename ziperator<Const>::iterator_concept;
    using value_type =
      remove_cvref_t<invoke_result_t<maybe-const<Const, F>&,
                                     range_reference_t<maybe-const<Const, Views>>...>>;
    using difference_type = range_difference_t<Base>;
    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<ziperator<false>, ziperator<Const>>;

    constexpr decltype(auto) operator*() const noexcept(see below);
    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<Base>;

    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;

    constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

    constexpr decltype(auto) operator[](difference_type n) const
      requires random_access_range<Base>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<ziperator<Const>>;

    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires random_access_range<Base>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;
  };
}
```

1 The member *typedef-name* `iterator::iterator_category` is defined if and only if `Base` models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:

(1.1) — If

```
invoke_result_t<maybe-const<Const, F>&, range_reference_t<maybe-const<Const, Views>>...>
```

is not a reference, `iterator_category` denotes `input_iterator_tag`.

(1.2) — Otherwise, let `Cs` denote the pack of types `iterator_traits<iterator_t<maybe-const<Const, Views>>>::iterator_category...`.

(1.2.1) — If `(derived_from<Cs, random_access_iterator_tag> && ...)` is `true`, `iterator_category` denotes `random_access_iterator_tag`.

(1.2.2) — Otherwise, if `(derived_from<Cs, bidirectional_iterator_tag> && ...)` is `true`, `iterator_category` denotes `bidirectional_iterator_tag`.

(1.2.3) — Otherwise, if `(derived_from<Cs, forward_iterator_tag> && ...)` is `true`, `iterator_category` denotes `forward_iterator_tag`.

(1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, ziperator<Const> inner);
```

2 *Effects*: Initializes *`parent_`* with `addressof(parent)` and *`inner_`* with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<ziperator<false>, ziperator<Const>>;
```

3 *Effects*: Initializes *`parent_`* with `i.parent_` and *`inner_`* with `std::move(i.inner_)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

4 *Effects*: Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

5 *Remarks*: Let `Is` be the pack `0, 1, ..., (sizeof...(Views) - 1)`. The exception specification is equivalent to: `noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...))`.

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++inner_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects*: Equivalent to: `++*this`.

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

9 *Effects*: Equivalent to:

```
--inner_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;
```

11 *Effects*: Equivalent to:

```
inner_ += x;
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

12 *Effects*: Equivalent to:

```
inner_ -= x;
return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
  requires random_access_range<Base>;
```

13 *Effects*: Equivalent to:

```
return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
}, inner_.current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<ziperator<Const>>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

14 Let *op* be the operator.

15 *Effects*: Equivalent to: `return x.inner_ op y.inner_;`

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

16 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ + n);`

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

17 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ - n);`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;
```

18 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.26.4 Class template zip_transform_view::*sentinel* [range.zip.transform.sentinel]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  template<bool Const>
  class zip_transform_view<F, Views...>::sentinel {
    zentinel<Const> inner_;                                    // exposition only
    constexpr explicit sentinel(zentinel<Const> inner);        // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && convertible_to<zentinel<false>, zentinel<Const>>;

    template<bool OtherConst>
      requires sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const sentinel& x, const iterator<OtherConst>& y);
  };
}
```

```
constexpr explicit sentinel(zentinel<Const> inner);
```

1 *Effects*: Initializes *inner_* with `inner`.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<zentinel<false>, zentinel<Const>>;
```

2 *Effects*: Initializes *inner_* with `std::move(i.inner_)`.

```
template<bool OtherConst>
  requires sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.inner_ == y.inner_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

```
template<bool OtherConst>
  requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const sentinel& x, const iterator<OtherConst>& y);
```

4 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.27 Adjacent view [range.adjacent]

25.7.27.1 Overview [range.adjacent.overview]

1 `adjacent_view` takes a view and produces a view whose M^{th} element is a tuple of references to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::adjacent<N>` denotes a range adaptor object (25.7.2). Given a subexpression `E` and a constant expression `N`, the expression `views::adjacent<N>(E)` is expression-equivalent to

(2.1) — `((void)E, auto(views::empty<tuple<>>))` if `N` is equal to `0` and `decltype((E))` models `forward_-range`,

(2.2) — otherwise, `adjacent_view<views::all_t<decltype((E))>, N>(E)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent<2>) {
  cout << "(" << std::get<0>(i) << ", " << std::get<1>(i) << ") ";  // prints (1, 2) (2, 3) (3, 4)
}
```

— *end example*]

3 Define `REPEAT(T, N)` as a pack of `N` types, each of which denotes the same type as `T`.

25.7.27.2 Class template `adjacent_view` [range.adjacent.view]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  class adjacent_view : public view_interface<adjacent_view<V, N>> {
    V base_ = V();                    // exposition only

    // 25.7.27.3, class template adjacent_view::iterator
    template<bool> class iterator;    // exposition only

    // 25.7.27.4, class template adjacent_view::sentinel
    template<bool> class sentinel;    // exposition only

    struct as-sentinel{};             // exposition only

  public:
    adjacent_view() requires default_initializable<V> = default;
    constexpr explicit adjacent_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>) {
      return iterator<false>(ranges::begin(base_), ranges::end(base_));
    }

    constexpr auto begin() const requires range<const V> {
      return iterator<true>(ranges::begin(base_), ranges::end(base_));
    }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (common_range<V>) {
        return iterator<false>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<false>(ranges::end(base_));
      }
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (common_range<const V>) {
        return iterator<true>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<true>(ranges::end(base_));
      }
    }

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };
}
```

```
constexpr explicit adjacent_view(V base);
```

1 *Effects*: Initializes *base_* with `std::move(base)`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

2 *Effects*: Equivalent to:

```
using ST = decltype(ranges::size(base_));
using CT = common_type_t<ST, size_t>;
auto sz = static_cast<CT>(ranges::size(base_));
sz -= std::min<CT>(sz, N - 1);
return static_cast<ST>(sz);
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

3 *Effects*: Equivalent to:

```
using DT = range_difference_t<decltype((base_))>;
using CT = common_type_t<DT, size_t>;
auto sz = static_cast<CT>(ranges::reserve_hint(base_));
sz -= std::min<CT>(sz, N - 1);
return to-unsigned-like(sz);
```

25.7.27.3 Class template `adjacent_view::`*`iterator`* [range.adjacent.iterator]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  template<bool Const>
  class adjacent_view<V, N>::iterator {
    using Base = maybe-const<Const, V>;                                   // exposition only
    array<iterator_t<Base>, N> current_ = array<iterator_t<Base>, N>();   // exposition only
    constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);    // exposition only
    constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
                                                                          // exposition only
  public:
    using iterator_category = input_iterator_tag;
    using iterator_concept  = see below;
    using value_type = tuple<REPEAT(range_value_t<Base>, N)...>;
    using difference_type = range_difference_t<Base>;

    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
    constexpr auto operator*() const;
    constexpr iterator& operator++();
    constexpr iterator operator++(int);

    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;

    constexpr iterator& operator+=(difference_type x)
      requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type x)
      requires random_access_range<Base>;

    constexpr auto operator[](difference_type n) const
      requires random_access_range<Base>;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator<=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base> &&
               three_way_comparable<iterator_t<Base>>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires random_access_range<Base>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

    friend constexpr auto iter_move(const iterator& i) noexcept(see below);
    friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
      requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *Base* models random_access_range, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *Base* models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, iterator_concept denotes forward_iterator_tag.

2 If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```
constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);
```

3 *Postconditions*: *current_*[0] == first is true, and for every integer $1 \leq i <$ N, *current_*[*i*] == ranges::next(*current_*[*i*-1], 1, last) is true.

```
constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
```

4 *Postconditions*: If *Base* does not model bidirectional_range, each element of *current_* is equal to *last*. Otherwise, *current_*[N-1] == last is true, and for every integer $0 \leq i <$ (N $-$ 1), *current_*[*i*] == ranges::prev(*current_*[*i*+1], 1, first) is true.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 *Effects*: Initializes each element of *current_* with the corresponding element of `i.`*current_* as an xvalue.

```
constexpr auto operator*() const;
```

6 *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

7 *Preconditions*: *current_*`.back()` is incrementable.

8 *Postconditions*: Each element of *current_* is equal to `ranges::next(i)`, where `i` is the value of that element before the call.

9 *Returns*: `*this`.

```
constexpr iterator operator++(int);
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Preconditions*: *current_*`.front()` is decrementable.

12 *Postconditions*: Each element of *current_* is equal to `ranges::prev(i)`, where `i` is the value of that element before the call.

13 *Returns*: `*this`.

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;
```

15 *Preconditions*: *current_*`.back() + x` has well-defined behavior.

16 *Postconditions*: Each element of *current_* is equal to `i + x`, where `i` is the value of that element before the call.

17 *Returns*: `*this`.

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

18 *Preconditions*: *current_*`.front() - x` has well-defined behavior.

19 *Postconditions*: Each element of *current_* is equal to `i - x`, where `i` is the value of that element before the call.

20 *Returns*: `*this`.

```
constexpr auto operator[](difference_type n) const
  requires random_access_range<Base>;
```

21 *Effects*: Equivalent to:

```
return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

22 *Returns*: `x.`*current_*`.back() == y.`*current_*`.back()`.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

23 *Returns*: `x.current_.back() < y.current_.back()`.

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

24 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

25 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

26 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> &&
           three_way_comparable<iterator_t<Base>>;
```

27 *Returns*: `x.current_.back() <=> y.current_.back()`.

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

28 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

29 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

30 *Effects*: Equivalent to: `return x.current_.back() - y.current_.back();`

```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
```

31 *Effects*: Equivalent to: `return tuple-transform(ranges::iter_move, i.current_);`

32 *Remarks*: The exception specification is equivalent to:

```
noexcept(ranges::iter_move(declval<const iterator_t<Base>&>())) &&
is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>
```

```
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires indirectly_swappable<iterator_t<Base>>;
```

33 *Preconditions*: None of the iterators in `l.current_` is equal to an iterator in `r.current_`.

34 *Effects*: For every integer $0 \leq i < N$, performs `ranges::iter_swap(l.current_[i], r.current_[i])`.

35 *Remarks*: The exception specification is equivalent to:

```
noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))
```

25.7.27.4 Class template `adjacent_view::sentinel` [range.adjacent.sentinel]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  template<bool Const>
  class adjacent_view<V, N>::sentinel {
    using Base = maybe-const<Const, V>;                    // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();            // exposition only
    constexpr explicit sentinel(sentinel_t<Base> end);     // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    template<bool OtherConst>
      requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
      operator-(const sentinel& y, const iterator<OtherConst>& x);
  };
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects*: Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `std::move(i.end_)`.

```
template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.current_.back() == y.end_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 *Effects*: Equivalent to: `return x.current_.back() - y.end_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const sentinel& y, const iterator<OtherConst>& x);
```

5 *Effects*: Equivalent to: `return y.end_ - x.current_.back();`

25.7.28 Adjacent transform view [range.adjacent.transform]

25.7.28.1 Overview [range.adjacent.transform.overview]

1 `adjacent_transform_view` takes an invocable object and a view and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::adjacent_transform<N>` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F` and a constant expression `N`:

(2.1) — If N is equal to 0 and decltype((E)) models forward_range, views::adjacent_transform<N>(E, F) is expression-equivalent to ((void)E, views::zip_transform(F)), except that the evaluations of E and F are indeterminately sequenced.

(2.2) — Otherwise, the expression views::adjacent_transform<N>(E, F) is expression-equivalent to adjacent_transform_view<views::all_t<decltype((E))>, decay_t<decltype((F))>, N>(E, F).

3 [*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
  cout << i << ' ';       // prints 2 6 12
}
```

— *end example*]

25.7.28.2 Class template adjacent_transform_view [range.adjacent.transform.view]

```
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
             regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
             can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
  class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
    movable-box<F> fun_;                    // exposition only
    adjacent_view<V, N> inner_;             // exposition only

    using InnerView = adjacent_view<V, N>;  // exposition only
    template<bool Const>
      using inner-iterator = iterator_t<maybe-const<Const, InnerView>>;         // exposition only
    template<bool Const>
      using inner-sentinel = sentinel_t<maybe-const<Const, InnerView>>;         // exposition only

    // 25.7.28.3, class template adjacent_transform_view::iterator
    template<bool> class iterator;          // exposition only

    // 25.7.28.4, class template adjacent_transform_view::sentinel
    template<bool> class sentinel;          // exposition only

  public:
    adjacent_transform_view() = default;
    constexpr explicit adjacent_transform_view(V base, F fun);

    constexpr V base() const & requires copy_constructible<V> { return inner_.base(); }
    constexpr V base() && { return std::move(inner_).base(); }

    constexpr auto begin() {
      return iterator<false>(*this, inner_.begin());
    }

    constexpr auto begin() const
      requires range<const InnerView> &&
               regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
      return iterator<true>(*this, inner_.begin());
    }

    constexpr auto end() {
      if constexpr (common_range<InnerView>) {
        return iterator<false>(*this, inner_.end());
      } else {

    };
  }
```

1 The member *typedef-name* *`iterator`*`::iterator_category` is defined as follows:

- (1.1) — If `invoke_result_t<`*`maybe-const`*`<Const, F>&,` *`REPEAT`*`(range_reference_t<`*`Base`*`>, N)...>` is not a reference, `iterator_category` denotes `input_iterator_tag`.
- (1.2) — Otherwise, let `C` denote the type `iterator_traits<iterator_t<`*`Base`*`>>::iterator_category`.
  - (1.2.1) — If `derived_from<C, random_access_iterator_tag>` is `true`, `iterator_category` denotes `random_access_iterator_tag`.
  - (1.2.2) — Otherwise, if `derived_from<C, bidirectional_iterator_tag>` is `true`, `iterator_category` denotes `bidirectional_iterator_tag`.
  - (1.2.3) — Otherwise, if `derived_from<C, forward_iterator_tag>` is `true`, `iterator_category` denotes `forward_iterator_tag`.
  - (1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, inner-iterator<Const> inner);
```

2 *Effects*: Initializes *`parent_`* with `addressof(parent)` and *`inner_`* with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<inner-iterator<false>, inner-iterator<Const>>;
```

3 *Effects*: Initializes *`parent_`* with `i.`*`parent_`* and *`inner_`* with `std::move(i.`*`inner_`*`)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

4 *Effects*: Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

5 *Remarks*: Let `Is` be the pack `0, 1, ..., (N - 1)`. The exception specification is equivalent to:

```
noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...))
```

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
    ++inner_;
    return *this;
```

```
constexpr iterator operator++(int);
```

7 *Effects*: Equivalent to:

```
    auto tmp = *this;
    ++*this;
    return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

8 *Effects*: Equivalent to:

```
    --inner_;
    return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

9 *Effects*: Equivalent to:

```
    auto tmp = *this;
    --*this;
    return tmp;
```

```
constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
```

10 *Effects*: Equivalent to:

```
    inner_ += x;
    return *this;
```

```
constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;
```

11 *Effects*: Equivalent to:

```
    inner_ -= x;
    return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
  requires random_access_range<Base>;
```

12 *Effects*: Equivalent to:

```
    return apply([&](const auto&... iters) -> decltype(auto) {
      return invoke(*parent_->fun_, iters[n]...);
    }, inner_.current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> && three_way_comparable<inner-iterator<Const>>;
```

13 Let *op* be the operator.

14 *Effects*: Equivalent to: `return x.inner_ op y.inner_;`

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

15 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ + n);`

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

16 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ - n);`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<inner-iterator<Const>, inner-iterator<Const>>;
```

17 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.28.4 Class template adjacent_transform_view::*sentinel* [range.adjacent.transform.sentinel]

```
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
             regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
             can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
  template<bool Const>
  class adjacent_transform_view<V, F, N>::sentinel {
    inner-sentinel<Const> inner_;                               // exposition only
    constexpr explicit sentinel(inner-sentinel<Const> inner);   // exposition only

  public:

      requires sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const sentinel& x, const iterator<OtherConst>& y);
  };
}
```

```
constexpr explicit sentinel(inner-sentinel<Const> inner);
```

1 *Effects*: Initializes *inner_* with `inner`.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<inner-sentinel<false>, inner-sentinel<Const>>;
```

2 *Effects*: Initializes *inner_* with `std::move(i.inner_)`.

```
template<bool OtherConst>
  requires sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.inner_ == y.inner_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

```
template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const sentinel& x, const iterator<OtherConst>& y);
```

4 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.29 Chunk view [range.chunk]

25.7.29.1 Overview [range.chunk.overview]

1 `chunk_view` takes a view and a number N and produces a range of views that are N-sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than N elements.

2 The name `views::chunk` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `N`, the expression `views::chunk(E, N)` is expression-equivalent to `chunk_view(E, N)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4, 5};

for (auto r : v | views::chunk(2)) {
  cout << '[';
  auto sep = "";
  for (auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "] ";
}
// The above prints [1, 2] [3, 4] [5]
```

— *end example*]

25.7.29.2 Class template `chunk_view` for input ranges [range.chunk.view.input]

```
namespace std::ranges {
  template<class I>
  constexpr I div-ceil(I num, I denom) {                   // exposition only
    I r = num / denom;
    if (num % denom)
      ++r;
    return r;
  }

  template<view V>
    requires input_range<V>
  class chunk_view : public view_interface<chunk_view<V>> {
    V base_;                                               // exposition only
    range_difference_t<V> n_;                              // exposition only
    range_difference_t<V> remainder_ = 0;                  // exposition only

    non-propagating-cache<iterator_t<V>> current_;         // exposition only

    // 25.7.29.3, class chunk_view::outer-iterator
    class outer-iterator;                                  // exposition only

    // 25.7.29.5, class chunk_view::inner-iterator
    class inner-iterator;                                  // exposition only

  public:
    constexpr explicit chunk_view(V base, range_difference_t<V> n);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr outer-iterator begin();
    constexpr default_sentinel_t end() const noexcept;
```

      constexpr auto size() const requires sized_range<const V>;

      constexpr auto reserve_hint() requires approximately_sized_range<V>;
      constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
    };

    template<class R>
      chunk_view(R&&, range_difference_t<R>) -> chunk_view<views::all_t<R>>;
  }
```

```
constexpr explicit chunk_view(V base, range_difference_t<V> n);
```

1 *Preconditions*: `n > 0` is `true`.

2 *Effects*: Initializes *`base_`* with `std::move(base)` and *`n_`* with `n`.

```
constexpr outer-iterator begin();
```

3 *Effects*: Equivalent to:

```
  current_ = ranges::begin(base_);
  remainder_ = n_;
  return outer-iterator(*this);
```

```
constexpr default_sentinel_t end() const noexcept;
```

4 *Returns*: `default_sentinel`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

5 *Effects*: Equivalent to:

```
  return to-unsigned-like(div-ceil(ranges::distance(base_), n_));
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

6 *Effects*: Equivalent to:

```
  auto s = static_cast<range_difference_t<decltype((base_))>>(ranges::reserve_hint(base_));
  return to-unsigned-like(div-ceil(s, n_));
```

25.7.29.3 Class `chunk_view::`*`outer-iterator`* [range.chunk.outer.iter]

```
namespace std::ranges {

```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

25 *Returns*: `(x.current_ - y.current_ + x.missing_ - y.missing_) / x.n_`.

```
friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

26 *Returns*: `div-ceil(x.end_ - x.current_, x.n_)`.

```
friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

27 *Effects*: Equivalent to: `return -(y - x);`

25.7.30 Slide view [range.slide]

25.7.30.1 Overview [range.slide.overview]

1 `slide_view` takes a view and a number N and produces a view whose M^{th} element is a view over the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::slide` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `N`, the expression `views::slide(E, N)` is expression-equivalent to `slide_view(E, N)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::slide(2)) {
  cout << '[' << i[0] << ", " << i[1] << "] ";          // prints [1, 2] [2, 3] [3, 4]
}
```

— *end example*]

25.7.30.2 Class template slide_view [range.slide.view]

```
namespace std::ranges {
  template<class V>
  concept slide-caches-nothing = random_access_range<V> && sized_range<V>;        // exposition only

  template<class V>
  concept slide-caches-last =                                               // exposition only
    !slide-caches-nothing<V> && bidirectional_range<V> && common_range<V>;

  template<class V>
  concept slide-caches-first =                                              // exposition only
    !slide-caches-nothing<V> && !slide-caches-last<V>;

  template<forward_range V>
    requires view<V>
  class slide_view : public view_interface<slide_view<V>> {
    V base_;                              // exposition only
    range_difference_t<V> n_;             // exposition only

    // 25.7.30.3, class template slide_view::iterator
    template<bool> class iterator;        // exposition only

    // 25.7.30.4, class slide_view::sentinel
    class sentinel;                       // exposition only

  public:
    constexpr explicit slide_view(V base, range_difference_t<V> n);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }
    constexpr auto begin()
      requires (!(simple-view<V> && slide-caches-nothing<const V>));
    constexpr auto begin() const requires slide-caches-nothing<const V>;

    constexpr auto reserve_hintsize() const requires approximately_sized_range<const V>;
  };

  template<class R>
    slide_view(R&&, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}
```

```
constexpr explicit slide_view(V base, range_difference_t<V> n);
```

1 *Preconditions*: `n > 0` is `true`.

2 *Effects*: Initializes *`base_`* with `std::move(base)` and *`n_`* with `n`.

```
constexpr auto begin()
  requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

3 *Returns*:

(3.1) — If `V` models *`slide-caches-first`*,

```
iterator<false>(ranges::begin(base_),
                ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)
```

(3.2) — Otherwise, *`iterator`*`<false>(ranges::begin(`*`base_`*`), `*`n_`*`)`.

4 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `slide_view` for use on subsequent calls when `V` models *`slide-caches-first`*.

```
constexpr auto begin() const requires slide-caches-nothing<const V>;
```

5 *Returns*: *`iterator`*`<true>(ranges::begin(`*`base_`*`), `*`n_`*`)`.

```
constexpr auto end()
  requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

6 *Returns*:

(6.1) — If `V` models *`slide-caches-nothing`*,

```
iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
```

(6.2) — Otherwise, if `V` models *`slide-caches-last`*,

```
iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
```

(6.3) — Otherwise, if `V` models `common_range`,

```
iterator<false>(ranges::end(base_), ranges::end(base_), n_)
```

(6.4) — Otherwise, *`sentinel`*`(ranges::end(`*`base_`*`))`.

7 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `slide_view` for use on subsequent calls when `V` models *`slide-caches-last`*.

```
constexpr auto end() const requires slide-caches-nothing<const V>;
```

8 *Returns*: `begin() + range_difference_t<const V>(size())`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

9 *Effects*: Equivalent to:

```
auto sz = ranges::distance(base_) - n_ + 1;
if (sz < 0) sz = 0;
return to-unsigned-like(sz);
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

10 *Effects*: Equivalent to:

```
auto sz = static_cast<range_difference_t<decltype((base_))>>(ranges::reserve_hint(base_)) -
                                                                        n_ + 1;
if (sz < 0) sz = 0;
return to-unsigned-like(sz);
```

25.7.30.3 Class template `slide_view::iterator` [range.slide.iterator]

```
namespace std::ranges {
  template<forward_range V>
    requires view<V>

  requires random_access_range<Base>;
```

```
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

28 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

29 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

30 *Returns*: If `last_ele_` is present, `x.last_ele_ - y.last_ele_`; otherwise, `x.current_ - y.current_`.

25.7.30.4 Class slide_view::*sentinel* [range.slide.sentinel]

```
namespace std::ranges {
  template<forward_range V>
    requires view<V>
  class slide_view<V>::sentinel {
    sentinel_t<V> end_ = sentinel_t<V>();              // exposition only
    constexpr explicit sentinel(sentinel_t<V> end);    // exposition only

  public:
    sentinel() = default;

    friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

    friend constexpr range_difference_t<V>
      operator-(const iterator<false>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

    friend constexpr range_difference_t<V>
      operator-(const sentinel& y, const iterator<false>& x)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
  };
}
```

1 [*Note 1*: `sentinel` is used only when `slide-caches-first<V>` is `true`. — *end note*]

```
constexpr explicit sentinel(sentinel_t<V> end);
```

2 *Effects*: Initializes `end_` with `end`.

```
friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);
```

3 *Returns*: `x.last_ele_ == y.end_`.

```
friend constexpr range_difference_t<V>
  operator-(const iterator<false>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

4 *Returns*: `x.last_ele_ - y.end_`.

```
friend constexpr range_difference_t<V>
  operator-(const sentinel& y, const iterator<false>& x)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

5 *Returns*: `y.end_ - x.last_ele_`.

25.7.31 Chunk by view [range.chunk.by]

25.7.31.1 Overview [range.chunk.by.overview]

1 `chunk_by_view` takes a view and a predicate, and splits the view into `subrange`s between each pair of adjacent elements for which the predicate returns `false`.

2 The name `views::chunk_by` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::chunk_by(E, F)` is expression-equivalent to `chunk_by_view(E, F)`.

[*Example 1*:

```
vector v = {1, 2, 2, 3, 0, 4, 5, 2};

for (auto r : v | views::chunk_by(ranges::less_equal{})) {
  cout << '[';
  auto sep = "";
  for (auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "] ";
}
// The above prints [1, 2, 2, 3] [0, 4, 5] [2]
```

— *end example*]

25.7.31.2 Class template `chunk_by_view` [range.chunk.by.view]

```
namespace std::ranges {
  template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
    V base_ = V();                                          // exposition only
    movable-box<Pred> pred_;                                // exposition only

    // 25.7.31.3, class chunk_by_view::iterator
    class iterator;                                         // exposition only

  public:
    chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr explicit chunk_by_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr iterator begin();
    constexpr auto end();

    constexpr iterator_t<V> find-next(iterator_t<V>);       // exposition only
    constexpr iterator_t<V> find-prev(iterator_t<V>)        // exposition only
      requires bidirectional_range<V>;
  };

  template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;
}
```

`constexpr explicit chunk_by_view(V base, Pred pred);`

1 *Effects*: Initializes *`base_`* with `std::move(base)` and *`pred_`* with `std::move(pred)`.

`constexpr const Pred& pred() const;`

2 *Effects*: Equivalent to: `return *pred_;`

`constexpr iterator begin();`

3 *Preconditions*: `pred_.has_value()` is `true`.

4 *Returns*: `iterator(*this, ranges::begin(base_), find-next(ranges::begin(base_)))`.

5 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `chunk_by_view` for use on subsequent calls.

`constexpr auto end();`

6 *Effects*: Equivalent to:

```
if constexpr (common_range<V>) {
  return iterator(*this, ranges::end(base_), ranges::end(base_));
} else {
  return default_sentinel;
}
```

`constexpr iterator_t<V> find-next(iterator_t<V> current);`

7 *Preconditions*: `pred_.has_value()` is `true`.

8 *Returns*:

```
ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
             1, ranges::end(base_))
```

`constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;`

9 *Preconditions*:

(9.1) — `current` is not equal to `ranges::begin(base_)`.

(9.2) — `pred_.has_value()` is `true`.

10 *Returns*: An iterator `i` in the range [`ranges::begin(base_)`, `current`) such that:

(10.1) — `ranges::adjacent_find(i, current, not_fn(ref(*pred_)))` is equal to `current`; and

(10.2) — if `i` is not equal to `ranges::begin(base_)`, then `bool(invoke(*pred_, *ranges::prev(i), *i))` is `false`.

25.7.31.3 Class `chunk_by_view::iterator` [range.chunk.by.iter]

```
namespace std::ranges {
  template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class chunk_by_view<V, Pred>::iterator {
    chunk_by_view* parent_ = nullptr;                                  // exposition only
    iterator_t<V> current_ = iterator_t<V>();                          // exposition only
    iterator_t<V> next_    = iterator_t<V>();                          // exposition only

    constexpr iterator(chunk_by_view& parent, iterator_t<V> current,    // exposition only
                       iterator_t<V> next);

  public:
    using value_type = subrange<iterator_t<V>>;
    using difference_type  = range_difference_t<V>;
    using iterator_category = input_iterator_tag;
    using iterator_concept = see below;

    iterator() = default;

    constexpr value_type operator*() const;
    constexpr iterator& operator++();
    constexpr iterator operator++(int);

    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;
```

```
      friend constexpr bool operator==(const iterator& x, const iterator& y);
      friend constexpr bool operator==(const iterator& x, default_sentinel_t);
    };
  }
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.2) — Otherwise, iterator_concept denotes forward_iterator_tag.

```
constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);
```

2 *Effects*: Initializes *parent_* with addressof(parent), *current_* with current, and *next_* with next.

```
constexpr value_type operator*() const;
```

3 *Preconditions*: *current_* is not equal to *next_*.

4 *Returns*: subrange(*current_*, *next_*).

```
constexpr iterator& operator++();
```

5 *Preconditions*: *current_* is not equal to *next_*.

6 *Effects*: Equivalent to:

```
current_ = next_;
next_ = parent_->find-next(current_);
return *this;
```

```
constexpr iterator operator++(int);
```

7 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<V>;
```

8 *Effects*: Equivalent to:

```
next_ = current_;
current_ = parent_->find-prev(next_);
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<V>;
```

9 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

10 *Returns*: x.*current_* == y.*current_*.

```
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
```

11 *Returns*: x.*current_* == x.*next_*.

25.7.32 Stride view [range.stride]

25.7.32.1 Overview [range.stride.overview]

1 stride_view presents a view of an underlying sequence, advancing over n elements at a time, as opposed to the usual single-step succession.

2 The name views::stride denotes a range adaptor object (25.7.2). Given subexpressions E and N, the expression views::stride(E, N) is expression-equivalent to stride_view(E, N).

3 [*Example 1*:

```
auto input = views::iota(0, 12) | views::stride(3);
ranges::copy(input, ostream_iterator<int>(cout, " "));                  // prints 0 3 6 9
ranges::copy(input | views::reverse, ostream_iterator<int>(cout, " ")); // prints 9 6 3 0
```

— *end example*]

25.7.32.2 Class template stride_view [range.stride.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class stride_view : public view_interface<stride_view<V>> {
    V base_;                                    // exposition only
    range_difference_t<V> stride_;              // exposition only
    // 25.7.32.3, class template stride_view::iterator
    template<bool> class iterator;              // exposition only
  public:
    constexpr explicit stride_view(V base, range_difference_t<V> stride);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr range_difference_t<V> stride() const noexcept;

    constexpr auto begin() requires (!simple-view<V>) {
      return iterator<false>(this, ranges::begin(base_));
    }

    constexpr auto begin() const requires range<const V> {
      return iterator<true>(this, ranges::begin(base_));
    }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (common_range<V> && sized_range<V> && forward_range<V>) {
        auto missing = (stride_ - ranges::distance(base_) % stride_) % stride_;
        return iterator<false>(this, ranges::end(base_), missing);
      } else if constexpr (common_range<V> && !bidirectional_range<V>) {
        return iterator<false>(this, ranges::end(base_));
      } else {
        return default_sentinel;
      }
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (common_range<const V> && sized_range<const V> && forward_range<const V>) {
        auto missing = (stride_ - ranges::distance(base_) % stride_) % stride_;
        return iterator<true>(this, ranges::end(base_), missing);
      } else if constexpr (common_range<const V> && !bidirectional_range<const V>) {
        return iterator<true>(this, ranges::end(base_));
      } else {
        return default_sentinel;
      }
    }

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };

  template<class R>
    stride_view(R&&, range_difference_t<R>) -> stride_view<views::all_t<R>>;
}
```

```
constexpr stride_view(V base, range_difference_t<V> stride);
```

1 *Preconditions*: `stride > 0` is `true`.

2 *Effects*: Initializes *`base_`* with `std::move(base)` and *`stride_`* with `stride`.

```
constexpr range_difference_t<V> stride() const noexcept;
```

3 *Returns*: `stride_`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

4 *Effects*: Equivalent to:

```
return to-unsigned-like(div-ceil(ranges::distance(base_), stride_));
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

5 *Effects*: Equivalent to:

```
auto s = static_cast<range_difference_t<decltype((base_))>>(ranges::reserve_hint(base_));
return to-unsigned-like(div-ceil(s, stride_));
```

25.7.32.3 Class template `stride_view::iterator` [range.stride.iterator]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  template<bool Const>
  class stride_view<V>::iterator {
    using Parent = maybe-const<Const, stride_view>;                   // exposition only
    using Base = maybe-const<Const, V>;                               // exposition only

    iterator_t<Base> current_ = iterator_t<Base>();                   // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();                       // exposition only
    range_difference_t<Base> stride_ = 0;                             // exposition only
    range_difference_t<Base> missing_ = 0;                            // exposition only

        requires random_access_range<Base>;
      friend constexpr difference_type operator-(const iterator& x, const iterator& y)
        requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

      friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
      friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

      friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current_)));

      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
        requires indirectly_swappable<iterator_t<Base>>;
    };
  }
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *Base* models random_access_range, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *Base* models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *Base* models forward_range, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member *typedef-name* iterator_category is defined if and only if *Base* models forward_range. In that case, *iterator*::iterator_category is defined as follows:

(2.1) — Let C denote the type iterator_traits<iterator_t<*Base*>>::iterator_category.

(2.2) — If C models derived_from<random_access_iterator_tag>, then iterator_category denotes random_access_iterator_tag.

(2.3) — Otherwise, iterator_category denotes C.

```
constexpr iterator(Parent* parent, iterator_t<Base> current,
                   range_difference_t<Base> missing = 0);
```

3 *Effects*: Initializes *current_* with std::move(current), *end_* with ranges::end(parent->*base_*), *stride_* with parent->*stride_*, and *missing_* with missing.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>
               && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

4 *Effects*: Initializes *current_* with `std::move(i.current_)`, *end_* with `std::move(i.end_)`, *stride_*-with `i.stride_`, and *missing_* with `i.missing_`.

```
constexpr iterator_t<Base> base() &&;
```

5 *Returns*: `std::move(current_)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

6 *Returns*: *current_*.

```
constexpr iterator& operator++();
```

7 *Preconditions*: `current_ != end_` is `true`.

8 *Effects*: Equivalent to:

```
missing_ = ranges::advance(current_, stride_, end_);
return *this;
```

```
constexpr void operator++(int);
```

9 *Effects*: Equivalent to `++*this;`

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Effects*: Equivalent to:

```
ranges::advance(current_, missing_ - stride_);
missing_ = 0;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

12 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type n) requires random_access_range<Base>;
```

13 *Preconditions*: If `n` is positive, `ranges::distance(current_, end_) > stride_ * (n - 1)` is `true`.

[*Note 1*: If `n` is negative, the *Effects* paragraph implies a precondition. — *end note*]

14 *Effects*: Equivalent to:

```
if (n > 0) {
  ranges::advance(current_, stride_ * (n - 1));
  missing_ = ranges::advance(current_, stride_, end_);
} else if (n < 0) {
  ranges::advance(current_, stride_ * n + missing_);
  missing_ = 0;
}
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

15 *Effects*: Equivalent to: `return *this += -x;`

```
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
```

16 *Returns*: `x.current_ == x.end_`.

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<Base>>;
```

17 *Returns*: `x.current_ == y.current_`.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

18 *Returns*: `x.current_ < y.current_`.

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

19 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

20 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

21 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;
```

22 *Returns*: `x.current_ <=> y.current_`.

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

23 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

24 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

25 *Returns*: Let `N` be `(x.current_ - y.current_)`.

(25.1) — If `Base` models `forward_range`, `(N + x.missing_ - y.missing_) / x.stride_`.

(25.2) — Otherwise, if `N` is negative, `-div-ceil(-N, x.stride_)`.

(25.3) — Otherwise, `div-ceil(N, x.stride_)`.

```
friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

26 *Returns*: `div-ceil(x.end_ - x.current_, x.stride_)`.

```
friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

27 *Effects*: Equivalent to: `return -(y - x);`

```
friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

28 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<Base>>;
```

29 *Effects*: Equivalent to: `ranges::iter_swap(x.current_, y.current_);`

25.7.33 Cartesian product view [range.cartesian]

25.7.33.1 Overview [range.cartesian.overview]

1 `cartesian_product_view` takes any non-zero number of ranges n and produces a view of tuples calculated by the n-ary cartesian product of the provided ranges.

2 The name `views::cartesian_product` denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions `Es`, the expression `views::cartesian_product(Es...)` is expression-equivalent to

(2.1) — `views::single(tuple())` if `Es` is an empty pack,

(2.2) — otherwise, `cartesian_product_view<views::all_t<decltype((Es))>...>(Es...)`.

3 [*Example 1*:

```
vector<int> v { 0, 1, 2 };
for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
  cout << a << ' ' << b << ' ' << c << '\n';
}
// The above prints
// 0 0 0
// 0 0 1
// 0 0 2
// 0 1 0
// 0 1 1
// ...
```

— *end example*]

25.7.33.2 Class template cartesian_product_view [range.cartesian.view]

```
namespace std::ranges {
  template<bool Const, class First, class... Vs>
  concept cartesian-product-is-random-access =          // exposition only
    (random_access_range<maybe-const<Const, First>> && ... &&
      (random_access_range<maybe-const<Const, Vs>>
        && sized_range<maybe-const<Const, Vs>>));

  template<class R>
  concept cartesian-product-common-arg =                // exposition only
    common_range<R> || (sized_range<R> && random_access_range<R>);

  template<bool Const, class First, class... Vs>
  concept cartesian-product-is-bidirectional =          // exposition only
    (bidirectional_range<maybe-const<Const, First>> && ... &&
      (bidirectional_range<maybe-const<Const, Vs>>
        && cartesian-product-common-arg<maybe-const<Const, Vs>>));

  template<class First, class...>
  concept cartesian-product-is-common =                 // exposition only
    cartesian-product-common-arg<First>;

  template<class... Vs>
  concept cartesian-product-is-sized =                  // exposition only
    (sized_range<Vs> && ...);
  template<bool Const, template<class> class FirstSent, class First, class... Vs>
    concept cartesian-is-sized-sentinel =                 // exposition only
      (sized_sentinel_for<FirstSent<maybe-const<Const, First>>,
          iterator_t<maybe-const<Const, First>>> && ...
        && (sized_range<maybe-const<Const, Vs>>
          && sized_sentinel_for<iterator_t<maybe-const<Const, Vs>>,
              iterator_t<maybe-const<Const, Vs>>>));

  template<cartesian-product-common-arg R>
  constexpr auto cartesian-common-arg-end(R& r) {         // exposition only
    if constexpr (common_range<R>) {
      return ranges::end(r);
    } else {
      return ranges::begin(r) + ranges::distance(r);
    }
  }

  template<input_range First, forward_range... Vs>
    requires (view<First> && ... && view<Vs>)
  class cartesian_product_view : public view_interface<cartesian_product_view<First, Vs...>> {
  private:
    tuple<First, Vs...> bases_;                   // exposition only
    // 25.7.33.3, class template cartesian_product_view::iterator
    template<bool Const> class iterator;         // exposition only

  public:
    constexpr cartesian_product_view() = default;
    constexpr explicit cartesian_product_view(First first_base, Vs... bases);

    constexpr iterator<false> begin()
      requires (!simple-view<First> || ... || !simple-view<Vs>);
    constexpr iterator<true> begin() const
      requires (range<const First> && ... && range<const Vs>);

    constexpr iterator<false> end()
      requires ((!simple-view<First> || ... || !simple-view<Vs>) &&
        cartesian-product-is-common<First, Vs...>);
    constexpr iterator<true> end() const
      requires cartesian-product-is-common<const First, const Vs...>;
    constexpr default_sentinel_t end() const noexcept;

    constexpr see below size()
      requires cartesian-product-is-sized<First, Vs...>;
    constexpr see below size() const
      requires cartesian-product-is-sized<const First, const Vs...>;
  };

  template<class... Vs>
    cartesian_product_view(Vs&&...) -> cartesian_product_view<views::all_t<Vs>...>;
}
```

```
constexpr explicit cartesian_product_view(First first_base, Vs... bases);
```

1 *Effects*: Initializes `bases_` with `std::move(first_base), std::move(bases)...`.

```
constexpr iterator<false> begin()
  requires (!simple-view<First> || ... || !simple-view<Vs>);
```

2 *Effects*: Equivalent to:

```
return iterator<false>(*this, tuple-transform(ranges::begin, bases_));
```

```
constexpr iterator<true> begin() const
  requires (range<const First> && ... && range<const Vs>);
```

3 *Effects*: Equivalent to:

```
    return iterator<true>(*this, tuple-transform(ranges::begin, bases_));
```

```
constexpr iterator<false> end()
  requires ((!simple-view<First> || ... || !simple-view<Vs>)
    && cartesian-product-is-common<First, Vs...>);
constexpr iterator<true> end() const
  requires cartesian-product-is-common<const First, const Vs...>;
```

4 Let:

(4.1) — *is-const* be `true` for the const-qualified overload, and `false` otherwise;

(4.2) — *is-empty* be `true` if the expression `ranges::empty(rng)` is `true` for any `rng` among the underlying ranges except the first one and `false` otherwise; and

(4.3) — *begin-or-first-end*`(rng)` be expression-equivalent to *is-empty* `? ranges::begin(rng) :` *cartesian-common-arg-end*`(rng)` if `rng` is the first underlying range and `ranges::begin(rng)` otherwise.

5 *Effects*: Equivalent to:

```
    iterator<is-const> it(*this, tuple-transform(
      [](auto& rng){ return begin-or-first-end(rng); }, bases_));
    return it;
```

```
constexpr default_sentinel_t end() const noexcept;
```

6 *Returns*: `default_sentinel`.

```
constexpr see below size()
  requires cartesian-product-is-sized<First, Vs...>;
constexpr see below size() const
  requires cartesian-product-is-sized<const First, const Vs...>;
```

7 The return type is an implementation-defined unsigned-integer-like type.

8 *Recommended practice*: The return type should be the smallest unsigned-integer-like type that is sufficiently wide to store the product of the maximum sizes of all the underlying ranges, if such a type exists.

9 Let p be the product of the sizes of all the ranges in *bases_*.

10 *Preconditions*: p can be represented by the return type.

11 *Returns*: p.

25.7.33.3 Class template `cartesian_product_view::`*`iterator`* [range.cartesian.iterator]

```
  namespace std::ranges {

    };
  }
```

1 *`iterator`*`::iterator_concept` is defined as follows:

(1.1) — If *cartesian-product-is-random-access*<Const, First, Vs...> is modeled, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *cartesian-product-is-bidirectional*<Const, First, Vs...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *maybe-const*<Const, First> models forward_range, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 *iterator*::difference_type is an implementation-defined signed-integer-like type.

3 *Recommended practice*: *iterator*::difference_type should be the smallest signed-integer-like type that is sufficiently wide to store the product of the maximum sizes of all underlying ranges if such a type exists.

```
template<size_t N = sizeof...(Vs)>
  constexpr void next();
```

4 *Effects*: Equivalent to:

```
auto& it = std::get<N>(current_);
++it;
if constexpr (N > 0) {
  if (it == ranges::end(std::get<N>(parent_->bases_))) {
    it = ranges::begin(std::get<N>(parent_->bases_));
    next<N - 1>();
  }
}
```

```
template<size_t N = sizeof...(Vs)>
  constexpr void prev();
```

5 *Effects*: Equivalent to:

```
auto& it = std::get<N>(current_);
if constexpr (N > 0) {
  if (it == ranges::begin(std::get<N>(parent_->bases_))) {
    it = cartesian-common-arg-end(std::get<N>(parent_->bases_));
    prev<N - 1>();
  }
}
--it;
```

```
template<class Tuple>
  constexpr difference_type distance-from(const Tuple& t) const;
```

6 Let:

(6.1) — *scaled-size*(N) be the product of static_cast<difference_type>(ranges::size(std::get<N>(*parent_*->*bases_*))) and *scaled-size*($N+1$) if $N \leq$ sizeof...(Vs), otherwise static_cast<difference_type>(1);

(6.2) — *scaled-distance*(N) be the product of static_cast<difference_type>(std::get<N>(*current_*) - std::get<N>(t)) and *scaled-size*($N+1$); and

(6.3) — *scaled-sum* be the sum of *scaled-distance*(N) for every integer $0 \leq N \leq$ sizeof...(Vs).

7 *Preconditions*: *scaled-sum* can be represented by difference_type.

8 *Returns*: *scaled-sum*.

```
constexpr iterator(Parent& parent, tuple<iterator_t<maybe-const<Const, First>>,
  iterator_t<maybe-const<Const, Vs>>...> current);
```

9 *Effects*: Initializes *parent_* with addressof(parent) and *current_* with std::move(current).

```
constexpr iterator(iterator<!Const> i) requires Const &&
  (convertible_to<iterator_t<First>, iterator_t<const First>> &&
    ... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);
```

10 *Effects*: Initializes *parent_* with i.*parent_* and *current_* with std::move(i.*current_*).

```
constexpr auto operator*() const;
```

11 *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

12 *Effects*: Equivalent to:

```
next();
return *this;
```

```
constexpr void operator++(int);
```

13 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires forward_range<maybe-const<Const, First>>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--()
  requires cartesian-product-is-bidirectional<Const, First, Vs...>;
```

15 *Effects*: Equivalent to:

```
prev();
return *this;
```

```
constexpr iterator operator--(int)
  requires cartesian-product-is-bidirectional<Const, First, Vs...>;
```

16 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

17 Let `orig` be the value of `*this` before the call.

Let `ret` be:

(17.1) — If `x > 0`, the value of `*this` had *`next`* been called `x` times.

(17.2) — Otherwise, if `x < 0`, the value of `*this` had *`prev`* been called `-x` times.

(17.3) — Otherwise, `orig`.

18 *Preconditions*: `x` is in the range [`ranges::distance(*this, ranges::begin(*parent_))`, `ranges::distance(*this, ranges::end(*parent_))`].

19 *Effects*: Sets the value of `*this` to `ret`.

20 *Returns*: `*this`.

21 *Complexity*: Constant.

```
constexpr iterator& operator-=(difference_type x)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

22 *Effects*: Equivalent to:

```
*this += -x;
return *this;
```

```
constexpr reference operator[](difference_type n) const
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

23 *Effects*: Equivalent to: `return *((*this) + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<maybe-const<Const, First>>>;
```

24 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
```

25 *Returns*: `true` if `std::get<i>(x.current_) == ranges::end(std::get<i>(x.parent_->bases_))` is `true` for any integer $0 \le i \le$ `sizeof...(Vs)`; otherwise, `false`.

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires all-random-access<Const, First, Vs...>;
```

26 *Effects*: Equivalent to: `return x.current_ <=> y.current_;`

```
friend constexpr iterator operator+(const iterator& x, difference_type y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

27 *Effects*: Equivalent to: `return iterator(x) += y;`

```
friend constexpr iterator operator+(difference_type x, const iterator& y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

28 *Effects*: Equivalent to: `return y + x;`

```
friend constexpr iterator operator-(const iterator& x, difference_type y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

29 *Effects*: Equivalent to: `return iterator(x) -= y;`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;
```

30 *Effects*: Equivalent to: `return x.distance-from(y.current_);`

```
friend constexpr difference_type operator-(const iterator& i, default_sentinel_t)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;
```

31 Let `end-tuple` be an object of a type that is a specialization of `tuple`, such that:

(31.1) — `std::get<0>(end-tuple)` has the same value as `ranges::end(std::get<0>(i.parent_->bases_));`

(31.2) — `std::get<N>(end-tuple)` has the same value as `ranges::begin(std::get<N>(i.parent_->bases_))` for every integer $1 \le N \le$ `sizeof...(Vs)`.

32 *Effects*: Equivalent to: `return i.distance-from(end-tuple);`

```
friend constexpr difference_type operator-(default_sentinel_t s, const iterator& i)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;
```

33 *Effects*: Equivalent to: `return -(i - s);`

```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
```

34 *Effects*: Equivalent to: `return tuple-transform(ranges::iter_move, i.current_);`

35 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

(35.1) — `noexcept(ranges::iter_move(std::get<N>(i.current_)))` for every integer $0 \le N \le$ `sizeof...(Vs)`,

(35.2) — `is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const, T>>>` for every type `T` in `First, Vs...`.

```
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires (indirectly_swappable<iterator_t<maybe-const<Const, First>>> && ... &&
        indirectly_swappable<iterator_t<maybe-const<Const, Vs>>>);
```

36 *Effects*: For every integer $0 \le i \le$ `sizeof...(Vs)`, performs:

```
ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
```

37 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

(37.1) — `noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_)))` for every integer $0 \leq i \leq$ `sizeof...(Vs)`.

25.7.34 Cache latest view [range.cache.latest]

25.7.34.1 Overview [range.cache.latest.overview]

1 `cache_latest_view` caches the last-accessed element of its underlying sequence so that the element does not have to be recomputed on repeated access.

[*Note 1*: This is useful if computation of the element to produce is expensive. — *end note*]

2 The name `views::cache_latest` denotes a range adaptor object (25.7.2). Let `E` be an expression. The expression `views::cache_latest(E)` is expression-equivalent to `cache_latest_view(E)`.

25.7.34.2 Class template `cache_latest_view` [range.cache.latest.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class cache_latest_view : public view_interface<cache_latest_view<V>> {
    V base_ = V();                                                   // exposition only
    using cache-t = conditional_t<is_reference_v<range_reference_t<V>>, // exposition only
                                  add_pointer_t<range_reference_t<V>>,
                                  range_reference_t<V>>;

    non-propagating-cache<cache-t> cache_;                           // exposition only

    // 25.7.34.3, class cache_latest_view::iterator
    class iterator;                                                  // exposition only
    // 25.7.34.4, class cache_latest_view::sentinel
    class sentinel;                                                  // exposition only

  public:
    cache_latest_view() requires default_initializable<V> = default;
    constexpr explicit cache_latest_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }

    constexpr range_reference_t<V>& operator*() const;

    constexpr iterator& operator++();
    constexpr void operator++(int);

    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current_)));

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<V>>;
  };
}
```

`constexpr explicit iterator(cache_latest_view& parent);`

1 *Effects*: Initializes *current_* with ranges::begin(parent.*base_*) and *parent_* with addressof(parent).

`constexpr iterator_t<V> base() &&;`

2 *Returns*: std::move(*current_*).

`constexpr const iterator_t<V>& base() const & noexcept;`

3 *Returns*: *current_*.

`constexpr iterator& operator++();`

4 *Effects*: Equivalent to:

```
parent_->cache_.reset();
++current_;
return *this;
```

`constexpr void operator++(int);`

5 *Effects*: Equivalent to: ++*this.

`constexpr range_reference_t<V>& operator*() const;`

6 *Effects*: Equivalent to:

```
if constexpr (is_reference_v<range_reference_t<V>>) {
  if (!parent_->cache_) {
    parent_->cache_ = addressof(as-lvalue(*current_));
  }
```

```
      return **parent_->cache_;
    } else {
      if (!parent_->cache_) {
        parent_->cache_.emplace-deref(current_);
      }
      return *parent_->cache_;
    }
```

[*Note 1*: Evaluations of `operator*` on the same iterator object can conflict (6.9.2.2). — *end note*]

```
friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

7 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<V>>;
```

8 *Effects*: Equivalent to `ranges::iter_swap(x.current_, y.current_)`.

25.7.34.4 Class `cache_latest_view::sentinel` [range.cache.latest.sentinel]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class cache_latest_view<V>::sentinel {
    sentinel_t<V> end_ = sentinel_t<V>();                        // exposition only

    constexpr explicit sentinel(cache_latest_view& parent);      // exposition only

  public:
    sentinel() = default;

    constexpr sentinel_t<V> base() const;

    friend constexpr bool operator==(const iterator& x, const sentinel& y);

    friend constexpr range_difference_t<V> operator-(const iterator& x, const sentinel& y)
      requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
    friend constexpr range_difference_t<V> operator-(const sentinel& x, const iterator& y)
      requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
  };
}
```

```
constexpr explicit sentinel(cache_latest_view& parent);
```

1 *Effects*: Initializes `end_` with `ranges::end(parent.base_)`.

```
constexpr sentinel_t<V> base() const;
```

2 *Returns*: `end_`.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

3 *Returns*: `x.current_ == y.end_`.

```
friend constexpr range_difference_t<V> operator-(const iterator& x, const sentinel& y)
  requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

4 *Returns*: `x.current_ - y.end_`.

```
friend constexpr range_difference_t<V> operator-(const sentinel& x, const iterator& y)
  requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

5 *Returns*: `x.end_ - y.current_`.

25.7.35 To input view [range.to.input]

25.7.35.1 Overview [range.to.input.overview]

1 `to_input_view` presents a view of an underlying sequence as an input-only non-common range.

[*Note 1*: This is useful to avoid overhead that can be necessary to provide support for the operations needed for greater iterator strength. — *end note*]

2 The name `views::to_input` denotes a range adaptor object (25.7.2). Let `E` be an expression and let `T` be `decltype((E))`. The expression `views::to_input(E)` is expression-equivalent to:

(2.1) — `views::all(E)` if `T` models `input_range`, does not satisfy `common_range`, and does not satisfy `forward_range`.

(2.2) — Otherwise, `to_input_view(E)`.

25.7.35.2 Class template `to_input_view` [range.to.input.view]

```
template<input_range V>
  requires view<V>
class to_input_view : public view_interface<to_input_view<V>> {
  V base_ = V();                          // exposition only

  template<bool Const> class iterator;    // exposition only

public:
  to_input_view() requires default_initializable<V> = default;
  constexpr explicit to_input_view(V base);

  constexpr V base() const & requires copy_constructible<V> { return base_; }
  constexpr V base() && { return std::move(base_); }

  constexpr auto begin() requires (!simple-view<V>);
  constexpr auto begin() const requires range<const V>;

  constexpr auto end() requires (!simple-view<V>);
  constexpr auto end() const requires range<const V>;

  constexpr auto size() requires sized_range<V>;
  constexpr auto size() const requires sized_range<const V>;
};

template<class R>
  to_input_view(R&&) -> to_input_view<views::all_t<R>>;
```

```
constexpr explicit to_input_view(V base);
```

1 *Effects*: Initializes `base_` with `std::move(base)`.

```
constexpr auto begin() requires (!simple-view<V>);
```

2 *Effects*: Equivalent to: `return iterator<false>(ranges::begin(base_));`

```
constexpr auto begin() const requires range<const V>;
```

3 *Effects*: Equivalent to: `return iterator<true>(ranges::begin(base_));`

```
constexpr auto end() requires (!simple-view<V>);
constexpr auto end() const requires range<const V>;
```

4 *Effects*: Equivalent to: `return ranges::end(base_);`

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

5 *Effects*: Equivalent to: `return ranges::size(base_);`

25.7.35.3 Class template `to_input_view::iterator` [range.to.input.iterator]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  template<bool Const>
  class to_input_view<V>::iterator {
    using Base = maybe-const<Const, V>;                     // exposition only
```

```
      iterator_t<Base> current_ = iterator_t<Base>();              // exposition only

      constexpr explicit iterator(iterator_t<Base> current);       // exposition only

    public:
      using difference_type = range_difference_t<Base>;
      using value_type = range_value_t<Base>;
      using iterator_concept = input_iterator_tag;

      iterator() requires default_initializable<iterator_t<Base>> = default;

      iterator(iterator&&) = default;
      iterator& operator=(iterator&&) = default;

      constexpr iterator(iterator<!Const> i)
        requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

      constexpr iterator_t<Base> base() &&;
      constexpr const iterator_t<Base>& base() const & noexcept;

      constexpr decltype(auto) operator*() const { return *current_; }

      constexpr iterator& operator++();
      constexpr void operator++(int);

      friend constexpr bool operator==(const iterator& x, const sentinel_t<Base>& y);

      friend constexpr difference_type operator-(const sentinel_t<Base>& y, const iterator& x)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
      friend constexpr difference_type operator-(const iterator& x, const sentinel_t<Base>& y)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

      friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current_)));

      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
        requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

```
constexpr explicit iterator(iterator_t<Base> current);
```

1 *Effects*: Initializes *current_* with `std::move(current)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

2 *Effects*: Initializes *current_* with `std::move(i.current_)`.

```
constexpr iterator_t<Base> base() &&;
```

3 *Returns*: `std::move(current_)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

4 *Returns*: *current_*.

```
constexpr iterator& operator++();
```

5 *Effects*: Equivalent to:

```
  ++current_;
  return *this;
```

```
constexpr void operator++(int);
```

6 *Effects*: Equivalent to: `++*this;`

```
friend constexpr bool operator==(const iterator& x, const sentinel_t<Base>& y);
```

7 *Returns*: `x.current_ == y`.

```
friend constexpr difference_type operator-(const sentinel_t<Base>& y, const iterator& x)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

8 *Returns*: `y - x.current_`.

```
friend constexpr difference_type operator-(const iterator& x, const sentinel_t<Base>& y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

9 *Returns*: `x.current_ - y`.

```
friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

10 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<Base>>;
```

11 *Effects*: Equivalent to: `ranges::iter_swap(x.current_, y.current_);`

25.8 Range generators [coro.generator]

25.8.1 Overview [coroutine.generator.overview]

1 Class template `generator` presents a view of the elements yielded by the evaluation of a coroutine.

2 A `generator` generates a sequence of elements by repeatedly resuming the coroutine from which it was returned. Elements of the sequence are produced by the coroutine each time a `co_yield` statement is evaluated. When the `co_yield` statement is of the form `co_yield elements_of(r)`, each element of the range `r` is successively produced as an element of the sequence.

[*Example 1*:

```
generator<int> ints(int start = 0) {
  while (true)
    co_yield start++;
}

void f() {
  for (auto i : ints() | views::take(3))
    cout << i << ' ';        // prints 0 1 2
}
```

— *end example*]

25.8.2 Header <generator> synopsis [generator.syn]

```
namespace std {
  // 25.8.3, class template generator
  template<class Ref, class Val = void, class Allocator = void>
    class generator;

  namespace pmr {
    template<class Ref, class Val = void>
      using generator = std::generator<Ref, Val, polymorphic_allocator<>>;
  }
}
```

25.8.3 Class template generator [coro.generator.class]

```
namespace std {
  template<class Ref, class Val = void, class Allocator = void>
  class generator : public ranges::view_interface<generator<Ref, Val, Allocator>> {
  private:
    using value = conditional_t<is_void_v<Val>, remove_cvref_t<Ref>, Val>;  // exposition only
    using reference = conditional_t<is_void_v<Val>, Ref&&, Ref>;           // exposition only
    // 25.8.6, class generator::iterator
    class iterator;                                                     // exposition only

  public:
    using yielded =
      conditional_t<is_reference_v<reference>, reference, const reference&>;

    // 25.8.5, class generator::promise_type
    class promise_type;

    generator(const generator&) = delete;
    generator(generator&& other) noexcept;

    ~generator();

    generator& operator=(generator other) noexcept;

    iterator begin();
    default_sentinel_t end() const noexcept;

  private:
    coroutine_handle<promise_type> coroutine_ = nullptr;   // exposition only
    unique_ptr<stack<coroutine_handle<>>> active_;         // exposition only
  };
}
```

1 *Mandates*:

(1.1) — If `Allocator` is not `void`, `allocator_traits<Allocator>::pointer` is a pointer type.

(1.2) — *`value`* is a cv-unqualified object type.

(1.3) — *`reference`* is either a reference type, or a cv-unqualified object type that models `copy_constructible`.

(1.4) — Let `RRef` denote `remove_reference_t<`*`reference`*`>&&` if *`reference`* is a reference type, and *`reference`* otherwise. Each of:

(1.4.1) — `common_reference_with<`*`reference`*`&&, `*`value`*`&>`,

(1.4.2) — `common_reference_with<`*`reference`*`&&, RRef&&>`, and

(1.4.3) — `common_reference_with<RRef&&, const `*`value`*`&>`

is modeled.

[*Note 1*: These requirements ensure the exposition-only *`iterator`* type can model `indirectly_readable` and thus `input_iterator`. — *end note*]

2 If `Allocator` is not `void`, it shall meet the *Cpp17Allocator* requirements.

3 Specializations of `generator` model `view` and `input_range`.

4 The behavior of a program that adds a specialization for `generator` is undefined.

25.8.4 Members [coro.generator.members]

`generator(generator&& other) noexcept;`

1 *Effects*: Initializes *`coroutine_`* with `exchange(other.`*`coroutine_`*`, {})` and *`active_`* with `exchange(other.`*`active_`*`, nullptr)`.

2 [*Note 1*: Iterators previously obtained from `other` are not invalidated; they become iterators into `*this`. — *end note*]

`~generator();`

3 *Effects*: Equivalent to:

```
if (coroutine_) {
  coroutine_.destroy();
}
```

4 [*Note 2*: Ownership of recursively yielded generators is held in awaitable objects in the coroutine frame of the yielding generator, so destroying the root generator effectively destroys the entire stack of yielded generators. — *end note*]

```
generator& operator=(generator other) noexcept;
```

5 *Effects*: Equivalent to:

```
swap(coroutine_, other.coroutine_);
swap(active_, other.active_);
```

6 *Returns*: `*this`.

7 [*Note 3*: Iterators previously obtained from `other` are not invalidated; they become iterators into `*this`. — *end note*]

```
iterator begin();
```

8 *Preconditions*: *`coroutine_`* refers to a coroutine suspended at its initial suspend point (9.6.4).

9 *Effects*: Pushes *`coroutine_`* into `*`*`active_`*, then evaluates *`coroutine_`*`.resume()`.

10 *Returns*: An *`iterator`* object whose member *`coroutine_`* refers to the same coroutine as does *`coroutine_`*.

11 [*Note 4*: A program that calls `begin` more than once on the same generator has undefined behavior. — *end note*]

```
default_sentinel_t end() const noexcept;
```

12 *Returns*: `default_sentinel`.

25.8.5 Class generator::promise_type [coro.generator.promise]

```
namespace std {
  template<class Ref, class Val, class Allocator>
  class generator<Ref, Val, Allocator>::promise_type {
  public:
    generator get_return_object() noexcept;

    suspend_always initial_suspend() const noexcept { return {}; }
    auto final_suspend() noexcept;

    suspend_always yield_value(yielded val) noexcept;

    auto yield_value(const remove_reference_t<yielded>& lval)
      requires is_rvalue_reference_v<yielded> &&
        constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;

    template<class R2, class V2, class Alloc2, class Unused>
      requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
        auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
    template<class R2, class V2, class Alloc2, class Unused>
      requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
        auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&, Unused> g) noexcept;

    template<ranges::input_range R, class Alloc>
      requires convertible_to<ranges::range_reference_t<R>, yielded>
        auto yield_value(ranges::elements_of<R, Alloc> r);

    void await_transform() = delete;

    void return_void() const noexcept {}
    void unhandled_exception();

    void* operator new(size_t size)
      requires same_as<Allocator, void> || default_initializable<Allocator>;

    template<class Alloc, class... Args>
      void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);
    template<class This, class Alloc, class... Args>
      void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                         const Args&...);

    void operator delete(void* pointer, size_t size) noexcept;

  private:
    add_pointer_t<yielded> value_ = nullptr;      // exposition only
    exception_ptr except_;                        // exposition only
  };
}
```

```
generator get_return_object() noexcept;
```

1 *Returns*: A `generator` object whose member *`coroutine_`* is `coroutine_handle<promise_type>::from_promise(*this)`, and whose member *`active_`* points to an empty stack.

```
auto final_suspend() noexcept;
```

2 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*`*`active_`* of some `generator` object `x`. This function is called by that coroutine upon reaching its final suspend point (9.6.4).

3 *Returns*: An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the calling coroutine to be suspended, pop the coroutine handle from the top of `*x.`*`active_`*, and resume execution of the coroutine referred to by `x.`*`active_`*`->top()` if `*x.`*`active_`* is not empty. If it is empty, control flow returns to the current coroutine caller or resumer (9.6.4).

```
suspend_always yield_value(yielded val) noexcept;
```

4 *Effects*: Equivalent to *`value_`* `= addressof(val)`.

5 *Returns*: `{}`.

```
auto yield_value(const remove_reference_t<yielded>& lval)
  requires is_rvalue_reference_v<yielded> &&
    constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;
```

6 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*`*`active_`* of some `generator` object.

7 *Returns*: An awaitable object of an unspecified type (7.6.2.4) that stores an object of type `remove_cvref_t<yielded>` direct-non-list-initialized with `lval`, whose member functions arrange for *`value_`* to point to that stored object and then suspend the coroutine.

8 *Throws*: Any exception thrown by the initialization of the stored object.

9 *Remarks*: A *yield-expression* that calls this function has type `void` (7.6.17).

```
template<class R2, class V2, class Alloc2, class Unused>
  requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
  auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
template<class R2, class V2, class Alloc2, class Unused>
  requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
  auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&, Unused> g) noexcept;
```

10 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*`*`active_`* of some `generator` object `x`. The coroutine referred to by `g.range.`*`coroutine_`* is suspended at its initial suspend point.

11 *Returns*: An awaitable object of an unspecified type (7.6.2.4) into which `g.range` is moved, whose member `await_ready` returns `false`, whose member `await_suspend` pushes `g.range.`*`coroutine_`* into `*x.`*`active_`* and resumes execution of the coroutine referred to by `g.range.`*`coroutine_`*, and whose member `await_resume` evaluates `rethrow_exception(`*`except_`*`)` if `bool(`*`except_`*`)` is `true`. If `bool(`*`except_`*`)` is `false`, the `await_resume` member has no effects.

12 *Remarks*: A *yield-expression* that calls one of these functions has type `void` (7.6.17).

```
template<ranges::input_range R, class Alloc>
  requires convertible_to<ranges::range_reference_t<R>, yielded>
  auto yield_value(ranges::elements_of<R, Alloc> r);
```

13 *Effects*: Equivalent to:

```
auto nested = [](allocator_arg_t, Alloc, ranges::iterator_t<R> i, ranges::sentinel_t<R> s)
  -> generator<yielded, void, Alloc> {
    for (; i != s; ++i) {
      co_yield static_cast<yielded>(*i);
    }
  };
return yield_value(ranges::elements_of(nested(
  allocator_arg, r.allocator, ranges::begin(r.range), ranges::end(r.range))));
```

14 [*Note 1*: A *yield-expression* that calls this function has type `void` (7.6.17). — *end note*]

```
void unhandled_exception();
```

15 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*active_` of some `generator` object `x`.

16 *Effects*: If the handle referring to the coroutine whose promise object is `*this` is the sole element of `*x.active_`, equivalent to `throw`, otherwise, assigns `current_exception()` to `except_`.

```
void* operator new(size_t size)
  requires same_as<Allocator, void> || default_initializable<Allocator>;

template<class Alloc, class... Args>
  void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);

template<class This, class Alloc, class... Args>
  void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                     const Args&...);
```

17 Let `A` be

(17.1) — `Allocator`, if it is not `void`,

(17.2) — `Alloc` for the overloads with a template parameter `Alloc`, or

(17.3) — `allocator<void>` otherwise.

Let `B` be `allocator_traits<A>::template rebind_alloc<U>` where `U` is an unspecified type whose size and alignment are both `__STDCPP_DEFAULT_NEW_ALIGNMENT__`.

18 *Mandates*: `allocator_traits<B>::pointer` is a pointer type. For the overloads with a template parameter `Alloc`, `same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>` is modeled.

19 *Effects*: Initializes an allocator `b` of type `B` with `A(alloc)`, for the overloads with a function parameter `alloc`, and with `A()` otherwise. Uses `b` to allocate storage for the smallest array of `U` sufficient to provide storage for a coroutine state of size `size`, and unspecified additional state necessary to ensure that `operator delete` can later deallocate this memory block with an allocator equal to `b`.

20 *Returns*: A pointer to the allocated storage.

```
void operator delete(void* pointer, size_t size) noexcept;
```

21 *Preconditions*: `pointer` was returned from an invocation of one of the above overloads of `operator new` with a `size` argument equal to `size`.

22 *Effects*: Deallocates the storage pointed to by `pointer` using an allocator equivalent to that used to allocate it.

25.8.6 Class generator::*iterator* [coro.generator.iterator]

```
namespace std {
  template<class Ref, class Val, class Allocator>
  class generator<Ref, Val, Allocator>::iterator {
  public:
    using value_type = value;
```

```
      using difference_type = ptrdiff_t;

      iterator(iterator&& other) noexcept;
      iterator& operator=(iterator&& other) noexcept;

      reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
      iterator& operator++();
      void operator++(int);

      friend bool operator==(const iterator& i, default_sentinel_t);

    private:
      coroutine_handle<promise_type> coroutine_; // exposition only
    };
  }
```

`iterator(iterator&& other) noexcept;`

1 *Effects*: Initializes *coroutine_* with `exchange(other.coroutine_, {})`.

`iterator& operator=(iterator&& other) noexcept;`

2 *Effects*: Equivalent to `coroutine_ = exchange(other.coroutine_, {})`.

3 *Returns*: `*this`.

`reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);`

4 *Preconditions*: For some `generator` object `x`, *coroutine_* is in `*x.active_` and `x.active_->top()` refers to a suspended coroutine with promise object `p`.

5 *Effects*: Equivalent to: `return static_cast<reference>(*p.value_);`

`iterator& operator++();`

6 *Preconditions*: For some `generator` object `x`, *coroutine_* is in `*x.active_`.

7 *Effects*: Equivalent to `x.active_->top().resume()`.

8 *Returns*: `*this`.

`void operator++(int);`

9 *Effects*: Equivalent to `++*this`.

`friend bool operator==(const iterator& i, default_sentinel_t);`

10 *Effects*: Equivalent to: `return i.coroutine_.done();`

26 Algorithms library [algorithms]

26.1 General [algorithms.general]

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 23) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the C library, as summarized in Table 83.

Table 83 — Algorithms library summary [tab:algorithms.summary]

	Subclause	Header
26.2	Algorithms requirements	
26.3	Parallel algorithms	`<execution>`
26.5	Algorithm result types	`<algorithm>`
26.6	Non-modifying sequence operations	
26.7	Mutating sequence operations	
26.8	Sorting and related operations	
26.10	Generalized numeric operations	`<numeric>`
26.11	Specialized `<memory>` algorithms	`<memory>`
26.12	Specialized `<random>` algorithms	`<random>`
26.13	C library algorithms	`<cstdlib>`

26.2 Algorithms requirements [algorithms.requirements]

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the `std::ranges` namespace in this Clause and specified as function templates are algorithm function objects (16.3.3.4).

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm's *Effects* element specifies that a value pointed to by any iterator passed as an argument is modified, then the type of that argument shall meet the requirements of a mutable iterator (24.3).

(4.2) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall meet the *Cpp17InputIterator* requirements (24.3.5.3).

(4.3) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `Output-Iterator2`, the template argument shall meet the *Cpp17OutputIterator* requirements (24.3.5.4).

(4.4) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, `ForwardItera-tor2`, or `NoThrowForwardIterator`, the template argument shall meet the *Cpp17ForwardIterator* requirements (24.3.5.5) if it is required to be a mutable iterator, or model `forward_iterator` (24.3.4.11) otherwise.

(4.5) — If an algorithm's template parameter is named `NoThrowForwardIterator`, the template argument is also required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.6) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall meet the *Cpp17BidirectionalIterator* requirements (24.3.5.6) if it is required to be a mutable iterator, or model `bidirectional_iterator` (24.3.4.12) otherwise.

(4.7) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) if it is required to be a mutable iterator, or model `random_access_iterator` (24.3.4.13) otherwise.

[*Note 1*: These requirements do not affect iterator arguments that are constrained, for which iterator category and mutability requirements are expressed explicitly. — *end note*]

5 Both in-place and copying versions are provided for certain algorithms.[201] When such a version is provided for *algorithm* it is called *algorithm*`_copy`. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).

6 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. If an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, the expression `pred(*first)` shall be well-formed and the type `decltype(pred(*first))` shall model *`boolean-testable`* (18.5.2). The function object `pred` shall not apply any non-constant function through its argument. Given a glvalue `u` of type (possibly const) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.

7 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that, when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature, returns a value testable as `true`. If an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, the expression `binary_pred(*first1, *first2)` shall be well-formed and the type `decltype(binary_pred(*first1, *first2))` shall model *`boolean-testable`*. Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, the expression `binary_pred(*first1, value)` shall be well-formed and the type `decltype(binary_pred(*first1, value))` shall model *`boolean-testable`*. `binary_pred` shall not apply any non-constant function through any of its arguments. Given a glvalue `u` of type (possibly const) `T1` that designates the same object as `*first1`, and a glvalue `v` of type (possibly const) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.

8 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (22.10).

9 [*Note 2*: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — *end note*]

10 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.

11 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If $[\texttt{a}, \texttt{b})$ denotes a range, the semantics of `b - a` in these cases are the same as those of

```
iter_difference_t<decltype(a)> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;
```

and if $[\texttt{b}, \texttt{a})$ denotes a range, the same as those of

```
iter_difference_t<decltype(b)> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;
return n;
```

201) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users can invoke `copy` followed by `sort`.

12 In the description of the algorithms, given an iterator `a` whose difference type is `D`, and an expression `n` of integer-like type other than *cv* `D`, the semantics of `a + n` and `a - n` are, respectively, those of `a + D(n)` and `a - D(n)`.

13 In the description of algorithm return values, a sentinel value `s` denoting the end of a range [`i`, `s`) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.

14 Overloads of algorithms that take `range` arguments (25.4.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the `range`(s) and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.

15 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[*Note 3*: Consequently, an implementation can declare an algorithm with different template parameters than those presented. — *end note*]

26.3 Parallel algorithms [algorithms.parallel]

26.3.1 Preamble [algorithms.parallel.defns]

1 Subclause 26.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

2 A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy`.

3 Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

(3.1) — All operations of the categories of the iterators or `mdspan` types that the algorithm is instantiated with.

(3.2) — Operations on those sequence elements that are required by its specification.

(3.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.

(3.4) — Operations on those function objects required by the specification.

[*Note 1*: See 26.2. — *end note*]

These functions are herein called *element access functions*.

4 [*Example 1*: The `sort` function may invoke the following element access functions:

(4.1) — Operations of the random-access iterator of the actual template argument (as per 24.3.5.7), as implied by the name of the template parameter `RandomAccessIterator`.

(4.2) — The `swap` function on the elements of the sequence (as per the preconditions specified in 26.8.2.1).

(4.3) — The user-provided `Compare` function object.

— *end example*]

5 A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[*Note 2*: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — *end note*]

[*Example 2*:

```
int x = 0;
std::mutex m;
void f() {
  int a[] = {1,2};
  std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);            // incorrect: lock_guard constructor calls m.lock()
    ++x;
  });
}
```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — *end example*]

26.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

1 Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, `BinaryDivideOp`, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

26.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

1 Parallel algorithms have template parameters named `ExecutionPolicy` (26.3.6) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[*Note 1*: For example, `swap`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — *end note*]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`.

[*Note 2*: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — *end note*]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

[*Note 3*: The invocations are not interleaved; see 6.9.1. — *end note*]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[*Note 4*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::unsequenced_policy` algorithm.

[*Note 5*: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (32.4.3) or `jthread` (32.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[*Note 6*: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — *end note*]

[*Example 1*:

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
  v.push_back(i*2+1);                    // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — *end example*]

[*Example 2*:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  x.fetch_add(1, std::memory_order::relaxed);
  // spin wait for another iteration to change the value of x
  while (x.load(std::memory_order::relaxed) == 1) { }            // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — *end example*]

[*Example 3*:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  std::lock_guard<mutex> guard(m);
  ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — *end example*]

7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

[*Note 7*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::parallel_unsequenced_policy` algorithm.

[*Note 8*: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

8 [*Note 9*: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — *end note*]

9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

(9.1) — temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or

(9.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

[*Note 10*: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — *end note*]

10 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

26.3.4 Parallel algorithm exceptions [algorithms.parallel.exceptions]

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

26.3.5 `ExecutionPolicy` algorithm overloads [algorithms.parallel.overloads]

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel

algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

[*Note 1*: Not all algorithms have parallel algorithm overloads. — *end note*]

2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.

3 Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says "at most *expr*" or "exactly *expr*" and does not specify the number of assignments or swaps, and *expr* is not already expressed with $\mathscr{O}()$ notation, the complexity of the algorithm shall be $\mathscr{O}(expr)$.

4 Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_-cvref_t<ExecutionPolicy>>` is `true`.

26.3.6 Execution policies [execpol]

26.3.6.1 General [execpol.general]

1 Subclause 26.3.6 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. Execution policy types are declared in header `<execution>` (33.4).

[*Example 1*:

```
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```

— *end example*]

[*Note 1*: Implementations can provide additional execution policies to those described in this document as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — *end note*]

26.3.6.2 Execution policy type trait [execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

2 `is_execution_policy<T>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[*Note 1*: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — *end note*]

3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

26.3.6.3 Sequenced execution policy [execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.4 Parallel execution policy [execpol.par]

```
class execution::parallel_policy { unspecified };
```

1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.5 Parallel and unsequenced execution policy [execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.6 Unsequenced execution policy [execpol.unseq]

```
class execution::unsequenced_policy { unspecified };
```

1 The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

2 During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.7 Execution policy objects [execpol.objects]

```
inline constexpr execution::sequenced_policy            execution::seq{ unspecified };
inline constexpr execution::parallel_policy             execution::par{ unspecified };
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };
inline constexpr execution::unsequenced_policy          execution::unseq{ unspecified };
```

1 The header `<execution>` (33.4) declares global objects associated with each type of execution policy.

26.4 Header `<algorithm>` synopsis [algorithm.syn]

```
  // mostly freestanding
  #include <initializer_list>     // see 17.11.2

  namespace std {
    namespace ranges {
      // 26.5, algorithm result types
      template<class I, class F>
        struct in_fun_result;

      template<class I1, class I2>
        struct in_in_result;

      template<class I, class O>
        struct in_out_result;

      template<class I1, class I2, class O>
        struct in_in_out_result;

      template<class I, class O1, class O2>
        struct in_out_out_result;

      template<class T>
        struct min_max_result;
      template<class I>
        struct in_found_result;

      template<class I, class T>
        struct in_value_result;

      template<class O, class T>
        struct out_value_result;
    }

    // 26.6, non-modifying sequence operations
    // 26.6.1, all of
